a door movably supported on the first guiding means for movement between a closed position covering a portion of the opening and an open position wherein the door is positioned within the space between the support post and said one of the side walls whereby the railway car has substantially continuous side walls while permitting the placement of the door laterally outward of the support post when the door is in the open position, and a locking mechanism for securing the door in the closed position, said locking mechanism comprising;

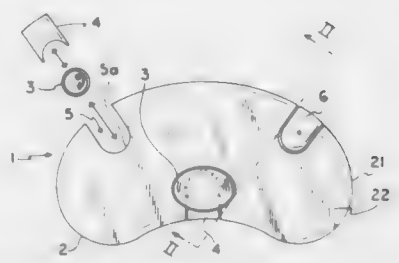
a first lower keeper structure supported on the floor structure; and

a first latch structure supported on the door and supporting a first latch member therein;

the keeper structure receiving the latch member therein for securing the door in the closed position, and said latch structure having biasing means urging the latch member downwardly;

said keeper structure comprising:

a receiving portion having an aperture therein receiving the latch member;



a ramp member connected with the receiving portion for cammingly elevating the latch member to the receiving portion as the door is moved to the closed position.

PLATFORM HAVING A NOTCH AND PLUG MEMBER THEREFOR

Barbara L. Kudlac, Apt. 14A, 3298 S. Lakewood, Tulsa, Okla. 74135

Filed Dec. 20, 1989, Ser. No. 453,845
Int. Cl.[5] A47B *85/00*
U.S. Cl. 108—25 **7 Claims**

1. A serving unit comprising;

a substantially planar platform having top and bottom faces and an outer edge,

said platform provided with at least one U-shaped notch vertically extending completely therethrough,

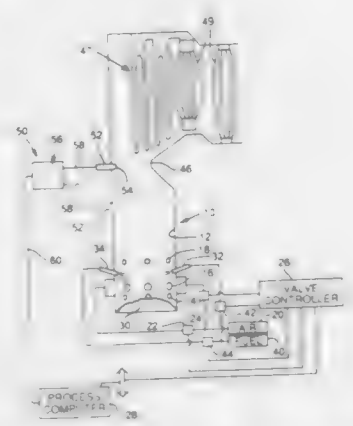
each notch bounded by a semi-circular inner wall joined to a pair of opposed parallel side walls, said side walls terminating with the platform outer edge,

the notch side walls each including a longitudinal side wall channel therein spaced from said top and bottom faces,

a food server including a food receiving body attached to a base having an arcuate periphery, said arcuate periphery mating within the sidewall channels whereby,

said food server is attachable to said platform upon the lateral insertion of said base into a said notch with said arcuate periphery mating within said channels, and

a planar plug member having side walls and an inner wall mating with the area as defined by the notch side wall and the notch inner wall, said plug member provided with an outer wall, a track extending outwardly from the plug member side walls and mating with the side wall channels whereby,



upon removal of said food server base from a said notch, said plug member is insertable into said notch and retained therein by engagement of the side wall tracks within said channels with said plug member fully filling said notch as the plug member outer wall is juxtaposed said platform outer edge.

APPARATUS FOR DETECTING CARRYOVER PARTICLES IN THE INTERIOR OF A FURNACE

George Kychakoff, Maple Valley, Wash., and Gene P. Ort, Spring, Tex., assignors to Wyerehaeuser Company, Tacoma, Wash.

Filed May 8, 1990, Ser. No. 521,082
Int. Cl.[5] F23N *5/00*
U.S. Cl. 110—185 **9 Claims**

1. An apparatus for detecting carryover particles in the interior of a furnace comprising

plural spaced apart carryover particle detectors each directed toward a different region of the interior of the furnace for detecting the presence of carryover particles in such regions of the furnace interior, the detectors producing output signals upon the detection of carryover particles,

a signal processor coupled to the detectors for receiving the output signals and for producing a count signal corresponding to the count of the carryover particles detected by the detectors

5,010,828

GASIFICATION REACTOR FOR COMBUSTIBLE SOLID MATERIAL

Heinz Mallek, Linnich, Fed. Rep. of Germany, assignor to Forschungszentrum Jülich GmbH, Jülich, Fed. Rep. of Germany

Filed Jul. 23, 1990, Ser. No. 556,824
Claims priority, application Fed. Rep. of Germany, Jul. 26, 1989, 3924626
Int. Cl.[5] F23G *5/00, 5/12*
U.S. Cl. 110—256 **7 Claims**

1. A gasifying reactor for combustible solid materials having a gasification shaft, a movable support at the lower end of said shaft for accumulation thereabove a loose filling of solid material in said shaft, said movable support leaving gaps between at least its principal edges and walls of said shaft for passage of gases and solid material pieces, mains for supplying an oxygen containing gasification medium for gasification and partial combustion of solid material in said accumulation of solid material above said support, a combustion chamber below said support for combustion of gas passing through said passages which is generated in said accumulation of said material, gas suction means connected to said combustion chamber for removal of gases produced by combustion and an ash chamber below said combustion chamber and closing the bottom thereof for receiving solid materials converted in part to ashes falling through said passages and through said combustion chamber, characterized in that:

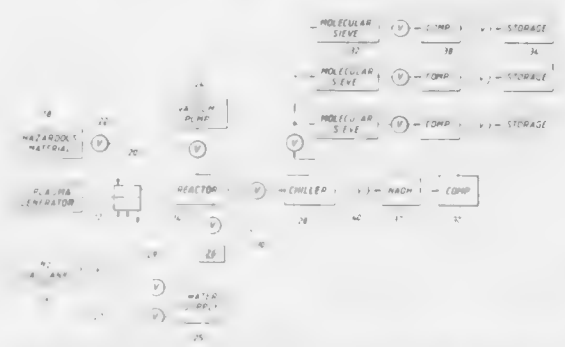
a movable emptying device **(18)** for ashes is provided at the bottom of said ash chamber **(16)** in such a way that passages **(20)** remain between edges of said emptying device and walls of said ash chamber for introducing an oxygen containing gas into the ashes in said ash chamber from below, said passages being subject to change of width during movement of said device.

5,010,829

METHOD AND APPARATUS FOR TREATMENT OF HAZARDOUS WASTE IN ABSENCE OF OXYGEN

Prabhakar Kulkarni, 12027 Circle Dr. E., Houston, Tex. 77071

Continuation-in-part of Ser. No. 241,318, Sep. 15, 1988, Pat. No. 4,896,614. This application Jan. 29, 1990, Ser. No. 471,551
Int. Cl.[5] F23G *7/04*
U.S. Cl. 110—346 **8 Claims**



1. A method of converting solid hazardous waste material into useful by-products, comprising the steps of:

(a) introducing the solid waste material into a first high temperature zone generated by at least one plasma gun and converting the waste material into a mixture of carbon black, gases and metallic non-converted material,

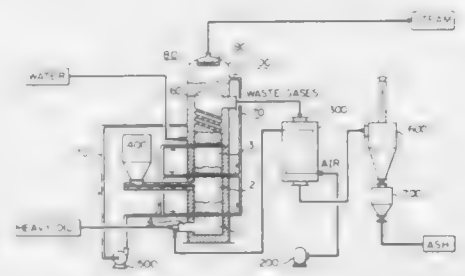
(b) collecting said mixture in a first reactor chamber in the absence of oxygen for preventing the recombination of said mixture with oxygen,

(c) discharging the carbon black and metallic nonconverted material into a magnetic separator for separating the metallic material from the carbon black and collecting said metallic material for subsequent use;

(d) directing said carbon black through a second high temperature zone into a second reactor chamber for further separation and conversion of hazardous constituents into non-hazardous gases;

(e) directing the gases from said first and second reactor chambers through cooling apparatus for reducing the temperature of said gases;

(f) passing said gases through molecular sieve apparatus permitting selected constituents of said gases to pass through said molecular sieve apparatus; and



(f) collecting said selected constituents in storage vessels.

5,010,830

PROCESS AND APPARATUS FOR INCINERATING WET REFUSE

Masahiro Asuka; Shinjiro Yokota; Makoto Tonogouchi, and Mitsuo Kasai, all of Ube, Japan, assignors to Ube Industries, Inc., Japan

Continuation of Ser. No. 306,727, Feb. 6, 1989, abandoned. This application Jul. 6, 1990, Ser. No. 549,641
Claims priority, application Japan, Feb. 9, 1988, 63-26628; Jun. 14, 1988, 63-144683; Jun. 28, 1988, 63-158101; Oct. 4, 1988, 63-249120
Int. Cl.[5] F23D *1/00*; F23G *5/00*
U.S. Cl. 110—347 **6 Claims**

1. A process for incinerating wet refuse containing not less than 60% water and having a size of not more than 30 mm in a combustion chamber having a fluidized bed of solid particles formed therein, comprising:

(a) forming at least three adjacent chamber zones arranged vertically and in series, two or more upper zones thereof having perforated bottoms and being provided with a fluid and heat medium of solid particles, said medium being fluidized to form a fluidized bed on each perforated bottom by gases fed continuously from below said zones;

(b) continuously feeding air into the lower non-fluidized bed zone to cause a combustion and fluidization, and through the upper fluidized bed zones via the perforated bottoms thereof, to be discharged from a topmost fluidized bed zone;

(c) continuously feeding wet refuse into an intermediate primary fluidized bed zone;

(d) continuously feeding auxiliary fuel into the lower non-fluidized bed zone to cause a combustion with a part of the fed air, whereby a combination of said air feed, said refuse feed, and said fluidization of the heat particle medium, generates sufficient heat energy to dry the fed refuse and incinerate 70% to 80% of the dried fed refuse in said intermediate primary fluidized bed zone; the balance of said refuse being in a form of unburnt carbon particles having a size small enough to move upward through said perforated bottoms, said carbon particles being forced to move from said intermediate primary fluidized bed zone into one or more of said upper fluidized bed zones and to be incinerated therein, said generated heat energy combining with additional heat energy generated by an incineration of the refuse with a remaining portion of the fed air

PARTICULATE FUEL BURNER AND METHOD OF OPERATION

Frans L. Halfhide, Binnenwalder 17, NL-1112 RW Diemen, Netherlands

PCT No. PCT/NL88/00017, § 371 Date Oct. 18, 1989, § 102(e) Date Oct. 18, 1989, PCT Pub. No. WO88/08505, PCT Pub. Date Nov. 3, 1988
PCT Filed Apr. 18, 1988, Ser. No. 427,118
Claims priority, application Netherlands, Apr. 21, 1987, 8700945
Int. Cl.[5] F23D *1/00*
U.S. Cl. 110—347 **8 Claims**

1. Burner comprising two coaxially mounted tubes provided with means to introduce air as well as particulate matter in the space between both tubes and means to discharge burnt matter from that space and wherein the inner tube being at least partially gas porous, said inner tube being provided with means to introduce a combustion agent, characterized in that, in the space between both tubes screw conveyor means are provided.

5,010,832

QUICK FEED DRIVE UNIT HAVING AN ELECTROMAGNETIC CLUTCH, A WORM, WORM WHEEL, AND PATTERN WHEEL FOR FEEDING A SEWN CLOTH IN A PERFORATING SEWING MACHINE

Katsuo Hiratsuka; Yoshiyuki Odaka, and Takeshi Yoshida, all of Tochigi, Japan, assignors to SSMC Inc., Edison, N.J.

Filed Sep. 22, 1989, Ser. No. 410,788
Claims priority, application Japan, Oct. 20, 1988, 63-136174[U]
Int. Cl.[5] D05B *3/00, 3/04, 3/06, 69/10*
U.S. Cl. 112—68 **2 Claims**

1. A quick feeding driving unit for use in a perforating sewing machine having a bed and comprising:

a quick feeding shaft having two opposite ends;

a worm secured to one end of the quick feeding shaft;

said quick feeding shaft having a portion thereof rotatably supported in a bearing secured to said bed and rotatable in one direction;

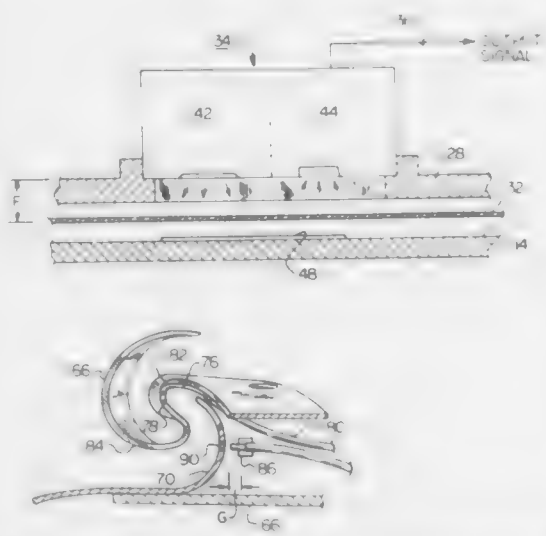
a magnetic clutch having a stationary winding supported by the bed and a magnetic clutch shaft having two opposite ends, one end of the clutch shaft being coaxially opera-

tively connected to the other end of the feeding shaft, the clutch, when the winding is energized, engaging the clutch shaft with the feeding shaft to transmit a rotational driving force of the clutch shaft to the feeding shaft;

a pattern wheel shaft having two opposite ends and disposed at a right angle to the quick feeding shaft and rotatably supported at one end thereof in a bearing secured at the bed;

a pattern wheel secured at the other end of the pattern wheel shaft for feeding a sewn cloth quickly,

a worm wheel coaxially fixed to the pattern wheel shaft at an intermediate portion thereof and meshing with said worm, the worm wheel and the worm constituting a gear mechanism for transmitting the rotational driving force of the quick feeding shaft to the pattern wheel shaft



---

5,010,833

EDGE DETECTOR FOR FELLING FOLDER AND METHOD

James T. Spencer, III, Greensboro, and James K. Walker, Elon College, both of N.C., assignors to Wrangler, Greensboro, N.C.

Filed Sep. 6, 1988, Ser. No. 240,859
Int. Cl.[5] D05B *35/10*
U.S. Cl. 112—262.1 **44 Claims**

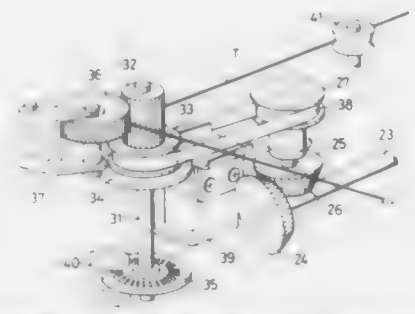
42 A method for detecting the presence of a workpiece of cut fabric wherein the workpiece is processed by a sewing machine having a work surface over which the workpiece is progressively moved, comprising the steps of

(a) directing electromagnetic radiation upon said workpiece,

(b) receiving electromagnetic radiation reflected from said workpiece;

(c) attenuating said radiation when said workpiece is not present, and

(d) providing an output signal in response to said reflected radiation, said output signal indicating the presence of said workpiece



---

CLUTCH TYPE ROLLER FEED FOR A SEWING MACHINE NEEDLE THREAD

Ikuro Iimuro, Sagamihara; Toshiki Matsushita, and Toshihiro Furuya, both of Chofu, all of Japan, assignors to Juki Corporation, Chofu, Japan

Filed Oct. 26, 1988, Ser. No. 262,710
Claims priority, application Japan, Oct. 31, 1987, 62-276464; Jun. 30, 1988, 63-164613
Int. Cl.[5] D05B *49/04*
U.S. Cl. 112—302 **14 Claims**

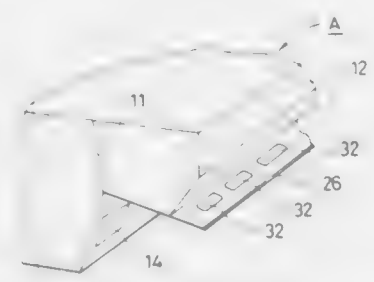
1 A needle thread feeding mechanism, comprising

(a) a drive source including a drive shaft, a first pulley, means for allowing said first pulley to loosely receive said drive shaft therethrough, and connect means for frictionally connecting said first pulley to said drive shaft;

(b) thread drawing means including a driven shaft, a drawing roller for drawing needle thread from a spool, and a second pulley, said drawing roller and said second pulley being fixed to said driven shaft.

(c) a belt for transmitting the rotation of said first pulley to said driven shaft;

(d) detecting means for detecting the rotation of said drawing roller to generate a signal; and



(e) disconnect means responsive to said detected signal for drivingly disconnecting said first pulley from said drive shaft.

5,010,835

SEMI-SUBMERGED GLASS BOAT

Yoshikuni Kunitake, Nagareyama, and Yasuhiro Harita, Funabashi, both of Japan, assignors to Mitsui Engineering & Shipbuilding Co., Ltd., Tokyo, Japan

Filed Nov. 30, 1989, Ser. No. 443,631
Claims priority, application Japan, Dec. 2, 1988, 63-156578[U]; Dec. 2, 1988, 63-156579; Feb. 2, 1989, 1-11005; Mar. 10, 1989, 1-26665[U]
Int. Cl.[5] B63B *35/72*
U.S. Cl. 114—66 **5 Claims**

1. A semi-submerged glass boat having a hull formed of a main hull having a center line, a center of gravity, a center of flotation, and float tanks provided on lateral sides of an upper part of said main hull, said main hull having observation windows provided on the lateral sides of a lower part thereof and anti-rolling fins secured to a bottom of each float tank, each anti-rolling fin projecting outside of a straight line connecting the outer end part of the bottom of the float tank and the outer end part of the bottom of the main hull, and projecting along a line from the center line of the main hull between the center of flotation and the center of gravity, and a bottom point on the float tank, an outermost edge of each said anti-rolling fin being within a vertical extension line of an outer side surface of the float tank

5,010,836

LIVEWELL VALVE FOR FISHING BOATS

Anthony L. Riviezzo, Springfield, Mo., assignor to Tracker Marine Corporation, Springfield, Mo.

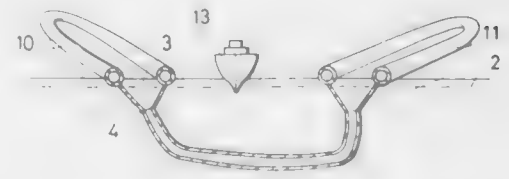
Filed Jul. 27, 1989, Ser. No. 385,448
Int. Cl.[5] B63B *35/14*
U.S. Cl. 114—255 **13 Claims**

1 A valve for controlling waterflow to and from a livewell in a fishing boat, said valve comprising:

a valve body having a flow passage therethrough and a substantially cylindrical valve chamber intersecting said flow passage, said valve body being arranged to accommodate a flow of water between a body of fresh water and the livewell when said flow passage is open;

a substantially cylindrical valve plug having a longitudinal axis and a flow port extending therethrough perpendicular to said axis, and opposite longitudinal ends between which said flow port is located, said valve plug being mounted in said valve chamber for axial rotation between an open position wherein said port is aligned with said flow passage to allow flow therethrough and a closed position wherein said port is misaligned with said flow passage and said valve plug blocks said flow passage;

seal means for effecting fluid tight seals between said valve plug and said valve body at locations between said flow port and each said end of said valve plug, said seal means including an annular groove located in and coaxial with said valve chamber in proximity to each of said ends of said plug, an O-ring mounted in each of said grooves, and means mounted on said valve plug in proximity to said ends thereof for compressing an associated one of said O-rings against said groove; and



means for effecting rotation of said valve plug between said open and closed positions from a location remote from said valve body.

5,010,837

FLOATING RACEWAY, FLOATING WATER STORAGE TANK, COMPOSITE FLOATING RACEWAY, MARINE PADDY FARMING DEVICE, FLOATING HYDROPONIC FARMING DEVICE, AND VESSEL

Tokuzo Hirose, 13-13, Higashiyamacho, Ashiya-shi, Hyogo-ken, Japan

Filed Aug. 17, 1989, Ser. No. 394,941
Claims priority, application Japan, Jun. 8, 1989, 1-146438
Int. Cl.[5] B65D *88/78*
U.S. Cl. 114—256 **2 Claims**

1. A composite floating raceway comprising:

a pair of raceways, each of said raceways including a raceway portion formed of a trough-shaped tough and flexible film of material defining a space therein for accommodating water, and a floating bank portion extending along the periphery of said raceway portion,

said floating bank portion imparting buoyancy to said raceway portion when the raceway portion is disposed in a body of water such that said trough-shaped raceway extends below the surface of the body of water while said floating bank portion floats thereon, and providing a barrier with respect to said space against a body of water when said raceway portion is disposed in the body of water with said floating bank portion floating on the surface of the body of water; and

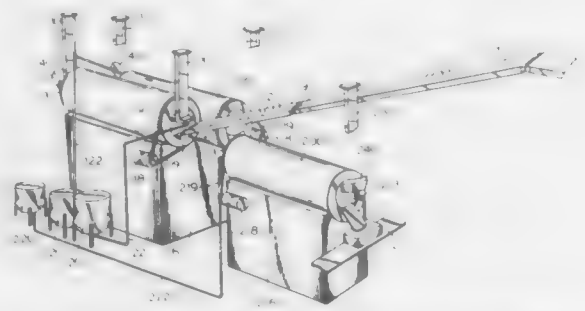
a communicating raceway formed of a tube of flexible material interconnecting said pair of raceways and communicating with the space defined in each said raceway portion, said tube of flexible material allowing said pair of raceways to be spaced apart from one another to in turn allow marine traffic to pass therebetween when said pair of raceways are disposed in a body of water.

2. A floating farming device comprising:

a raceway portion formed of a trough-shaped tough and flexible film of material defining a space therein for accommodating water, said trough-shaped film forming sides of said raceway portion extending around said space at an upper part of the raceway portion;

a floating bank portion extending along the periphery of said raceway portion at said upper part thereof, and imparting buoyancy to said raceway portion when the raceway portion is disposed in a body of water such that said trough-shaped raceway extends below the surface of the body of water while said floating bank portion floats thereon;

a buoyant support around the entirety of which said floating bank portion extends, said buoyant support extending across said space from one side of said raceway portion toward the other side of said raceway portion so as to be floatable on freshwater occupying the space defined in said raceway portion, and said buoyant support being capable of supporting plants thereon; and



a membrane extending radially outwardly from said floating bank portion and a second floating bank portion extending around said membrane and imparting buoyancy to said membrane, said membrane and said second floating bank portion providing a barrier with respect to said space against a body of water when said raceway portion is disposed in the body of water with said floating bank portion floating on the surface of the body of water.

5,010,838

APPARATUS FOR CONTINUOUS PAN COATING

William Simelunas, Glen Rock, N.J., and Joseph T. Deloy, Lyndhurst, N.Y., assignors to Nabisco Brands, Inc., East Hanover, N.J.

Filed Jul. 10, 1985, Ser. No. 753,738
Int. Cl.[5] A23G *3/26*
U.S. Cl. 118—19 15 Claims

1. An apparatus useful for continuous pan coating of edible cores, comprising in combination:

a coating drum arranged for rotation around an inclined axis and having an inlet opening at the upper axial end of said inclined coating drum for reception of said edible cores, a discharge opening at the lower axial end of said drum, whereby the force of gravity urges said cores through said drum during pan coating operation;

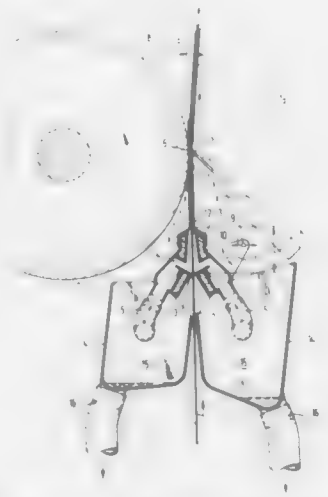
means for continuously driving said drum;

means for providing coating material to said cores at a controllable rate, said means for providing coating material comprising a coating manifold extending lengthwise through the interior of said coating drum and provided with adjustable coating nozzles along the length thereof for selectively controlling the rate that coating material is delivered to said cores, and a control means for selectively adjusting each of said nozzles from a location exterior said coating drum to vary the quantity of coating material ejected from each of said nozzles per unit of time, each of said adjustable coating nozzles comprising a nozzle housing having a coating supply bore with an exit port, a movable means for restricting fluid flow through said exit port responsive to means for adjusting said flow restriction means, said adjustment means fixed to said nozzle housing at a location exterior thereto and operable to adjust said flow restriction means;

means for simultaneously delivering drying gas to said cores at a controllable rate during passage of said cores through said drum;

at least one after-treatment drum likewise arranged for rotation around an inclined axis and having an inlet opening at the upper axial end of said inclined after-treatment drum for the reception of said coated cores from said coating drum, a discharge opening for the discharge of treated coated cores and means for continuously driving said at least one after-treatment drum;

means for continuously conveying said coated cores from said discharge end of said coating drum to said inlet opening of said after-treatment drum; and



means for continuously providing after-treatment coating to said coated cores at a controllable rate during the passage of said cores through said after-treatment drum.

5,010,839

COATER FOR SELECTIVELY COATING A RUNNING WEB EITHER ON ONE SIDE OR ON BOTH SIDES

Dan Eklund, Kauniainen, and Markku Grästen, Järvenpää, both of Finland, assignors to Valmet Paper Machinery Inc., Helsinki, Finland

Continuation of Ser. No. 580,882, Feb. 16, 1984, abandoned.
This application Nov. 17, 1987, Ser. No. 121,668
Claims priority, application Finland, Mar. 1, 1983, 830674
The portion of the term of this patent subsequent to Dec. 15, 2004, has been disclaimed.
Int. Cl.[5] B05C *11/02*
U.S. Cl. 118—122 14 Claims

1. A device for coating at least one side of a running paper web, comprising:

a roll having a central axis,

means supporting the roll for rotation about its central axis,

a counter piece which cooperates with the roll to define a smoothing nip,

a coating substance applicator disposed below the smoothing nip and spaced therefrom along a linear path of movement of the web, said applicator comprising

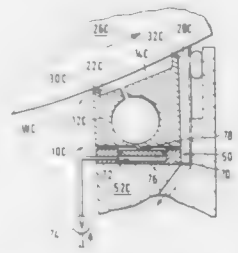
means defining an applicator chamber at one side of said path of movement, and means for feeding coating substance to the applicator chamber to form therein a body of coating substance in substantially non-pressurized contact over a contact distance of at least 5 cm with one side of a web passing upwardly along said path to the smoothing nip, said means defining the applicator chamber being spaced from the path of movement of the web, allowing the coating substance to contact the web in substantially non-pressurized manner and also allowing the web to run through the applicator substantially without any mechanical contact with the applicator, and

means defining a collecting space below said applicator and said smoothing nip for collecting excess coating substance and leading it to a recycling system.

5,010,840

SHORT DWELL COATER APPARATUS

L. H. Busker, and E. W. Wight, both of Rockton, Ill., assignors to Beloit Corporation, Beloit, Wis.



Filed Oct. 30, 1989, Ser. No. 429,200
Int. Cl.[5] B05D *1/02*
U.S. Cl. 118—421 13 Claims

1. A short dwell coater apparatus for coating a web with a coating material, said web moving contiguously with a rotating backing roll, said apparatus comprising:

a housing disposed on the opposite side of the web relative to the backing roll, said housing defining a coating chamber having an upstream and a downstream end, said chamber being connected to a pressurized source of the coating material, said chamber being exposed to the web such that the web supported by the backing roll is coated with the coating material during passage of the web past said coating chamber, said upstream and downstream ends of said coating chamber defining a first and second weir respectively, each of said weirs extending in a cross-machine direction such that said coating chamber is bounded by said weirs and the web moving between said weirs;

said first weir defining a first overflow gap disposed between said first weir and the web moving past said first weir;

said second weir defining a second overflow gap disposed between said second weir and the web moving past said second weir, the arrangement being such that during use of the apparatus, when the web moves past said coating chamber, coating material is coated onto the web while

excess coating material overflows through said first and second gaps for recirculation through said coating chamber;

a resilient blade disposed downstream relative to said second weir, said blade cooperating with the coating material coated onto the web such that the pressure exerted by the coating material on said blade is less than the pressure of the coating material within said coating chamber, so that mottling and streaking of the resultant web is inhibited, while maintaining minimum pressure on said blade; and

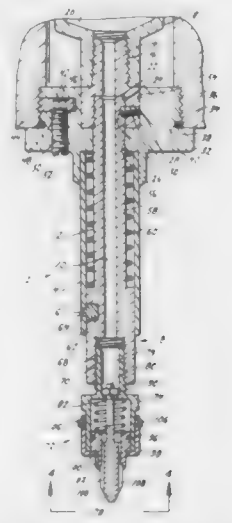
said apparatus further including: overflow control means connected to said housing for controllably urging said housing and said first and second weirs radially relative to the backing roll for controlling said first and second gaps such that the pressure within said coating chamber is controlled, the arrangement being such that when said weirs are urged towards the web, said gaps are decreased and the pressure within said coating chamber is increased.

5,010,841

ROTATING SEALANT APPLICATOR

William R. Stewart, LaPalma, Calif., assignor to McDonnell Douglas Corporation, Long Beach, Calif.

Filed May 23, 1989, Ser. No. 355,674
Int. Cl.[5] B05C *5/02*
U.S. Cl. 118—711 4 Claims



1. A sealant dispenser for discharging sealant into a fastener hole, comprising:

(a) a sleeve having a first bore and an oblique slot;

(b) a dispenser tube within said first bore having a longitudinal channel;

(c) spring means operatively connected to said dispenser tube, for biasing said dispenser tube toward an outward position relative to said sleeve;

(d) a guide pin attached to said dispenser tube, said guide pin extending into said oblique slot; and

(e) a nozzle attached to said dispenser tube that dispenses the sealant, said nozzle having a plurality of openings in fluid communication with said longitudinal channel.

5,010,[illegible]2

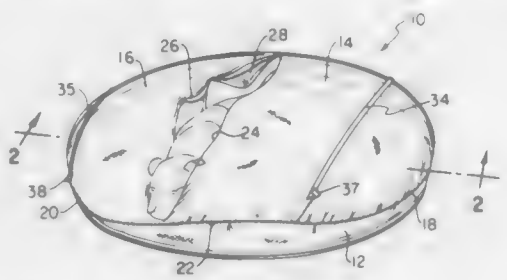
APPARATUS FOR FORMING THIN FILM

Masao Oda; Yoshimi Kinoshita, and Masahiro Hayama, all of Hyogo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Jun. 7, 1989, Ser. No. 362,745
Claims priority, application Japan, Oct. 25, 1988, 63-268746
Int. Cl.[5] C23C *16/50*
U.S. Cl. 118—723 6 Claims

1. An apparatus for forming a thin film which comprises a reaction chamber for containing a substrate therein and forming the thin film on a surface of said substrate by a reaction of a first reactive gas with an active species formed through excitation of a second reactive gas, said reaction chamber comprising:

heater means for supporting and heating said substrate;



a reactive gas supply portion comprising diffusing means disposed facing and completely covering the surface of said substrate so as to diffuse the first reactive gas and supply uniformly said first reactive gas directly over the surface of said substrate; and

active species supply means comprising uniformizing means disposed adjacent said diffusing means on a side opposite

said substrate surface and completely covering said substrate surface, so as to introduce said active species and uniformly mix said active species with said first reactive gas in the vicinity of the surface of the substrate directly over the entire area of the substrate, and supply uniformly the mixed gas subsequent to a gas-phase chemical reaction to the surface of said substrate for forming said thin film

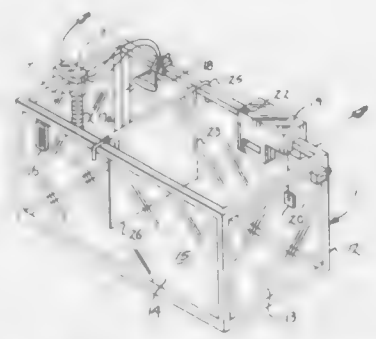
PET BED
Beth Henry, La Tierra Nueva, 1063 Buckman Rd., Santa Fe, N. Mex. 87501
Filed Nov. 16, 1989, Ser. No. 438,163
Int. Cl.[5] A01K *1/035*
U.S. Cl. 119—28.5 **12 Claims**



1. A bed for pet comprising:
a base having a defined area;
a first top cushion having a first edge around the perimeter thereof, said first cushion being positioned on top of said base and covering a first portion of said base area, said first cushion being attached to said base along a major portion of said first edge, a minor portion of said first edge being unattached to said base, said unattached portion being an entrance to a first pocket formed between said first cushion and said base;
a second top cushion having a second edge around the perimeter thereof, said second cushion being positioned on top of said base and covering a second portion of said base area, an attachment being formed between said base and the second edge of said second top cushion, the unattached portion of said first top cushion edge being opposed to said second top cushion, a trough being formed between said cushions, said pocket entrance being within said trough.

5,010,844
VACUUM-PRESSURE SUPPLY DEVICE
Toru Takeuchi, and Minoru Matsugawa, both of Suzaka, Japan, assignors to Orion Machinery Co., Ltd., Nagano, Japan
Division of Ser. No. 218,235, Jul. 12, 1988, Pat. No. 4,944,249.
This application Mar. 15, 1990, Ser. No. 494,151
Int. Cl.[5] A01J *5/04*
U.S. Cl. 119—14.25 **1 Claim**

1. A method of supplying vacuum pressure to a cow milking unit for milking purposes, comprising the steps of:
generating a high vacuum pressure in a high vacuum pressure pipe line using a vacuum pump; providing a low vacuum pressure pipe line; connecting the low vacuum pressure pipe line to the high vacuum pressure line via a vacuum pressure adjuster to generate a vacuum pressure in the low vacuum pressure pipe line which is lower than the vacuum of the high vacuum pressure pipe line and maintaining the vacuum pressure of the high vacuum pressure pipe line at a required vacuum pressure to provide both a high and a low vacuum pressure to a cow milking unit employing a single vacuum pump

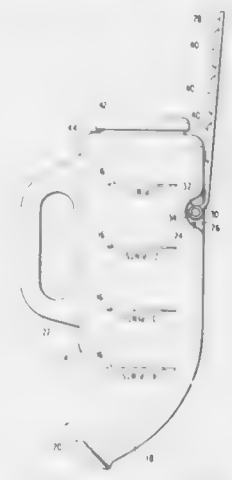
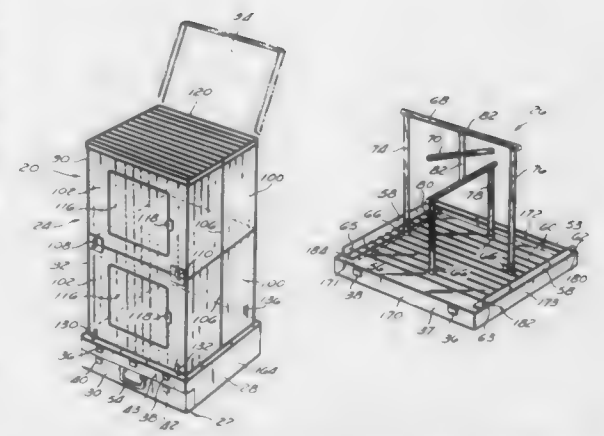
REPTILE CAGE APPARATUS
Diana M. Azpûrua, and Francisco J. Azpurua, both of Shore Base Yacht Service, Oficina, Postal Telegraphica, Pampatar Margarita, Venezuela 6316
Filed Mar. 15, 1990, Ser. No. 493,820
Int. Cl.[5] A01K *1/00*
U.S. Cl. 119—17 **4 Claims**

1. A reptile cage apparatus comprising, in combination,
a framed transparent enclosure, the transparent enclosure including a rigid perimeter framework, the perimeter framework including a transparent forward end wall and a transparent rear end wall spaced away from and parallel to the forward wall, and
a transparent forward end side wall spaced away from and parallel to a transparent rear side wall, and
the walls orthogonally mounted integrally to an underlying opaque floor, and
a heating means mounted on the framework for providing selective heating of an interior of the enclosure, and
a humidifier means mounted on the framework for providing selective humidification of the enclosure, and
wherein the heating means includes a first heating means mounted to an upper end of the rear end wall, and a second heating means mounted to upper end of the rear side wall, and a thermometer mounted to an interior surface of the forward side wall to provide visual observation of temperature within the enclosure, and
wherein the first heating means includes a resistance heater and a thermostat, and the second heating means includes an infra-red lamp directed interiorly of the enclosure and operatively associated with the thermostat to permit recurrent heating by the resistance heater and the infra-red lamp, and

wherein the humidifier includes a fan mounted interiorly thereof, the fan operatively associated with a humidistat, wherein the humidistat is mounted interiorly of the enclosure and suspended from the humidifier, and the humidifier further includes a fill plug to permit directing of water interiorly of the humidifier, and
further including a flexible heat reflector web selectively mounted within the enclosure, the heat reflector web including a flexible web including a lower terminal edge and an upper terminal edge, the upper terminal edge defined by a tube, and a "U" shaped rigid rod captured within the tube, the rigid rod spanning the forward and rear side walls of the enclosure, and fixedly mounted within the tube to permit furling of the web about the "U" shaped rigid rod.



5,010,846
LABORATORY ANIMAL FEEDER COVER
Thomas O. Nass, 14502 La Cuarta, Whittier, Calif. 90605
Filed Nov. 6, 1989, Ser. No. 432,527
Int. Cl.[5] A01K *39/00*
U.S. Cl. 119—18 **12 Claims**



1. An apparatus comprising:
a laboratory animal feeder having an upper open end and a plurality of walls, at least one of said walls having a flange formed thereon;
a generally planar member sized to extend over the upper open end of said laboratory animal feeder;
a spring clip pivotally mounted to said planar member and engageable with one wall of said laboratory animal feeder to pivotally mount said planar member to said laboratory animal feeder, said spring clip being formed from a juxtaposed first and second wire member, said first member sized to extend downwardly upon one side of said one wall of said laboratory animal feeder and said second member sized to extend downwardly upon the opposite side of said one wall of said laboratory animal feeder; and
a shoulder portion formed upon said second member of said spring clip, said shoulder portion positioned to abut an edge portion of the flange formed on said one wall of said laboratory animal feeder.

5,010,847
CALF FEEDER BOTTLE FOR DRY FEED
Joe T. Braden, Pickton, Tex., assignor to Braden Industries, Pickton, Tex.
Filed Nov. 21, 1989, Ser. No. 439,956
Int. Cl.[5] A01K *5/00*
U.S. Cl. 119—18 **5 Claims**

1. A calf feeder bottle for dry feed comprising a bottle having a curved neck portion at one end thereof curved toward one side of said bottle, support means pivotally connected to said bottle on a side opposite said one side for supporting the bottle in an inverted position with the neck portion disposed downwardly and nipple means detachably connected to said neck portion and including flap valve means therein normally closing said nipple means while permitting dispensing of dry feed upon application of pressure to said nipple means.

5,010,848
FOLDING TRAVEL CAGE
William J. Rankin, 1250 Victoria, Abilene, Tex. 79603
Filed Oct. 23, 1989, Ser. No. 425,579
Int. Cl.[5] A01K *31/08, 31/12*
U.S. Cl. 119—26 **13 Claims**

1. An adjustable, portable travel animal cage which may be conveniently stored in a self-contained suitcase and quickly and easily be assembled into a small cage or a large cage, comprising:
a suitcase base;
a suitcase lid having means for securing said lid to said suitcase base to form a closed suitcase;

a first grate storable in said suitcase and removably attached to said suitcase base for providing a cage floor;

a first cage wall assembly having a top and bottom, corners and four rectangular sides hingeably interconnected at the corners for placement upon said suitcase base to form an animal cage of a height suitable for automobile travel, said first cage wall assembly being collapsible and storable in said suitcase and having means for releasably securing said first cage wall assembly on top of said suitcase base;

a cage lid storable in said suitcase for securing to the top of said first cage wall assembly and enclosing said cage to prevent escape of birds therefrom, and

a second wall assembly having a top and bottom, corners and four rectangular sides hingeably interconnected at the corners for placement between said suitcase base and said first cage wall assembly to form an animal cage of a height suitable for a long-term storage of an animal, said second cage wall assembly being collapsible and storable in said suitcase and having means for securing said second cage wall assembly between said suitcase base and said first cage wall assembly.

12. A playpen for birds, comprising:

a rigid U-shaped outer frame having a horizontal upper perch and depending legs;

a rigid U-shaped inner frame which is shorter and narrower than said outer frame, said inner frame having a horizontal lower perch and depending legs;

a first support column rigidly attached to and extending downwardly from said upper perch;

a second support column rigidly attached to and extending upwardly from said lower perch;

a horizontal intermediate perch rotatably disposed between said first and second support columns; and

an elastic member connecting said first and second support columns and urging same against said intermediate perch above the shelf for depositing the feed onto the shelf for taking by the animal with any feed moved by the animal from the shelf falling into the trough; the shelf being positioned above the rear wall so that rear portion thereof, extends rearwardly of the upper edge of the rear wall, and said shelf being movable in a vertical direction from a first position, in which a lower edge of the flange at the front edge of the shelf is located below said upper edge of the rear wall and closely adjacent the rear wall, to a second position, in which the shelf is raised to define a first space between the lower edge of the flange and the rear wall and a second space between the upper edge of the rear wall and an underside of the shelf to allow a jet of cleaning fluid to exit from the trough moving up the rear wall, behind the flange, under the shelf and over the upper edge of the rear wall

FEEDER FOR ANIMALS

Jonathan R. Kleinsasser, Ste. Agathe, Canada, assignor to Crystal Spring Colony Farms Ltd., Agathe, Canada

Filed Oct. 2, 1989, Ser. No. 415,619
Int. Cl.[5] A01K *5/00*
U.S. Cl. 119—53 6 Claims

1. A feeder for animals comprising a trough, means for supporting the trough on a floor surface; the trough being defined by a base wall on which feed can rest for being eaten by the animal, a front wall extending generally upwardly from the base wall to a front edge over which the animal standing on the floor surface can reach to access the feed on the base wall, and a rear wall extending generally upwardly from the base wall to an upper edge, the front wall, rear wall and base wall acting to confine the feed in the trough; the upper edge of the rear wall being shaped and arranged so that material falling outwardly therefrom falls onto the floor surface for disposal; a shelf having a front edge extending along the trough at a position above the base wall, rearwardly of the front wall, forwardly of the upper edge of the rear wall and a height accessible by the animal, the shelf having a downwardly extending flange along the front edge thereof; and a hopper

SEAT AND HARNESS DEVICE

Michael P. Sailer, HCR 70, Box 110, Plymouth, Vt. 05056

Filed Sep. 12, 1990, Ser. No. 581,024
Int. Cl.[5] A01K *29/00*; A62B *35/00*
U.S. Cl. 119—96 10 Claims

1. A sling/harness device comprising:

a first elongated pad having a first end and a second end;

a second elongated pad having a first end and a second end;

a first strap segment engaging said first end of said first elongated pad;

a second strap segment engaging said second end of said first elongated pad and said second end of said second elongated pad;

a third strap segment engaging said first end of said second elongated pad, said third strap segment having a free end and said first strap segment attaching to said third strap segment forming a junction point, said junction point being substantially equal distant from said first elongated pad and said second elongated pad;

a second strap having a second strap first end and a second strap second end; and

means for attaching said second strap to said second strap segment, said means having an opening therein through which said third strap segment can be slidably engaged.

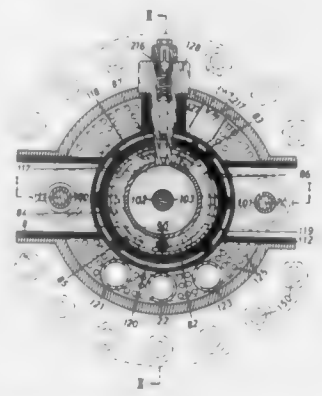
METHODS OF RAISING COMMERCIAL ANIMALS

Gadi Gvaryahu, Rehovot, Israel, and Danis L. Cunningham, Athens, Ga., assignors to Cornell Research Foundation, Inc., Ithaca, N.Y.

Continuation-in-part of Ser. No. 58,116, Jun. 4, 1987, Pat. No. 4,913,092, and a continuation-in-part of Ser. No. 217,977, Jul. 12, 1988. This application Apr. 2, 1990, Ser. No. 502,276
The portion of the term of this patent subsequent to Apr. 3, 2007, has been disclaimed.
Int. Cl.[5] A01K *31/00*
U.S. Cl. 119—174 9 Claims



1. A method of raising precocial birds comprising exposing precocial birds to the combined effects of filial imprinting, environmental enrichment and music for improving their feeding habits and general behavior.

5,010,852

HEAT ENGINE

Milorad S. Milisavljevic, Gutschstrasse 6/148, Lucerne, Switzerland

Filed Apr. 14, 1989, Ser. No. 339,321
Int. Cl.[5] F02B *69/06*
U.S. Cl. 123—21 15 Claims

1. A heat engine, comprising:

a cylinder block;

a cylinder-block casing enclosing said cylinder block and defining therewith an upper part of a crankcase;

a cylinder member received in said cylinder block and formed with:

an inner working cylinder,

an outer cylinder surrounding said inner cylinder and spaced therefrom by a spacing,

an annular constricting shoulder extending inwardly from said inner working cylinder, and

a common bottom for said inner working cylinder and said outer cylinder;

a cylinder block head mounted on said casing above said cylinder member;

another cylinder suspended from said cylinder block head and extending into said working cylinder and defining an internal cylinder motor within said other cylinder;

a piston member slidable in said working and other cylinders and comprising an outer piston received between said other cylinder and said working cylinder and delimiting at least one air compressor with at least one of said cylinders and an inner piston received in said other cylinder and delimiting said internal cylinder motor at said end of said piston member, and a bottom at an opposite end of said piston member common to both said inner and outer pistons;

at least one pair of oil filters received in said cylinder member between said working cylinder and said outer cylinder and communicating between said crankcase and said head;

at least one pair of air filters received in said cylinder member between said working cylinder and said outer cylinder, connected to an air intake and communicating with said motors and with said compressors through bores formed in said working cylinder;

respective valves for selectively blocking and unblocking said bores;

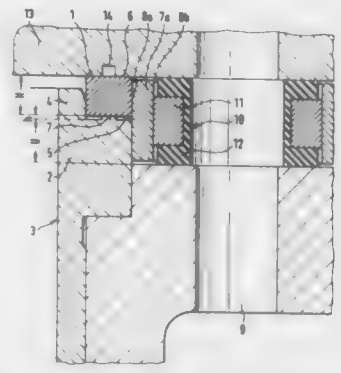
a camshaft in said head provided with cams for operating at least some of said valves;

means for connecting said piston member to a crankshaft whereby, in an upper dead position, said inner piston defines in said internal cylinder motor an upper expansion chamber;

a first tappet valve opening into said upper expansion chamber and operated by said camshaft;

means in said other cylinder above said tappet valve defining a secondary chamber communicating with said upper expansion chamber upon opening of said first tappet valve;

means in said other cylinder defining a preliminary chamber above said secondary chamber and communicating with said secondary chamber upon opening of a second tappet valve coaxial with said first tappet valve and controlled by said camshaft; and



a compressed air distributor connected with said compressor and communicating with said preliminary chamber through a third tappet valve coaxial with said first and second tappet valves and controlled by said camshaft.

5,010,853

CYLINDER HEAD SEALING ELEMENT FOR RECIPROCATING PISTON ENGINES

Heribert Kubis, Nuremberg, and Josef Winter, Rednitzhembach, both of Fed. Rep. of Germany, assignors to MAN Nutzfahrzeuge Aktiengesellschaft, Nuremberg, Fed. Rep. of Germany

Filed Jul. 12, 1990, Ser. No. 552,181
Claims priority, application Fed. Rep. of Germany, Jul. 12, 1989, 3922885
Int. Cl.[5] F02F *1/10*
U.S. Cl. 123—41.[illegible] 6 Claims

1. In a cylinder head sealing element for a reciprocating piston engine, especially an internal combustion engine, and advantageously an engine having cylinder liners, whereby an end face of a cylinder liner that faces a cylinder head is provided with a collar that has a centering means and also has an annular rib that is concentric to said cylinder liner, with said cylinder head, across from said rib, being provided with an annular groove that is concentric to said rib, and whereby when cylinder head screws are tightened, said sealing element, which is disposed between said rib and said groove, penetrates into said groove and is penetrated by said rib, accompanied by plastic deformation of said sealing element, the improvement wherein:

said sealing element is formed by a ring, with said ring resting against said centering means with a clearance fit;

said ring has a first end face that faces said rib and has a surface area with a value A1;

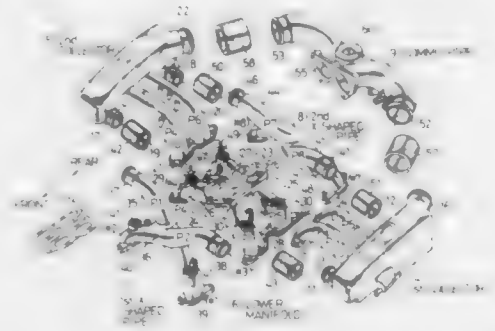
said ring has a second end face that faces said groove and has

a surface area, less an annular surface area of said groove, with a value A2;

the ratio of A1 to A2 is

$$\frac{A1}{A2} = \frac{3}{2}$$

said rib has an annular surface area with a value A3, and the ratio of A3 to A2 is



$$\frac{A1}{A2} = \frac{3}{2}$$

INTAKE APPARATUS FOR V-TYPE 8-CYL INTERNAL COMBUSTION ENGINE

Urabe Suehiro, Fujisawa; Honma Masayuki, and Kamibeppu Tohru, both of Yokohama, all of Japan, assignors to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Jul. 12, 1990, Ser. No. 551,367
Int. Cl.[5] F02B 75/18
U.S. Cl. 123—52 MV **11 Claims**

1 An intake apparatus for a V-type eight-cylinder engine having a cylinder block with a first bank along which first, third, fifth and seventh cylinders are arranged open and a second bank along which second, fourth, sixth and eight cylinders are arranged open, comprising:

(a) a first collector disposed over said first bank an formed by casting with third and fifth upper bent branch pipes;

(b) a second collector disposed over said second bank and formed by casting with fourth and sixth upper bent branch pipes;

(c) a first X-shaped pipe member disposed at first ends of the first and second banks and formed by casting with a first intake pipe connected between the first cylinder and said second collector and a second intake pipe connected between the second cylinder and said first collector;

(d) a second X-shaped pipe member disposed at second ends of the first and second banks and formed by casting with a seventh intake pipe connected between the seventh cylinder and said second collector and an eighth intake pipe connected between the eighth cylinder and said first collector; and

(e) a lower manifold (6) disposed between the first and second collectors and between said first and second X-shaped pipes and formed by casting with a third lower bent branch pipe connected between the third cylinder and the third upper bent branch pipe into U-shape, a fifth lower bent branch pipe connected between the fifth cylinder and the fifth upper bent branch pipe into U-shape, a fourth lower bent branch pipe connected between the fourth cylinder and the fourth upper bent branch pipe into U-shape, and a sixth lower bent branch pipe connected between the sixth cylinder and the sixth upper bent pipe into U-shape.

CAMSHAFT DRIVING ARRANGEMENT FOR DOUBLE OVERHEAD CAMSHAFT ENGINE

Etsuo Ogami, Yokohama, and Yoshio Iwasa, Nagareyama, both of Japan, assignors to Nissan Motor Company, Ltd. of No. 2, Yokohama, Japan

Filed Dec. 14, 1989, Ser. No. 450,509
Claims priority, application Japan, Dec. 26, 1988, 63-326033
Int. Cl.[5] F01L 1/02; F02F 7/00
U.S. Cl. 123—[illegible].31 **4 Claims**

1. In a DOHC engine having a cylinder block including at least one cylinder bank, a cylinder head mounted on each of the at least one cylinder bank, a pair of camshafts rotatably mounted on the cylinder head, and a crankshaft, further comprising:

a pair of cam sprockets respectively mounted to the pair of camshafts on one end thereof;

a sprocket chamber formed on the cylinder head at one end thereof, said sprocket chamber being formed with a lateral opening, said sprocket chamber receiving said pair of cam sprockets;

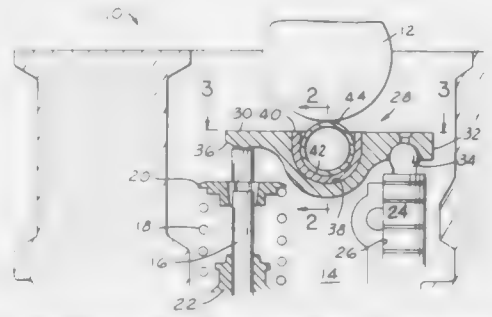
an idler gear rotatably mounted to the cylinder head;

a timing chain drivingly interconnecting the crankshaft and said idler gear;

a camshaft driving chain drivingly interconnecting said idler gear and said pair of cam sprockets;

a first tensioner mounted to the cylinder block, said first tensioner adjusting the tension of said timing chain;

a second tensioner mounted to a wall defining in part said sprocket chamber, said second tensioner adjusting the tension of said camshaft driving chain; and



means defining an access to said first tensioner, said access defining means including a front cover detachably mounted to the cylinder block to conceal said timing chain and formed with an opening positioned opposite to said first tensioner.

5,010,856

ENGINE FINGER FOLLOWER TYPE ROCKER ARM ASSEMBLY

William K. Ojala, Birmingham, Mich., assignor to Ford Motor Company, Dearborn, Mich.

Filed Oct. 15, 1990, Ser. No. 597,460
Int. Cl.[5] F01M 9/10; F01L 1/18
U.S. Cl. 123—90.36 **9 Claims**

1. A reduced friction finger follower type rocker arm assembly for an overhead camshaft type engine including a one-piece pivotally movable finger follower type lever having a fulcrum at one end and engaging an engine valve stem at its opposite end for reciprocation thereof, the lever having a recess therein opening upwardly and containing an axleless roller bearing therein against lateral movement and an engine rotated cam located above the roller and contiguous thereto for rotating the roller in the lever, the recess including a smoothly formed one-piece bearing insert in the lever upon which the roller slides during rotation by the cam for reducing friction between the parts, the recess retaining engine lubricant admitted thereto during operation of the engine for further reducing friction between the parts and for a lubricated restart after engine shutdown

5,010,857

ROCKER ARM

Heinrich J. Hempelmann, Farmington Hills, and Eugene P. Manier, Canton, both of Mich., assignors to NI Industries, Inc., Novi, Mich.

Filed Aug. 15, 1990, Ser. No. 567,829
Int. Cl.[5] F01L 1/18
U.S. Cl. 123—90.39 **14 Claims**

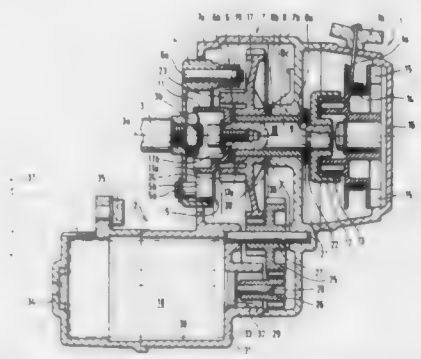
1. A rocker arm formed from a one-piece sheet metal blank,

a pair of sidewalls opposing one another, said pair of side walls each defining an aperture, said apertures being positioned coaxial with one another with an integral circumferential flange extending from each sidewall about said aperture therein to define a shaft journal;

an end wall integral with and interconnecting said side walls at one end thereof;

at least one integral finger extending transversely from each said sidewall towards the other said side wall, the ends of said fingers being welded together to rigidify said rocker arm;

force receiving means adjacent one end of said rocker arm adapted to engage a push rod or the like; and



force exerting means at the opposite end of said rocker arm than said force exerting means and adapted for contacting a valve stem or the like to activate same.

5,010,858

STARTER ARRANGEMENT FOR AN INTERNAL COMBUSTION ENGINE

Roland Schierling, Affalterbach, and Hans-Peter Dohse, Kernen, both of Fed. Rep. of Germany, assignors to Andreas Stihl, Waiblingen, Fed. Rep. of Germany

Filed Sep. 14, 1989, Ser. No. 407,339
Claims priority, application Fed. Rep. of Germany, Sep. 17, 1988, 3[illegible]1710
Int. Cl.[5] F02N 3/02, 11/00
U.S. Cl. 123—179 P **9 Claims**

1. A starter arrangement for an internal combustion engine, especially a two-stroke engine of a portable handheld tool such as a motor-driven chain saw or the like, the engine having a crankshaft and the starter arrangement comprising:

a housing;

a manual starter device mounted in said housing;

an electric starter motor; and,

an overrun clutch assembly interposed between the crankshaft and the manual starter device as well as between said crankshaft and said electric starter motor, the overrun clutch assembly including:

a carrier fixedly mounted on the crankshaft so as to rotate therewith;

a first drive member rotatably mounted in said housing and operatively connected to said manual starter device so as to be rotatable therewith;

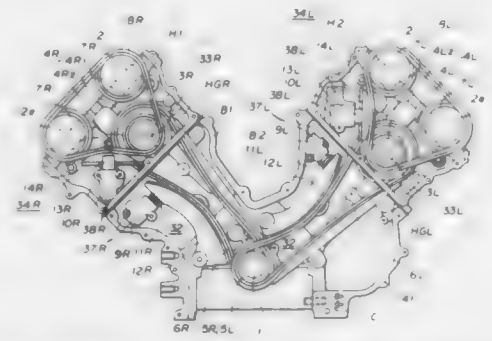
first latching means for connecting said first drive member to said carrier to rotate said carrier therewith so long as said first drive member rotates faster than said carrier and to disconnect said first drive member from said carrier as soon as the speed of said carrier exceeds the speed of said first drive member;

a second drive member rotatably mounted in said housing and operatively connected to said electric starter motor so as to be rotatable therewith;

second latching means for connecting said second drive member to said carrier to rotate said carrier therewith so long as said second drive member rotates faster than said carrier and to disconnect said second drive member from said carrier as soon as the speed of said carrier exceeds the speed of said second drive member;

said overrun clutch further including rotating connecting means rotatably journalled in said housing for fixedly connecting said manual starter device to said first drive member so as to cause said first drive member to rotate with said manual starter device independently of said second drive member;

said second drive member being rotatably mounted in said housing so as to be rotatable relative to said rotating connecting means; and,



said overrun clutch assembly further including torque transmitting means for interconnecting said second drive member and said starter motor so as to permit said starter motor to rotate said second drive member independently of said first drive member.

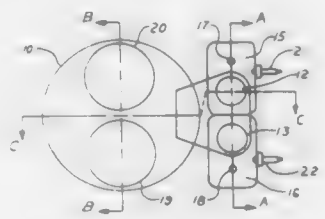
5,010,859

CHAIN COVER FOR V-TYPE ENGINE

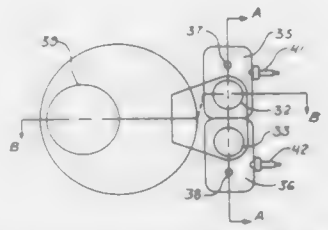
Etsuo Ogami, Yokohama, and Yoshio Iwasa, Nagareyama, both of Japan, assignors to Nissan Motor Company, Ltd. of No. 2, Yokohama, Japan

Filed Mar. 14, 1990, Ser. No. 498,245
Claims priority, application Japan, Mar. 15, 1989, 1-[illegible]886
Int. Cl.[5] F02F *7/00*
U.S. Cl. 123—195 C **3 Claims**

1. In a V-type engine having a cylinder block bifurcated to form two cylinder banks, a cylinder head mounted on each of the cylinder banks, and a crankshaft, comprising:
- a first camshaft rotatably mounted to one of the cylinder heads;
- a second camshaft rotatably mounted to the other of the cylinder heads;
- a first chain drivingly interconnecting the crankshaft and said first camshaft;
- a second chain drivingly interconnecting the crankshaft and said second camshaft;
- first and second tensioners so constructed and arranged as to provide the tensions to said first and second chains, respectively;
- a first cover so constructed and arranged as to conceal said first and second chains, said first cover being formed with two openings positioned adjacent said first and second tensioners; and
- a pair of second covers so constructed and arranged as to conceal said two openings in a seal-tight manner.



5,010,860



INTERNAL COMBUSTION ENGINE WITH TWIN COMBUSTION CHAMBERS

Thomas Broussard, P.O. Box 841081, Houston, Tex. 77284-1081

Filed Apr. 30, 1990, Ser. No. 516,971
Int. Cl.[5] F02B *19/00*
U.S. Cl. 123—256 **1 Claim**

1. A twin combustion chamber type internal-combustion engine comprising;
- a first combustion space and a second combustion space each of a size to provide a desired compression ratio and shaped to minimize heat loss,
- an upper cylinder space of sufficient size to minimize an amount of air that remains in said upper cylinder space when a piston is at top center,
- a main passage formed in said upper cylinder space and of sufficient size to permit flow alternately therethrough between said combustion spaces and said cylinder space,
- a first combustion valve in a first passage in communication with said main passage and a second combustion valve in a second passage in communication with said main passage, said valves open and close said first and second passages to said first and second combustion spaces respectively,
- at least one exhaust valve controlling passage from said upper cylinder space,
- a first fuel injector and a second fuel injector located in said first and second combustion spaces respectively and positioned to sufficiently mix fuel and the air to form respective charges,
- a first ignition plug and a second ignition plug located in said first and second combustion spaces respectively and positioned to provide proper ignition, wherein
- said first combustion valve opens to release a burnt charge from said first combustion space into said cylinder space at the beginning of a first expansion stroke to drive said piston and remains open to receive fresh air during a first compression stroke and then closing at the end of the first compression stroke,
- said second combustion valve opens to release a burnt charge from said second combustion space at the beginning of a second expansion stroke to drive said piston and remains open to receive fresh air during a second compression stroke and then closing at the end of the second compression stroke,
- the metered amount of charge in said first and second combustion spaces being ignited respectively by said first and second ignition plugs or by auto-ignition and completely burnt during the period when said first and second combustion valves are closed.

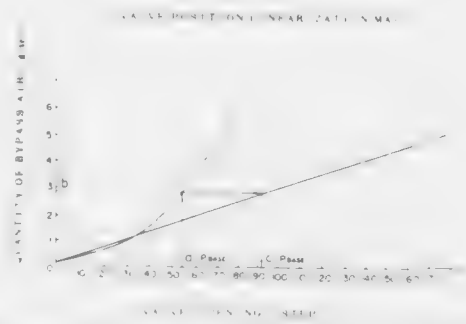
HEAT-INSULATING STRUCTURE OF SWIRL CHAMBER AND PRODUCTION METHOD THEREOF

Hiroshi Matsuoka, Yamato, Japan, assignor to Isuzu Motors Limited, Tokyo, Japan

Filed Jul. 27, 1990, Ser. No. 558,544
Claims priority, application Japan, Aug. 10, 1989, 1-205644
Int. Cl.[5] F02B *19/08, 19/16*
U.S. Cl. 123—271 **14 Claims**

1. In an internal combustion engine including a cylinder block having formed therein cylinders, a cylinder head fixed to said cylinder block and equipped with hole portions formed in such a manner as to correspond to said cylinders for forming swirl chambers, and main combustion chambers formed inside said cylinders of said cylinder block, a heat-insulating structure of a swirl chamber comprising:
- swirl chamber blocks having formed therein said swirl chambers and jet ports establishing communication between said swirl chambers and said main combustion chambers, and made of a ceramic material; and
- cast metal blocks formed by casting a metal material into gaps in molded articles made of a fiber-reinforced material and disposed outside said swirl chamber blocks, said cast metal blocks being fixed to said hole portions formed in said cylinder head.

11. A production method of a heat-insulating structure of a swirl chamber comprising the steps of:
- forming swirl chamber blocks equipped with swirl chambers, jet ports for establishing communication between said swirl chambers and said main combustion chambers and fitting holes for receiving fuel injection nozzles therethrough, from a ceramic material;
- disposing a molded article made of a fiber-reinforced material and having gaps outside each of said swirl chamber blocks;
- packing casting sand into the portions for forming said swirl chambers, said jet ports and said fitting holes formed in said swirl chamber blocks;
- disposing said swirl chamber blocks having packed thereinto said casting sand and encompassed by said molded articles into casting molds having gates;
- pouring molten metal via said gates so as to pack said molten metal material into said gaps of said molded articles;
- forming cast metal blocks;
- cooling and solidifying said molten metal material packed into said gaps of said molded articles so as to form said molded articles in said cast metal blocks; and
- fitting and fixing said cast metal blocks into said hole portions formed in said cylinder head.

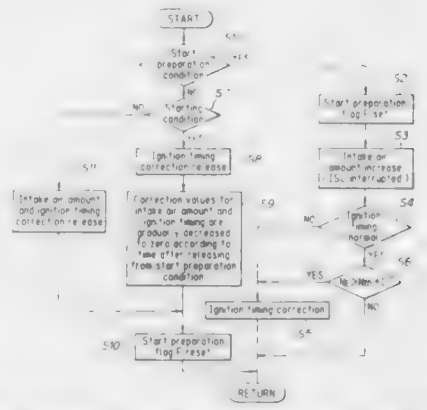


5,010,862

METHOD FOR CONTROLLING THE QUANTITY OF INTAKE AIR SUPPLIED TO AN INTERNAL COMBUSTION ENGINE

Toru Hashimoto; Hitoshi Kamura, both of Kyoto; Katutoshi Yoshida, Anjo; Takeshi Jimbo, and Tokushige Inuzuka, both of Okazaki, all of Japan, assignors to Mitsubishi Jidosha Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 21, 1990, Ser. No. [illegible]2,527
Claims priority, application Japan, Feb. 28, 1989, 1-48270
Int. Cl.[5] F02D *41/16*
U.S. Cl. 123—339 **8 Claims**



1. A method for controlling an internal combustion engine provided with a flow control valve which has a non-linear characteristic between the quantity of intake air flowing therethrough and the position of its valve member when the flow control valve is in its open position, and for controlling the quantity of intake air supplied to the engine by actuating the flow control valve by an actuator, said method comprising:
- a first step of converting the position of the valve member of said flow control valve under a predetermined operating condition of said engine into a quantity of intake air determined according to said non-linear characteristic of said flow control valve;
- a second step of adding, to said quantity of intake air computed as a result of the conversion according to said non-linear characteristic, a pre-set intake air quantity change previously determined to deal with a change in the operating condition of the engine thereby computing an objective quantity of intake air;
- a third step of converting said objective quantity of intake air into an objective position of the valve member of said flow control valve according to said non-linear characteristic; and
- a fourth step of actuating said flow control valve by said actuator on the basis of a deviation of the real position of the valve member of said flow control valve from the objective position of the valve member of said flow control valve.

5,010,863

APPARATUS FOR PREVENTING ENGINE FROM STALLING

Tetsuro Ishida; Yoshiaki Hano; Katsuo Akishino, all of Kyoto, and Toyoaki Fukui, Uji, all of Japan, assignors to Mitsubishi Jidosha Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 16, 1990, Ser. No. 568,466
Claims priority, application Japan, Aug. 31, 1989, 1-223316
Int. Cl.[5] F02D *41/04*
U.S. Cl. 123—339 **20 Claims**

1. An apparatus for preventing an engine from stalling comprising start preparation detecting means for detecting a start preparation condition of a vehicle, intake air amount increasing means for increasing the amount of intake air when the vehicle is in a start preparation condition compared to an idling condition, rotation speed increase prevention means for suppressing an increase in rotation speed of the engine due to said increase in the amount of intake air by said intake air amount increasing means, start detecting means for detecting a starting condition of the vehicle, and control means for interrupting operations of said intake air amount increasing means and said rotation speed increase prevention means according to a detection signal of the start preparation condition by said start preparation detecting means.

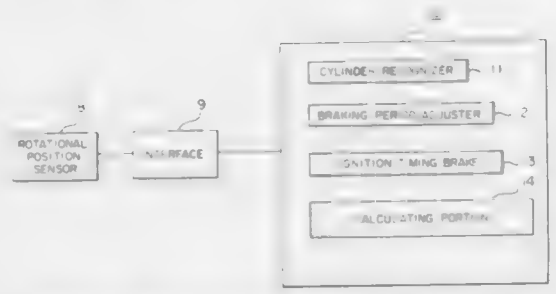
IGNITION TIMING CONTROL APPARATUS FOR AN INTERNAL COMBUSTION ENGINE



Atsuko Matsuoka, and Wataru Fukui, both of Himeji, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 13, 1989, Ser. No. 421,022

Claims priority, application Japan, Oct. 13, 1988, 63-255834; Oct. 13, 1988, 63-255835

Int. Cl.[5] F02P *5/15*

U.S. Cl. 123—414 **3 Claims**

1. An ignition timing control apparatus for a multi-cylinder internal combustion engine comprising:

a position sensor for generating a series of position signals, each signal corresponding to one of the cylinders of the engine and indicating a first position and a second position with respect to top dead center of a piston of the corresponding cylinder, the number of degrees of crankshaft rotation of the engine between the first and second positions being different for a prescribed reference cylinder of the engine from that for the other cylinders of the engine,

cylinder recognizing means for recognizing the reference cylinder based on the signals from the position sensor;

ignition timing calculating means for calculating a target ignition timing;

ignition timing braking means for performing ignition timing braking on a cylinder if (1) the target ignition timing falls during a predetermined braking period A for the cylinder, the braking period A being measured from the time when the piston of the cylinder is at its first position, and (2) ignition has yet to take place by the time the piston reaches its second position; and

braking period adjusting means for changing the length of the braking period A from a prescribed first length to a prescribed second length for either of the reference cylinder and the other cylinders after cylinder recognition has been completed by the cylinder recognizing means.

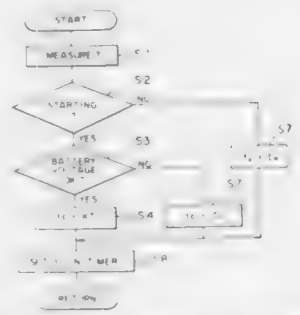
IGNITION TIMING CONTROLLER FOR AN INTERNAL COMBUSTION ENGINE

Wataru Fukui, and Toshio Iwata, both of Himeji, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 26, 1990, Ser. No. 485,004

Claims priority, application Japan, Feb. 27, 1989, 1-43322; Feb. 27, 1989, 1-43323



Int. Cl.[5] F02P *5/15*

U.S. Cl. 123—424 **13 Claims**

1. An ignition timing controller for a multi-cylinder internal combustion engine comprising:

a rotational signal generator which generates a signal in synchrony with the engine rotations which indicates a prescribed first piston position with respect to top dead center of the piston of each cylinder of the engine; and

an ignition timing calculator including means for determining whether the engine is operating in a starting mode or a normal operating mode, generating a signal to initiate current conduction through an ignition coil at a certain piston position when the engine is operating in the normal operating mode, calculating a delay period when the engine is operating in the starting mode, and generating a signal to initiate current conduction through the ignition coil only after the delay period has elapsed, as measured from the first piston position, when the engine is operating

in the starting mode to thereby reduce the duration of current flow through the ignition coil and attendantly prevent thermal damage

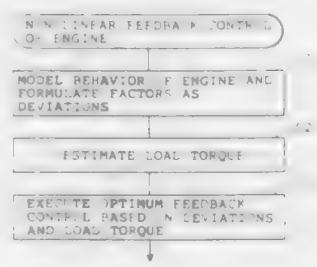
5,010,866

NONLINEAR FEEDBACK CONTROL METHOD AND APPARATUS FOR AN INTERNAL COMBUSTION ENGINE



Akira Ohata, Mishima, Japan, assignor to Toyota Jidosha Kabushiki Kaisha, Japan

Filed Apr. 12, 1989, Ser. No. 337,178

Claims priority, application Japan, Apr. 12, 1988, 63-89739

Int. Cl.[5] F02D *41/14*

U.S. Cl. 123—436 **12 Claims**

1. A nonlinear feedback control method for an internal combustion engine comprising the steps of:

preparing a model of the behavior of the engine by formulating a motion equation representing the fluctuating motion of the engine, including a load torque portion that is an unmeasurable state of the engine, and formulating the mass conservation equation representing fluctuations in an intake air pressure of the engine for a predetermined time, including a mass flow portion that is an unmeasurable state of the engine,

detecting a measurable state of the engine;

determining deviations that are unmeasurable factors between the actual engine operation and the modeled behavior of the engine according to the measurable states of the engine;

incorporating the deviations into the motion equation and the mass conservation equation;

estimating the load torque by developing the simultaneous equations of the motion equation and the mass conservation equation for an augmented system; and

executing optimum feedback control based on the measurable operating states of the engine, the formulated deviations, and the estimated load torque.

FUEL ECONOMIZER

Raphael B. Johstoneaux, Miami, Fla., assignor to S.O.F.O. Engineering & Distributing Co., Hialeah, Fla.

Continuation of Ser. No. 156,852, Jun. 5, 1980, abandoned, which is a continuation of Ser. No. 817,172, Jul. 20, 1977, abandoned, which is a continuation-in-part of Ser. No. 657,572, Feb. 12, 1976, abandoned. This application Dec. 19, 1986, Ser. No. 943,722

Int. Cl.[5] F02M *37/00*

U.S. Cl. 123—511 **1 Claim**

1. A system for supplying liquid fuel under reduced pressure to the carburetor of an internal combustion engine said system including fuel reservoir and a fuel pump for drawing fuel from the reservoir and supplying it to the carburetor, and means for reducing the pressure at which fuel is supplied to the carburetor, said pressure reducing means comprising:

a closed container having a hollow, unencumbered interior, said container being connected between the fuel pump and the carburetor for holding a quantity of fuel sufficient for acceleration demands of the carburetor;

a first unrestricted line connected between said closed container at a location above the bottom thereof and the outlet of said fuel pump for carrying fuel to said closed container from said fuel pump;

a second unrestricted line connected between said closed container and said carburetor for supplying the latter with fuel from said closed container; and

a third constantly-open relief line connected between the fuel reservoir and said closed container at a point on said closed container above the level where said first line connects thereto and adjacent the top thereof so that a predetermined quantity of fuel will be held in the said closed container and available to meet acceleration demands in response to the suction of the carburetor, said constantly-open relief line consisting of a hollow elongated conduit containing means for adjusting the openness thereof for bleeding off fuel pump pressure thereby setting a reduced pressure on the fuel in said closed container relative to fuel pump pressure thereby developing a reduced pressure at which fuel is supplied to the carburetor whereby the said closed container will hold a volume of fuel with a sufficient air or vapor cushion thereabove at a substantially uniform pressure less than fuel pump pressure while the pump is in operation.

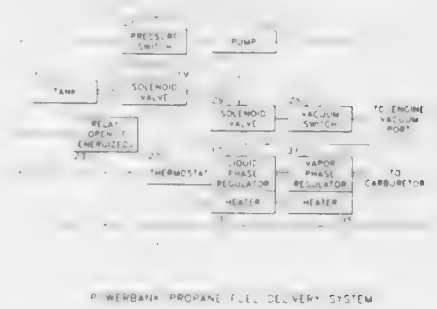
5,010,8[illegible]

GAS-PHASE PROPANE FUEL DELIVERY SYSTEM

Jerry Clements, 24555 Pases De Toronto, Yorba Linda, Calif. 92[illegible]6

Filed Apr. 3, 1990, Ser. No. 504,558

Int. Cl.[5] F02B *43/00*



U.S. Cl. 123—527 **7 Claims**

1. A gas-phase fuel delivery system for delivering a vapor phase fuel independent of exterior temperatures, the system comprising:

a storage tank for storing a volume of fuel; a regulator in fluid communication with said tank for receiving fuel from said tank and for outputting the fuel in a vapor phase;

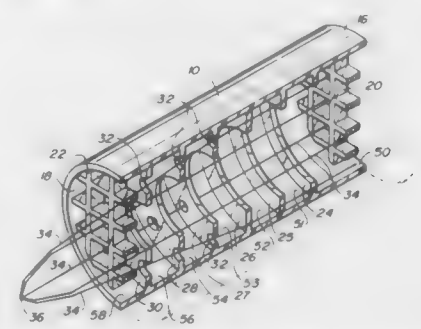
a pressure sensor in fluid communication with said tank for monitoring pressure within said tank, said pressure sensor being operative to generate a pump enable signal when the pressure within said tank is less than a predetermined threshold;

a pump in fluid communication with said tank and said

POWERMAX PROPANE FUEL DELIVERY SYSTEM

regulator for supplementing fluid pressure of the fuel from said tank to said regulator in response to the pump enable signal from the pressure sensor, the pump being operative to supplement fuel fluid pressure to a level sufficient to cause the output of said regulator to remain in a vapor phase.

5,010,869



AIR IONIZATION SYSTEM FOR INTERNAL COMBUSTION ENGINES

Jimmy L. Lee, Rohnert Park, Calif., assignor to Zenion Industries, Inc., Rohnert Park, Calif.

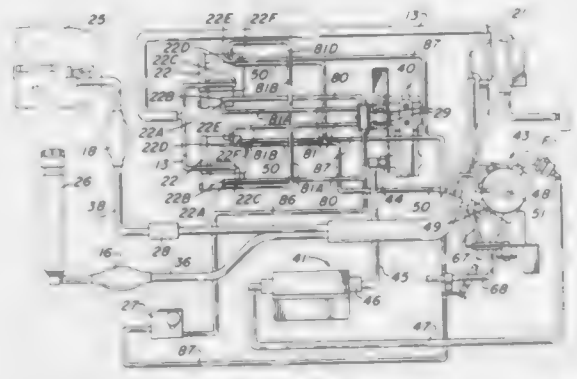
Filed Aug. 11, 1989, Ser. No. 392,752

Int. Cl.[5] F02M *33/00*

U.S. Cl. 123—539 **32 Claims**

1. A combustion air ionization apparatus for internal combustion engines comprising:

a container having an air inlet and an air outlet;



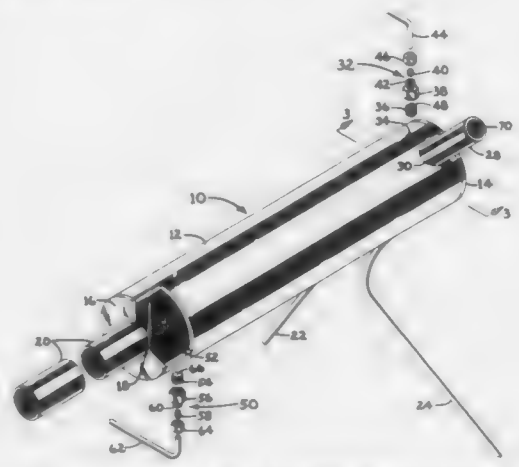
means for communicating the container air outlet with the combustion air inlet of an internal combustion engine;

an electrical charge source disposed in the container;

a voltage source connected in a circuit path to the electrical charge source, said voltage source providing a series of voltage pulses of a single polarity ranging from a non-zero base voltage to a predetermined peak voltage; and

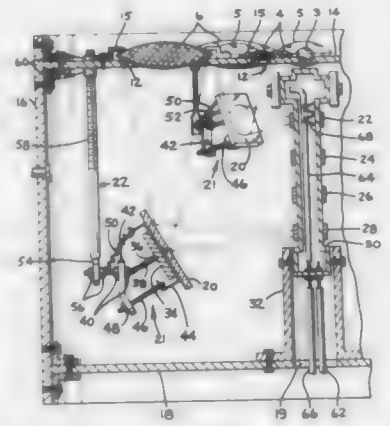
means for creating pockets of static air in the container said means for creating pockets of static air comprising a baffle disposed in the container.

5,010,870
PORTABLE ENGINE-PUMP ASSEMBLY
Michael A. Laskaris, Collegeville; Kalman Broitman, Dresher; Richard E. Teske, Norristown; David L. Miller, Conshohocken, and Michael Sulmone, Trooper, all of Pa., assignors to Hale Fire Pump Company, Conshohocken, Pa.
Filed Apr. 10, 1990, Ser. No. 507,670
Int. Cl.[5] F02B 1/00
U.S. Cl. 123—576 14 Claims



1. In an internal combustion engine adapted to operate on a running fuel of low volatility such as a kerosene based fuel or a diesel fuel, the combination comprising
a fuel inlet means for delivering fuel to the engine combustion chamber,
means for supplying said running fuel to said fuel inlet means, and
means for supplying a starting fuel having a relatively high volatility to said fuel inlet means for use in starting the engine,
said means for supplying said running fuel comprising a carburetor means including
a carburetor bowl,
an idle fuel supply passage means having an idle orifice restriction therein,
a high speed fuel supply passage means having a high speed orifice restriction therein, and
a fuel enrichment supply passage means constructed and arranged to bypass said high speed orifice and said idle orifice to compensate for the increased viscosity of said running fuel at extremely low temperatures by providing a substantial supply of fuel at said low temperatures

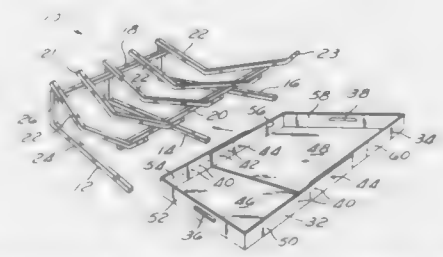
5,010,871
PROPHYLACTIC SAFETY DEVICE
Louis J. Christina, and Anna M. Christina, both of 42-30 189th St., Flushing, N.Y. 11358-2815
Filed Jun. 16, 1989, Ser. No. 367,354
Int. Cl.[5] A61F 6/04
U.S. Cl. 128—844 6 Claims



1. A prophylactic condom comprising an open-ended sheath, said sheath comprising a rim, integral with said sheath and located at the open end of said sheath, and an attached sealing device, said attached sealing device comprising:
(a) a foot attached to said sheath at said rim;
(b) an elastic ring portion; and
(c) a stem separating said foot and said elastic ring portion.

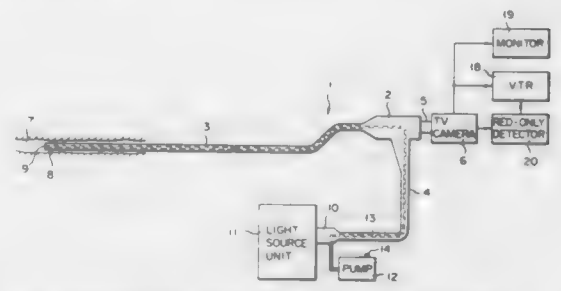
5,010,872
STEAM-PRODUCING ORCHARD HEATER
Edward J. Kish, 9305 Tieton Dr., Yakima, Wash. 98908, and Joseph E. Smith, 31379 Pittsburg Rd., St. Helens, Oreg. 97051
Filed Aug. 22, 1990, Ser. No. 570,869
Int. Cl.[5] A01G 13/06
U.S. Cl. 126—59.5 8 Claims

1. A steam-producing pulse-jet-combustion orchard heater comprising:
a cylindrical metal combustion chamber having a first end in which combustion occurs, and having a second end,
an exhaust tube connected to the combustion chamber for conveying the products of combustion to the surrounding atmosphere,
a means to supply liquefied petroleum gas to the combustion chamber,
a means to supply air to the combustion chamber,
a means to inject water directly into the combustion chamber near the second end thereof, and
a means to support the heater above the ground.



5,010,873
SOLAR ENERGY INTENSIFIER AND COLLECTOR SYSTEM
Jack W. Hoyle, 2609 Taylorsville Rd., Louisville, Ky. 40205
Filed Aug. 29, 1990, Ser. No. 574,057
Int. Cl.[5] F24J 2/08
U.S. Cl. 126—440 10 Claims

1. A solar energy intensifier and collector system comprising
a plurality of solar radiation intensifying lenses disposed in a single plane in at least one circular array, each said circular array having a common center,
mounting means for supporting said lenses,



a plurality of solar radiation reflector assemblies equal in number to said plurality of lenses and spaced from said mounting means, each of said assemblies being adapted to reflect solar energy beamed thereon from a different one of said lenses inwardly toward an axis of said circular array, and
solar radiation absorbing means disposed on said axis in a line of sight of each of said reflector assemblies, each of said assemblies being disposed so as to reflect solar radiation passing through its corresponding lens onto said absorbing means at the focal point of said corresponding lens.

5,010,874
FIREPLACE GRATE WITH ADJUSTABLE ASH PAN
Joel D. Toth, 1924 Mamosa Pl., Fullerton, Calif. 92634
Continuation-in-part of Ser. No. 414,190, Sep. 28, 1989. This application Mar. 2, 1990, Ser. No. 487,458
Int. Cl.[5] F24B 1/193
U.S. Cl. 126—543 2 Claims

1. An ash pan for collecting ashes in a fireplace, said ash pan comprising:
(a) a first section having a substantially planar bottom and having first, second and third substantially planar walls attached thereto;
(b) a recessed handle formed in the first wall of said first section;
(c) a linear array of apertures formed in said second and third walls of said first section, said apertures sized to receive a screw;
(d) a second section having a substantially planar bottom and having first, second and third substantially planar walls attached thereto, said second section sized to be received within said first section;
(e) a recessed handle formed in the first wall of said second section;
(f) at least one aperture formed in said second and third walls of said second section such that two screws may be used to adjustably attach said first and second sections together;
(g) wherein the shape of said first and second sections, when attached together, defines a trapezoid;
(h) wherein said first, second and third walls of said first section and said first, second and third walls of said second section are inclined outward at an angle of approximately 5 degrees to the vertical to facilitate stacking;
(i) wherein the minimum width of the ash pan is approximately 26 inches and the maximum width is approximately 33 inches; and
(j) wherein the shape and adjustability of the ash pan make it suitable for use in a wide variety of fireplaces.

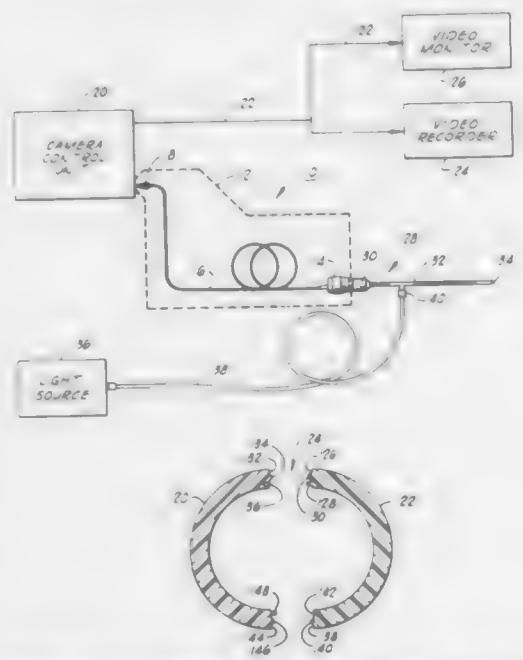
INTRAVASCULAR ENDOSCOPE APPARATUS
Shinichi Kato, Ome, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan
Continuation of Ser. No. 356,996, May 25, 1989, Pat. No. 4,934,339. This application May 22, 1990, Ser. No. 526,841
Claims priority, application Japan, Oct. 7, 1988, 63-252958
The portion of the term of this patent subsequent to Jun. 19, 2007, has been disclaimed.
Int. Cl.[5] A61B 1/04
U.S. Cl. 128—6 13 Claims



1. An intravascular endoscope apparatus, comprising:
an endoscope main body, having an insert portion to be inserted into a blood vessel, for observing the interior of the blood vessel;
fluid supplying means, coupled to said endoscope main body, for spraying a fluid through said insert portion;
image recording means, coupled to said endoscope main body, for recording an image observed by said endoscope main body;
color tone detecting means for detecting a color tone of the image observed by said endoscope main body; and
control means for controlling an operation state of said image recording means in accordance with a detection result of said color tone detecting means.

5,010,876
ARTHROSCOPIC SURGICAL PRACTICE
Gary D. Henley; Larry B. Milner, both of Yukon, and Clifford A. Dowdy, Oklahoma City, all of Okla., assignors to Smith & Nephew Dyonics, Inc., Andover, Mass.
Filed Jun. 2, 1986, Ser. No. 869,595
Int. Cl.[5] A61B 1/04
U.S. Cl. 128—6 9 Claims

1. In combination with video monitor, camera control unit, light source and scope instrument for imaging surgical activity, a disposable camera device comprising:
an imaging device including control circuitry;
a sterilized connector cable of pre-selected length connected to said control circuitry and extending to an external plug connector for connection to said camera control unit;
a sterilized camera housing means for containing said imaging device and control circuitry in sealed, fluid-tight disposition, said camera housing means consisting of a generally cylindrical housing bisected to define a first half-housing having sidewall, base portion and sleeve portion, and a second half-housing having sidewall, base portion and sleeve portion for mating engagement as said first and second half-housings are juxtaposed; and

sterile container means for enclosing and maintaining said camera housing means and connector cable in sterile

storage until opening of the container means for exposure during usage.

5,010,877

SURGICAL COLLAR AND LINER THEREFOR

Sue Druskoczi, 64 Second St., Fairfield, Conn. 06430

Filed Nov. 24, 1989, Ser. No. 440,716
Int. Cl.[5] A61F *5/01, 5/00*
U.S. Cl. 128—87 B **7 Claims**

7. A liner for use with a surgical collar comprising a flat blank of soft pliable absorbent washable material,

said blank having opposed end portions,

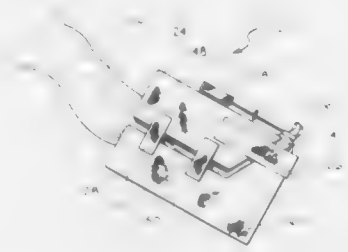
said opposed end portions being outwardly and reversely folded to form an end pocket thereat,

said end pockets being adapted to receive the opposed ends of a surgical collar,

said blank having opposed longitudinally extending marginal portions adapted to be reversely folded along the longitudinal edges therof

said longitudinally extending marginal portions extending beyond the longitudinal edges of a surgical collar, and

said longitudinally extending marginal portions being foldable outwardly and reversably about the longitudinal circumferential edges of the collar,



at least one of said end pockets having a slit formed therein adapted for providing a pass through for the collar securing means.

5,010,878

APPARATUS FOR MOBILIZING A PATIENT'S TOES

Joel L. Kline, 6854 Maple Leaf Dr., Carlsbad, Calif. 92009, and Mindy S. Armstrong, 3910 Lamont #6, San Diego, Calif. 92109

Filed Aug. 29, 1989, Ser. No. 3[illegible],846
Int. Cl.[5] A61H *1/02*
U.S. Cl. 128—25 R **12 Claims**

1. An apparatus for supporting a patient's foot and adjustably positioning a continuous passive motion device for mobilizing a patient's toes, comprising:

a soft resilient foam base for supporting a patient's lower leg and foot, said base having a concave channel extending substantially along a longitudinal axis of said base for supporting the posterior portion of said lower leg, said base further having a slanted abutment at one end of said channel having a depression for supporting the heel, said abutment forming a base angle with said longitudinal axis of about one hundred twenty degrees;

a soft resilient foam cover having a top surface and a concave channel extending substantially along a longitudinal axis of said cover, said cover being engageable with the anterior portion of said lower leg;

means for detachably fastening said cover to said base securely in position about said lower leg to hold said foot in a fixed position at said base angle of about one hundred twenty degrees;

means mounted on said top surface for removably adjustably attaching said continuous passive motion device securely in position for anterior topical placement of the device for mobilizing the patient's toes;

a continuous passive motion device having means for removably attaching said device to said cover; and

marking means for indicating longitudinal positioning of said continuous passive motion device on said top surface.

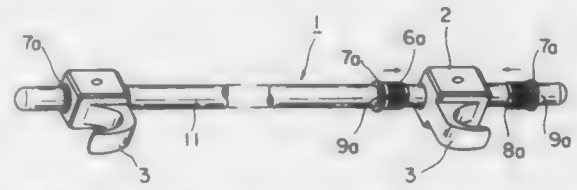
DEVICE FOR CORRECTING SPINAL DEFORMITIES

Hideshige Moriya; Hiroshi Kitahara; Shohei Minami, all of Chiba, Japan; Keijiro Isobe, Ontario, Canada; Yoshinori Nakata, Chiba, and Chiaki Tanaka, Tokyo, both of Japan, assignors to Tanaka Medical Instrument Manufacturing Co., Japan



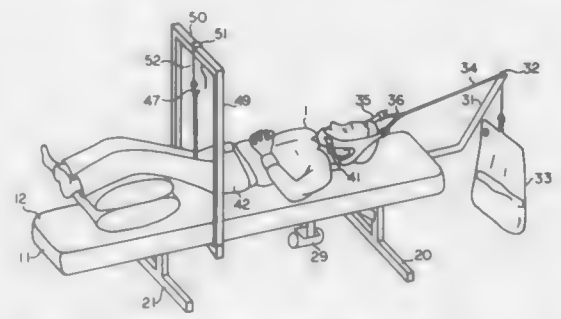
Filed Oct. 17, 1989, Ser. No. 422,562
Claims priority, application Japan, Mar. 31, 1989, 1-82019
Int. Cl.[5] A61F *5/00, 5/04*
U.S. Cl. 128—69 **9 Claims**

1. A device for correcting spinal deformities by attachment to a patient's spine for a predetermined period for correctively fixing the same, comprising:

an elongated rod, having a smooth peripheral surface;

a hook member, formed with a hook-like engagement member at one end and comprising a retaining portion through which said elongated rod is loosely inserted; and

a wedge-like fixing member in the form of a hollow cylinder formed with a lengthwise slit, said cylinder having a flange at a first end and a taper at a second end,



whereby said elongated rod is loosely inserted into said retaining portion of said hook member with a predetermined play and the fixing member mounted on the elongated rod is forcibly inserted at said tapered end thereof into an interstice formed between the loosely fitted rod and hook members to thereby firmly fix the hook member to the elongated rod.

ORTHOPEDIC FIXATION DEVICE

Michael P. Boudreau; Randall W. Jacoby, both of Greenwood, and James L. Laughlin, Hodges, all of S.C., assignors to Kirschner Medical Corporation, Timonium, Md.

Continuation of Ser. No. 224,826, Jul. 27, 1988. This application Jan. 24, 1990, Ser. No. 457,082
Int. Cl.[5] A61F *5/01;* **A61H** *1/02*
U.S. Cl. 128—76 R **7 Claims**

1. An improved ambulatory halo device to be worn by a patient for rigid immbilization of the cervical spine comprising vest means for positionally fixed attachment to the upper torso of the patient, a halo member for closely surrounding the skull of a patient between the eyes and the top of the skull, said halo member having a plurality of radially adjustable skull pins disposed about the halo for engagement with the skull of the patient to fix the position of the skull relative to the halo member, and framework means for adjustably fixing the position of the halo member relative to the vest means to maintain traction on and rigidly immobilize the cervical spine of the patient; said framework means comprising first and second pairs of generally rigid support rods having upper and lower end portions, means attaching said lower end portion of each support rod to the vest, means for adjustable axial movement of each support rod and for adjustable pivotal movement in an anterior/posterior direction and a lateral direction whereby said upper end portions of said first pair of said support rods may be generally positioned in anterior/posterior spaced relation laterally on one side of the skull of a patient and said upper end portions of said second pair of said support rods may be generally positioned in anterior/posterior spaced relation laterally on the other side of the skull, means interconnecting said upper end portions of said support rods of each pair on each side of the skull comprising a first clamp means pivotally attached to said upper end portion of each support rod, a rigid connector rod

extending between said support rods of each respective pair and grippingly held within said first clamp means on said support rods whereby a connector rod extends in anterior/-posterior direction on each side of the skull of the patient, and an adjustable bracket means mounted for sliding movement along and for fixed location on each connector rod, each bracket means including means engaging an opposite side portion of the halo member for positional adjustment of the halo member in elevation, anterior/posterior translation and tilt, and in rotation about a medial axis of the body of a patient without loss of control of traction on the cervical spine of the patient, each of said adjustable bracket means comprising a housing having means for pivotal attachment of said halo member thereto for said anterior/posterior tilt adjustment of the halo relative to the patient, each housing including a central passageway therein, each of said adjustable bracket means further comprising a second clamp means attached to its respective connector rod and having a post slidably received within the housing passageway, and means for adjustably positioning the housing along the longitudinal axis of the post to positionally adjust the halo member in elevation relative to the patient.

5,010,882

IMPLANTABLE PENILE PROSTHESIS

Mark Polyak, Minnetonka, and Robert W. Pugh, Jr., Lakeville, both of Minn., assignors to American Medical Systems, Inc., Minnetonka, Minn.

Filed Nov. 13, 1989, Ser. No. 435,641
Int. Cl.[5] A61F *2/26*
U.S. Cl. 128—79 **30 Claims**

1. A penile prosthesis implantable within at least one corpus cavernosum of the penis, said prosthesis comprising:

an implantable broadly tubular enclosure;

a generally tubular pressurizable chamber section defined within said enclosure, said chamber section being transformable from a flaccid to an erect state, and which is capable of being squeezed or bent; and a deflation valve for returning said chamber section from the erect to flaccid state, said valve being in fluid communication with said tubular pressurizable chamber section and with a fluid

reservoir, said valve comprising closure means for normally keeping the valve in a closed mode, means for time-deferring the transfer of fluid within said valve thereby effecting a change in the internal pressure conditions within said valve, and a movable partition disposed within a distensible chamber within said valve capable of exerting sufficient force upon said closure means, as a consequence of said change in internal pressure conditions, to place said valve in an open mode.

MEDICAL PROBE ASSEMBLY HAVING COMBINED ULTRASONIC IMAGING AND LASER ABLATION CAPABILITIES

James D. Passafaro, Santa Ana, and James M. Griffith, Newport Beach, both of Calif., assignors to InterTherapy, Inc., Santa Ana, Calif.

Filed Aug. 18, 1989, Ser. No. 395,840

Int. Cl.[5] A61B *8/12*

U.S. Cl. 128—660.03 **24 Claims**

1. An intravascular probe assembly comprising:

a distally located housing;

optical fiber means having an end terminating within said housing for directing a beam of light along a first path generally parallel to a longitudinal axis of said housing;

ultrasonic transducer means disposed within said housing for generating ultrasonic acoustic waves and for propagating said generated acoustic waves along a second path generally parallel to said housing longitudinal axis;

means disposed in said first and second paths for redirecting said light beam and said acoustic waves from said first and second paths to respective redirected paths generally radially of said housing, and

electrical connection means for electrically connecting said transducer means in series, said electrical connection means including;

(i) means for establishing electrical connection between an outer periphery of said ultrasonic transducer means and said housing;

(ii) two-lead cable means having a terminal end located within a proximal portion of said housing;

(iii) a longitudinally extending channel defined in said housing and extending from a proximal location adjacent said terminal end of said two-lead cable means to a distal location adjacent a distal face of said transducer means;

(iv) an electrically insulated wire disposed in said defined channel and having exposed proximal and distal ends at said proximal and distal locations of said defined channel, respectively;

(v) an electrically conductive filler material which fills said channel and retains said wire therewithin;

(vi) one of said leads of said two-lead cable means being electrically connected to said exposed proximal end of said wire at said proximal location of said channel; wherein

(vii) said exposed distal end of said wire at said distal location of said channel is electrically connected to a distal face of said transducer means; and wherein

(viii) another lead of said two-lead cable means is electrically connected to a proximal region of said housing, whereby said transducer means is series connected.

NOISE DISCRIMINATION IN IMPLANTABLE PACEMAKERS

Hans T. Thornander, Paris, France, assignor to Siemens-Pacesetter, Inc., Sylmar, Calif.

Filed Nov. 17, 1989, Ser. No. 438,818

Int. Cl.[5] A61B *5/04*

U.S. Cl. 128—696 **21 Claims**

1. A noise discrimination circuit used in an implantable medical device, said implantable medical device including sensing means for sensing electrical signals originating within heart tissue with which said medical device is in electrical contact, said sensing means comprising a single wire lead in contact with said heart tissue, said noise discrimination circuit comprising:

first and second threshold detectors coupled to the sensing means, the first threshold detector generating a first signal when the electrical signal sensed exceeds a first threshold value, the second threshold detector generating a second signal when the electrical signal sensed falls below a second threshold value;

timer means for generating a window signal having a prescribed time period, the window signal being triggered whenever the electrical signal sensed exceeds the first threshold value;

latch means for generating a latch signal upon the occurrence of the first signal and for terminating the latch signal upon the occurrence of the second signal; and

means for designating the electrical signal sensed as being valid during an interval defined by the absence of the window signal and the presence of the latch signal.

5,010,888

METHOD AND APPARATUS FOR DETECTION OF POSTERIOR ISCHEMIA

Hossein Jadvar, Ann Arbor, Mich., and Robert C. Arzbaecher, Chicago, Ill., assignors to Arzco Medical Electronics, Inc., Vernon Hills, Ill.

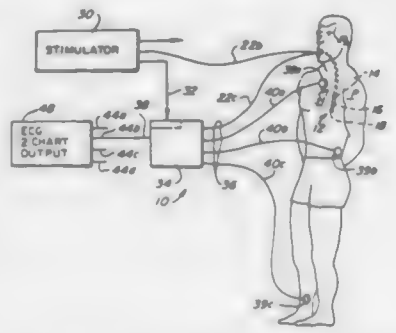
Continuation-in-part of Ser. No. 173,367, Mar. 25, 1988. This application Nov. 4, 1988, Ser. No. 267,459

Int. Cl.[5] A61B *5/04*

U.S. Cl. 128—696 **42 Claims**

1. A method of automatically detecting a selected posterior heart condition in a person comprising:

positioning a sensing electrode adjacent a posterior surface of the person's heart;



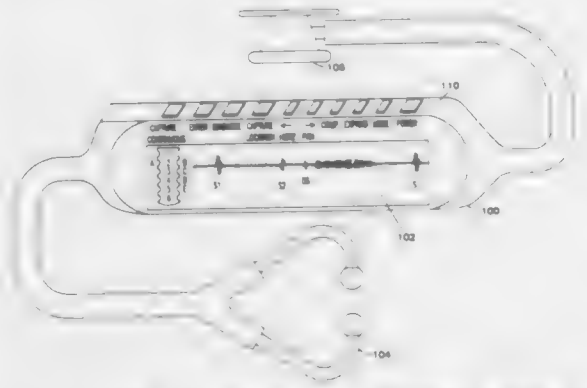
electrically stressing the heart;

detecting electrical signals from the electrode that have been generated in response to stressing the heart irrespective of the presence of stressing induced artifacts;

filtering the detected signals;

automatically locating a local maximum of the filtered signals;

automatically measuring selected regions of the filtered signals adjacent the local maximum; and



generating an indicium indicative of the presence or absence of the selected posterior heart condition.

5,010,889

INTELLIGENT STETHOSCOPE

Mark S. Bredesen, and Elliott D. Schmerler, both of Incline Village, Nev., assignors to Bloodline Technology, Incline Village, Nev.

Filed Feb. 4, 1988, Ser. No. 153,719
Int. Cl.[5] A61B *5/62, 7/00*
U.S. Cl. 128—715 **34 Claims**

1. An intelligent stethoscope for automatic diagnosis of sensed body sounds, comprising:

(a) input means for receiving the sensed body sounds;

(b) first memory means connected to said input means for storing the sensed body sounds;

(c) second memory means for storing first characteristics of at least one representative body sounds corresponding to a known physical abnormality;

(d) control means connected to said first memory means and said second memory means for generating second characteristics corresponding to the sensed body sounds and for comparing said second characteristics corresponding to the sensed body sounds of said first memory means to said first characteristics of said at least one representative body sounds of said second memory means; and

(e) indicator means attached to said control means for indicating a match between said second characteristics and said first characteristics.

5,010,890

VITAL SIGNS MONITORING SYSTEM

Robert L. Pfohl, Anaheim Hills, and James D. Uphold, Canoga Park, both of Calif., assignors to Vitacomm, Ltd., Orange, Calif.

Continuation of Ser. No. 828,777, Feb. 7, 1986, Pat. No. 4,705,048, which is a continuation of Ser. No. 660,454, Oct. 12, 1984, abandoned, which is a continuation-in-part of Ser. No. 522,640, Aug. 11, 1983, Pat. No. 4,619,268. This application Nov. 2, 1987, Ser. No. 116,287
The portion of the term of this patent subsequent to Nov. 10, 2004, has been disclaimed.
Int. Cl.[5] A61B *5/0205*
U.S. Cl. 128—773 **25 Claims**

1. A portable patient vital signs monitoring system comprising, in combination:

first sensing means to be attached to a patient's body for sensing a first physiological condition represented by heart and lung sounds and for generating a first electrical signal corresponding thereto;

second sensing means to be attached to a patient's body for sensing a second physiological condition and for generating a second electrical signal corresponding thereto;

elongated conductor means connected to said first and second sensing means for conducting said signals away from the patient's body;

a remotely located monitoring unit including control means connected to said conductor means for receiving said first and second signals from said conductor means and for processing said signals;

said monitoring unit including an IR transmitter having emitter means for omnidirectional transmission of said processed first and second signals; and

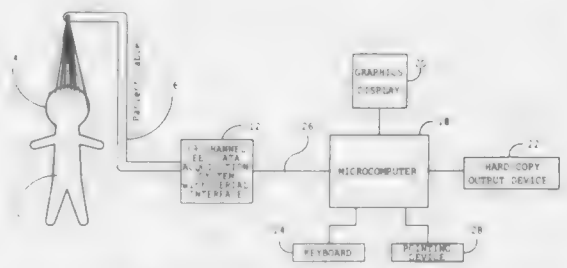
a remote portable, IR receiver to be worn on an operator's body for receiving said processed first and second signals and for converting said received signals into audible form.

5,010,891

CEREBRAL BIOPOTENTIAL ANALYSIS SYSTEM AND METHOD

Nassib G. Chamoun, Dedham, Mass., assignor to Biometrak Corporation, Cambridge, Mass.

Continuation-in-part of Ser. No. 107,357, Oct. 9, 1987, Pat. No. 4,907,597. This application Apr. 12, 1989, Ser. No. 336,874
Int. Cl.[5] A61B *5/04*
U.S. Cl. 128—731 **70 Claims**



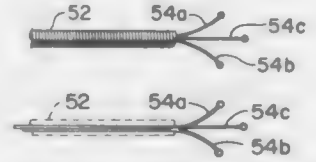
1. A method of noninvasively detecting cerebral phenomena comprising the steps of:

acquiring electroencephalographic signals through at least one electrode from a body surface of a subject being analyzed;

filtering said electroencephalographic signals to obtain filtered signals having frequencies between 2 and 500 hertz;

dividing said filtered signals into a plurality of equally sized data records,

characterizing dynamic phase relations within said filtered signals by processing said filtered signals to generate bispectral values;



comparing said generated bispectral values to reference values to derive a diagnostic index that quantifies the detected cerebral phenomena.

5,010,892

BODY LUMEN MEASURING INSTRUMENT

David P. Colvin, Apex; Raymond A. Whitney, Raleigh, both of N.C.; Bernard R. Marsh, Upperco, Md.; William M. Kline, Gloversville, N.Y.; Ronald R. Rizzo, Gloversville, N.Y., and Mark E. Orlosky, Gloversville, N.Y., assignors to Triangle Research and Development Corp., Research Triangle Park, N.C.; Johns Hopkins University, Baltimore, Md. and Medical Evaluation Devices & Instruments Corp., Gloversville, N.Y.

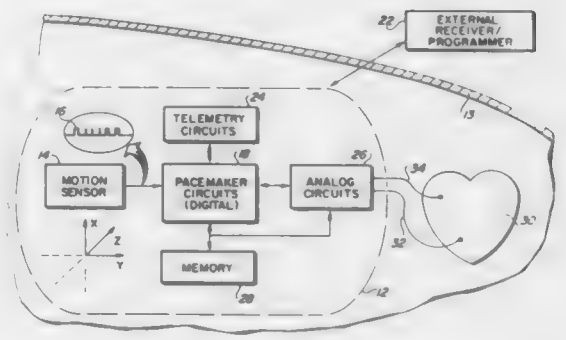
Filed May 4, 1988, Ser. No. 189,998
Int. Cl.[5] A61B *5/103*
U.S. Cl. 128—774 **2 Claims**

1. An instrument for determining size characteristics of body lumens or passageways or the like and comprising:

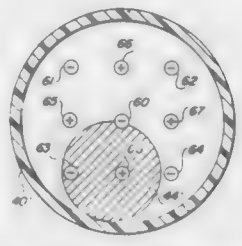
an elongated flexible sleeve adapted to be inserted into a body lumen or passageway or the like;

a handle secured to one end of said flexible sleeve;

an elongated cable slidably received within said sleeve and including probe means for determining body lumen or passageway or the like size characteristics at one end thereof; means cooperatively associated with said handle for sliding said cable within said sleeve so as to selectively extend and withdraw said probe means from the other end of the sleeve, wherein said elongated cable comprises a first cable, wherein said probe means comprises at least one resilient wire connected at one end thereof to said cable and having a normally curved shape so that said at least one wire extends generally radially outwardly from the other end of said flexible sleeve remote from said handle when extended by said sliding means, wherein said elongated cable further comprises a second cable and wherein said probe means also comprises at least one resilient wire connected at one end thereof to said second cable and extending generally coaxially outwardly from the end of said flexible sleeve when extended by said sliding means; and



measurement means mounted on said handle and cooperatively associated with said cable sliding means for measuring movement by said probe means.



5,010,893

MOTION SENSOR FOR IMPLANTED MEDICAL DEVICE

Jason A. Sholder, Canoga Park, Calif., assignor to Siemens-Pacesetter, Inc., Sylmar, Calif.

Continuation-in-part of Ser. No. 3,433, Jan. 15, 1987, Pat. No. 4,771,780. This application Mar. 24, 1988, Ser. No. 172,610
The portion of the term of this patent subsequent to Sep. 20, 2005, has been disclaimed.
Int. Cl.[5] A61N *1/36*
U.S. Cl. 128—782 **15 Claims**

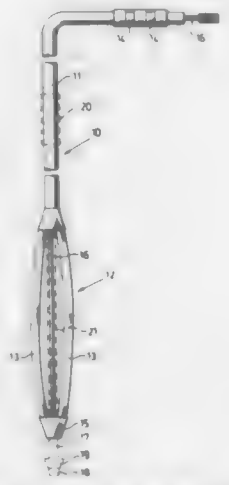
1. A body implantable motion sensor for use with a pacemaker, said sensor comprising:

housing means for implantation in a body, said housing means comprising a housing containing electronic circuits, said housing including an enclosed non-conductive cavity therewithin having a plurality of conductive electrodes exposed on an inside wall of said enclosed non-conductive cavity;

means responsive to the application of external forces for making and breaking electrical contact between at least two of said plurality of electrodes; and

means for electrically monitoring said electrodes with said electronic circuits for determining when electrical contact is made therebetween.

5,010,894



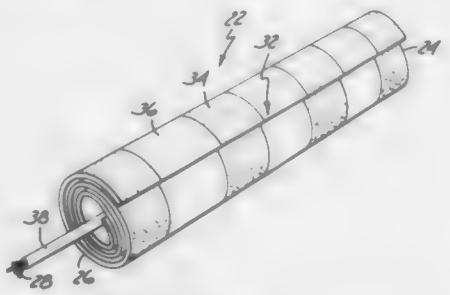
INTRAVASCULAR ELECTRODE LEAD USABLE FOR CARDIAC DEFIBRILLATION

Knut O. Edhag, Sandstensvägen 11, Bromma, Sweden S-161 39

PCT No. PCT/SE89/00002, § 371 Date Sep. 7, 1989, § 102(e) Date Sep. 7, 1989, PCT Pub. No. WO89/06148, PCT Pub. Date Jul. 13, 1989
PCT Filed Jan. 9, 1989, Ser. No. 399,489
Claims priority, application Sweden, Jan. 7, 1988, 00019/88
Int. Cl.[5] A61N *1/05*
U.S. Cl. 128—785 **4 Claims**

1. An intravascular electrode lead usable for cardiac defibrillation, said lead comprising an elongate electrically insulated lead body having a central longitudinal cavity and an electrode arrangement carried by said lead body and extending substantially in the longitudinal direction of the lead body from an end thereof and insertable into an atrial or ventricular cardiac room, said electrode arrangement comprising at least two

elongate resiliently flexible electrodes which are arranged to be brought into resilient contact with circumferentially spaced portions of the surrounding wall of said room, said electrodes extending in longitudinally mutually overlapping and circumferentially spaced apart relationship from a first end of said electrode arrangement, where said electrodes are anchored to the lead body adjacent to each other and to a second end of said electrode arrangement where said electrodes are anchored adjacent to each other to a common interconnecting member, which is arranged to each other to a common interconnecting member, which is arranged for limited movement in the longitudinal direction of the electrode arrangement to permit the electrodes to move in relation to each other under the action of spring forces from laterally retracted positions in which they



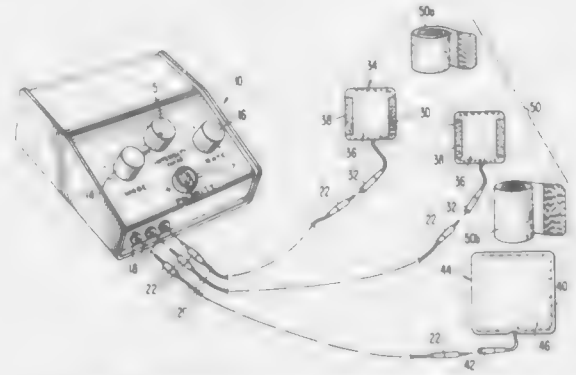
extend close to each other along their whole length and in which they permit an unobstructed insertion of the electrode arrangement into said room, to laterally expanded positions, in which they may bear resiliently against the surrounding wall of said room, the electrode lead further comprising a stylet wire removably inserted through the central longitudinal cavity in the lead body and applied against said interconnecting member to releasably hold the interconnecting member in a position in which said member, in its turn, may hold said electrodes in their laterally retracted positions, and an elastic tensile member, forming an extension of the lead body and extending to the interconnecting member and connected thereto to apply a spring-force on the interconnecting member, tending to assist in moving said electrodes to their said laterally expanded positions.

5,010,895

EXPANDABLE VAGINAL ELECTRODE

Donald D. Maurer, and Stacy D. Mattson, both of Anoka, Minn., assignors to Empi, Inc., St. Paul, Minn.

Filed Aug. 3, 1989, Ser. No. 389,175
Int. Cl.[5] A61N *1/05*
U.S. Cl. 128—788 **27 Claims**



1. A vaginal electrode, including:
a sheet of material having a first surface and windable into a spiral, the sheet of material tending to unwind after insertion into a woman's vagina to force the first surface against the vaginal wall;
a plurality of electrically isolated conductive electrode elements on the first surface of the sheet of material so as to contact the vaginal wall after insertion, and
leads for coupling electrical signals to the electrode elements.

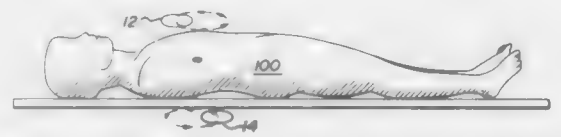
5,010,896

PULSED GALVANIC STIMULATOR

Barbara-Ann Westbrook, Falls Church, Va., assignor to Westec Corporation, Manassas, Va.

Filed Oct. 17, 1989, Ser. No. 422,532
Int. Cl.[5] A61N *1/04*
U.S. Cl. 128—798 **14 Claims**

1. A pulsed galvanic medical treatment device, comprising:
means for controlling power;
a plurality of substantially planar pads, including treatment and return pads, said treatment and return pads each having a coating forming a first surface thereof, a liquid absorbing member forming a second surface thereof opposite said first surface, and an electrical conductor disposed between said first and second surfaces;
a first elongated band adapted to be wrapped around a first part of a body to be treated;
means for adjustably attaching said treatment pads to said first elongated band;
connecting means for connecting the electrical conductor of each of said pads to said power control means;
a second elongated band adapted to be wrapped around a second part of the body to be treated; and
means for adjustably attaching said return pad to said second elongated band;
wherein each of said first and second elongated bands has a substantially inelastic starter portion forming a first end portion thereof and adapted to receive said treatment pads and said return pad, respectively, an elastic tightening portion forming a second end portion thereof, and fasteners located on said first and second end portions and adapted to be joined to said inelastic starter portion.



5,010,897

APPARATUS FOR DEEP HEATING OF CANCER

Harry H. Leveen, 321 Confederate Cir., Charleston, S.C. 29407

Filed Apr. 26, 1989, Ser. No. 343,832
Int. Cl.[5] A61N *1/40*
U.S. Cl. 128—804 **17 Claims**

1. An apparatus for developing radio frequency energy between spaced coils to apply an electromagnetic field between the coils to heat a tumor deep seated in a human body comprising a pair of spaced coils spaced apart a distance greater than the diameter of the smallest coil, a radio frequency generator means which generates radio frequency waves to at least one of said coils, means to rotate said coils so that one coil is movably positioned from one surface of the body and the other coil is movably positioned from another surface of the body with both coils being movably positioned from the respective surface of the body to move synchronously in planes which are parallel to each other to maximize magnetic lines of force on said tumor.

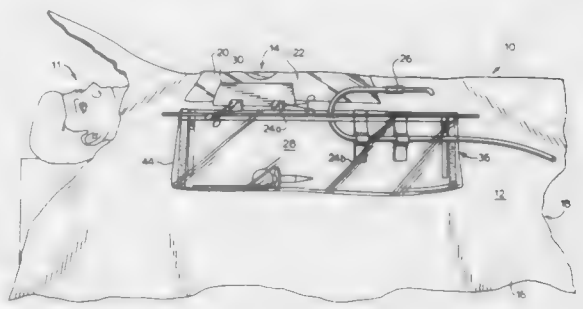
5,010,898

HEAD SUPPORTING AND SUSTAINING APPARATUS

Gisleine C. de Kanawati, and George G. Philot, both of Sao Paulo, Brazil, assignors to Mara Teixeira De Freitas, Sao Paulo, Brazil

Filed May 15, 1990, Ser. No. 524,298
Claims priority, application Brazil, May 16, 1989, 8902279
Int. Cl.[5] A61F *5/37*
U.S. Cl. 128—845 **16 Claims**

1. An apparatus for movably supporting the head of a patient in an upright position to a support element comprising:
(a) means for mounting the apparatus on the support element comprising a slidable rod and a mounting element having a first guide member formed thereon for receiving the slidable rod, stop means for positioning the rod within the first guide member, and a second guide member comprising a cushioned brace and stop means thereon for slidably positioning the cushioned brace along the rod;
(b) hanger means operatively associated with the mounting means;
(c) means for movably supporting the head of the patient; and
(d) resilient means connecting the supporting means to the hanger means whereby the head of the patient is supported and maintained in an upright position for relatively unrestrained movement by the patient.



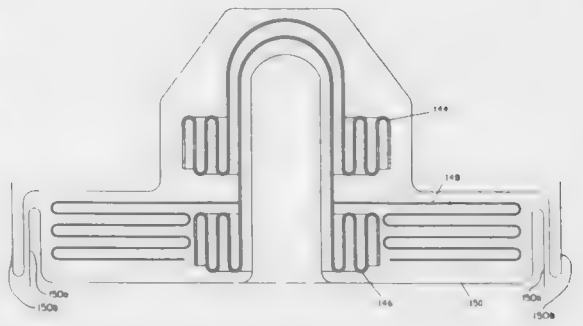
5,010,899

SURGICAL DRAPE WITH LOOPS

Joseph F. Thompson, Lindenhurst, Ill., assignor to Baxter International Inc., Deerfield, Ill.

Filed Jun. 26, 1990, Ser. No. 543,638
Int. Cl.[5] A61B *19/08, 19/10*
U.S. Cl. 128—849 **3 Claims**

1. A drape for covering a patient during a procedure comprising:
a main sheet for covering the operative site of a patient, said main sheet having an upper surface positioned away from said patient and a lower surface positioned in proximity with said patient, said main sheet having fenestration means for accessing the operative site;
a plurality of loops attached to said upper surface of said main sheet for maintaining medical devices; and
a second sheet having edges, one of said edges of said second sheet being attached to said upper surface of said drape in juxtaposition with said fenestration means, and said plurality of loops being located in close proximity to said attached edge of said second sheet, wherein said second sheet further includes sealing means along at least one edge adjacent said attached edge for allowing said second sheet to be foldingly sealed to itself along said adjacent edge to form a pocket-like structure, said loops being alternatively positioned inside or outside of said pocket-like structure.

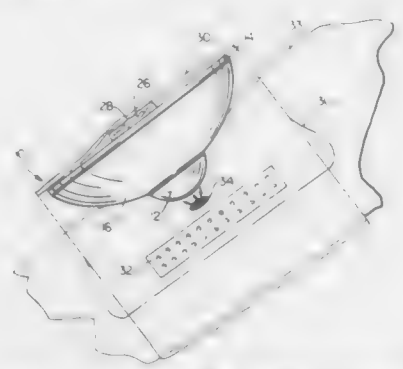


5,010,900

LOWER LIMB POSITIONING APPARATUS AND SURGICAL DRAPE

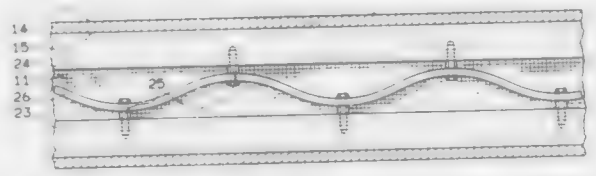
Geoffrey F. Auchinleck, #5-1182 West 7th Avenue, Vancouver, British Columbia, Canada V6H 1B4 ; James A. McEwen, 5259 Turquoise Drive, Richmond, British Columbia, Canada V7C 4Z6 ; John C. Osborne, 4040 Toronto Street, Port Coquitlam, British Columbia, Canada V3B 6X8 , and Carlo R. Bussani, 4877 Colbrook Court, Burnaby, British Columbia, Switzerland V5G 3Y4

Filed Feb. 27, 1989. Ser. No. 316,852
Int. Cl.[5] A61F *5/04*
U.S. Cl. 128—855 **4 Claims**



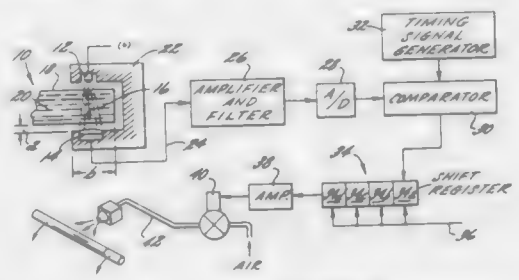
1. A surgical drape assembly, comprising:
a first flexible tube having an open end and
a second flexible tube having an open end and a closed end, the closed end of the second flexible tube being disposed within the first flexible tube; and
removable flexible wrap material sealed around the first and second flexible tubes, the wrap material extending into the second flexible tube to define a space into which an object may be inserted to be within the second flexible tube with the wrap material positioned between the object and the second flexible tube.

5,010,901
DEVICE FOR PREVENTING SUCKING OF THUMB OR FINGER
Jaime M. Pales, Calle Mendez Vigo 343, Dorado, P.R. 00646
Filed Sep. 20, 1985, Ser. No. 778,484
Int. Cl.[5] A61F *13/10*
U.S. Cl. 128—880 2 Claims



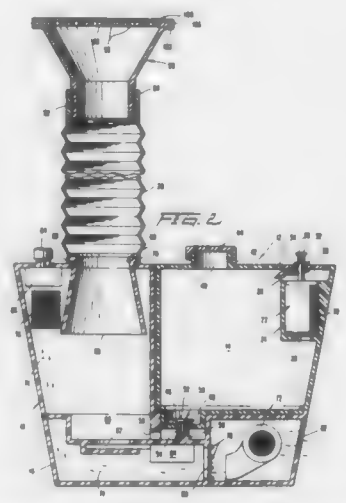
1. A device for preventing sucking of at least one of the digits of the human hand, comprising:
(a) a glove having a part encircling the wrist and at least a part of the hand, and a tubular part shaped to closely enclose at least one of the digits and having a closed outer end,
(b) an annular flat flange extending radially outwardly from the tubular part a distance such as to prevent insertion thereof into the mouth and at a position spaced downwardly from said closed outer end to which when said glove is in its position of use is adjacent to but below the outer end of said at least one digit.

5,010,902
COMPRESSION ORB
Robert D. Rambo, Sellersville, Pa., and John A. Yorke, Canastota, N.Y., assignors to Ace Medical Inc., Sellersville, Pa.
Filed Jul. 19, 1990, Ser. No. 554,349
Int. Cl.[5] A61F *5/30, 5/34*
U.S. Cl. 128—888 3 Claims



1. A compression orb for use in combination with flexible bandage means for application and securement of said orb to an arterial or venous puncture site to simulate manual digital pressure hemostasis, said orb comprising:
(a) a circular base having a substantially flat bandage contacting surface including means for attachment to said bandage means;
(b) a first domed surface integrally extending from the side of said base opposite said bandage contacting surface, said first domed surface having an internal, concave surface; and
(c) a second domed surface integrally formed and raised from said first domed surface wherein the center of said second domed surface is concentric with said first domed surface and said circular base and wherein said orb is formed as a hollow piece.

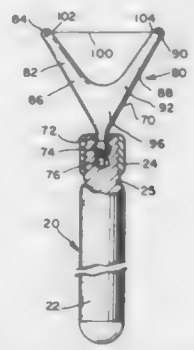
5,010,903
CONTINUOUS-WORM CIGARETTE-MAKING MACHINE
Bruno Belvederi, Bologna, Italy, assignor to G.D. S.p.A., Bologna, Italy
Filed Feb. 21, 1989, Ser. No. 313,413
Claims priority, application Italy, Mar. 4, 1988, 3358 A/88
Int. Cl.[5] A24C *5/18*
U.S. Cl. 131—84.3 2 Claims



1. A continuous-worm cigarette-making machine, comprising a chimney for upwardly feeding a continuous flow of tobacco particles, a conveyor for forming and transferring a layer of tobacco particles, said conveyor comprising an air-permeable belt closed in a loop around two end rollers which define in said belt a stringer arranged at an upper outlet end of said chimney, a box-like body internal to said loop and downwardly delimited by a wall in contact with said stringer, suction means connected to said box-like body, a longitudinal opening inside said box-like body closed by said stringer, a contrast element internal to said box-like body arranged in contact with said stringer so as to oppose the action exerted on said stringer, through said longitudinal opening, by said suction means, wherein said contrast element comprises a strip in contact with said stringer at its lower edge, wherein said strip is undulated in the plane of said stringer.

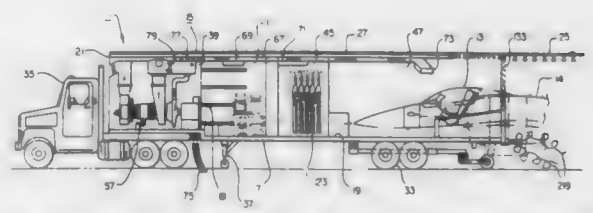
5,010,904
METHOD AND APPARATUS FOR DETECTING LOOSE ENDS OF CIGARETTES
Wallace R. Lassiter, Winston-Salem, N.C., assignor to R. J. Reynolds Tobacco Company, Winston-Salem, N.C.
Filed Dec. 21, 1989, Ser. No. 454,208
Int. Cl.[5] A24C *5/32, 5/34*
U.S. Cl. 131—280 44 Claims

1. An apparatus for identifying cigarettes having loose ends comprising:
conveyor means for serially conveying a plurality of cigarettes along a path of travel with the cigarettes being oriented transversely to the direction of travel so that tobacco filled ends of the cigarettes pass serially along one side of the conveying means; and
inspection means fixedly positioned along the path of travel adjacent the one side of the conveyor and comprising an infrared emitter and an infrared receiver, the emitter and receiver being aligned with each other on opposite sides of, and spaced from, the path of travel so that tobacco filled end portions of the cigarettes serially pass between the emitter and the receiver.



5,010,905
WATER-VAPOR HAIR TREATMENT APPARATUS
Marilyn J. Snyder, 1185 Park Ave., New York, N.Y. 10028, and Susan Bjurman, 969 Hilgard Ave., Los Angeles, Calif. 90024
Filed Oct. 20, 1989, Ser. No. 424,612
Int. Cl.[5] A45D *19/16*
U.S. Cl. 132—272 22 Claims

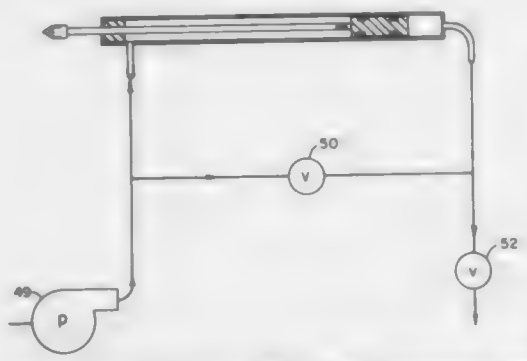
1. An apparatus for treating hair with moisture, comprising:
a base member including
a water reservoir for holding a predetermined quantity of water, said water reservoir including manually actuable dispensing means for holding a predetermined quantity of hair care products and dispensing said hair care products into said water upon manual actuation of said dispensing means,
means for producing vapor from said water or from water containing hair care products,
means for connecting said water reservoir to said vapor producing means to allow a flow of water from said water reservoir to said vapor producing means, and
outlet means for delivering said vapor out of said vapor producing means;
an elongated flexible hose, having a first end and a second end, detachably connectable to said outlet means at said first end, for use in directing said vapor to a subject's hair; and
detachable nozzle means, detachably connectable to said second end of said elongated flexible hose, for creating jets of vapor to apply to said subject's hair.



5,010,906
MULTI-PURPOSE DENTAL APPLICATOR
Roberto Preciutti, 5883 Cape Horn Dr., Agoura Hills, Calif. 91301
Filed Apr. 13, 1990, Ser. No. 509,287
Int. Cl.[5] A61C *15/00*
U.S. Cl. 132—323 34 Claims

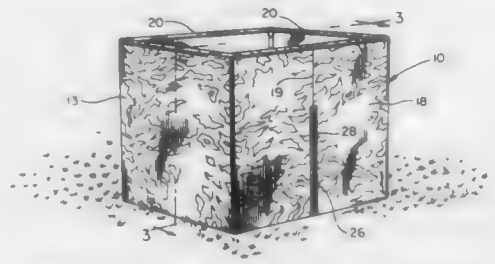
1. A multi-purpose dental applicator comprising:
a. a handle member further comprising,
(i) an elongated shank,
(ii) a throat section extending from the elongated shank and extending to a head section,
(iii) the head section including an internal opening at the top of the head section leading to a generally inverted frustum shaped cavity which in turn is contiguous with and leading to a spherical cavity which in turn is contiguous with and leading to an arcuate cavity within the head section,
(iv) the outer surface of the head section having threads thereon,
(v) a slidable collar which partially rests around the throat section of the handle and having internal threads for mating engagement with the threads on the head section;
b. an interchangeable removable member further comprising,
(i) an elongated shank,
(ii) the elongated shank ending in a spherical ball at one end,
(iii) a stem extending from the spherical ball at a location diametrically opposite to an attachment point of the

elongated shank and the spherical ball and in alignment with the elongated shank, and
(iv) a dental applicator part integral with the elongated shank at the end remote from the spherical ball;
c. whereby the interchangeable removable member can be removably retained within the head of said handle by insertion of the shank, spherical ball and stem into the head through the opening in the top of the head while the collar is resting partially on the throat of the handle, with the stem resting in the arcuate cavity, the spherical ball retained within the spherical cavity and a portion of the shank resting within the inverted frustum shaped cavity, and the collar is then threaded onto the head to thereby tighten the interchangeable removable member into the head.



5,010,907
MOBILE ENCLOSURE FOR ALLOWING ACCESS TO A VEHICLE IN AN UNSAFE ENVIRONMENT
Kenneth C. Henson, and Michael K. Barron, both of Fort Worth, Tex., assignors to General Dynamics Corporation, Fort Worth, Tex.
Filed Dec. 22, 1989, Ser. No. 456,163
Int. Cl.[5] B08B *3/02*
U.S. Cl. 134—94 21 Claims

7. A portable enclosure for protecting humans from an unsafe exterior environment and for allowing access to an aircraft comprising:
(a) a plurality of chambers located within said enclosure, said chambers capable of being pressurized above the exterior air pressure so as to prevent ingress of the unsafe

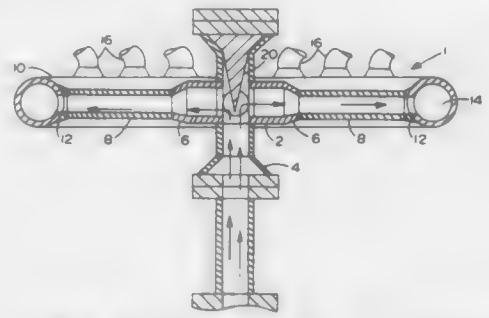


exterior air into said chambers, said chambers communicating with each other by interior doorways;
(b) one of said chambers being adapted to receive the vehicle personnel hatchway portion of an aircraft, said chamber allowing a pilot to access the cockpit and a crew to work on the cockpit without protective clothing;
(c) said one chamber having aircraft docking doors that allow the aircraft vehicle personnel hatchway portion to ingress and egress said one chamber, said docking doors being contoured to fit around the aircraft vehicle personnel hatchway portion, said docking doors opening and closing around the vehicle personnel hatchway portion as the vehicle personnel hatchway portion enters said one chamber;
(d) another of said chambers being a decontamination chamber, said decontamination chamber having a hatch which allows ingress and egress of humans into said enclosure, said decontamination chamber having a decontamination area for decontaminating protective clothing worn by humans who enter said enclosure and an area for storing said protective clothing, said decontamination area comprising shower means for spraying water and decontaminants and air wash means for providing high volume flow of decontaminated air;
(e) ventilation means for providing air to said chambers and said air wash means, said ventilation means comprising filtration means for filtering and decontaminating exterior air for use, said ventilation means providing sufficient decontaminated air to said chambers such that the air pressure inside of said enclosure is greater than the exterior air pressure, with the decontaminated air flowing from said clean chamber to said decontamination chamber;
(f) power generating means for providing electrical power for said enclosure.

5,010,908
APPARATUS FOR CLEANING THE INTERIOR OF ELONGATED TUBULAR OBJECTS
Andrew E. McLeod; Gaines C. Fields, both of Kingsport, Tenn., and Donald J. Sanders, Gate City, Va., assignors to Eastman Kodak Company, Rochester, N.Y.
Filed Jan. 29, 1990, Ser. No. 471,580
Int. Cl.[5] B08B *3/02, 9/04*
U.S. Cl. 134—168 C **2 Claims**

1. An apparatus for cleaning the interior of elongated tubular objects with pressurized fluid comprising:
(a) a cylinder having opposite closed ends,
(b) a double-acting piston mounted for reciprocating motion in said cylinder defining variable volume chambers at each end of said cylinder,
(c) a hollow rod fixed to the piston and extending coaxially with the cylinder through an end thereof defining a chamber of said cylinder through which the hollow rod extends, said rod having a nozzle at the end thereof outside said cylinder and openings therein for allowing passage of fluid from said cylinder to the inside of said hollow rod,
(d) means providing a fluid seal between said rod and said cylinder end,
(e) a first conduit for supplying pressurized fluid to the chamber of said cylinder through which the hollow rod extends,
(f) a second conduit for conducting pressurized liquid to and from the others chamber of said cylinder,
(g) a connecting conduit having a valve connecting said first and second conduits,
(h) said second conduit having a valve downstream from the junction with said connecting conduit, and
(i) means for supplying fluid under pressure to said first conduit upstream from its junction with said connecting conduit.

5,010,909
KNOCK-DOWN DEER BLIND
Thomas J. Cleveland, P.O. Box 153, Carlsbad, Tex. 76934
Filed Apr. 17, 1990, Ser. No. 510,121
Int. Cl.[5] E04H *15/00*
U.S. Cl. 135—901 **6 Claims**



1. A hunting blind including a skeletal frame incorporating upper and lower open frames of generally the same shape and the same size, said upper and lower frames each including a plurality of relatively angulated, generally horizontal and substantially straight marginal members releasably interconnected at adjacent ends to define corner portions between peripherally adjacent marginal members, corresponding corner portions of said frames being joined by elongated, generally straight and upstanding spacing members including upper and lower ends releasably connected to corresponding corner portions of said upper and lower frames, respectively, and extending therebetween, and a cover for said skeletal frame including an upstanding peripherally continuous sleeve of flexible material having open upper and lower ends, said sleeve being downwardly telescoped over said frame, the upper end of said sleeve including inwardly directed peripherally adjacent and extending upper end flaps projecting inwardly over the marginal members of said upper frame, adjacent ends of said flaps being secured relative each other, said sleeve also including peripherally extending lower end flaps on its lower end directed inwardly beneath said lower frame, said sleeve, intermediate the opposite ends of one of said lower end flaps including a slot cut through said one lower end flap and also an upstanding slit extending upwardly along said sleeve from the lower end thereof to a point spaced below the upper end thereof, said slot and slit including communicated adjacent ends, means removably closing said slit, and means releasably closing said slot.

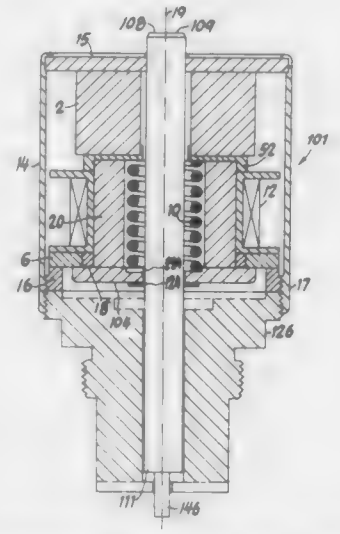
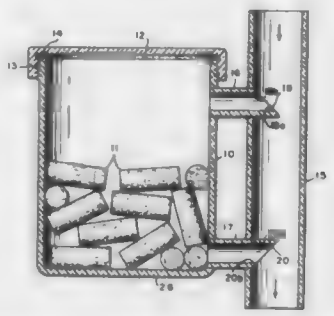
STEAM DISTRIBUTION MANIFOLD
Patrick J. Hickey, Paso Robles, Calif., assignor to Mobil Oil Corporation, Fairfax, Va.
Filed May 21, 1990, Ser. No. 526,475
Int. Cl.[5] F16K *51/00;* **E21B** *43/24*
U.S. Cl. 137—1 **17 Claims**



10. A method for distributing a two-phase mixed stream of vapor and liquid of substantially uniform quality to multiple injector sites, comprising the steps of:

(a) feeding a two-phase mixed stream of vapor and liquid into a generally toroidally configured steam distribution manifold, the steam distribution manifold including:
(i) a flow disperser having an inlet port for receiving the vapor-liquid mixture and at least two outlet ports;
(ii) at least two hollow runners, each runner having a first end in fluid communication with one of the outlet ports of the flow disperser and a second end;
(iii) a substantially toroidal manifold shell having at least



two fluid receiver ports in fluid communication with each of the second ends of the runners, the manifold shell defining a manifold chamber; and
(iv) a plurality of distribution ports spaced about the substantially toroidal manifold shell, each distribution port in fluid communication with the manifold chamber of the toroidal manifold shell; and
(b) distributing the two-phase mixed stream of vapor and liquid from the distribution ports of the steam distribution manifold to a plurality of injector sites.

5,010,911
ELECTROMAGNETIC VALVE OPERATOR
Dale A. Grant, Marinette, Wis., assignor to Wormald U.S., Inc., Marinette, Wis.
Filed Dec. 15, 1989, Ser. No. 451,734
Int. Cl.[5] F16K *31/08;* **H01F** *7/08*
U.S. Cl. 137—68.1 **17 Claims**

1. An electromagnetic operator apparatus comprising:
a. a hollow housing of magnetically permeable material, having a longitudinal axis and an inner wall, said housing having a first end and a second end;
b. a magnet having an intrinsic room temperature magnetic coercivity of at least about 5,000 Oersteds in close magnetic contact with said first end of said housing, and substantially axially aligned with said longitudinal axis, said magnet stationary within said housing;
c. a coil;
d. a core, of magnetically permeable material, substantially axially aligned with said longitudinal axis, at least a portion of said coil being disposed about said core and said core including a portion extending axially beyond said coil and away from said magnet;
e. a pole piece, of magnetically permeable material, disposed adjacent said coil and about said portion of said core extending beyond said coil and away from said magnet, said pole piece in close magnetic contact with said inner wall of said housing and forming a gap, between an inner surface of said pole piece and said portion of said core;
f. an armature, including an armature plate, of magnetically permeable material, disposed for reciprocal movement in said housing between first and second stable positions, along said longitudinal axis, said plate disposed to overlie, in close magnetic contact, said core and said pole piece in said first position, and to be spaced from said pole piece and said core in said second position;
g. means for urging said armature plate with a force of at least 35 pounds to said second position;
h. said magnet being sufficiently spaced from said inner wall and located in close magnetic contact with said core, for directing flux from said magnet through the entirety of said core prior to passing said flux into said inner wall when said armature is in said first position and when said armature is in said second position, said first position being a working position and said second position being a non-working position;
i. whereby said magnet exerts sufficient flux to overcome said means for urging and to hold said armature in said first position when said armature has been returned to said first position after having been in said second position in spite of the close magnetic contact between said magnet and core, whereby said operator has no non-working gap to divert flux to said inner wall prior to the passing through said core.

WATER TREATING DEVICE, OR SIMILAR ARTICLE
Richard D. Riding, 16631 Canyon View, Riverside, Calif. 92504
Filed Mar. 15, 1990, Ser. No. 493,629
Int. Cl.[5] B05B *7/14;* **B01D** *11/02*
U.S. Cl. 137—268 **3 Claims**

1. A device particularly adapted for treating water comprising:
a supply pipe adapted to be supported in a vertical position and convey a downward stream of water therethrough;
a container adapted to receive soluble solid agglomerates and having a closure lid;
an inlet pipe extending between said supply pipe and said container in the upper portion of said container; and
an outlet pipe extending between said container and said supply pipe from near the lower end of said container;
the inlet and outlet pipes serving to support said container in an upright position for use, said inlet pipe having a part extending into said supply pipe with a lower portion and

an upper portion, the lower portion extending farther into the supply pipe than the upper portion whereby to direct water from said supply pipe into said container and over said solids, and said outlet pipe being located near the lower end 15 of said container to enable most of the water in said container to drain out of it when water flow into said supply pipe is discontinued.

5,010,913
FLUID BLEED APPARATUS
Martin A. Clements, Cincinnati, Ohio, assignor to General Electric Co., Cincinnati, Ohio
Filed Jan. 10, 1990, Ser. No. 463,073
Int. Cl.[5] F16K *31/44*
U.S. Cl. 137—322 **12 Claims**

1. Apparatus for bleeding fluid from a fluid line, comprising:
a bleed valve adapted to mount to the wall of a fluid line over an opening therein, said bleed valve having a seat and a valve member, said valve member being movable with respect to said seat between an open position spaced from said seat to permit the passage of fluid from the fluid line through said bleed valve and a closed position against said seat to prevent the passage of fluid therethrough;
biasing means for urging said valve member to said closed position against said seat;
a valve actuator coupled to said bleed valve, said valve actuator including:
(i) a plunger slidably disposed within said actuator and engageable with said valve member;
(ii) force limiting means for exerting a limiting controlled force between said actuator and said plunger so that said valve member is moved from said closed position to said open position without damaging said biasing means associated with said valve member;
(iii) means for receiving fluid from said bleed valve with said valve member in said open position.

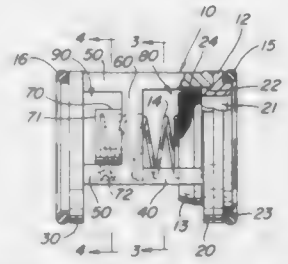
WIG
Heinz Merges, Herzogstrasse 29, D-5000 Koeln 1, Fed. Rep. of Germany
Filed Aug. 15, 1989, Ser. No. 393,730
Claims priority, application Fed. Rep. of Germany, May 30, 1989, 8906608[U]
Int. Cl.[5] A41G *5/00*
U.S. Cl. 132—54 **9 Claims**

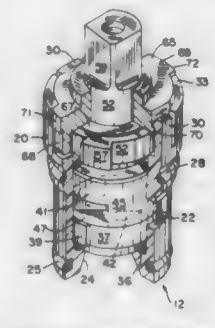
1. A wig adapted to be worn by a person to cover a bald spot comprising a support member (10) for hair shaped like the calotte of the head and including curved webs,
said support member (10) being formed as a basket of rods (12, 13) radiating from a crown area and defining in pairs an intermediate space (14) continuously and uninterruptedly extending from said crown area to a free end of each of said rods (12, 13), and outer surfaces of said rods (12, 13) are directly covered with and carry hair secured

thereto whereby said support member (10) and hair can be applied to and removed from a person's bald spot.



5,010,915
TWO STAGE AUTOMATIC SHUT OFF VALVE
Bruce Johnson, Muskegon, and Robert Whitney, Grand Haven, both of Mich., assignors to EBW, Inc., Muskegon, Mich.
Filed Jun. 6, 1990, Ser. No. 534,442
Int. Cl.[5] F16K *31/22, 33/00*
U.S. Cl. 137—423 **15 Claims**

1. A shut off valve assembly for shutting off the flow of fluid into and to prevent overfilling of said tank, said tank having a storage tank, an inlet pipe projecting upwardly from the top of said tank, said valve assembly comprising a valve housing mounted at the upper end of said inlet pipe, an elongate drop tube fixed at its upper end to said housing and projecting downwardly from said housing through said inlet pipe into said tank to an open lower end located substantially below the top of said tank, means defining a fluid inlet chamber at the upper end of said housing for receiving fluid under pressure from a fluid supply source and a fluid flow passage extending downwardly from said chamber through said housing and said drop tube for conducting fluid from said inlet chamber into said tank tube, a first hollow tubular float slidably received upon said drop tube adjacent the lower end thereof, a second hollow float slidably received upon said drop lube at a location spaced above said first float and below the top of said tank, a first valve flapper pivotally mounted in said inlet chamber adjacent the upper end of said flow passage for pivotal movement between an open position clear of said flow passage and a closed position wherein said first valve flapper overlies and blocks a major portion of said flow passage, a second valve flapper mounted in said inlet chamber adjacent the upper end of said

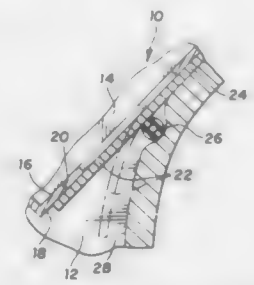


flow passage for movement between an open position clear of said flow passage and a closed position wherein said second valve flapper overlies and blocks a minor portion of said flow passage, said first and second valve flappers when in their respective closed positions cooperatively blocking all fluid communication between said inlet chamber and said flow passage, first and second flapper actuating means respectively coupled between said first and second floats and and said first and second valve flappers for normally locating said first and second flappers in their respective open positions when the level of fluid within said tank is below a preselected first level and for pivoting said first flapper toward its closed position when the level of fluid within said tank rises above said first level and for pivoting said second flapper toward its closed position when the level of fluid in said tank rises above a second level substantially above said first level for shutting off the flow of fluid into and to prevent overfilling of said tank.

5,010,916
CHECK VALVE
David E. Albrecht, 1383 Granary Rd., Blue Bell, Pa. 19422
Filed Mar. 23, 1990, Ser. No. 498,918
Int. Cl.[5] F16K *15/02, 27/00*
U.S. Cl. 137—454.2 **10 Claims**

1. In a slip-in check valve adapted to be slipped into place in a cylindrical bore of a fluid flow component for controlling axial flow through said bore, said check valve having an annular valve seat providing means, a movable valve member cooperable with said valve seat for controlling flow therepast, spring means for biasing said valve member toward said valve seat, and a cartridge valve body for supporting said valve seat providing means, said valve member, and said spring means in their operating positions, the improvement comprising:
said cartridge having a cage-like configuration and including an inlet retainer portion adapted to support said valve seat providing means at an inlet end of the check valve,
an outlet retainer portion defining an outlet port at an outlet end of the check valve and spaced axially away from said inlet retainer portion,
said valve seat providing means, said inlet retainer and said outlet retainer each having cylindrical wall portions of the same outer diameter which fits slidably within said cylindrical bore so that said cartridge and valve seat providing means can be slipped into said cylindrical bore to be concentric therewith.
a valve stop portion located between said inlet and outlet retainer portion for limiting the movement of said valve member away from said valve seat,
a plurality of inlet posts extending axially between said inlet retainer portion and said stop portion in circumferentially spaced apart relation,
a spring retainer centrally located on said stop portion for supporting said spring means in its operative position,
said valve member being located on the inlet side of said stop portion and within said inlet posts for movement toward and away from said valve seat,
a plurality of outlet posts extending axially between said stop portion and said outlet retainer in circumferentially spaced apart relation.
a plurality of inlet windows defined between said inlet posts to provide flow passages for the flow of fluid radially outwardly from said valve seat and the inlet side of said valve member to the outer portions of said cartridge, and
a plurality of outlet windows defined between said outlet posts to provide flow passages for the flow of fluid radially inwardly from the outer portions of said cartridge to said outlet port,
said stop portion having peripheral wall portions spaced radially inwardly from the outer portions of said cartridge to cooperate with said cylindrical bore to provide flow passages for the flow of fluid axially from said inlet windows to said outlet windows within the outer diameter of said cartridge.

5,010,917
FLUID CONTROL VALVE
Muhammad Iqbal, Sheboygan, Wis., assignor to Kohler Co., Kohler, Wis.
Filed Apr. 2, 1990, Ser. No. 502,929
Int. Cl.[5] F16K *27/06*
U.S. Cl. 137—454.6 **15 Claims**

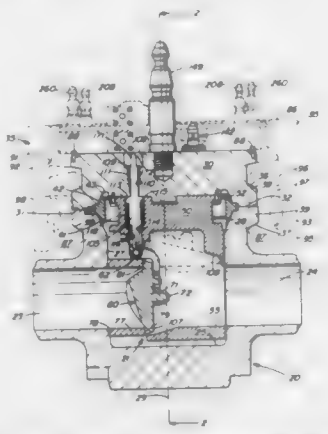


1. A cartridge fluid control valve for use in a valve housing, the housing having a fluid inlet and a fluid outlet, the cartridge comprising:
a body member having:
an inlet port open to the fluid inlet; and
a side wall with an aperture therethrough;
a stationary valve element positioned within the body member, the stationary valve element having at least one aperture therethrough;
a movable valve element rotatably mounted within the body member adjacent the stationary valve element, the rotational position of the movable valve element relative to the stationary valve element regulating fluid flow through the cartridge;
a valve stem linked to the movable valve element in the body to rotate therewith;
a stop element extending radially outward from and rotatable with the valve stem; and
a stop table which is mounted within the body member, the stop table having:
a leg which limits rotational movement of the stop element; and
a radially-projecting extension which extends radially past the cartridge and through the aperture in the side wall of the body member to engage the housing so as to limit rotation of the stop table relative to the housing.

5,010,918
REED VALVE HAVING VARIABLE LENGTH PETAL
Jay Tolsma, Grand Ledge, Mich., assignor to General Motors Corporation, Detroit, Mich.
Filed May 17, 1990, Ser. No. 524,603
Int. Cl.[5] F16K *15/16*
U.S. Cl. 137—512.15 **9 Claims**

1. A reed valve for a passage defined by an inner surface in an engine comprising:
a cage mounted across the passage, said cage having a cage port, an upstream side and a downstream side;

a flexible petal having a fixed portion connected to said cage enabling said petal to flex away from said cage in a cantilevered manner, said petal overlying said cage port to allow fluid flow therethrough from said upstream side to said downstream side by flexing away from said cage, and to obstruct fluid back-flow in the reverse direction by seating against said cage; and



an inflatable member adjoining a portion of said petal which flexes away from said cage, said petal being sandwiched between said inflatable member and cage so that inflation of said inflatable member obstructs said flexing of said petal away from said cage to reduce the effective length of said petal.

5,010,919

SUBSEA BARRIER VALVE

Charles C. Partridge, Houston, Tex., assignor to Tom Wheatley Valve Co., Houston, Tex.

Filed Feb. 23, 1990, Ser. No. 484,055
Int. Cl.[5] F16K *15/00*
U.S. Cl. 137—527.4 **12 Claims**

1. A subsea barrier valve comprising a valve body having a valve chamber therein and inlet and outlet ports communicating with said chamber to define a flow passage through said valve, said valve body having an access opening communicating with said valve chamber;

a cover member for said access opening;

a valve insert member mounted to said cover member and suspended thereon within said valve chamber;

a valve clapper element in said chamber;

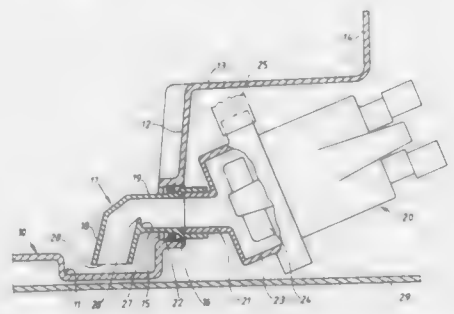
a valve clapper shaft mounted on said valve insert body in said valve body for limited axial rotation;

means connecting said valve clapper to said clapper shaft whereby said valve clapper is pivotally movable in said valve chamber between a first closed position wherein said valve clapper closes said flow passage and a second full open position wherein said valve clapper is an unobstructing valve open position with respect to said flow passage with said flow passage being partially open when said valve clapper is in a pivoted position intermediate said first and second positions;

clamp means for releasably clamping said cover member to said valve body in a position which covers and seals said access opening, said cover member having a bore opening extending therethrough;

latch means selectively operable for latching said valve clapper in the valve open position, said latch means comprising a locking shaft mounted to extend through said valve cover bore opening with an internal end portion of said locking shaft extending into said valve chamber and an external end portion being engageable outside said cover member to impart axial rotation to said locking shaft;

seal means mounted in said cover bore opening for establishing a fluid-tight seal between said locking shaft and said cover member; and



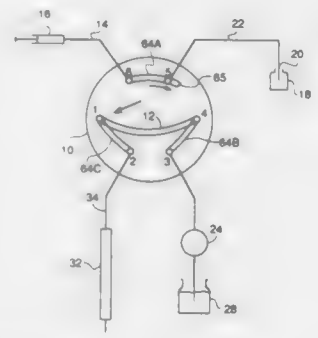
a drive gear mechanism operatively connected to said internal end portion of the lock shaft responsive to axial rotation of said locking shaft to pivotally move said valve clapper between the valve closed and valve open positions and to lock said valve clapper in the valve open position, said drive mechanism including a clutch gear means for allowing free pivotal movement of said clapper element from the valve closed position to a position proximate said full open position.

5,010,920

DEVICE FOR EMPTYING WATER FROM A DISHWASHER

Anders K. H. Tolf, and Keijo A. Stridh, both of Jönköping, Sweden, assignors to Aktiebolaget Electrolux, Stockholm, Sweden

Filed Mar. 29, 1990, Ser. No. 502,067
Claims priority, application Sweden, Apr. 5, 1989, 8901194
Int. Cl.[5] F16K *24/00*
U.S. Cl. 137—565 **16 Claims**



1. A device for a dishwasher comprising a tub with a bottom which is provided with a sump (**11**) for collecting liquid circulating in the tub, the liquid during emptying of the dishwasher being distributed from the sump to the inlet side of a sewage pump (**20**) from which the liquid is discharged to a sewer, the bottom surface of the sump (**11**) being disposed no higher than the level of the pump housing (**23**) of the sewage pump, the inlet (**21**) of the sewage pump communicating via a pipe (**17**) with the sump, wherein the pipe (**17**) has a restriction (**26**). the pipe (**17**) comprising an outer part (**18**), the axial direction of which is mainly vertical. and an inner part (**19**). the axial direction of which is mainly horizontal. the restriction (**26**) being a wall extending mainly vertically upwards from the inner part (**19**).

5,010,921

NONSYMMETRICAL VALVE

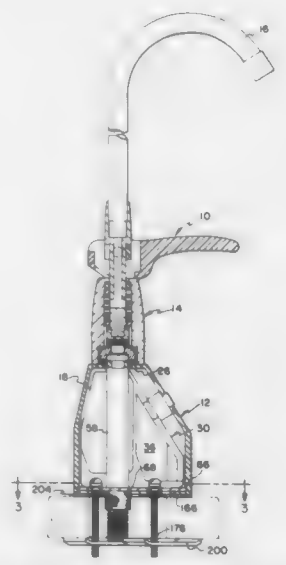
Andre Nohl, San Jose, Calif., assignor to Spectra-Physics, Inc., San Jose, Calif.

Filed Jul. 17, 1989, Ser. No. 380,827
Int. Cl.[5] F16K *11/74, 3/08*
U.S. Cl. 137—625.46 **4 Claims**

1. A valve comprising:

at least six ports; and

at least three non-connected channels, each channel selectively connecting only two ports at any one time;



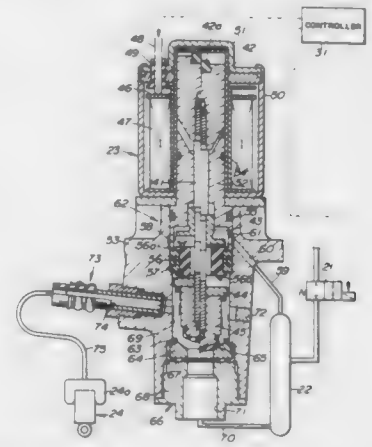
wherein a first channel is of a length greater than a length of the two other channels and wherein the ports are arranged symmetrically about a circle, and each of the channels has a shape which is a segment of the circle.

5,010,922

ACCESSORY FAUCET HAVING QUICK ATTACHING MEANS

Frank J. Agresta, Wallingford, Conn., assignor to WPM, Inc., Waterbury, Conn.

Continuation-in-part of Ser. No. 525,069, May 18, 1990, which is a division of Ser. No. 448,526, Dec. 11, 1989, Pat. No. 4,967,784. This application Sep. 10, 1990, Ser. No. 579,678
Int. Cl.[5] E03C *1/02*
U.S. Cl. 137—359 **13 Claims**



1. An accessory faucet for installation on a sink or counter top over an access opening, the faucet including a threaded inlet pipe for connection to a water inlet, a faucet outlet portion, the threaded pipe and the faucet outlet portion having a common axis, a valve housing and a base assembly under the housing, both positioned between the threaded pipe and the faucet outlet, valve means in the valve housing for controlling flow into the faucet outlet portion, means connecting the valve housing to the threaded pipe, a base plate having an aperture therein, the base plate aperture receiving the threaded pipe, immobilizing means holding the base plate on the pipe against movement with respect thereto, an installation plate substantially the same diameter as the base plate, and having an opening for the pipe, means securing the installation plate to the sink over the access opening, the installation plate having at least two spaced upstanding elements having downwardly inclined locking surfaces, the base plate being formed with holes aligned respectively with the elements, each hole narrowing in the same rotary direction whereby the faucet can be mounted on the sink by inserting the pipe into the opening in the installation plate, aligning the elements and the wider portion of the holes, juxtaposing the plates and turning the base plate so that the inclined locking surfaces wedge against the margins of the narrower part of the holes, and resilient gasket means disposed under the base assembly urging it upward to enhance the wedging action.

5,010,923

STRUCTURE OF AN ELECTROMAGNETIC VALVE FOR OPENING AND CLOSING A FLUID FLOW PASSAGE

Masanori Kouda; Minoru Suzuki; Tetsuya Okamura, and Toshihisa Tobisawa, all of Kanagawa, Japan, assignors to Atsugi Motor Parts Company, Limited, Kanagawa, Japan

Filed Dec. 1, 1987, Ser. No. 127,193
Int. Cl.[5] F16K *11/04*
U.S. Cl. 137—625.34 **11 Claims**

1. An electromagnetic valve comprising:

a hollow housing;

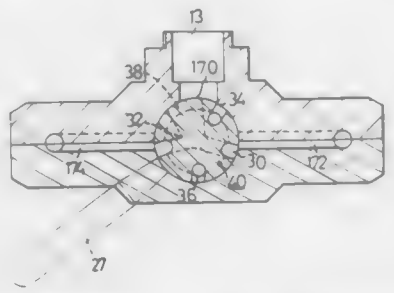
a valve seating member disposed in said hollow housing so as to define a first main chamber and a second chamber, said valve seating member having a central bore;

a plunger reciprocally mounted within said hollow housing and received in said central bore and in said first main chamber and said second chamber;

a first valve member mounted on said plunger and movable therewith within said second chamber for opening and closing a fluid passageway between said first and second chambers and a second valve member mounted on said plunger and movable therewith within said first chamber;

spring means for biasing said plunger to a first position for opening a fluid passageway between a valve seat and said second valve member for communicating fluid from a pressurized fluid supply means via said first chamber to a first passage means and for moving said first valve member so as to open said fluid passageway between said first chamber and said second chamber;

electromagnetic means for biasing said plunger to a second position for closing said second valve member for preventing communication of fluid from said pressurized fluid supply means to said first passage means and for closing said first valve; and



second passage means for continually communicating fluid from said pressurized fluid supply means to said second chamber so that fluid pressures between the first chamber and the second chamber are balanced regardless of the position of the second valve.

SINGLE HANDLE MIXING FAUCET

Chin S. Jenn, No. 23-6, Ping Ho St., Ta Lin Chen, Chia I Hsien, Taiwan

Filed Jul. 19, 1990, Ser. No. 554,380
Int. Cl.[5] F16K *11/083*
U.S. Cl. 137—625.47 **4 Claims**

1. A faucet comprising:

a substantially T-shaped body with a truncated cone-shaped compartment formed therein, a hot water passage and a cold water passage being formed in said T-shaped body and respectively communicating with a hot water supply and a cold water supply, a shower outlet which communicates with a shower head and a tub outlet which communicates with a tub being formed on an inner periphery of said cone-shaped compartment;

a truncated cone being pivotally received in said cone-shaped compartment, a control arm being attached to said truncated cone for pivotally controlling the water temperature as well as the output destination of the faucet, said truncated cone having a first hot water path, a first cold water path and a shower head path formed therein which communicate with one another, said truncated cone further having a second hot water path and a second cold water path formed therein which independently communicate with said tub outlet, such that

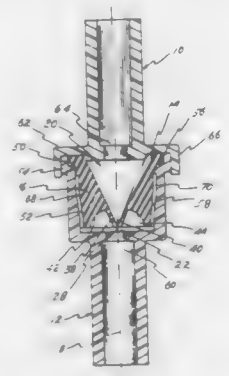
all of said first and second hot water paths, said first and second cold water paths and said shower head path are blocked when said control arm is in a neutral position;

said first hot water path, said first cold water path and said shower head path are respectively communicable with said hot water passage, said cold water passage and said shower outlet when said control arm is in a leftward Position while said second hot water path and said second cold water path are blocked; and

said first hot water path and said cold water path are respectively communicable with said hot water passage and said cold water passage when said control arm is in a rightward position while said first hot water path, said first cold water path and said shower head path are blocked.

5,010,925

NORMALLY CLOSED DUCKBILL VALVE ASSEMBLY



Gordon E. Atkinson, Cedarville, and James C. Bailey, Yellow Springs, both of Ohio, assignors to Vernay Laboratories, Inc., Yellow Springs, Ohio

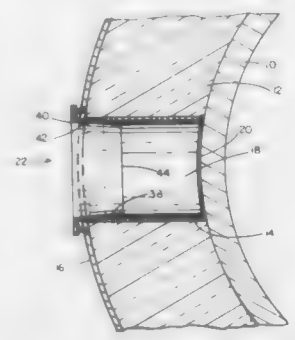
Filed Apr. 9, 1990, Ser. No. 506,142
Int. Cl.[5] F16K *15/14*
U.S. Cl. 137—847 **13 Claims**

1. A one-way duckbill check valve for use in a flow path for permitting relatively free flow in said flow path in a first direction from a first to a second end of said valve and for preventing flow in said path in a second opposite direction, said valve comprising:

an elongated valve body having a central longitudinal axis and an outer wall wherein said outer wall is substantially parallel to said axis and defines an axial and circumferential extent of said second end of said valve;

a pair of valve lips positioned within the axial and circumferential extent of said second end defined by said outer wall portion of said valve body and oriented in diverging relationship to each other toward said first end of said valve;

said valve body and lips being formed of an elastomeric material and wherein said lips define an elongated normally closed outlet opening of said valve at said second end; and



means forming a pivot connection between said outer wall and said lips including a pair of connecting walls located on either side of said outlet opening and extending radially inwardly from said outer wall to intersect said lips along a smoothly curved edge.

5,010,926

INSULATION ACCESS APERTURE LINER

Herman Kurth, 600 N. 18th Pl.; David Kemble, 2410 Francis Rd., and Romeo N. Ubungen, 2307 N. 18th Pl., all of Mount Vernon, Wash. 98273

Filed Mar. 17, 1989, Ser. No. 325,458
Int. Cl.[5] F16L *55/10, 9/14*
U.S. Cl. 138—149 **12 Claims**

1. A through insulation access aperture liner to provide visual access to an insulated pipe wall comprising:

a body having a substantially cylindrical portion depending from a flange, said flange having means to attach said body to the outer surface of said insulation;

a tubular extension extending from said substantially cylindrical body section to said wall, said extension including a saddle cut end mating with said wall to prevent entry of insulation into said body; and

cover means pivotally mounted on said flange for closing the outer opening of said liner.

5,010,927

HOLD-DOWN DEVICE FOR JACQUARD-CONTROLLED LOOMS

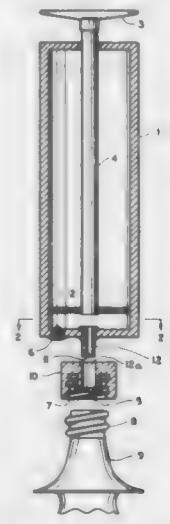
Walter Keim, Senden, Fed. Rep. of Germany, assignor to Grosse Webereimaschinen GmbH, Burlafingen, Fed. Rep. of Germany

Filed Jan. 10, 1989, Ser. No. 295,593
Int. Cl.[5] D03C *3/24*
U.S. Cl. 139—89 **14 Claims**

1. A hold-down device for Jacquard-controlled loom machines, said machine having needles for weaving, in which warp threads are movable in a pattern between two shed positions under control of the Jacquard machine by means of a cord assembly and a pull-down device connected to a frame of the machine, said pull-down device including a spring force exerting means and being further connected at one end to said cord assembly to exert said spring force thereon, comprising:

a cord releasably attached to another end of the cord assembly and connected to a respective needle of the Jacquard machine, said cord being pulled downwards against a lifting movement of the needles, and a resilient element arranged releasably between the hook cord and the cord assembly,

wherein the spring force exerting means is constructed to apply said spring force according to predetermined parameters of a weaving process for which the device is used, and said resilient element has a spring force that corresponds to the force required by the Jacquard machine to pull down the needles.



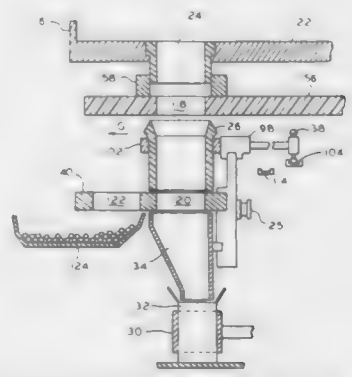
5,010,928

REPRESSURIZER FOR CARBONATED DRINK CONTAINERS

Mitchell J. Ballas, 925 Nixon Ave., Indiana, Pa. 15701

Filed Jul. 13, 1990, Ser. No. 552,309
Int. Cl.[5] B65B *31/00, 1/04;* **B65D** *39/00*
U.S. Cl. 141—64 **1 Claim**

1. For use in combination with a bottle having an externally threaded opening, a cap which is internally threaded to engage said externally threaded opening, said cap having a central tubular opening at the top thereof and a one-way valve at the bottom of said tubular opening, a hand operated air pump including a cylinder, a piston therein, a handle operatively connected to said piston and extending externally of said cylinder and a rubber air outlet tube connected to said cylinder and extending outwardly of said pump of a size to detachably fit snugly inside said central tubular opening of said cap in an air-tight manner, whereby said pump is useful for caps of



different internal thread sizes for use on different bottle openings of corresponding thread sizes.

5,010,929

FAST ACTING DOUBLE LOADING SYSTEM FOR AUTOMATIC PACKAGING MACHINE

Steven Tisma, Chicago, Ill., assignor to Tisma Machine Corporation

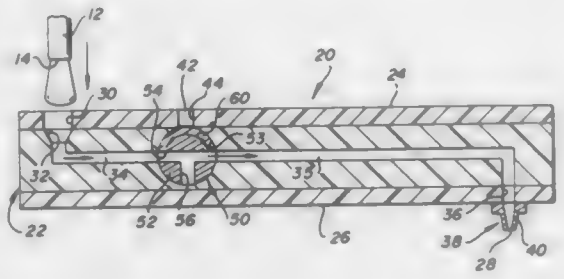
Continuation-in-part of Ser. No. 164,010, Mar. 4, 1988, Pat. No. 4,856,566. This application May 9, 1989, Ser. No. 349,224
The portion of the term of this patent subsequent to Aug. 15, 2006, has been disclaimed.
Int. Cl.[5] B65B *3/04*
U.S. Cl. 141—1 **28 Claims**

8. A method of transferring product through an automatic packaging machine for controllably loading at least two different products, said method comprising the steps of:

(a) simultaneously transporting a plurality of bottomless measuring cups, bottomless transfer cups, and boxes around closed paths which converge with each other in at least two different predetermined points along said paths;

(b) supporting products within said measuring cups and said transfer cups by individually associated underlying surfaces which are interrupted at predetermined locations to selectively allow product to fall in a two step operation out of said cups in order to transfer product from said measuring cups to said transfer cups and from said transfer cups to said boxes in at least said two predetermined points;

(c) detecting the presence or absence of any of said boxes as they move around said path; and



(d) continuously moving said cups over said surfaces in coordination with movement of said boxes in order to produce a three step fill sequence at each of said predetermined points, said fill sequence comprising (i) transferring product from said measuring cups through one of said surface interruptions into said transfer cups, (ii) transferring product from said transfer cups through another of said surface interruptions into said boxes which are individually associated with said transfer cups; and (iii) selectively deflecting the path of one of said transfer cups responsive to the detection of an absence of a box in step (c), said selective deflection being effective at one of said two predetermined points where the absent box would otherwise be filled, so that product is not transferred from said transfer cup through said other interruption while it is in said deflected path.

5,010,930

PIPETTE AND LIQUID TRANSFER APPARATUS FOR DISPENSING LIQUID FOR ANALYSIS

Richard L. Columbus, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Dec. 22, 1989, Ser. No. 455,548
Int. Cl.[5] B65B *1/04; B67D 5/00*
U.S. Cl. 141—1 **6 Claims**

1. Apparatus for dispensing liquid, comprising a pipette, and a liquid transfer apparatus for manually receiving liquid from said pipette at an inlet aperture and for automatically dispensing that liquid at a dispensing aperture onto a test element, said transfer apparatus comprising

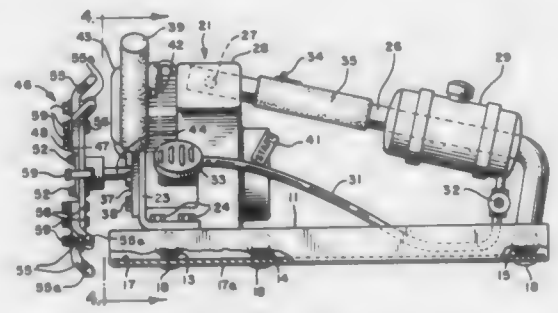
means defining said inlet aperture for liquid to be deposited into the apparatus,

means defining said dispensing aperture for dispensing some of the liquid in droplet form,

means defining a first liquid flow path extending from said inlet aperture towards said dispensing aperture,

means defining an air vent at the exterior of the apparatus and a second flow path extending from said vent towards said first flow path,

and valve means interposed between said first and second flow paths for allowing continuous flow alternately from said inlet aperture to said dispensing aperture, or from said air vent to said dispensing aperture with said inlet aperture blocked,



said apparatus further including a first support adapted to support a test element with an upper surface that is to receive the liquid, a second support adapted to support said transfer apparatus, and means for accurately positioning said second support from said first support at a predetermined distance such that an initial droplet from said dispensing aperture contacts said upper surface while still in contact with said dispensing aperture to achieve proper dispensing of the liquid onto the test element.

5,010,931

PORTABLE STUMP REMOVER

Steven M. Hooser, 1 S. 726 Ott Ave., Glen Ellyn, Ill. 60137

Continuation of Ser. No. 466,462, Jan. 16, 1990, abandoned. This application Aug. 28, 1990, Ser. No. 573,107
Int. Cl.[5] B02C *1/04*
U.S. Cl. 144—2 N **43 Claims**

1. A portable, self-contained stump remover which is manually movable by an operator across a tree stump to effect grinding thereof, comprising;

a base element having a lower base surface for engaging and resting on the top of the tree stump when the stump remover is placed on the stump;

at least one rotatable cutting device having a plurality of cutting teeth;

and driving means for rotating said cutting device to rotate said cutting teeth through a circular path at least a portion of which path extends below said lower base surface, a cutting depth being defined by the extent to which the rotating cutting teeth project below the base surface,

the lower base surface engaging the tree stump and supporting, guiding and stabilizing the stump remover as the stump remover is manually moved by the operator across the stump, the stump thereby being cut away and ground down to the cutting depth as the stump remover traverses the stump.

5,010,932

ADJUSTABLE SAILBOARD BOOM HANDLE APPARATUS

Joseph A. Brinz, 1040 Focis St., Apt. 14, Metairie, La. 70005

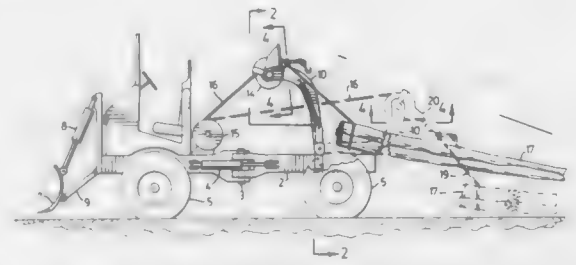
Filed Jul. 10, 1989, Ser. No. 377,701
Int. Cl.[5] B63B *35/79*
U.S. Cl. 114—39.2 **10 Claims**

1. An adjustable sailboard boom handle apparatus for use with a board sailor having a flat elongated buoyant board having a mast that carries a sail, the mast movably attached to the board center portion and a transverse hand held boom and

attached to the mast and generally encircling the sail during use, comprising:

(a) a pair of spaced apart attachments affixable at spaced apart respective fore and aft positions along the boom;

(b) a handle assembly including fore and aft handle portions attached respectively to the boom at the pair of attachments and providing an enlarged gripping surface that is spaced from the boom during use;



(c) the pair of handle portions being pivotally attached respectively to the pair of attachments, and to each other at a position spaced away from the boom, so that the handle portions can be angularly oriented to form an angle with each other, each handle portion forming an acute angle with the boom.

5,010,933

LOG SKIDDING VEHICLE

James R. Doyle, G12-378 Lake Street, Sault Ste. Marie, Ontario, Canada P6B 3K9

Filed Jun. 8, 1990, Ser. No. 535,068
Int. Cl.[5] A01G *23/08;* **B60P** *1/04*
U.S. Cl. 144—336 **13 Claims**

1. A vehicle having a chassis for skidding timber comprising:

a frame having inner and outer ends, said frame pivotally mounted at its inner end to a rearward portion of said chassis for rotation about a horizontal axis transverse to the vehicle's longitudinal axis between a forward and a rearward position;

a cable sheave pivotally mounted to said outer end of said frame for rotation about a transverse sheave axis;

a cable winch connected to said chassis forward of the inner end of said frame;

a cable, the forward end of which engages said cable winch, said cable being reeved over said cable sheave;

attachment means, connected to the rearward end of said cable, for securing at least one log to said cable; and

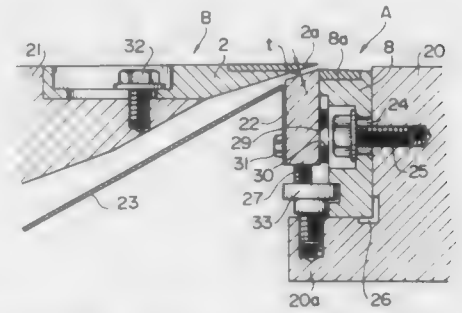
abutment means, connected to said outer end of said frame outward of said cable sheave, for engaging said attachment means as said cable and log are drawn forwardly by said winch to rotate said frame from said rearward position, to said forward position, whereby the load exerted by said cable upon said vehicle is applied forward of the rear wheels of said vehicle when said frame is in a forward position.

5,010,934

SLICER APPARATUS FOR WOODWORK

Toshihei Mochizuki, and Shigeru Ikeda, both of Shizuoka, Japan, assignors to Marunaka Tekkosho, Inc., Shizuoka, Japan

Filed Apr. 17, 1990, Ser. No. 510,222
Claims priority, application Japan, Mar. 6, 1990, 2-54285
Int. Cl.[5] B27L *5/06*
U.S. Cl. 144—175 **10 Claims**



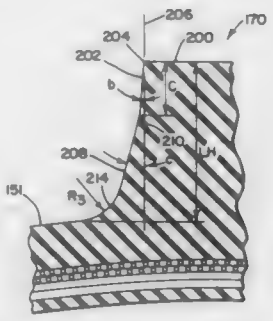
1. A woodwork slicer apparatus for slicing a material, comprising,

a table for supporting the material to be sliced and having an opening therein,

means for moving the material on the table, said moving means being installed on the table for forcibly transferring the material on the table for slicing,

a knife attached to the table to be located at one side of the opening and having an edge and a relief face,

a knife piece attached to the table to be located at a side of the opening opposite to the knife, said knife piece being arranged parallel to the knife, and



a support member attached to the knife piece and located at a side opposite to the relief face of the knife to form a space between the support member and the relief face of the knife, said space being at least substantially the same as a thickness of a piece of the material sliced by the knife so that the sliced piece does not warp after being sliced by the knife to prevent warp and twist of the sliced piece of the material.

5,010,935

AGRICULTURAL TIRE AND TREAD LUG THEREFOR

Mark L. Bonko, Hartville, and Loran C. Lopp, Jr., Wadsworth, both of Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio

Filed Oct. 11, 1989, Ser. No. 419,878
Int. Cl.[5] B60C *11/03*
U.S. Cl. 152—209 B **5 Claims**

1. A pneumatic tire for agricultural use having a tread including an inner tread surface and a plurality of spaced tread lugs, the inner tread surface being spaced between tread lugs, each of the lugs having at least one sidewall, and in cross-section comprising:

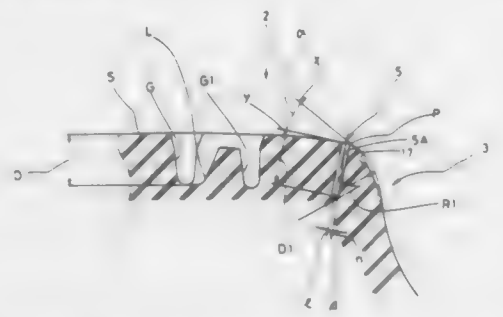
a first substantially straight portion extending radially inwardly from a cutting edge of a radially outermost surface of said lug at a first angular inclination in the range of 0° to 5° with respect to the radial direction;

a second substantially straight portion extending radially inwardly at a second angular inclination in the range of 12° to 25° with respect to the radial direction;

a first concave curved portion extending from said first straight portion to the second straight portion;

a second concave curved portion extending radially inwardly from the second straight portion to the inner tread surface; and

wherein each of such lugs is spaced apart from another of such lugs by a distance of at least 12% to about 15% of the



tread width and wherein the net-to-gross ratio of the tire is in the range of 25% to 40%.

5,010,936

RADIAL TIRE INCLUDING A NARROW GROOVE IN THE TREAD SHOULDER

Kazuki Numata, Nishinomiya, and Kiyoshi Ochiai, Kobe, both of Japan, assignors to Sumitomo Rubber Industries, Ltd., Hyogo, Japan

Filed Jul. 26, 1989, Ser. No. 385,148
Claims priority, application Japan, Aug. 11, 1988, 63-202558
Int. Cl.[5] B60C *11/03*
U.S. Cl. 152—209 R **2 Claims**

1. A pneumatic radial tire comprising

a tread portion and a pair of buttress portions located one on each side of the tread portion adjacently to the tread portion,

said tread portion provided with wide main grooves and narrow, straight axially outer grooves extending circumferentially of the tire,

each of said narrow, straight axially outer grooves disposed in a boundary region between said tread portion and each buttress portion so that the radially outer edge of the axially outer groove sidewall thereof corresponds with an intersection between the surfaces of the tread portion and the buttress portion,

said narrow, straight axially outer grooves being inclined axially inward at the bottom thereof at an angle of 0 to 5 degrees in a normal direction to the surface of the tread portion and at an axially inward position adjacent to said intersection,

the contour of each buttress portion comprising a circular arc portion adjacent to said intersection having a radius R1 of 15 to 35 mm, and

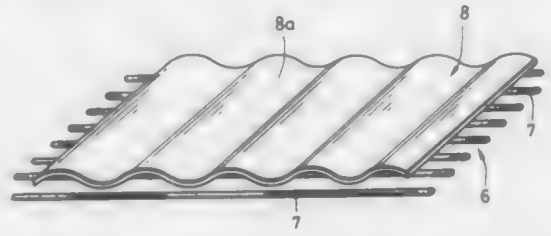
a tangent X to the buttress portion at said intersection being inclined at an angle of 25 to 35 degrees with respect to a tangent Y to the tread portion at said intersection.

5,010,937

BELTED TIRE FOR VEHICLES

Jonny Janus, Kreuzstrasse 53, D-4000 Düsseldorf 1, Fed. Rep. of Germany

Continuation-in-part of Ser. No. 57,500, Jun. 3, 1987, Pat. No. 4,809,758. This application Mar. 6, 1989, Ser. No. 319,524
The portion of the term of this patent subsequent to Mar. 7, 2006, has been disclaimed.
Int. Cl.[5] B60C *9/18*
U.S. Cl. 152—531 **6 Claims**



1. A dual belted tire for vehicles, comprising

(a) a toroidal body having an equatorial tire plane of elastomeric material with a contact surface at the outer periphery,

(b) a circumferentially extending annular belt construction which is embedded as an insert in the region of the contact surface in the material of the body and which comprises a first circumferential belt defining a zero degree position to the equatorial tire plane for circumferential stiffness and a second transverse belt for lateral stiffness, said belts being separate,

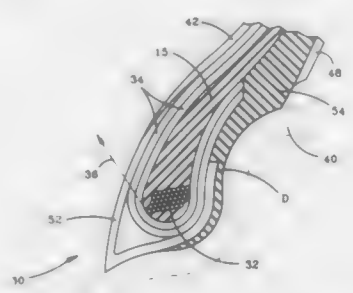
(c) said circumferential belt having a number of annular strength supports which are arranged substantially in the zero degrees position and in juxtaposed relationship at lateral spacings in at least one plane and which extend in the circumferential direction of the body,

(d) said transverse belt having at least one transverse bracing strength support which extends substantially over the width of the contact surface and which is embedded in the

elastomeric material in parallel relationship to and at a spacing from the circumferentially extending strength supports of the circumferential belt,

(e) said transverse belt including at least one strip,

(f) said at least one strip is steel foil and has corrugated portions, the flutes thereof being aligned substantially transversely to said zero degree annular strength supports, and



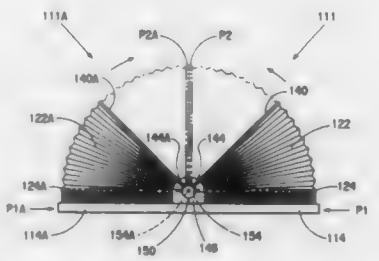
(g) the transverse belt being stretchable in the circumferential direction of the tire at least as much as the strength supports of the circumferential belt.

5,010,938

TIRE INCORPORATING A BEAD RING COMPRISING ROUND WIRE DISPOSED IN THE SHAPE OF A PARALLELOGRAM

Mahmoud C. Assaad, and Danny E. Harrison, both of Uniontown, Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio

Filed Mar. 30, 1990, Ser. No. 501,446
Int. Cl.[5] B60C *15/04*
U.S. Cl. 152—539 **3 Claims**



1. A pneumatic tire comprising a bead area, said bead area comprising an apex, a bead ring, and a reinforced carcass ply wrapped around said bead ring, said bead ring comprising metal wire having a circular cross section, said wire forming multiple adjoining annular turns wherein said turns of wire are disposed in the cross section shape of a parallelogram having an acute angle of 75°–85°, each turn of wire in said bead ring is coated with a layer of about 0.005 to 0.015 inch green rubber whereby said green rubber provides a rubber matrix in which bead wires are contained when the green rubber is cured, and substantially maintains the relative position of wires in said bead, and wherein rubber in said matrix is harder than rubber used in said apex.

5,010,939

BLIND FOR ARCHED WINDOWS

William J. King, 108 Cheyenne Ct., Newark, Del. 19702

Filed Feb. 16, 1990, Ser. No. 480,916
Int. Cl.[5] E06B *3/94*
U.S. Cl. 160—84.1 **6 Claims**

1. An arcuate blind for arched windows having a first assembly of elements comprising:

a base having an upper side and a lower side;

an arcuately foldable body being adaptable to assume an open position and a closed position, the arcuately foldable body having

a stationary radial end-portion and a movable radial end-portion, the stationary radial end-portion rigidly supported on the upper side of the base,

an inner arc and an outer arc, the two arcs having a common center, and being fully developed when the foldable body is in the open position;

a rigid leading rib connected along the movable radial end-portion, the rigid leading rib having an inner end and an outer end, the inner end being movable in the vicinity of the inner arc and the outer end being movable in the vicinity of the outer arc;

central transmission means having an inlet and an outlet, for transmitting substantially radial motion to the leading rib with the outlet being connected to the inner end of the leading rib, thus causing the foldable body to fold and unfold in a radial manner, the transmission means supported on the base in the vicinity of the common center of the inner and outer arcs, the central transmission means comprising a worm gear, the worm gear being positioned in a manner to act as a brake against any spontaneous movement of the blind; and

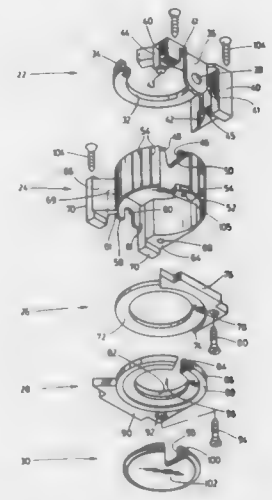
motion means connected to the inlet of the central transmission means for providing external motion to said central transmission means.

5,010,940

SWINGABLE JUNCTION FOR A WINDOW COVERING

Norbert Marocco, 46 Pennygrass Court, Woodbridge, Ontario, Canada

Continuation-in-part of Ser. No. 299,456, Jan. 23, 1989, abandoned, which is a continuation-in-part of Ser. No. 190,061, May 4, 1988, abandoned. This application Oct. 6, 1989, Ser. No. 418,175
Int. Cl.[5] E06B *9/36*
U.S. Cl. 160—168.1 **35 Claims**



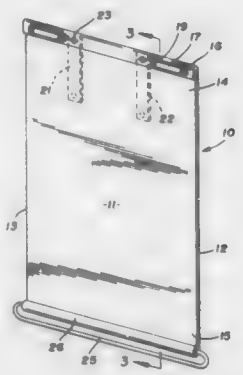
1. A corner junction assembly for use in association with window coverings supported on two adjacent rails, said rails each having at least one movable window covering control means, said corner junction assembly comprising:

upper and lower annular bearing ring means defining respective bearing openings;

respective upper and lower annular bearing hub means rotationally engaged within respective bearing openings in said bearing ring means to permit relative rotation thereof about a common axis;

respective locking rings formed integrally with respective said bearing hub means and making a rotatable captive pressure fit within respective said bearing ring means;

rail engagement means connected to respective ones of said bearing ring means and said bearing hub means for engagement with adjacent ends of respective ones of said rails, and,



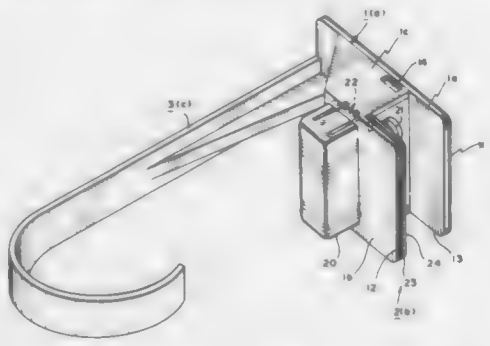
means attached to said corner junction assembly for facilitating operation of said control means around said corner.

5,010,941

GOLF CART DROP CURTAIN

Victor Ross, Sr., and Victor Ross, Jr., both of P.O. Box 34, New Castle, Pa. 16103

Filed May 10, 1990, Ser. No. 521,441
Int. Cl.[5] A47H *1/00*
U.S. Cl. 160—330 **2 Claims**



1. A golf cart drop curtain for use on golf carts to protect golf bags and golf clubs within said bags, said golf cart having a roof in spaced relation to said cart, said drop curtain comprising; a flexible sheet of non-porous material, said sheet is of a generally rectangular configuration having a top portion and a bottom portion, said top portion defining an area of increased thickness, a tubular member formed on said bottom portion of said flexible sheet by rolling said bottom portion upon itself, means for securing said top portion to said golf cart roof, an elastic cord secured by its free ends into said tubular member and extending therefrom in space parallel relation to said tubular member of said sheet.

5,010,942

HOOKING FRAME OF A WINDOW/BATHROOM CURTAIN

Wu-Hu Hung, 8F., No. 126, Roosevelt Road, Sec 3, Taipei, Taiwan

Filed Jan. 30, 1990, Ser. No. 472,657
Int. Cl.[5] A47H *1/00*
U.S. Cl. 160—349.1 **5 Claims**

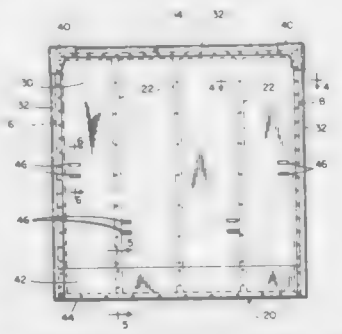
1. A retaining bracket for a curtain comprising:

(a) a base body adapted to be attached to a wall or the like, the base body defining first and second spaced apart clamping surfaces.

(b) a pushing member having a clamping portion operatively associated with the base body so as to be reciprocally movable with respect to the base body between a first position wherein a clamping force is exerted between the clamping portion and the first clamping surface, and a second position wherein a clamping force is exerted between the clamping portion and the second clamping surface;

(c) biasing means operatively interposed between the pushing member and the base body to urge the pushing member toward its first position;

(d) releasable latching means operatively interposed between the pushing member and the base body to releasably latch the pushing member in its second position; and,



(e) a hook member extending from the base body.

5,010,943

LIGHTWEIGHT INSULATING PARTITION

Gregory J. Boyer, 30122-50th La. S., Auburn, Wash. 98001

Filed Jan. 10, 1989, Ser. No. 295,654
Int. Cl.[5] A47G *5/00*
U.S. Cl. 160—351 **4 Claims**

1. A self-supporting partition for an enclosed volume, such as a refrigerated vehicle, the partition having front and back planar surfaces and a thickness dimension therebetween, comprising:

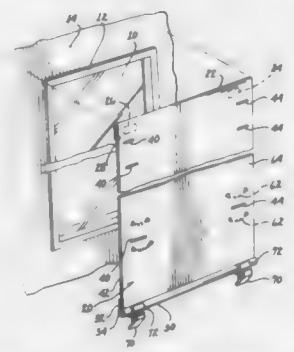
a frame which includes a top member, opposing side members and a base member;

at least one panel of insulation supported within said frame, wherein the frame and insulation are constructed and arranged such that the partition is capable of flexing under pressure;

a flexible member for sealing the frame to the interior boundaries of the refrigerated vehicle and for maintaining the partition in place within the vehicle, said flexible member extending along and outwardly from the frame's top and side members, wherein the flexible member has a width which is approximately as great as the thickness of said partition and a height which is approximately at least as great as said width, and wherein the flexible member is resilient and compressible, such that when the flexible member is compressed to permit the partition to fit upright within the vehicle, the partition is maintained in place solely by said flexible member, acting against the interior boundaries of the vehicle;

a flexible protective skin member covering at least a portion of opposed planar surfaces of the insulation;

a bumper plate of a rigid material which is substantially thicker than the protective skin member and resistant to puncture, extending across the partition and upwardly for a selected distance from the lower edge thereof, covering a portion of each skin member; and



a rigid skin plate secured to the lower edge of the base member of the frame and in contact with the floor boundary of the vehicle when the partition is in place in the vehicle, said skid plate being of such a material that it does not adhere to the floor boundary of the refrigerated vehicle.

5,010,944

VERTICALLY FOLDABLE WINDOW COVERING AND RETAINING CLIP

Althea J. Bussert, P.O. Box 27808, Tempe, Ariz. 85282

Continuation-in-part of Ser. No. 231,870, Aug. 12, 1988, which is a continuation-in-part of Ser. No. 37,686, Apr. 13, 1987, Pat. No. 4,836,265. This application Jan. 26, 1990, Ser. No. 470,874
Int. Cl.[5] A47H *23/00*
U.S. Cl. 160—354 **28 Claims**

1. Apparatus for temporarily covering a window to a selected degree of exposure, said apparatus comprising in combination:

I. a window covering comprising:

(a) material foldable upon itself to expose the window commensurate with the number and height of folds;

(b) at least a column of slots extending upwardly from a lower edge of said covering;

(c) at least one loop in vertical alignment with said column of slots; and

(d) means for vertically dependingly supporting said covering across a window;

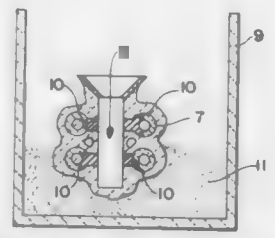
II. a clip comprising:

(a) retention means for retaining the lower edge of said covering;

(b) a hooked flange for engaging one of said slots, said hooked flange having a width commensurate with the width of said slots for penetrably engaging one of said slots upon folding of a lower part of said covering adjacent an upper part of said covering;

(c) a flange for engaging one of said loops, said flange having a width commensurate with the width of said loops for penetrably engaging one of said loops upon folding of a lower part of said folded covering adjacent an upper part of said folded covering; and

(d) means for supporting said hooked flange and said flange upon said retention means;



whereby, said clip can retain said covering folded over once or twice to expose a part of the covered window.

5,010,945

INVESTMENT CASTING TECHNIQUE FOR THE FORMATION OF METAL MATRIX COMPOSITE BODIES AND PRODUCTS PRODUCED THEREBY

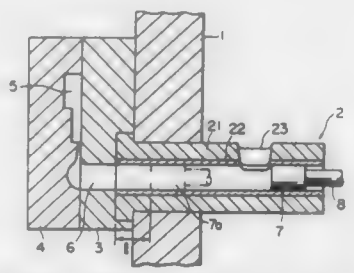
John T. Burke, Hockessin, Del., assignor to Lanxide Technology Company, LP, Newark, Del.

Filed Nov. 10, 1988, Ser. No. 269,302
Int. Cl.[5] B22D *11/14*
U.S. Cl. 164—97 **44 Claims**

1. A method for forming a metal matrix composite body comprising:

forming an investment shell having a cavity therein; providing a barrier material in at least a portion of said cavity; providing a substantially non-reactive filler in the cavity; contacting molten matrix metal with said filler material;

spontaneously infiltrating molten matrix metal into at least a portion of the filler up to said barrier material; and



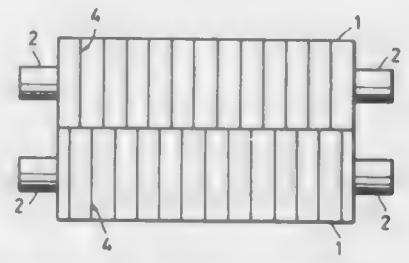
cooling said matrix metal within said filler, thereby forming a shaped metal matrix composite body corresponding substantially in shape to at least a portion of said cavity.

5,010,946

DIE CASTING CYLINDER

Shingo Nogami; Toshinori Yashiro; Toshio Okitsu; Kiyoshi Furushima, and Itsuo Korenaga, all of Kitakyusyu, Japan, assignors to Hitachi Metals, Ltd., Tokyo, Japan

PCT No. PCT/JP88/01018, § 371 Date Jun. 6, 1989, § 102(e) Date Jun. 6, 1989, PCT Pub. No. WO89/03263, PCT Pub. Date Apr. 20, 1989
PCT Filed Oct. 6, 1988, Ser. No. 368,393
Claims priority, application Japan, Oct. 7, 1987, 62-253198; Jun. 14, 1988, 63-78384
Int. Cl.[5] B22D *17/10, 17/20*
U.S. Cl. 164—312 **5 Claims**



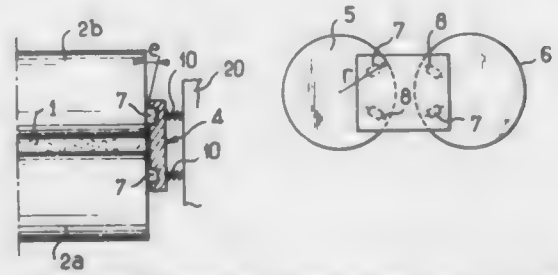
1. A die casting cylinder comprising an outer cylindrical member made of a metal and a ceramic inner cylindrical member, in a boundary between which a plurality of voids are provided, wherein said voids are grooves provided in an inner surface of said outer cylindrical member or in an outer surface of said inner cylindrical member, the width "a" of each groove and the distance "b" between the adjacent grooves satisfying an a/b ratio of 1:1–6:1.

5,010,947

TWIN COOLING ROLL APPARATUS FOR PRODUCING RAPIDLY SOLIDIFIED METAL STRIP

Masao Yukumoto; Michiharu Ozawa, and Hiroshi Yamane, all of Chiba, Japan, assignors to Kawasaki Steel Corporation, Kobe, Japan

Filed Feb. 23, 1990, Ser. No. 484,538
Claims priority, application Japan, Feb. 27, 1989, 1-43115
Int. Cl.[5] B22D *11/06*
U.S. Cl. 164—428 **2 Claims**



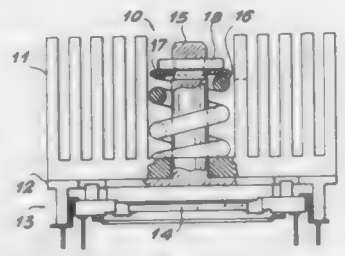
1. A twin cooling-roll continuous casting apparatus for producing a single metal strip, having a thickness of 1 mm. or less, directly from a molten metal through rapid solidification wherein each of said cooling rolls: has parallel grooves formed in the peripheral surface thereof so as to extend in a direction which crosses the direction of the roll axis, and said grooves on one of said cooling rolls are at a phase difference from the grooves on the other cooling rolls.

5,010,948

DEVICE FOR CONTINUOUSLY CASTING LIQUID METAL BETWEEN TWO ROLLS

Philippe Blin; Georges Weber, both of Metz, and Jacques Barbe, Saint Etienne, all of France, assignors to Institut de Recherces de la Siderurgie Francaise "Irsid", Paris, France

Filed May 22, 1990, Ser. No. 526,432
Claims priority, application France, May 29, 1989, 89 07011
Int. Cl.[5] B22D *11/06*
U.S. Cl. 164—428 **10 Claims**



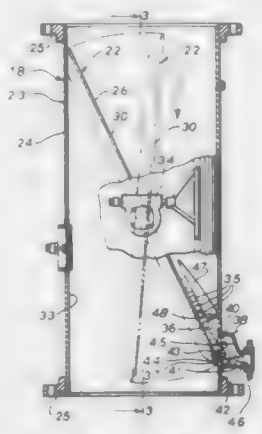
1. Device for continuously casting liquid metal, comprising two parallel horizontal rolls having end surfaces and cylindrical surfaces and spaced a predetermined distance apart and delimiting between the rolls a space for receiving liquid metal cast as a flat product under the rolls, plates for closing ends of said space disposed alongside said end surfaces of the rolls, and rolling members interposed between and in contact with said plates and said end surfaces of the rolls for maintaining a determined clearance between the plates and said end surfaces of the rolls constant during the casting.

5,010,949

DEVICE FOR FASTENING TOGETHER UNDER PRESSURE TWO PIECES, ONE TO THE OTHER

Gérard Dehaine, Chatillon, France, assignor to Bull, S.A., Paris, France

Filed Mar. 20, 1989, Ser. No. 325,763
Claims priority, application France, Mar. 22, 1988, 88 03675
Int. Cl.[5] F28F *7/00*; H01L *23/40*
U.S. Cl. 165—76 32 Claims



1. A device for dissipating heat from an integrated circuit, comprising a first piece coupled to said integrated circuit, a second piece having a surface and an opposite face, the surface adapted to thermally engage said first piece for enabling heat dissipation away from the integrated circuit, means for urging the first and second pieces together in thermal engagement, the means comprising a removable spring with shape memory, the spring extending between said opposite face of said second piece and a support means removably connected to said first piece.

5,010,950

BALL STRAINER FOR CIRCULATING BALL CLEANING SYSTEM

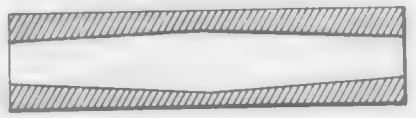
Donald J. Voith, Milwaukee, Wis., assignor to Water Services of America, Inc., Milwaukee, Wis.

Filed Sep. 13, 1989, Ser. No. 406,779
Int. Cl.[5] F28G *1/12*; B08B *9/04*
U.S. Cl. 165—95 6 Claims

1. In a circulating ball cleaning system for a fluid-carrying process piping arrangement, including a tubular ball straining section having a generally smooth cylindrical interior wall having an elliptical screen mounted in a screening position therein said screen having a regular elliptical edge in continuous engagement with the section wall and the screen surface disposed at an acute angle to the section wall to provide a narrow downstream collecting and discharge area, the improvement comprising:

a ball collecting and discharge chamber in the wall of the tubular section at the collecting and discharge area, said chamber lying entirely outside the cylindrical interior wall,

said chamber having an enlarged inlet opening in the interior surface of the section wall defining an enlarged cylindrical subchamber and a smaller outlet opening radially outwardly of said inlet opening,



whereby continuous engagement between the edge of the elliptical screen and the cylindrical interior wall in the screening position is maintained.

5,010,951

GRADED-GROOVE HEAT PIPE

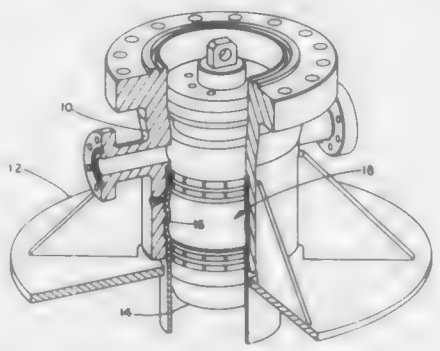
Michael R. Kapolnek, Sunnyvale; Alexander R. Feild, Mt. View; Robert T. Hartle, Cupertino, and Hillard R. Holmes, Menlo Park, all of Calif., assignors to Lockhead Missiels & Space Company, Inc., Sunnyvale, Calif.

Filed Aug. 3, 1989, Ser. No. 389,238
Int. Cl.[5] F28D *15/02*
U.S. Cl. 165—104.26 4 Claims

1. A heat pipe comprising a closed hollow structure elongate along an axis, said heat pipe having:

(a) an evaporator domain in which working fluid in liquid phase is evaporated to vapor phase, and

(b) a condenser domain to which working fluid in vapor phase is conveyed for condensation to liquid phase,



said evaporator domain and said condenser domain being separated from each other along said axis, a capillary groove being provided on an interior surface portion of said heat pipe to transport liquid-phase working fluid by capillary action from said condenser domain to said evaporator domain for evaporation to vapor phase, said capillary groove having a transverse cross-sectional dimension that varies continuously with length of said heat pipe, said transverse cross-sectional dimension having an extreme value at a location between opposite ends of said capillary groove in accordance with a predetermined profile for said capillary groove.

5,010,952

TUBULAR MEMBER SECURED WITHIN A WELL SUPPORT MEMBER WITH A PRELOAD

Arthur H. T. Chin, Houston, and Thomas R. Schmitz, Katy, both of Tex., assignors to Cooper Industries, Inc., Houston, Tex.

Filed Sep. 17, 1987, Ser. No. 98,197
Int. Cl.[5] E21B *19/16*, *33/04*
U.S. Cl. 166—75.1 5 Claims

1. A preloaded joint comprising:

an annular wellhead member,

a well string having an upper end,

said wellhead member having an internal recess with an upper end and a lower end, the upper end of said recess being tapered radially inward and upward, said wellhead member recess having a plurality of grooves below said upper end,

said well string being radially cold formed into said recess with its upper end being wedged downwardly by said tapered upper end of said recess to provide a compression preload on said well string in addition to a tight gripping and sealing engagement between said well string and the interior of said wellhead member as said well string is radially cold formed into said recess,

said well string is radially formed into said grooves to provide said gripping and sealing engagement.

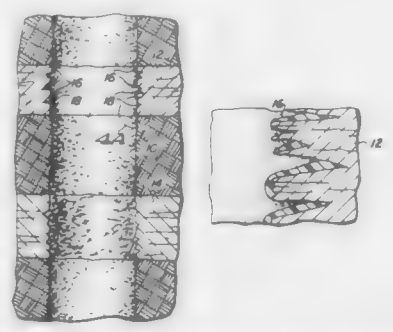
SAND CONSOLIDATION METHODS

Robert H. Friedman, and Billy W. Surles, both of Houston, Tex., assignors to Texaco Inc., White Plains, N.Y.

Filed Jan. 2, 1990, Ser. No. 459,609
Int. Cl.[5] E21B *33/138*, *43/24*
U.S. Cl. 166—288 8 Claims

1. A method for consolidating unconsolidated mineral particles including sand in a subterranean petroleum formation penetrated by a well in fluid communication with at least a portion of the formation, comprising:

introducing a sand consolidating fluid into the formation, said sand consolidating fluid containing a polymerizable compound comprising a monomer or oligomer, a diluent for the polymerizable compound, an acid catalyst capable of causing condensation polymerization of the polymerizable compound at fluid injection temperatures and an effective amount of swelling polymer which reduces shrinkage of the polymerizable compound during polymerization; and



allowing the injection fluid to remain in the formation for a period of time sufficient to accomplish at least partial polymerization of the polymerizable compound, forming a permeable consolidated mass around the wellbore.

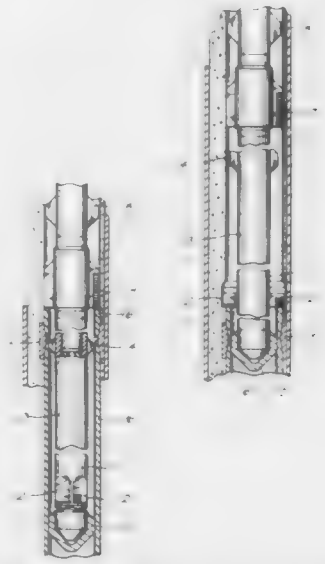
5,010,954

GEL COMPOSITION AND METHOD OF TREATMENT

David O. Falk, Denver, Colo., assignor to Marathon Oil Company, Findlay, Ohio

Division of Ser. No. 331,405, Mar. 30, 1989, Pat. No. 4,968,442.
This application Jul. 25, 1990, Ser. No. 557,870
Int. Cl.[5] E21B *33/138*, *43/22*
U.S. Cl. 166—295 9 Claims

4. A method of treating at least one of a plurality of formations intersected by a well bore comprising:



introducing into one of the plurality of formations which has a permeability which differs from another of the plurality of formations a first aqueous solution comprising a polymeric material selected from a biopolymer or a synthetic polymer, a crosslinking agent comprising a chromic carboxylate complex, a solvent selected from water or brine, and a gel breaker consisting essentially of ethylenediaminetetraacetic acid, the polymeric material crosslinking with the chromic carboxylate complex to form a gel impervious to fluid flow, the ethylenediaminetetraacetic acid being present in amount sufficient to break the gel after a predetermined period of time to a predetermined degree whereby limited permeability is restored to said one of the plurality of formations, said limited permeability more closely matching the permeability of said another of the plurality of formations.

5,010,955

CASING MILL AND METHOD

Johann B. Springer, Hanover, Fed. Rep. of Germany, assignor to Smith International, Inc., Houston, Tex.

Filed May 29, 1990, Ser. No. 530,107
Int. Cl.[5] E21B *10/46*, *29/00*
U.S. Cl. 166—298 26 Claims

13. A casing mill for milling oil well casing having sections of pipe coupled together by external couplings comprising:

a housing;

blades on the housing having a diameter sufficient for milling only pipe;

movable blades on the housing movable to a diameter sufficient for milling both pipe and coupling;

means in the housing for moving the movable blades to the diameter sufficient for milling both pipe and coupling; and

means for stabilizing the housing centered in a pipe to be milled.

26. A method for milling casing cemented in an oil well, the casing comprising a plurality of pipe sections interconnected by a plurality of couplings external to the pipe sections comprising:

milling both pipe and couplings in the vicinity of couplings; and

milling only pipe between the vicinities of adjacent couplings.

5,010,956

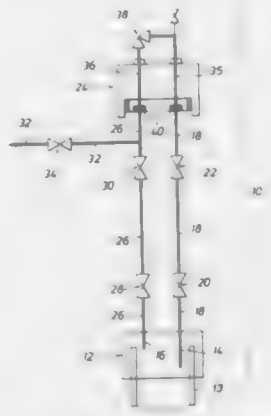
SUBSEA TREE CAP WELL CHOKE SYSTEM

John M. Bednar, Harvey, La., assignor to Exxon Production Research Company, Houston, Tex.

Filed Mar. 28, 1990, Ser. No. 500,438
Int. Cl.[5] E21B *34/04*, *43/01*
U.S. Cl. 166—344 2 Claims

1. An apparatus useful in subsea well completions requiring a subsea choke comprising:

a wellhead connector having a first connector passage therethrough in communication with production tubing in a wellbore and also having a second connector passage therethrough in communication with an annulus in the wellbore;



a tree flow passage connected to the wellhead connector and in communication with the first connector passage and extending through a first valve;

a tree annulus passage connected to the wellhead connector and in communication with the second connector passage and extending through a second valve;

a tree cap having:

1. a tree cap flow passage extending therethrough with the tree cap connected to and in communication with the tree flow passage at one end of the tree cap flow passage, and

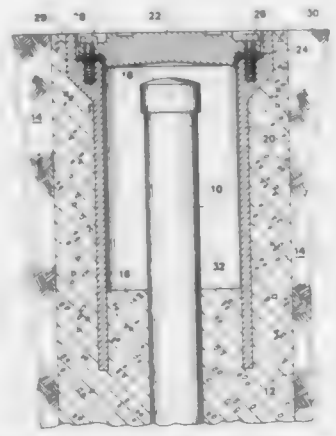
2. a choke return passage extending therethrough with the tree cap connected to and in communication with the

tree annulus passage at one end of the choke return passage;

a choke located on the tree cap and in communication with the tree cap flow passage and also in communication with the choke return passage whereby fluid flows through the tree cap flow passage and through the choke and then through the choke return passage; and

a production line in communication with the tree annulus passage between the second valve and the tree cap and extending through a third valve.

5,010,957



ENVIRONMENTAL MONITORING WELL HOUSING AND PROTECTION METHOD

Donald A. Kenner, Rt. 3, Box 220A, Sherwood, Oreg. 97140

Filed Aug. 22, 1989, Ser. No. 397,010

Int. Cl.[5] E21B *33/03*

U.S. Cl. 166—379 **19 Claims**

13. A method for housing and protecting an environmental monitoring well having a well pipe disposed in a well bore with an upper end extending toward the surface of the ground, comprising:

(a) placing an enclosure in said well bore around said upper end of said well pipe, said enclosure being of unitary construction and having an upper opening, a lower opening and an inwardly-protruding ledge between said upper opening and said lower opening;

(b) placing sealing means in said well bore between the outer surface of said well pipe and the inner surface of said enclosure, said sealing means being a composition distinct from said well pipe and said enclosure and having a characteristic that allows it to flow into the space between the outer surface of said well pipe and the inner surface of said enclosure and assume a stable condition so as to seal off the space therebetween;

(c) placing on said ledge a flexible gasket having a shape substantially identical to the shape of the surface of said ledge;

(d) placing on said gasket within said enclosure a cover having an upper surface and a peripheral shape substantially identical to the shape of the interior of said enclosure, and

(e) attaching said cover to said enclosure so that said upper opening of said enclosure and said upper surface of said cover are substantially flush with the surface of the ground.

5,010,958

MULTIPLE CUP BRIDGE PLUG FOR SEALING A WELL CASING AND METHOD

Dale E. Meek, Sugarland, and Merlin D. Hansen, Missouri City, both of Tex., assignors to Schlumberger Technology Corporation, Houston, Tex.

Filed Jun. 5, 1990, Ser. No. 533,624

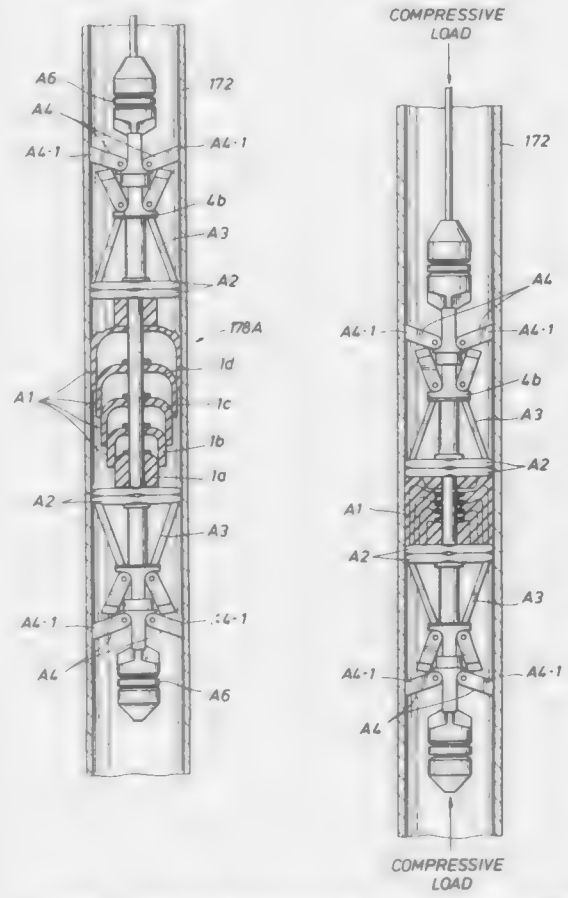
Int. Cl.[5] E21B *33/128, 33/129*

U.S. Cl. 166—382 **19 Claims**

4. A method of sealing a well casing, a plurality of successively sized cups adapted to interfit together being disposed within said well casing, each cup of the plurality of cups having a side and a top, the side and the top of said each cup together defining a hollow interior within said each cup, comprising the steps of:

applying a compressive load to both ends of said successively sized cups, the top of said each cup entering the hollow interior of a next adjacent cup of a successively larger size during the application of said compressive load, the applying step continuing until said plurality of cups interfit tightly together; and

further applying said compressive load to said both ends of the tightly interfitting, successively sized cups until a plug is formed, the plug sealing said well casing.



14. A sealing apparatus for sealing a well casing, comprising:

a plurality of cups of successively larger sizes, each cup of the plurality having a side and a top, the side and the top defining a hollow interior within said each cup; and

means for applying a compressive load to said plurality of cups,

the top of said cup entering the hollow interior of a next adjacent cup of successively larger size when the means for applying applies said compressive load to said plurality of cups,

the plurality of cups interfitting tightly together to form said sealing apparatus for sealing said well casing when said

means for applying continues to apply said compressive load to said plurality of cups.

5,010,959

AUTOMATIC SPRINKLER HEAD

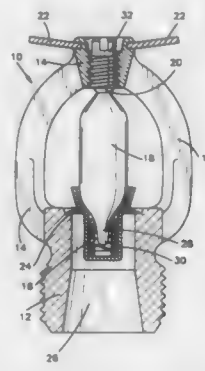
Douglas A. Lostoski, Richfield, Ohio, assignor to Automatic Sprinkler Corporation of America, Cleveland, Ohio

Filed Dec. 7, 1989, Ser. No. 447,045

Int. Cl.[5] A62C *37/08*

U.S. Cl. 169—37 **5 Claims**

1. An automatic sprinkler head having:



a body with a passageway for fire-extinguishing fluid;

a frame extending from said body having a deflector plate opposite said passageway;

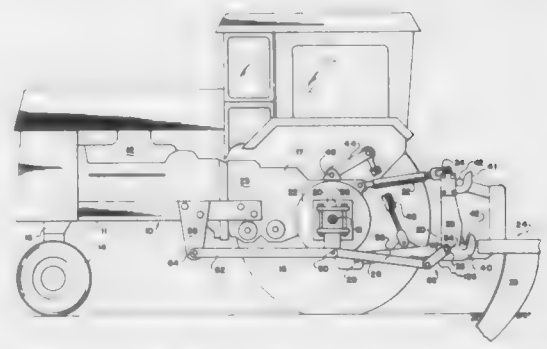
a closure assembly for closing said passageway, said closure assembly including a closure thimble;

a glass bulb interposed between said closure assembly and said deflector plate to hold said closure assembly closed, said glass bulb having a capillary end which is enclosed by the closure thimble, and said glass bulb being thermally responsive so as to fracture at a predetermined temperature into fragments and release said closure assembly; and

means to minimize lodgement of said closure assembly and fragments of said glass bulb, said means being at least partially enclosed by the closure thimble and being interposed between the closure thimble and the glass bulb such that one end of said means is lodged against the end of the glass bulb having the capillary end and the other end of said means is lodged against the closure thimble, and said

means causing the closure assembly and fragments of the glass bulb to tumble away from the axis of the passageway when the glass bulb fractures.

5,010,960



METHOD OF TILLING WITH IMPROVED DRAFT CONNECTION

Billey R. Barnes, Lemesa; Ronny L. Barnes, and David A. Gary, both of O'Donnell, all of Tex., assignors to Bar-Gar Corporation, O'Donnell, Tex.

Division of Ser. No. 331,454, Mar. 31, 1989, Pat. No. 4,905,769, which is a continuation-in-part of Ser. No. 925,162, Oct. 31, 1986, Pat. No. 4,860,833, which is a continuation-in-part of Ser. No. 754,619, Jul. 12, 1985, Pat. No. 4,655,295. This application Feb. 12, 1990, Ser. No. 479,083

Int. Cl.[5] A01B *59/041, 59/06*

U.S. Cl. 172—1 **4 Claims**

1. The procedure for tilling agricultural land with an agricultural tractor having

a. a differential housing to which a rear axle housing is connected,

b. rear wheels journaled to the axle housing,

c. large low pressure tires on the rear wheels,

d. a front axle,

e. front wheels on the front axle,

f. two spaced apart frame beams extending rearward from the front axle,

g. an engine on the frame beams,

h. transmission means on the tractor for transmitting power from the engine to the rear wheels,

i. a transmission housing interconnecting the frame beams and the differential housing,

j. a quick hitch yoke in the form of a vertical frame,

k. said yoke including three hooks, two draft hooks at the same level and spaced apart, and a top hook above and between the draft hooks,

l. two draft links,

m. each draft link pivoted to the yoke immediately forward

a draft hook, each draft link pivoted to the differential housing,

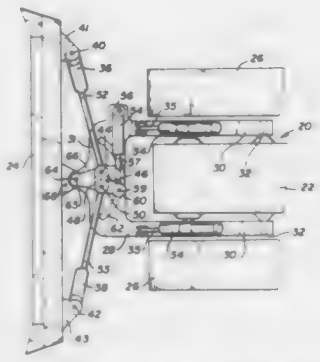
n. a top link connected from the yoke immediately forward of the top hook and extending to the differential housing,

o. an earth working implement having three bolts,

p. said three bolts located in said three hooks to quickly attach and detach the earth working implement to the quick hitch yoke,

q. the improved method of tilling the soil comprising:

r. at least partially drafting the earth working implement through the yoke from the frame beams forward of the transmission means, and



s. rigidly fixing horizontally and vertically the earth working implement to the tractor while tilling the soil.

5,010,961

ANGLE-TILT-PITCH MECHANISM FOR DOZER BLADE

Claude M. Frisbee, Schofield, Wis., assignor to J. I. Case Company, Racine, Wis.

Filed Feb. 20, 1990, Ser. No. 481,928
Int. Cl.[5] E02F *3/76*
U.S. Cl. 172—821 **12 Claims**

1. In an earth-working vehicle, a blade mounting arrangement comprising:

an earth-engaging blade;

a frame defining a longitudinal axis;

means to connect said blade to said frame, said means to connect allowing said blade to be moved to pitch forwardly or rearwardly by pivoting about an axis transverse to said longitudinal axis, to tilt by pivoting about said longitudinal axis, or to angle by pivoting about an axis extending vertically relative to said longitudinal axis; and

hydraulic cylinders for controlling the pitch, tilt and angling movement;

said hydraulic cylinders being pivotally connected to an intermediate member, said intermediate member being pivotally connected to said blade and movable relative to said frame;

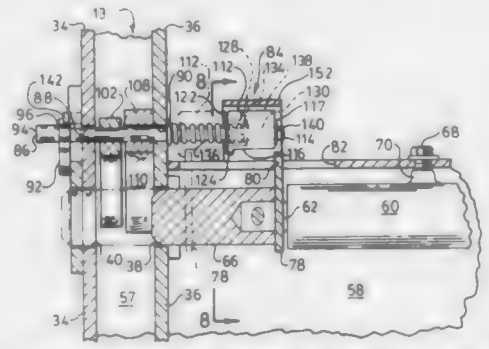
wherein a pair of hydraulic cylinders control the pitch and tilt, and a single hydraulic cylinder controls angle movement; and

wherein said pair of hydraulic cylinders is pivotally connected to said blade and pivotally connected to said intermediate member, said single hydraulic cylinder is pivotally connected to said frame and pivotally connected to said intermediate member.

5,010,962

INDICATING APPARATUS FOR A COUPLING

John J. Illoom, Jr., St. Charles, Ill., assignor to Caterpillar Inc., Peoria, Ill.



Filed Apr. 30, 1990, Ser. No. 516,367
Int. Cl.[5] A01B *39/20, 51/00;* **G01D** *5/00, 5/02*
U.S. Cl. 172—430 **18 Claims**

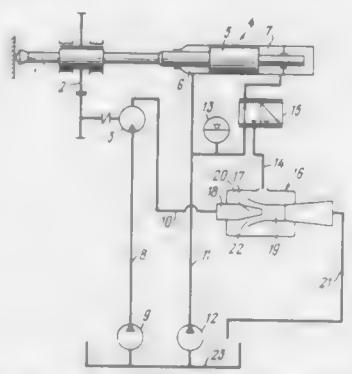
1. An apparatus for indicating the coupled condition between a first and second member, said first member having an opening formed therein and the second member having a mounting pin moveable into said opening to couple the respective members, comprising:

a plate having an opening formed therein and being mounted to the second member;

a shaft positioned in the opening formed in the plate;

a lever mounted on the shaft, said lever and said shaft being rotatable with respect to the plate member to establish

contact between the first and second members only when said members are in a position sufficient for being coupled to one another; and



means for indicating the movement of the pin into the opening of the first member, said indicating means being operable only when contact between the first and second members has been established.

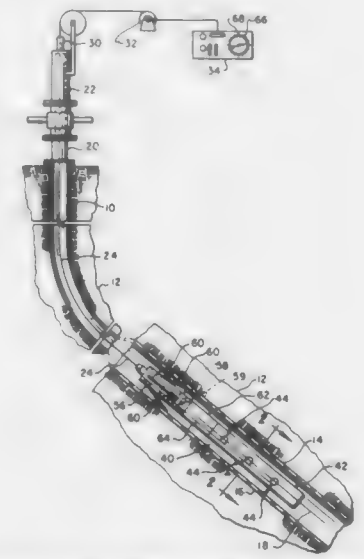
5,010,963

HYDRAULIC DRILLING MACHINE

Jury I. Neroznikov, ulitsa 40 let Kazakhstana, 40, kv.41; Ivan P. Rudakov, both of Karaganda; Valentin N. Fanshtein, 1 mikroralon, 63 kv. 10, Stepnogorsk; Vladimir A. Medyanik, ulitsa Shevchenok, 17, kv. 51, Zheltye Vody, and Valentina V. Gavrilova, ulitsa Mukanova, 13, kv. 64, Karaganda, all of U.S.S.R.

PCT No. PCT/SU89/00095, § 371 Date Mar. 2, 1990, § 102(e) Date Mar. 2, 1990, PCT Pub. No. WO89/11022, PCT Pub. Date Nov. 16, 1989
PCT Filed Apr. 14, 1989, Ser. No. 460,937
Claims priority, application U.S.S.R., May 4, 1988, 4473992
Int. Cl.[5] B25D *9/00*
U.S. Cl. 173—105 **1 Claim**

1. A hydraulic drilling machine comprising a drill tool (1) connected through a reduction gear (2) to a hydraulic motor (3) having a hydraulic pressure line (8) and a hydraulic discharge line (10), and a hydraulic percussive mechanism (4) with an idle stroke chamber (6) and a work stroke chamber (7), hydraulic pressure and discharge lines communicating with the hydraulic percussive mechanism (4) via a fluid distributor (15), a hydraulic accumulator (13) connected to the hydraulic pressure line (11) of the hydraulic percussive mechanism and hydraulic pumps (9 and 12), CHARACTERIZED in that the machine is provided with a means (16) for sucking liquid from



the work stroke chamber (7) of the hydraulic percussive mechanism (4) during its idle stroke including a mixing chamber (17) connected to the discharge line (14) of the hydraulic percussive mechanism via the fluid distributor (15), an ejector (18) and a diffuser (19) positioned in the mixing chamber (17), the ejector (18) being connected to the discharge line (10) of the hydraulic motor (3) and having a nozzle (20) positioned in the diffuser (19), said diffuser is connected to a hydraulic discharge line (21) common to the hydraulic motor (3) and hydraulic percussive mechanism (4).

5,010,964

METHOD AND APPARATUS FOR ORIENTING WELLBORE PERFORATIONS

H. Mitchell Cornette, Plano, Tex., assignor to Atlantic Richfield Company, Los Angeles, Calif.

Filed Apr. 6, 1990, Ser. No. 506,139
Int. Cl.[5] E21B *43/119*
U.S. Cl. 175—4.51 **2 Claims**

1. A method for perforating a casing in a portion of a wellbore inclined to the vertical preparatory to extending a hydraulic fracture into a formation region of interest in a preferred direction of said fracture comprising the steps of:

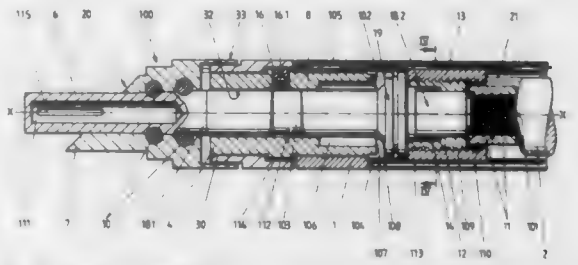
determining a preferred angular orientation of perforations in said casing for forming said fracture with respect to a reference point on said wellbore and the longitudinal wellbore axis in said region of interest;

providing a perforating apparatus including at least one perforating gun for firing a perforating charge to penetrate said casing to provide an opening for the flow of fluids between said formation and said wellbore, said apparatus including a reference unit for indicating the position of said apparatus in said wellbore with respect to the wellbore axis and said reference point, a housing, gripper means for engagement with said wellbore wall to hold said housing non-rotatable with respect to said axis, and motor means disposed in said housing and operably connected to said reference unit and said perforating gun for ratating said reference unit and said perforating gun to orient said perforating gun in a predetermined direction;

inserting said apparatus into said wellbore and positioning said apparatus adjacent to said region of interest;

determining the high side of said portion of said wellbore defined by a poing on said wellbore wall intersected by a line which lies in a plane which includes the vector indicating the direction of the force of gravity and passing through said wellbore axis;

operating said motor means to orient said perforating gun in said predetermined direction with respect to said line; and



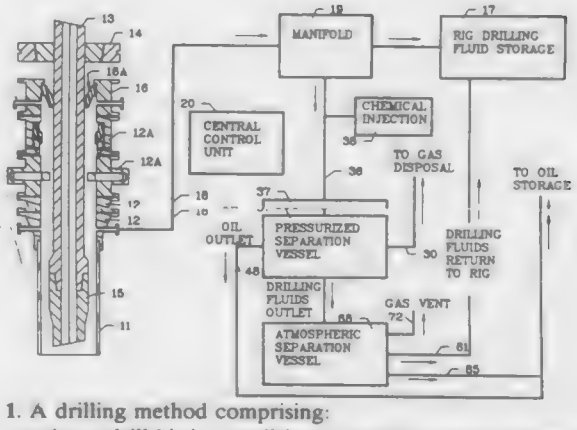
operating said apparatus to effect firing of said perforating gun to form at least one perforation in said casing.

5,010,965

SELF-PROPELLED RAM BORING MACHINE

Robert Schmelzer, Lennestadt, Fed. Rep. of Germany, assignor to Tracto-Technik Paul Schmidt Maschinenfabrik KG

Filed Apr. 4, 1990, Ser. No. 505,047
Claims priority, application Fed. Rep. of Germany, Apr. 8, 1989, 3911467
Int. Cl.[5] E21B *4/06, 7/08, 47/024*
U.S. Cl. 175—19 **16 Claims**



1. A self-propelled ram boring machine, in particular for making earth bores, having a striking tool at the leading end of a cylindrical housing, a striking piston movable to subject said striking tool to ramming blows, said striking piston being driven with pulsating, translatory working strokes, wherein said striking tool is mounted in the housing to rotate about the axis of rotation and comprises kinematic means cooperating with said housing for transforming a translatory movement following each blow of said striking piston into a gradual rotary movement, and means for initiating or interrupting the rotary movement.

5,010,966

DRILLING METHOD

Charles O. Stokley, Houston, and Richard C. Haas, Corpus Christi, both of Tex., assignors to Chalkbus, Inc., Houston, Tex.

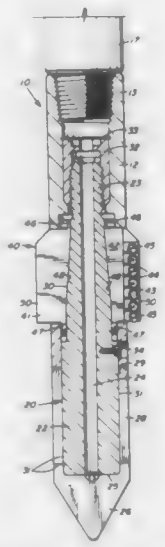
Filed Apr. 16, 1990, Ser. No. 509,203
Int. Cl.[5] E21B *21/06*
U.S. Cl. 175—66 **3 Claims**

1. A drilling method comprising:

rotating a drill bit in a well head to drill a well in an earth formation while circulating drilling fluid consisting essentially of a liquid;

conducting the returning drilling fluid, and oil and gas from the formation to a flow rate control valve and to a pressure control valve;

conducting fluid from said flow rate control valve and said pressure control valve to a separator vessel maintained under pressure;



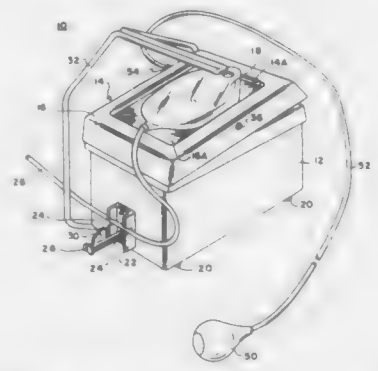
separating gas from the returning fluid in said separator vessel and conducting the separated gas from said separator vessel to disposal facilities;
conducting the remaining fluid in said separator vessel to an atmospheric separator vessel;
continuously circulating air through said atmospheric separator vessel to dilute to an inflammable mixture and to remove any well gases therein, and
separating the oil and drilling fluid in said atmospheric separator vessel and conducting the oil to disposal and returning the drilling fluid to the well.

5,010,967

MILLING APPARATUS WITH REPLACEABLE BLADES

Praful C. Desai, Houston, Tex., assignor to Smith International, Inc., Houston, Tex.

Filed May 9, 1989, Ser. No. 349,182
Int. Cl.[5] E21B *10/62*
U.S. Cl. 175—406 **3 Claims**



1. A pipe milling apparatus having replaceable milling blades fixedly secured within said apparatus prior to insertion of said apparatus into a wellbore for milling and cutting pipe utilized in oil and gas wells, said milling apparatus comprising:
a cylindrical body, said body forming a first upstream threaded end adapted to be connected to a drill string and a second downstream open, said body further forming at least a pair of equidistantly spaced, longitudinally extending slots therethrough positioned about midway between said first and second ends of said body,
at least a pair of pipe milling blades forming first and second ends adapted to be radially inserted through said slots in said cylindrical body from the inside of said body, means formed by said blade to fixedly secure said blade against an inside wall formed by said body, said blades extend radially from said body, said blades further form a cutting surface positioned toward a direction of rotation and along a radially disposed second downstream end formed by said milling blades, said cutting surface containing cutting means oriented substantially longitudinally adjacent said first longitudinally extending outer surface, the cutting means being positioned to mill said pipe as said milling apparatus is rotated, a first longitudinally extending outer surface formed by said blade determines the radial extension of said blade, an inner longitudinally extending surface formed by said blade forms an angled cam surface, the cam surface being angled from an axis of the milling apparatus,
a cylindrical mandrel confined within said cylindrical body and forming a first upstream end and a second pointed downstream pilot end said second pilot end serves to centrally guide said pipe milling apparatus down said well bore and into an end of said pipe to be milled, said mandrel further forming a tapered conical portion between said first and second end, the taper of the mandrel narrows from a large diameter nearest the second pilot end towards the first upstream threaded end, said conical surface substantially parallels said inner longitudinally extending surface formed by said cutter blades.

5,010,968

BLOOD AGITATING AND WEIGHING APPARATUS

Thomas E. Barrow, Rte. 3, Box 117B, Jacksonville, Tex. 75766

Filed Nov. 27, 1989, Ser. No. 441,311
Int. Cl.[5] G01G *13/02*
U.S. Cl. 177—118 **16 Claims**

1. Apparatus for agitating a liquid collected in container, comprising:
a base member;
a support member for receiving a container, said support member being pivotally mounted onto said base member;
means for biasing said support member to a first tilted position relative to the base member;
an inflatable member disposed between said support member and said base member; and,
means for introducing pneumatic pressure into said inflatable member to expand said inflatable member and for allowing said pneumatic pressure to be released therefrom.

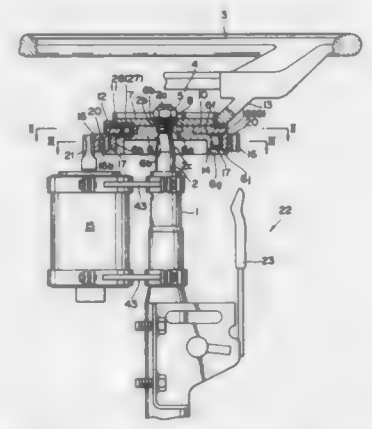
DRIVE SYSTEM

Georg Hirmann, Griesernweg 14, 8037 Zürich, Switzerland

PCT No. PCT/CH87/00064, § 371 Date Feb. 3, 1988, § 102(e) Date Feb. 3, 1988, PCT Pub. No. WO87/07586, PCT Pub. Date Dec. 17, 1987
Continuation-in-part of Ser. No. 129,965, Dec. 4, 1987, which is a continuation of Ser. No. 800,615, Nov. 12, 1985, abandoned.
This PCT application Jun. 4, 1987, Ser. No. 163,116
Claims priority, application Switzerland, Jun. 4, 1986, 2266/86; Jun. 25, 1986, 2568/86
Int. Cl.[5] B62D *57/002;* **B65G** *7/002*
U.S. Cl. 180—8.1 **12 Claims**

1. A drive device for conveying a load in a predetermined forward direction which is opposite to a predetermined backward direction, said device comprising:
a support platform with an upward-facing side for supporting said load and a downward-facing bottom side;
an inclined ramp connected to and defining an angle of incline with respect to said support platform, said ramp having a bottom side facing generally downward and generally backward;
lift means which is locatable below said ramp and which is operable for moving upward against said downward-facing ramp side to provide a generally upward lift against said downward-facing ramp side; and
means for providing a low coefficient of friction between said downward-facing ramp side and said upwardly movable lift means, thereby permitting said ramp and support platform to move freely in said predetermined forward conveying direction when said lift means is moved upward against said bottom ramp side, without requiring said lift means to move in either said forward or said backward direction.

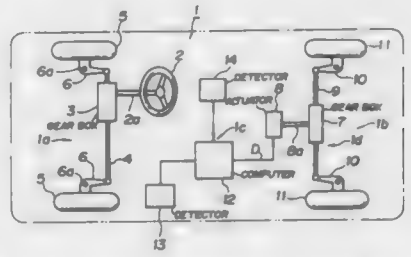


5,010,970

POWER-ASSISTED STEERING SYSTEM

Toshihiko Yamamoto, Hiroshima, Japan, assignor to Mazda Motor Corporation, Hiroshima, Japan

Filed May 26, 1989, Ser. No. 357,194
Claims priority, application Japan, May 27, 1988, 63-130783; Oct. 31, 1988, 63-275045
Int. Cl.[5] B62D *5/04*
U.S. Cl. 180—79.1 **18 Claims**



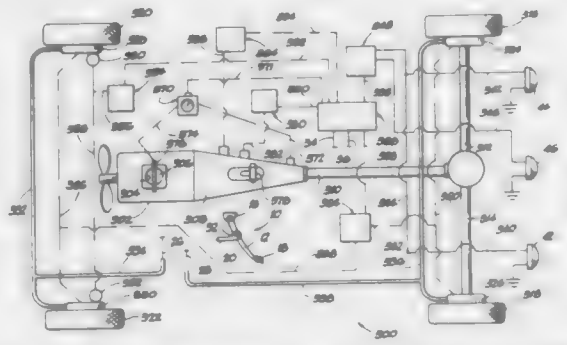
1. A power-assisted steering system for an automotive vehicle having a steering shaft rotatably supported by a steering column and a steering wheel through which a steering torque is transmitted to said steering shaft, said steering system comprising:
an electric motor mounted on said steering column having an output shaft offset from said steering shaft;
a connecting structure, said connecting structure comprising a driven steering member fixed to said steering shaft, a drive member fixed to said steering wheel, a motor driven member engaging said output shaft disposed radially outwardly of said driven steering member, a clutch mechanism disposed between said motor driven member and said driven steering member, and at least one spring disposed between said driven steering member and said drive member, said at least one spring providing a torsional resistance to movement of said drive member relative to said driven steering member, said connecting structure selectively connecting said steering shaft to a steering torque transmitted from said steering wheel when said steering torque is smaller than a predetermined torque equal to said torsional resistance and a motor output transmitted from said output shaft when said steering torque is greater than said predetermined torque; and
torque detecting means disposed in cooperation with said connecting structure for detecting said predetermined torque so as to actuate said electric motor, thereby rotating said output shaft and said motor driven member, engaging said clutch, and assisting in rotating said steering shaft.

5,010,971

STEERING SYSTEM FOR VEHICLES

Tetsuro Hamada, Tochigi; Shoichi Sano, Tokyo, and Yoshimi Furukawa, Tochigi, all of Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Continuation-in-part of Ser. No. 690,167, Jan. 10, 1985, Pat. No. 4,964,401, and a continuation-in-part of Ser. No. 684,613, Dec. 21, 1984, Pat. No. 4,971,175. This application May 3, 1988, Ser. No. 189,657
Claims priority, application Japan, Dec. 23, 1983, 58-243354; Dec. 23, 1983, 58-243355
Int. Cl.[5] B62D *5/06*
U.S. Cl. 180—140 **5 Claims**



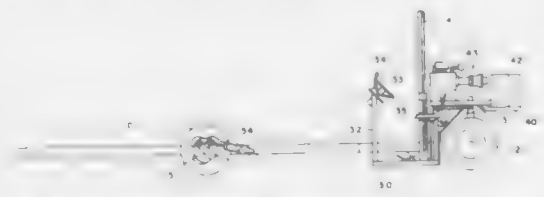
1. A steering system for a vehicle having front and rear steered wheels, comprising:
means for detecting a turning state of the vehicle;
means for detecting a velocity derivative of the vehicle;
means for determining a steering angle for the vehicle's rear wheels dependent on output signals of said turning state detecting means and said velocity derivative detecting means; and
means for driving the rear wheels to said steering angle as determined by said determining means;
said determining means including means for providing a reference steering angle for the rear wheels dependent on the output signal from said turning state detecting means, and means for correcting said reference steering angle dependent on at least the output signal of said velocity derivative detecting means to establish said steering angle for the rear wheels; and
said correcting means correcting said reference steering angle by way of a correction amount and a correction direction both corresponding to said velocity derivative.

5,010,972

COMBINATION VEHICULAR BRAKING AND ACCESSORY CONTROL SYSTEM

Ronald D. Ingraham; Todd M. Nykerk, and Peter H. Strom, all of Reed City, Mich., assignors to Nartron Corporation, Reed City, Mich.

Filed Jul. 6, 1989, Ser. No. 375,946
Int. Cl.[5] B60K *31/02*
U.S. Cl. 180—178 **22 Claims**



1. A braking and accessory control system for a vehicle having accessory means, comprising an arrangement effective for creating output signals, said arrangement comprising a first movable element, a second movable element, said first movable element being operatively connected to and effective for moving said second movable element, signal generating means effective for indicating when preselected magnitudes of a first force are applied to said first movable element when said first movable element is operatively engaging and at least urging said second movable element to move, said signal generating means comprising force sensitive electrical resistance means, wherein said force sensitive electrical resistance means varies its electrical resistance in response to the magnitudes of forces applied thereto, and wherein said force sensitive electrical resistance means is situated as to have applied thereagainst a reaction-force of a magnitude dependent upon the magnitude of said first force being applied in increasing magnitudes to said first movable element, said force sensitive electrical resistance means being effective upon said reaction-force attaining preselected magnitudes to produce related magnitudes of electrical resistance resulting in an output signal of varying electrical magnitude indicative of the corresponding attainment of said preselected magnitudes by said first force applied to said first movable element, and wherein said output signal is effective for initiating a response in said accessory means of said vehicle, wherein said first movable element comprises a manually actuatable vehicular brake lever, wherein said second movable element comprises a vehicular brake system actuating linkage, wherein said brake lever is pivotally mounted by first pivot means at least near a first of its ends to associated vehicular support structure as to have a second of its ends opposite to said first end generally freely swingable, wherein said actuating linkage is operatively connected to said brake lever by second pivot means, wherein one of said pivot means comprises said force sensitive resistance means, and further comprising first logic control electrical circuit means electrically connected to said force sensitive resistance means, second electrical circuit means electrically connected to said first circuit means, vehicular stop lamp means, wherein said accessory means comprises vehicular anti-skid brake system control means, wherein when said force sensitive resistance means produces an output signal of a first preselected electrical magnitude said first circuit means causes a first electrical control signal to be applied to said second circuit means to cause energization of said second circuit means and thereby energization of said vehicular stop lamp means, wherein when said force sensitive resistance means produces an output signal of a second preselected electrical magnitude said first circuit means causes a second electrical control signal to be applied to said vehicular anti-skid brake system control means, and wherein said first circuit means is effective to maintain energization of said second circuit means and said vehicular stop lamp means as the magnitude of said output signal changes from said first preselected electrical magnitude to said second preselected electrical magnitude.

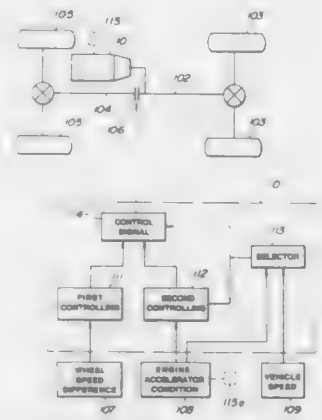
FREIGHT CARRIER

Philip A. Brown, 4689 - 8 Mile Rd., NW., Conklin, Mich. 49403

Filed Aug. 31, 1989, Ser. No. 400,662
Int. Cl.[5] B60P *1/02*
U.S. Cl. 180—213 **1 Claim**

1. A load-carrying vehicle, comprising:
a load-carrying platform section having wheel means;
a power section coupled to said platform section in fixed relationship with respect to relative rotation about a vertical axis, said power section including steerable drive wheel means and motor means adapted to rotate said drive wheel means;
means forming an operator's station including a footrest platform mounted on said power section adjacent ground level and laterally offset from a portion of said platform and from said drive wheel means; and
wherein said load-carrying platform section wheel means is vertically adjustable with respect to said load-carrying platform section, and is provided with drive means energized by said motor means, said platform section wheel drive means including spindle means and a wheel sprocket secured to at least one wheel rotatably mounted on said spindle, and also including a double chain having two sides, one side thereof being in fixed engagement with said wheel sprocket, and further including motor means having a driving sprocket laterally opposite said wheel sprocket, and rotatable on an axis adjacent and displaced from said wheel sprocket axis of rotation in engagement with the other of said two sides of said double chain, said letter motor means being mounted on a member fixed with respect to said spindle.



5,010,974

4WD VEHICLE WITH DRIVING FORCE DISTRIBUTION CONTROL

Toshiro Matsuda, Sagamihara, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Apr. 10, 1990, Ser. No. 506,788
Claims priority, application Japan, Apr. 10, 1989, 1-89969
Int. Cl.[5] B60K *17/34*
U.S. Cl. 180—233 **13 Claims**

1. A driving force distribution control system for a vehicle, comprising:
a torque distributing means comprising a primary drive means for transmitting a driving force from an engine of the vehicle to primary drive wheels of the vehicle, and a secondary drive means for transmitting a driving force from the engine to secondary drive wheels of the vehicle through a torque distributing clutch capable of varying the driving force transmitted to the secondary drive wheels in response to a control signal,
a first sensor means for determining a wheel speed difference between a primary wheel speed of said primary wheels and a secondary wheel speed of said secondary wheels,
a second sensor means for sensing an engine condition of an engine system which includes the engine and an accelerator system of the engine,
a third sensor means for sensing a vehicle speed of the vehicle,
a controller means for producing said control signal by processing signals of said first, second and third sensor means, said controller means comprising a first controlling means for normally controlling a clutch engagement force of said torque distributing clutch in accordance with said wheel speed difference, and a second controlling means for controlling the clutch engagement force in accordance with said engine condition when the engine system is in a predetermined state for accelerating the vehicle, and at the same time said vehicle speed is lower than a predetermined threshold speed value.

5,010,975

MOTOR VEHICLE COMPRISING TWO DRIVEN AXLES

Hans D. Sommer, Graz, Austria, assignor to Steyr-Daimler-Puch AG, Vienna, Austria

Filed Nov. 13, 1989, Ser. No. 436,067
Claims priority, application Austria, Dec. 21, 1988, 3119/88
Int. Cl.[5] B60K *17/35*
U.S. Cl. 180—248 **6 Claims**

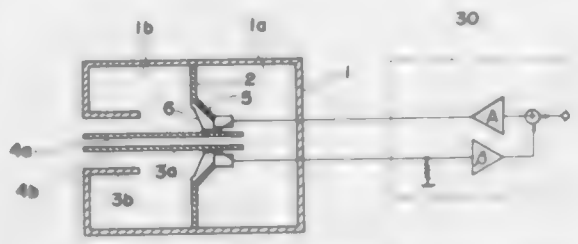
1. A motor vehicle comprising
first and second driven axles,
a transmission for driving said first and second driven axles, said transmission including at least one selectively engageable road gear and a selectively engageable cross-country gear,
a drive train operatively connecting said transmission to said second driven axle, said drive train including a liquid friction coupling and a clutch preceding said liquid friction coupling, said clutch being operative between a first position in which said second driven axle is connected to said transmission via said clutch and said liquid friction coupling, a second position in which said second driven axle is connected directly to said transmission via said clutch, and a third position in which said second driven axle is disconnected from said transmission,
first pick-up means for detecting which of said cross-country gear and said road gear is selected,
second pick-up means for detecting the speed of said vehicle,
third pick-up means for detecting when a brake is actuated, and
automatic switching and control means responsive to said first, second, and third pick-up means for automatically shifting said clutch into said first position when said road gear is selected, into said second position when said cross-country gear is selected, and into said third position when the speed of said vehicle is above a threshold value and said brake is actuated.

5,010,976

CHARACTERIZATION OF THE FULL ELASTIC EFFECT OF THE NEAR SURFACE ON SEISMIC WAVES

Tom P. Airhart, Plano, Tex., assignor to Atlantic Richfield Company, Los Angeles, Calif.

Filed Oct. 4, 1989, Ser. No. 417,792
Int. Cl.[5] G01V *1/00*
U.S. Cl. 181—108 **44 Claims**



1. A method for determining the full elastic effect of a near surface layer on a seismic source wave, comprising the steps of:
placing a plurality of surface seismic receivers arranged along a first direction on the surface of the earth;
placing at least one buried sensor beneath the surface of the earth at a depth where the filtering effect of the near surface layer is substantial;
injecting a directed seismic wave into the ground at a first source location remote from said surface receivers, such that at least one surface receiver is in-line and at least one surface receiver is off-line with respect to the projected path of said directed seismic wave;
receiving said seismic wave with said surface receivers and said buried sensor;
generating from said buried sensor and said surface receivers electrical representations of said received seismic waves; and
interpreting said electrical representations to determine the effect of the near surface layer on said seismic wave.

5,010,977

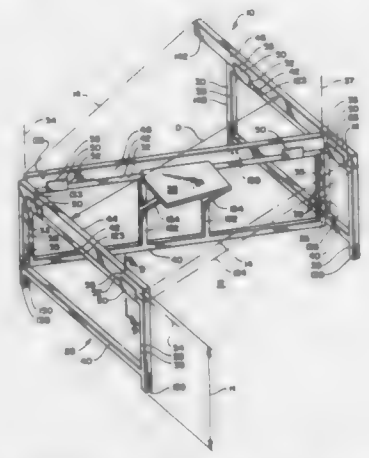
ACOUSTIC APPARATUS WITH PLURAL RESONATORS HAVING DIFFERENT RESONANCE FREQUENCIES

Kazunari Furukawa, and Daisuke Suzuki, both of Hamamatsu, Japan, assignors to Yamaha Corporation, Hamamatsu, Japan

Filed Jul. 13, 1989, Ser. No. 379,583
Claims priority, application Japan, Jul. 22, 1988, 63-96436[U]
Int. Cl.[5] G10K *11/04*
U.S. Cl. 181—160 8 Claims

1. An acoustic apparatus, comprising:

a housing having a plurality of cavities therein defining a plurality of resonators for generating an acoustic wave by resonance, wherein each of said cavities includes an acoustic mass means for causing said cavity to acoustically communicate with an external region, said plurality of resonators having different resonance frequencies and having resonance acoustic radiation portions arranged adjacent to each other and each having an end opening to an outside of the housing; and



a vibrator having a front surface for driving one of said resonators and an opposing rear surface for driving another of said resonators.

5,010,978

APPARATUS AND METHOD FOR A SAWING STAND

Scott A. Jimmerson, 2591 N. Shore Rd., Bellingham, Wash. 98226

Filed Mar. 29, 1990, Ser. No. 501,262
Int. Cl.[5] B27B *21/00*; B25H *1/06*
U.S. Cl. 182—153 21 Claims

1. A board supporting assembly for supporting a plurality of board means so that a workpiece may be placed upon the board means and sawed thereon, said assembly having a longitudinal axis and a transverse axis, said assembly comprising:

a. a front board supporting means adapted to support a front board means at a front end of said assembly;

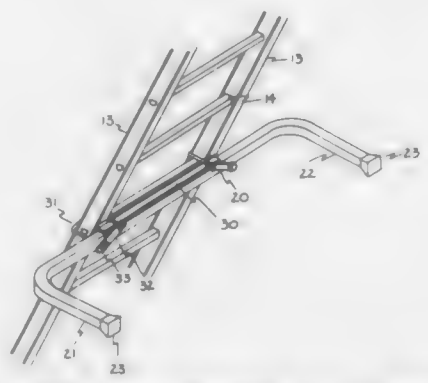
b. a rear board supporting means adapted to support a rear board means at a rear end of said assembly;

c. a connecting board supporting means adapted to support an intermediate board means and connected pivotally at a front end thereof to said front board supporting means in a manner that said front board supporting means is able to be rotated about a front pivot axis to a collapsed position, and with said connecting board supporting means being connected pivotally at a rear end thereof to said rear board supporting means in a manner that said rear board supporting means may be rotated about a rear pivot axis to a collapsed position

d. each of said front, rear, and connecting board supporting means comprising:

i. a board support portion defining a horizontally extending line;

ii. a board securing means for securing a lower portion of a related one of said front, rear, and intermediate board means at said horizontal line; and



iii. a base means for ground surface engagement, said assembly being adapted to position a top portion of said board means within a workpiece supporting plane, a length of said connecting board supporting means being at least about 4½ feet, whereby said board means is able to be positioned upon said board supporting means, a sheet of four foot by eight foot material is able to be placed upon top surfaces of said board means, and a longitudinal displacement component along said longitudinal axis from said front board means to said rear board means is able to be at least 4½ feet so that said sheet of material is able to remain supported by said board means while being sawed.

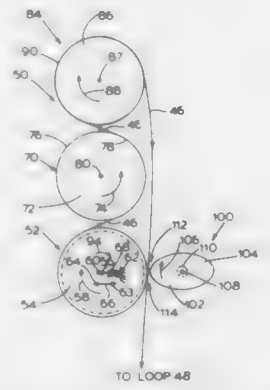
5,010,979

LADDER STABILIZING DEVICE

Arthur L. Shreve, III, P.O. Box 25, Butler, Md. 210[illegible]

Filed Jan. 30, 1990, Ser. No. 475,697
Int. Cl.[5] E06C *7/48*
U.S. Cl. 182—214 6 Claims

1. An improved ladder stabilizing device for supporting a ladder adjacent to a substantially vertical surface, of the type in which a ladder having a pair of generally parallel side rails connected by a plurality of transverse ladder rungs therebetween, is held by a first supporting means for supporting said ladder at a spaced distance from the said surface, and a second supporting means for removably clamping said first means to said ladder, and a third supporting means, wherein the improved third supporting means comprises:



a generally U-shaped member having parallel opposing sides positioned at oblique angles to a bottom of said member, an inside of said U-shaped member being shaped to receive and substantially engage and hold the said first supporting means parallel to the sides of the third supporting means and at right angles to the said vertical surface.

5,010,980

ASSEMBLY FOR LOWERING A PERSON TO SAFETY FROM A BUILDING

Richard B. Thomas, 10 Quintard Ave., Old Greenwich, Conn. 06870

Filed Jul. 25, 1990, Ser. No. 557,064
Int. Cl.[5] A62B *1/00*
U.S. Cl. 182—236 5 Claims

1. An assembly for lowering a person to safety from a building comprising:

(A) two bracket elements, each having

(1) an L-shaped body having a long leg and a short leg,

(2) fastener elements in said short leg which are attachable to a sill of a building window to releasably mount said each bracket element to that sill, and

(3) an elongated slot defined through said long leg;

(B) a housing having

(1) a hollow cylindrical body having two ends and a longitudinal centerline and an elongated slot defined therethrough,

(2) fastener elements on said hollow body which attach said housing to said bracket elements so that said housing longitudinal centerline is oriented essentially horizontally;

(C) a rope element having a person-supporting loop on one end thereof;

(D) a rope element storage and deployment unit which includes

(1) a storage drum having a longitudinal centerline and being rotatably mounted inside said housing body, said rope element having a second end affixed to said storage drum and being wound onto said storage drum to be dispensed from said storage drum when said drum rotates about said drum longitudinal centerline in a forward direction during a descent operation, and to be wound onto said storage drum when said storage drum rotates in a reverse direction about said drum longitudinal centerline,

(2) a support axle mounted on said housing body and attached to said storage drum on said storage drum longitudinal centerline and supporting said storage drum for rotation about said storage drum longitudinal centerline,

(3) a mounting element firmly affixed to said housing body,

(4) a spring element attaching said support axle to said mounting element and biasing said support axle in a first direction away from said mounting element,

(5) a first guide roller located adjacent to said storage drum and including

(a) a peripheral surface and a longitudinal centerline which is oriented to be parallel to said drum longitudinal centerline,

(b) a first mounting axle attached to said housing body, said first guide roller being mounted on said first mounting axle to rotate about said first mounting axle, and

(c) said rope element contacting said first guide roller about a first portion of the peripheral surface of said first guide roller,

(6) a second guide roller located adjacent to said first guide roller, with said first guide roller being located between said storage drum and said second guide roller, said second guide roller including

(a) a peripheral surface and a longitudinal centerline which is oriented to be parallel to said first guide roller longitudinal centerline,

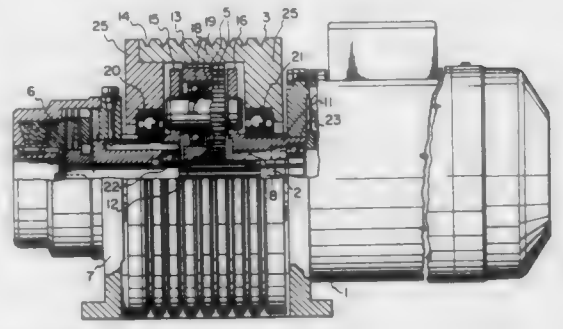
(b) a second mounting axle attached to said housing body, said second guide roller being mounted on said second mounting axle to rotate about said second mounting axle, and

(c) said rope element contacting said second guide roller about a first portion of the peripheral surface of said second guide roller,

(7) said first and second guide rollers and said storage drum being in a stacked configuration with said first guide roller first peripheral surface portion being on an opposite side of said first guide roller from said second guide roller first peripheral surface portion so that said rope element snakes around said first guide roller and exerts a rope force on said storage drum which opposes the biasing force exerted on said storage drum by said spring element,

(8) a cam element mounted on said housing body adjacent to said storage drum, said cam element being mounted on an axle to rotate and having two lobe ends, said lobe ends abutting against the portion of the rope element located on said storage drum when said cam element is in a first position and being spaced from said storage drum to define a gap when said cam element is in a second position as said cam element rotates, said cam element axle being mounted on said housing body,

(9) a torsion spring connected at one end thereof to said housing body and connected at another end thereof to said cam element axle and biasing said axle to rotate; and



(E) said rope element extending between said cam element and said storage drum to be jammed against the portion of said rope element on said storage drum when said cam element is in said first position and preventing further rope from moving off of said storage drum, and to be released when said cam element is in said second position to permit further rope to move off of said storage drum.

5,010,981

ELEVATOR MACHINE

Urho J. Heikkinen, Espoo, Finland, assignor to Kone Elevator GmbH, Baar, Switzerland

Filed Jul. 7, 1989, Ser. No. 376,478
Claims priority, application Finland, Jul. 7, 1988, 883244
Int. Cl.[5] B66B *11/04*
U.S. Cl. 187—20 5 Claims

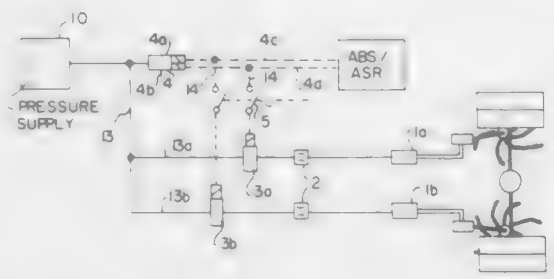
1. An elevator machine comprising:

a drive motor;

a drive shaft driven by said motor, said driveshaft being provided with gear teeth which are purposed to mesh with one or more intermediate gears;
said driveshaft being rotatably mounted in bearings located inside a fixed supporting axle;
said fixed supporting axle comprising one or more tubular parts and one or more flanges interconnected by one or more connecting members placed on the periphery of said flanges and rendering the supporting axle rigid, and wherein said one or more flanges support one or more intermediate gears between them, said one or more intermediate gears purposed to intermesh with said teeth of said driveshaft;
a traction sheave purposed to transmit motion of said drive shaft to an elevator car by means of cables;
said traction sheave being provided with internal toothing purposed to engage with said intermediate gears;
said intermediate gears comprising a gear assembly to reduce rotational speed of said motor for said traction sheave, said gear assembly being located inside said traction sheave;
said drive shaft passing through said traction sheave, said drive motor being coupled to one end of said drive shaft and a brake being mounted on the other end of said drive shaft on the opposite side of said traction sheave.

5,010,982

METHOD AND APPARATUS FOR IMPROVING VEHICLE TRACTION AND ROADABILITY



Joachim Sedlmayr, Lisle, Ill., assignor to Robert Bosch GmbH, Stuttgart, Fed. Rep. of Germany

Filed Aug. 7, 1989, Ser. No. 390,035

Claims priority, application Fed. Rep. of Germany, Aug. 6, 1988, 3826775

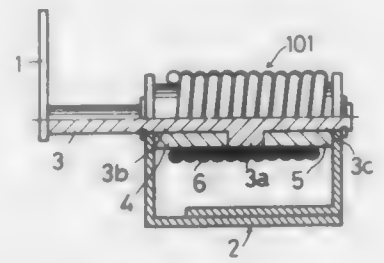
Int. Cl.[5] B60C *27/00*

U.S. Cl. 188—4 B **21 Claims**

1. A method for improving traction and roadability in vehicles including wheels and wheel brake cylinders, comprising the steps of initiating a traction control means to supply control signals to at least one control valve to control flow of a pressure medium to said brake cylinders and to separate adjusting cylinders (**1***a*, **1***b*), automatically evaluating signals generated by the traction control means to control said at least one fluid control valve for supplying a flow of said pressure medium to said separate adjusting cylinders (**1***a*, **1***b*) for controlling separate traction promoting means for increasing the wheel grip, and activating said separate traction promoting means for increasing the wheel grip on a road surface.

5,010,983

SHAFT LOCKING DEVICE



Yoshiharu Kitamura, Komagane, Japan, assignor to NHK Spring Co., Ltd., Yokohama, Japan

Continuation of Ser. No. 318,081, Mar. 2, 1989, abandoned. This application Jun. 28, 1990, Ser. No. 544,817

Claims priority, application Japan, Mar. 4, 1988, 63-[illegible]201; Mar. 4, 1988, 63-28202; Dec. 21, 1988, 63-165569

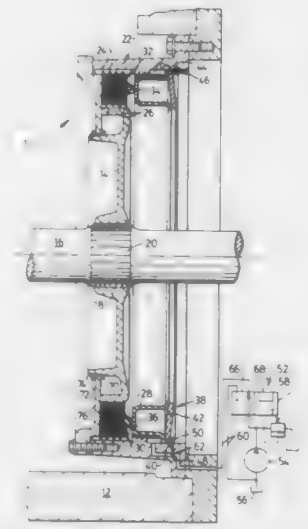
Int. Cl.[5] F16D *63/00*

U.S. Cl. 188—67 **11 Claims**

1. A shaft-locking device for locking rotation at any arbitrary position of an article requiring control of an inclined angle, said device comprising
a movable bracket secured to the article requiring control of an inclined angle,
a fixed bracket secured to a supporting member for supporting the article,
two fixed shafts integrally secured to said fixed bracket,
a movable shaft rotatably secured to the movable bracket,
the movable shaft being a stepped shaft with two small diameter portions being mounted within the fixed shafts and an outer diameter of a large diameter portion of the movable shaft being at least equal to the outer diameter of said fixed shafts and one of said fixed shafts being located between said movable bracket and said large diameter portion of said movable shaft,
a continuous coil spring spiraling in a single direction surrounding the fixed shafts and the movable shaft in a closely contacted state,
opposite end portions of said coil spring surrounding said fixed shafts to securely lock rotation of said movable bracket at any arbitrary position until an external force is applied to the movable bracket which is greater than a locking force exerted by the end portions of the coil spring on the fixed shafts to release said coil spring from said fixed shaft by expansion of said coil spring.

5,010,984

POWER TRANSFER ASSEMBLY WITH ONE-PIECE RETAINER RING



Bryan G. Lammers, Washington, and David M. Fee, Groveland, both of Ill., assignors to Caterpillar Inc., Peoria, Ill.

Filed Jun. 7, 1990, Ser. No. 544,292

Int. Cl.[5] F16D *55/36*

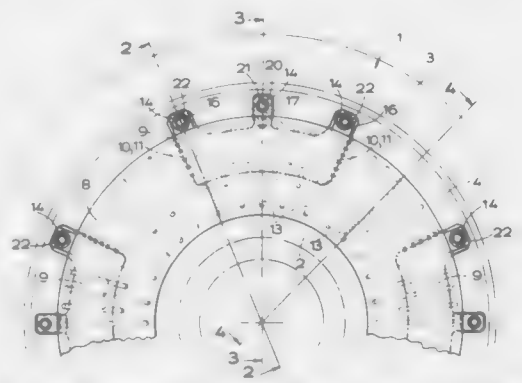
U.S. Cl. 188—71.5 **8 Claims**

1. A power transfer assembly, comprising:
a stationary non-rotatable housing;
a rotatable hub;
a rotatable power shaft splined to said hub;
a plurality of first and second friction discs splined respectively to said housing and to said hub, each of said first friction discs being adjacent at least one of said second friction discs;
a powered piston positioned within and moveable relative to said housing;
a cushion spring positioned between said piston and said friction discs;
first power means for moving said piston into contact with said cushion spring; and
a one-piece retainer and wear ring secured within said housing and in contact with said first power means, said one-piece retainer and wear ring including a split ring member having first and second portions, said first portion having

a substantially rectangular shape in cross-section, and said second portion having a substantially bulbous shape in cross-section.

5,010,985

DISC ASSEMBLIES FOR VEHICLE DISC BRAKES



David F. Russell, Mickle Trafford, and Keith Mungo, Liverpool, both of England, assignors to Lucas Industries Public Limited Company, Birmingham, England

Filed Aug. 30, 1989, Ser. No. 400,509

Claims priority, application United Kingdom, Sep. 2, 1988, 8821630

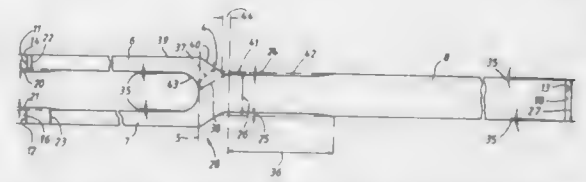
Int. Cl.[5] F16D *65/10*

U.S. Cl. 188—218 XL **8 Claims**

1. A disc assembly for a vehicle disc brake comprising a rotor, a pair of oppositely directed faces defined on said rotor, and an annular braking disc mounted on each of said faces, each said braking disc having a braking area and circumferentially spaced apart lugs which extend radially outwardly from the perimeter of the braking disc radially beyond the braking area, carrier means including a carrier plate, being secured both to the braking disc and to the rotor, the carrier plate having a plurality of lugs, said lugs extending radially outwardly with respect to the rotor; complementary radial abutment faces being provided on the carrier plate and the brake disc respectively, said lugs on the carrier plate being superimposed on said lugs of the brake disc; means for connecting at least one of said lugs of the carrier plate to the rotor; means for fastening another one of said lugs of the carrier plate to a superimposed one of said lugs of the brake disc; and means for permitting relative radial movement of said disc and said carrier.

5,010,986

BRAKEBAND



Gunter Jürgens, Stuttgart; Jürgen Pickard, Wernau, and Werner Sell, Quierschied, all of Fed. Rep. of Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart, Fed. Rep. of Germany

Filed Nov. 29, 1989, Ser. No. 442,654

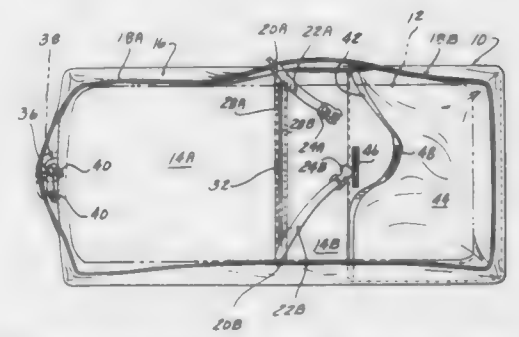
Claims priority, application Fed. Rep. of Germany, Dec. 7, 1988, 3841096

Int. Cl.[5] F16D *65/06*

U.S. Cl. 188—250 H **8 Claims**

1. A brakeband having two side band portions which branch off from a central connecting portion in one circumferential direction of an axis of rotation of a brake;
a middle band portion, located axially between these two side band portions, which branches off from the connecting portion in an opposite circumferential direction;
a thrust piece located circumferentially adjacent to each of free band ends of the two side band portions;
wherein circumferentially mutually confronting free end faces of the two side band portions and of the adjacent thrust piece are welded to one another;
wherein the free band ends of the side band portions are widened in the direction of the axis of rotation of the brake, in an axial direction pointing only toward the middle band, in such a manner as to provide a cross sectional area for the weld between said free band ends and said adjacent thrust pieces which is greater than the cross sectional area of said side bands in an area adjacent said widened band ends; and
wherein the middle band portion is narrowed at a region which is located adjacent the connecting portion and axially opposite the widened free band ends when said brakeband is disposed in the installed state, in such a manner as to effect an increase in a critical stress cross-section of said side bands in an area where said side bands branch off from said central connecting portion.

5,010,987



GARMENT BAG COVER

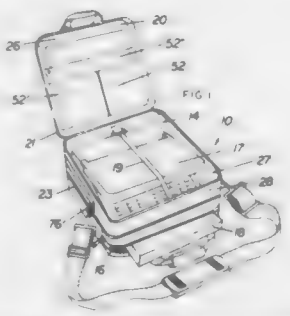
John Evans, Chesterfield, Mo., assignor to Design Research, Inc., Cookeville, Tenn.

Filed Apr. 20, 1990, Ser. No. 512,787

Int. Cl.[5] A45C *3/08, 13/30, 13/38*

U.S. Cl. 190—26 **5 Claims**

1. A cover for a garment bag luggage item comprising:



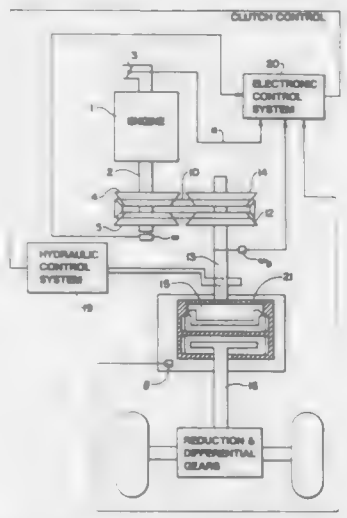
a generally rectangular main section of flexible material, of a size and shape to allow a garment bag to be laid atop said main section with the bag lying within its perimeter, said main section comprised of a pair of opposite halves lying on either side of the center of said main section;
an upturned border extending around said main section perimeter of a depth corresponding to that of said garment bag, the inside of said border defining a cover interior;
a pair of zipper tracks, each track extending about a respective one half of said border, each track joined to the other at either end at said center of said main section, and at least one zipper slider on one of said joined ends of said tracks, adapted to zipper together said tracks when said tracks are generally aligned with each other with said main section halves folded together;
a pair of straps, each one of said pair of strips connected at one end to a respective side of the interior of said cover at the center of said main section, the other end of each of said pair of straps free, means adapting the other end of each of said straps to be connected to each other to extend said connected straps across said cover;
a zippered opening extending partially across said main section at said center, whereby access to said garment bag through said opening is enabled.

5,010,988

EXPANDABLE SHOCK PROTECTED CARRYING CASE

Lauren Brown, 3704 NW. 82nd St., Miami, Fla. 33147

Filed Mar. 19, 1990, Ser. No. 495,614
Int. Cl.[5] A45C *7/00;* **B65D** *85/30*
U.S. Cl. 190—104 **20 Claims**



1. An expandable carrying case comprising:
a case including an exterior shell formed of a substantially rigid, yet flexible material defining an outer exposed surface, said case including a front panel, a rear panel and a surrounding side wall structure connecting between said front and said rear panels in enclosing relation to a case interior,
a main storage compartment formed in said case interior between said front panel and an interior dividing wall,
an expansion zone formed in said side wall structure between said interior dividing wall and said rear panel, said expansion zone structured and configured to permit movement of said rear panel relative to said interior dividing wall between a collapsed position and an expanded position,
a secondary storage compartment formed in said case between said interior dividing wall and said rear panel in the expanded position,
an inner lining disposed in substantially covering and surrounding relation to an interior surface of said case interior,
shock absorbing means disposed between said exterior shell and said inner lining and defined by a layer of shock absorbent material structured and configured to absorb impact to said exterior shell and forming a shock barrier between said exterior shell and said case interior,
access means formed in said surrounding side wall structure providing access to said main storage compartment and said secondary storage compartment, and
handle means disposed on said case for a single handed portability of said case.

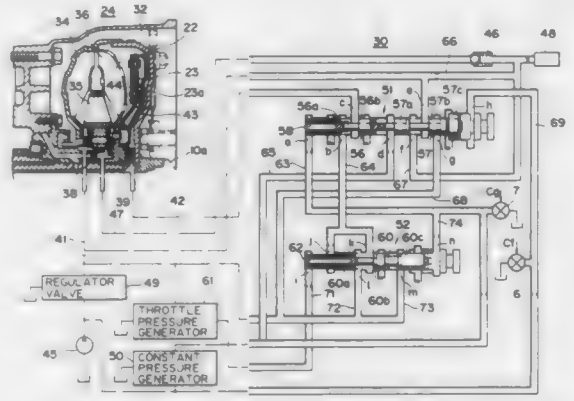
5,010,989

CLUTCH CONTROL FOR HIGH-RESPONSE CONTINUOUSLY VARIABLE TRANSMISSION

Peter Huntley, Ithaca, N.Y., assignor to Borg-Warner Automotive, Inc., Sterling Heights, Mich.

Filed Oct. 17, 1989, Ser. No. 422,627
Int. Cl.[5] B60K *41/02*
U.S. Cl. 192—0.033 **16 Claims**

1. A continuously variable transmission system having a controllable variable speed component and an adjustable clutch and means for controlling operation of said clutch in response to a demand for rapid power increase, said means for controlling clutch operation comprising:
means for providing a desired engine speed;
means for providing a measure of the actual engine speed;
means for comparing said desired engine speed with said measure of said actual engine speed measure to provide an error signal representative of the difference between said desired engine speed and said actual engine speed; and
means responsive to said error signal for providing an output signal representative of a required clutch engagement rate to allow said clutch to slip at a required controlled amount to facilitate an increase in said engine speed.



5,010,990

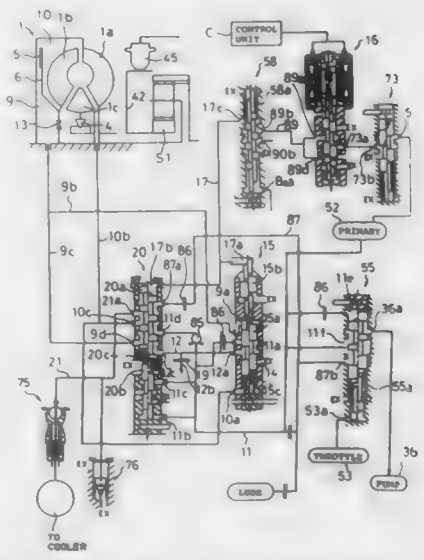
SLIP CONTROL SYSTEM FOR LOCKUP TORQUE CONVERTER

Hiroshi Yoshimura; Takuji Fujiwara; Kozo Ishi, and Kazuo Takemoto, all of Hiroshima, Japan, assignors to Mazda Motor Corporation, Hiroshima, Japan

Filed Nov. 6, 1989, Ser. No. 432,214
Claims priority, application Japan, Nov. 4, 1988, 63-278608; Aug. 17, 1989, 1-211972
Int. Cl.[5] F16H *61/14, 45/02*
U.S. Cl. 192—3.3 **23 Claims**

1. A slip control system for a lockup torque converter of an automatic transmission for an automotive vehicle having an engine, said lockup torque convertor consisting of a torque input element operatively connected to said engine, a torque output element operatively connected to said automatic transmission, and a lockup clutch for selectively coupling said torque input element and said torque output element of said lockup torque convertor, said slip control system comprising:
a shift operation detecting means for detecting shifting of said automatic transmission;
a deceleration detecting means for detecting that said automotive vehicle is decelerating in a predetermined speed region;
a hydraulic pressure supply system for supplying hydraulic pressure to said lockup torque convertor so as to actuate said lockup clutch to selectively couple said torque input element and said torque output element of said lockup torque converter; and
a hydraulic pressure control means disposed in said hydraulic pressure supply system for varying said hydraulic

pressure to provide at least two different slippage states of said lockup torque converter differentiating a first slipping stage when said deceleration detecting means detects deceleration of said automotive vehicle from a second slipping state when the deceleration detecting means detects no deceleration of said automotive vehicle in a condition where said shift operation detecting means detects a specified shifting of said automatic transmission, whereby allowing said lockup torque converter to differently slip dependent on deceleration of the vehicle.



5,010,991

LOCK-UP CLUTCH CONTROL DEVICE FOR A TORQUE CONVERTER

Kazumasa Tsukamoto; Kazunori Ishikawa, both of Toyota; Takuji Taniguchi, Okazaki; Kunihiro Iwatsuki, and Yutaka Taga, both of Aichi, all of Japan, assignors to Aisin Aw Co., Ltd. and Toyota Jidosha Kabushiki Kaisha, both of, Japan

Filed Sep. 14, 1989, Ser. No. 407,948
Claims priority, application Japan, Sep. 16, 1988, 63-231774
Int. Cl.[5] F16H *45/02*
U.S. Cl. 192—3.3 **8 Claims**

1. A lock up clutch control for a torque convertor, comprising:
an oil pressure supplying device,
regulator valve means for providing a regulated oil pressure,
a torque convertor for hydraulically transmitting engine power to an automatic transmission,
a lock up clutch disposed in the torque convertor with an orifice,
first and second oil chambers defined by the lock up clutch for supplying an oil fluid to release and connect the lock up clutch respectively and connected therebetween through said orifice,
a lock up valve means disposed between the torque convertor and the regulator valve means for selectively supplying the regulated oil pressure to one of the first and second oil chambers and connecting the torque convertor to an exhaust port to regulate a differential pressure between inside pressures of the first and second oil chambers, and
a solenoid valve means disposed between the oil supplying pressure source and the lock up valve means for regulating the differential pressure,
said lock up valve means having
a lock up relay valve for selectively supplying the regulated oil pressure to one of the first and second oil chambers, and
a lock up control valve for connecting the torque convertor to an exhaust port to regulate the differential pressure between the inside pressures of the first and second oil chambers,
said lock up relay valve including
a spool,
a first port connected to the first oil chamber,
a second port connected to the second oil chamber,
a third port connected to the regulator valve means for supplying the regulated oil pressure, and
a first control chamber connected to the solenoid valve means for supplying a solenoid controlled oil pressure to selectively connect the third port to one of the first and second ports,
said lock up control valve including

a second spool biased by a constant pressure means,
a first counter oil chamber connected to the first oil chamber,
a second counter oil chamber connected to the second oil chamber,
a second control chamber connected to the solenoid valve means, and
a third oil chamber connected to the torque convertor for connecting the torque convertor to an exhaust port through the spool to control the differential pressure in the torque convertor,
whereby said lock up control valve controls a connection between the torque convertor and the exhaust port under the condition of a differential-pressured state of the first and second oil chambers based on a solenoid controlled oil pressure.

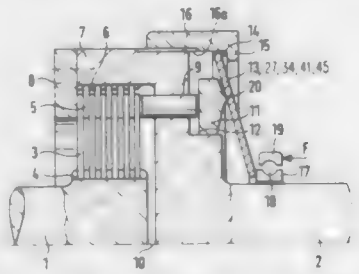
AXIALLY OPERATING POSITIONING ELEMENT, PARTICULARLY FOR A FRICTION CLUTCH STRUCTURE

Ruprecht Maurer, Bad Homburg, Fed. Rep. of Germany, assignor to Ringspann GmbH, Bad Homburg, Fed. Rep. of Germany

Filed Jan. 3, 1990, Ser. No. 460,409
Claims priority, application Fed. Rep. of Germany, Jan. 27, 1989, 3902360
Int. Cl.[5] F16D *13/50*
U.S. Cl. 192—70.27 **22 Claims**

1. Positioning apparatus to position a group of movable elements (9) located radially with respect to a shaft (1), optionally forming a clutch operating element to position axially

shiftable clutch plates (3, 5), selectively, into and out of engagement with each other, having



a ring disk;

circumferential means (14, 15) for supporting the ring disk at an outer circumference thereof and there locating said ring disk at a predetermined position with respect to said shaft;

movable means (18) engageable with an inner circumference of said ring disk and adjacent the circumference of the shaft, for moving the central region of the ring disk;

fulcrum means (11, 20) coupled to the movable elements (9) and engaging said disks opposite said movable means (18) at a radial position intermediate the inner circumference,

said movable means, upon axial movement in direction to and from said fulcrum means, deflecting said ring disk between essentially planar shape or position and conical

shape or position while applying a positioning force on said fulcrum means and hence moving said movable elements (9),

wherein the ring disk comprises a ring disk system (26) including individual separate parts or elements (27, 34, 41, 45) of generally sector shape;

said parts or elements are formed with inner engagement means (29, 30; 35, 37, 36;42, 43, 44; 46, 47, 48) for mutually supporting said parts or elements with respect to radial movement thereof; and

wherein said individual separate parts or elements (27, 34, 41, 45) are formed with outer circumferential engagement means outwardly of said inner engagement means for holding said parts in circumferentially essentially clearance-free or play-free alignment in all shapes or positions which said separate parts or elements may assume.

SERVO CONTROL DEVICE FOR A TORQUE COUPLING DEVICE, IN PARTICULAR FOR AUTOMOTIVE VEHICLES

Armadno Carneiro, Lyons; Marc Falcoz, Saint-Germain-En Laye, and Robert Michel, Mery-Sur-Oise, all of France, assignors to Valeo, Paris, France

Filed Jan. 16, 1990, Ser. No. 464,927

Claims priority, application France, Jan. 16, 1989, 89 00427

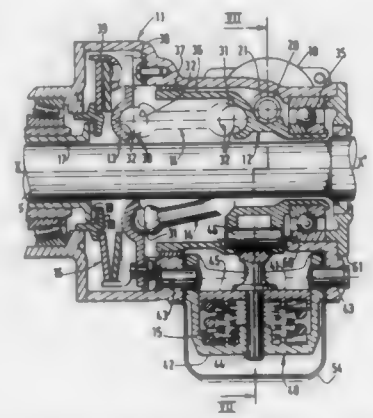
Int. Cl.[5] F16D *19/00*

U.S. Cl. 192—84 R **10 Claims**

1. A servo control device for modifying the state of a torque coupling device, wherein the control device comprises:

a fixed support defining a main axis of the device;

an electric motor mounted on the fixed support in a position offset from the main axis;



a driving member and a driven member;

means mounting the driving member in the fixed support for movement with respect to the latter in a rotational sense only;

means mounting the driven member in the fixed support coaxially, and in opposed relationship, with the driving member, for movement with respect to the fixed support in a translational sense only;

a mechanical connection coupling the electric motor with the driving member for actuating the latter;

and a plurality of elongated connecting members distributed circumferentially around the main axis, each of the driving member and driven member having a plurality of pivot means each mounting a respective end of a connecting member thereon, whereby each elongate connecting

member is pivoted to both the driving member and the driven member so that the driving member can drive the driven member through the connecting members.

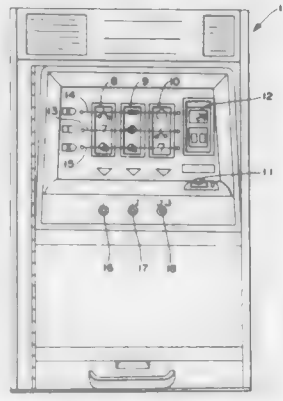
SLOT MACHINE



Kazuo Okada, Tokyo, Japan, assignor to Kabushiki Kaisha Universal, Tochigi, Japan

Continuation of Ser. No. 732,248, May 1, 1985, abandoned. This application Sep. 15, 1987, Ser. No. 97,423

Claims priority, application Japan, May 7, 1984, 59-65537

Int. Cl.[5] G07F *17/34*

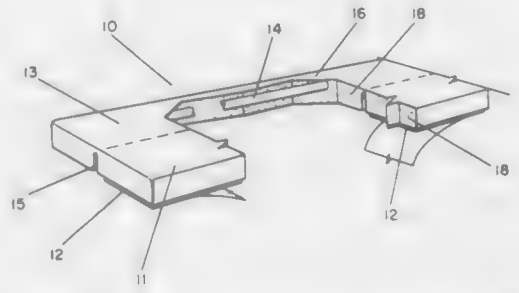
U.S. Cl. 194—219 **4 Claims**

4. A slot machine of the type having a plurality of lengthwise movable series of different symbols, means to select combinations of symbols at random during each game, and means to award prize coins when predetermined prize-winning combinations occur on prize-winning rows of symbols, comprising

(a) player-actuated means for designating any selected one of a plurality of combinations of plural prize-winning rows prior to each game, wherein said each combination has different number of said prize-winning rows in such a way that a combination with larger number of the prize-winning rows has all rows which another combination with smaller number of the prize-winning rows has; and

(b) means for starting the lengthwise movement of said series, said means for starting the lengthwise movement of said series operating to start the lengthwise movement of said series responsive to actuation by the player of said designating means.

5,010,996



WINDOW SILL ARMREST FOR MOTOR VEHICLES

Billy D. Washburn, 04 Peach Blossom, Los Lunas, N. Mex. 87031

Filed Dec. 4, 1989, Ser. No. 445,182

Int. Cl.[5] B60J *9/00*

U.S. Cl. 296—153 **48 Claims**

1. An armrest adapted to be attached to the window sill of a motor vehicle comprising:

a longitudinal inner support segment affixable to the window sill by adhering means disposed on an underside thereof;

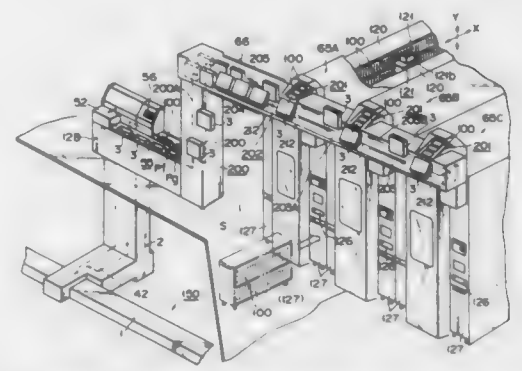
a longitudinal outer resilient support segment proximate and outboard of said inner support segment, said outer support segment comprising weighting means;

means for longitudinally hinging said outer segment to said inner affixable segment, said hinging means comprising a slot, said slot being sufficiently deep to accommodate vehicle windows which only partially retract; and

cover means for at least partially enclosing said segments.

5,010,997

TRANSPORT SYTSTEM



Yukito Matsuo, and Tsuyoshi Ishida, both of Yokohama, Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Sep. 13, 1988, Ser. No. 243,864

Claims priority, application Japan, Sep. 14, 1987, 62-230025

Int. Cl.[5] B65G *47/46*

U.S. Cl. 198—349.7 **19 Claims**

1. A system for transporting articles to stations having different addresses, respectively, comprising:

storage means for storing a plurality of articles, each article containing specific identification and address information;

selecting means for selecting address information and for retrieving said articles having the selected address information from said storage means;

carrying means for carrying a group of articles having the same selected address to a station having an address designated by the selected address information, the number of articles included in said group being not more than a predetermined number;

conveying means for conveying the articles retrieved from the selecting means and depositing the articles in the carrying means; and

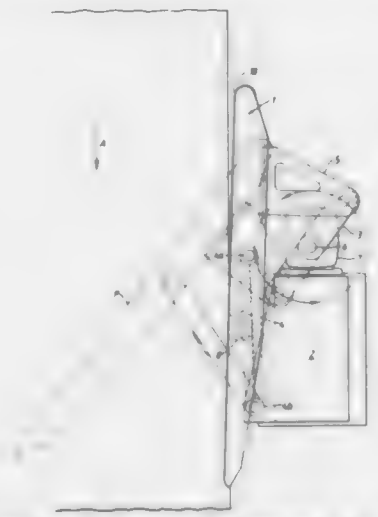
transport means for transporting said articles carried in said carrying means from said storage means to said stations and for transporting said articles carried in said carrying means from one station to another.

5,010,998

DIVERTER

Colin G. MacMillan, Cirencester, England, assignor to The Post Office, London, United Kingdom

Filed Jun. 29, 1989, Ser. No. 373,929



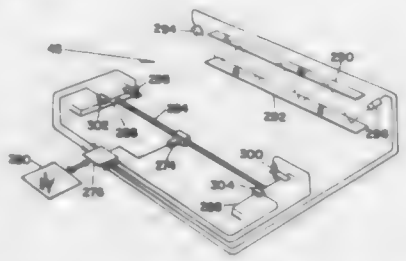
Claims priority, application United Kingdom, Jul. 7, 1988, 8816218.5

Int. Cl.[5] B65G *47/46*

U.S. Cl. 198—372 **8 Claims**

1. A diverter for diverting articles travelling on a conveyor, laterally of the conveying direction, comprising a diverter member which is mounted on a linkage for movement into and out of the path of the articles and which has an elongate article contact part to cooperate with the articles travelling on the conveyor, the linkage including a pivotal connection with the diverter member intermediate the length of the part, the arrangement of the linkage being such that the movement of the diverter member into the path of each article comprises an initial generally bodily movement in which the diverter member pivots about said pivotal connection to a small degree to enhance the diverting action of the portion of the article contact part nearer the approach of the articles such that the article contact parts pivots into the article path to give the

article a sustained push, followed by a pivoting movement about said pivotal connection in the opposite direction such that the near portion of the article contact part moves out of



the article path while pivoting that portion of the article into the article path to give the article a final nudge to complete the lateral displacement.

5,010,999

HIGH LAMINATION SPEED AUTOMATIC LAMINATOR

Amedeo Candore, Bodio Lomnago, Italy, assignor to Morton International, Inc., Chicago, Ill.

Division of Ser. No. 371,572, Jun. 26, 1989, Pat. No. 4,961,808. This application Mar. 23, 1990, Ser. No. 498,774
Claims priority, application Italy, Aug. 26, 1988, 48305 A/88
Int. Cl.[5] B65G *47/26*
U.S. Cl. 198—456 **1 Claim**

1. An automatic centering device for centering a board being conveyed into a machine, said board having parallel side edges, comprising:

means providing adjustable spaced parallel edges between which said board is conveyed with the side edges thereof substantially parallel to said adjustable spaced parallel edges,

reversible motor means,

screw means,

said reversible motor means and screw means being connected between said adjustable spaced parallel edges for effecting lateral displacement thereof,

a pair of vertically spaced elongated parallel mirrors between which said board is moved as said board is conveyed into the machine, said mirrors having adjacent first ends and adjacent second ends and positioned substantially perpendicularly with respect to said adjustable spaced parallel edges,

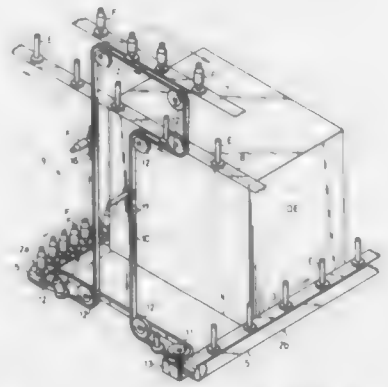
modulated infrared beam emitting means positioned adjacent said first ends of said mirrors,

infrared beam receiving means positioned adjacent said second ends of said mirrors and operative to respond to infrared reflections therebetween thereby to provide a signal to said reversible motor means that said board is between said mirrors for effecting energization thereof in the direction to close said parallel edges to center said board,

a slowing down photocell positioned above each of said adjustable spaced parallel edges, each of said slowing down photocells being arranged to respond to the presence of said board to provide a signal for effecting a decrease in the energization of said reversible motor,

a stop photocell positioned above each of said adjustable spaced parallel edges and arranged to respond to the presence of said board to provide a signal for effecting a discontinuance of the energization of said reversible motor, and

servocontrol means to which said signals from said infrared beam receiving means, slowing down photocells, and stop photocells are applied for controlling the operation of said reversible motor means to close said adjustable spaced parallel edges to center said board, the signals from said slowing down photocells being operative to effect a slowing down action on said reversible motor means, and the signals from said stop photocells being operative to effect stopping of said reversible motor means,



whereby precise centering of said board is effected with the side edges thereof parallel to said adjustable spaced parallel edges.

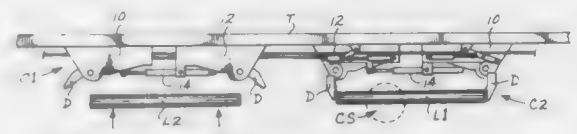
BOBBIN CARRIER IN SPINNING MACHINE

Yoshio Kawasaki, Shimada; Tatsutake Horibe, Fujieda; Takayuki Morita, Kariya; Haruyoshi Nakamura, Kariya; Kengo Ohashi, Kariya, and Tsutomu Miyazaki, Kariya, all of Japan, assignors to Kabushiki Kaisha Toyda Jidoshokki Seisakusho, Aichi and Nisshinbo Industries, Inc., Tokyo, both of, Japan

Filed Jun. 19, 1989, Ser. No. 368,023
Claims priority, application Japan, Jun. 21, 1988, 63-152662
Int. Cl.[5] B65G *29/00*
U.S. Cl. 198—465.1 **10 Claims**



1. A bobbin carrier in a spinning machine for carrying out full bobbins from and carrying in empty bobbins to a respective carrier provided on each longitudinal side of the spinning machine, the bobbins being supported on peg trays having trays from which pegs project from a face of the tray, and the bobbins being delivered by the bobbin carrier to a full-bobbin-carrying conveyor and received by the bobbin carrier from an empty-bobbin-carrying conveyor which conveyors extend substantially perpendicularly to the longitudinal direction of the spinning machine in the vicinity of one end in the longitudinal direction of the spinning machine, characterized in that the bobbin carrier comprises an endless belt provided adjacent both the carriers and the conveyors, guiding means for guiding and supporting the belt, driving means operatively connected to the belt for driving the belt, a pair of linear guiding members disposed so as to extend along the belt for sandwiching the pegs of the peg trays, the belt carrying the peg trays while sandwiching the trays elastically with pressure in cooperation with the guiding members, a full-bobbin introducing portion provided in the full-bobbin-carrying conveyor where delivering and receiving of the peg trays from the belt to the full-bobbin-carrying conveyor can occur, an empty-bobbin-discharging portion provided in the empty-bobbin-carrying conveyor where delivering and receiving of the peg trays from the empty-bobbin-carrying conveyor to the belt can occur, and a controlling member provided at the empty-bobbin-discharging portion and movable between a working position where it can engage the peg trays on the empty-bobbin-carrying conveyor and a waiting position not engageable therewith, the controlling member when in the working position controlling the moving direction of the peg trays to cause passage of the peg trays from the empty-bobbin-carrying conveyor to the belt.

TWIN CARRIAGE SYSTEM

Robert E. Cameron, Warrenton, Oreg.

Filed Sep. 15, 1989, Ser. No. 407,968
Int. Cl.[5] B65B *47/00*
U.S. Cl. 198—468.2 **13 Claims**

1. An end-dogging log carriage, comprising:

an elongated track comprising laterally spaced first and second track portions presenting inwardly directed first and second support rails, each said support rail including an upper support wheel engaging surface;

first and second carriage sections, each said section carrying an end dog for dogging an end of a log;

connector means extending between and adjustably interconnecting the carriage sections;

each carriage section comprising a frame having a top and inner and outer ends and first and second sides, a transverse axle at each end of said frame, on top of the frame, extending between said track portions above said rails, a carriage wheel at each end of each axle, said carriage wheels contacting said rails and serving to mount the carriage sections for movement along the rails;

each end dog being pivotally connected to its carriage section frame at a location below the rails, each end dog being positioned substantially vertically below said first support rail;

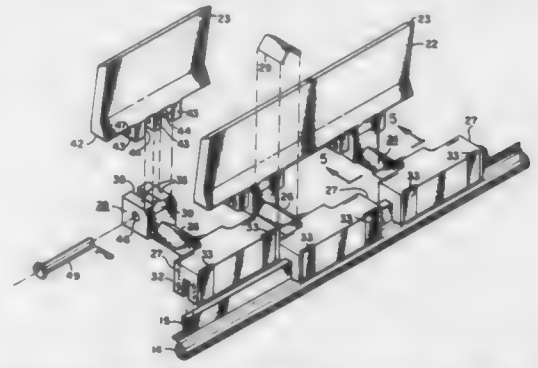
an elongated stabilizing rail positioned relatively adjacent the second support rail; and

stabilizing roller means at each end of each carriage section engaging the stabilizing rail and, together with the support rails and the carriage wheels, stabilizing the carriage section in position as it moves along the support rails.

5,011,002

SCRAPER APPARATUS FOR CONVEYOR BELTS

A. Todd Gibbs, Allentown, Pa., assignor to ASGCO Manufacturing, Inc., Allentown, Pa.



Continuation-in-part of Ser. No. 457,112, Dec. 26, 1989. This application Jul. 25, 1990, Ser. No. 557,642
Int. Cl.[5] B65G *45/00*
U.S. Cl. 198—497 **21 Claims**

1. In a scraper assembly for a conveyor belt normally traveling in one direction but capable of travel in the reverse direction, the assembly including a trailing arm supported at one end adjacent the belt and extending generally in the direction of normal travel of the belt, a scraper blade mounted at the distal end of said trailing arm having a home position disposed at an attack angle to the approaching portion of said belt, and having a scraping edge engaging said belt along a scraping line transverse to said normal direction of travel, and means biasing said trailing arm toward said belt to forcibly engage said scraping edge with said belt along said scraping line, the improvement wherein said assembly includes

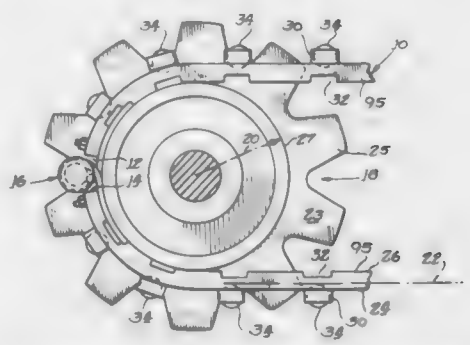
a stud element releasably mounting said scraper blade on the distal end of said trailing arm,

the distal end of said trailing arm having an exposed surface confronting said scraper blade,

the scraper blade having abutment means remote from said scraping edge operable to engage said exposed surface,

said stud element affording pivotal movement of said blade about a blade axis parallel to said scraping edge,

the engagement of said abutment means with said exposed surface being effective to limit said pivotal movement,



at least one of said exposed surface and said abutment means being of resilient material to yieldingly resist pivotal movement of said blade away from its home position upon encountering an obstruction on the belt as it travels past the blade, and to return said blade to its home position upon travel of the obstruction beyond the blade.

5,011,003

FULL DIAMETER HINGE ROD AND NOTCHED HARVESTER FASTENER

Alfred E. Gladding, Naperville, Ill., assignor to Flexible Steel Lacing Company, Downers Grove, Ill.

Filed Mar. 31, 1989, Ser. No. 332,228
Int. Cl.[5] B65G *17/00*
U.S. Cl. 198—728 **3 Claims**

1. In a conveyor belt assembly movable about a drive drum and having a plurality of fading rods equally spaced about an endless loop, the combination comprising:

a first belt having an outer edge and having opposite belt ends to be joined together to form a first endless belt loop,

a second belt having an outer edge and having opposite belt ends to be joined together to form a second endless belt loop,

a plurality of grading rods spanning said first and second belts, said grading rods being equally spaced from each other at equal distances and parallel to each other and having a predetermined diameter,

opposed belt fasteners of identical shape secured to the respective opposite ends of the first and second belts, an outer edge of each belt fastener being located adjacent to or inwardly of the outer edge of a first or second belt,

loops formed on the respective belt fasteners on the first and second belts to receive a hinge pin therein,

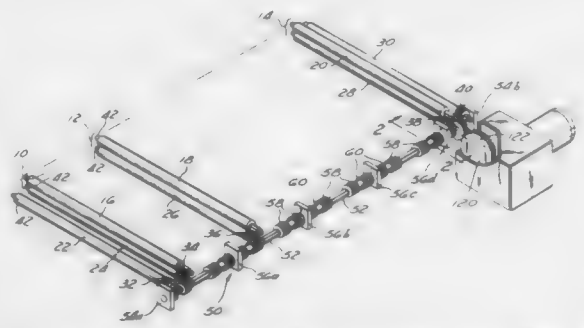
a hinge pin grading rod disposed parallel to said other grading rods and spaced equally therefrom and having opposite ends inserted into intermeshed loops for hingedly connecting the loops of the respectively-opposed belt fasteners to connect the belt fasteners to form the endless first and second belts,

said hinge pin grading rod being spaced at the equal spacing from the other grading rods and having a substantially constant diameter between the first and second belts and within the hinge loops,

retainer means between the hinge pin grading pin and the belt fasteners to hold the hinge pin grading rod from sliding from the loops, said retainer means being located inwardly of the outer edges of the belts,

lugs formed on the bottom of the first and second belts,

ends on the belts having reduced thickness and recesses formed by removal of the lugs at the ends of the respective belts,



the belt fasteners having a lower plate disposed in one of said recesses to provide a substantially flush lower surface for the bottom or each of the first and second belts as it moves about the drive drum.

5,011,004

CONVEYOR DRIVE ASSEMBLY

Mark D'Amato, Montreal, Canada, assignor to D.E.M. Controls of Canada, Montreal, Canada

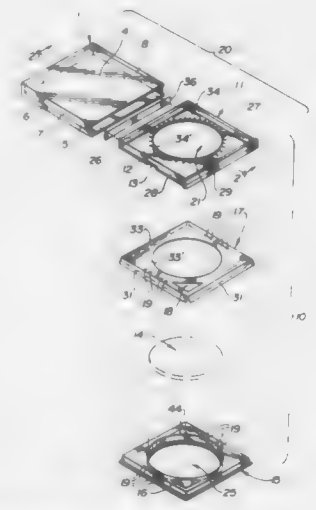
Filed Jul. 7, 1989, Ser. No. 377,422
Int. Cl.[5] B65G *13/06*
U.S. Cl. 198—791 **36 Claims**

1. A drive assembly for rotationally driving a plurality of conveyor rollers mechanically connected thereto, said drive assembly comprising:

an elongate, non-cylindrical drive shaft having first and second ends;

a plurality of roller drivers disposed about the drive shaft at spaced locations along the length thereof; and

a plurality of bearing assemblies disposed about the drive shaft at spaced locations along the length thereof, said bearing assemblies being sized and configured to hold and support said drive shaft in substantially fixed position relative to said conveyor rollers while permitting functional rotational movement of the drive shaft so as to drive said conveyor rollers;



said bearing assemblies comprising first and second bearing members having a plurality of plastic rolling elements positioned therebetween to permit rotational movement of said first bearing member relative to said second bearing member.

PROTECTIVE COIN HOLDER

Bruce D. Boyd, Sidney; Robert J. Geoghegan, Columbus; Barbara A. Metz, Baltimore; Karen L. Rosen; Richard D. Rosen, both of Hilliard, all of Ohio; Alex Bally, Pittsburgh, Pa., and Ronald J. Sears, Worthington, Ohio, assignors to Amos Press, Inc., Sidney, Ohio

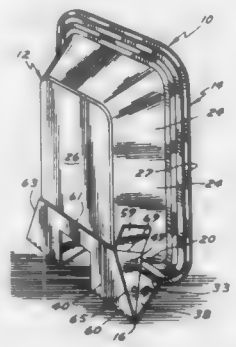
Filed Jul. 20, 1989, Ser. No. 383,368
Int. Cl.[5] A45G *1/00*
U.S. Cl. 206—0.81 **61 Claims**

1. A coin holder, comprising

an outer cover;

an inner element adapted to retain a coin therein, slidably inserted into said outer cover;

means for removably securing said inner element in said outer cover; and



tamper-evident means for permanently indicating removal of said inner element from said outer cover, said tamper-evident means interconnecting to at least a portion of opposing outer surfaces of said inner element and inner surfaces of said outer cover.

5,011,006

CONTAINER WITH LID CLOSURE HAVING AN IMPROVED FLARED STAND FEATURE

David S. Anderson, Brooklyn Park, Minn., assignor to General Mills, Inc., Minneapolis, Minn.

Continuation-in-part of Ser. No. 509,658, Apr. 16, 1990, which is a continuation-in-part of Ser. No. 418,425, Oct. 6, 1989, Pat. No. 4,962,849. This application Apr. 26, 1990, Ser. No. 515,012
Int. Cl.[5] B65D *5/52*
U.S. Cl. 206—45.24 **22 Claims**

18. A one-piece package blank for a package lid useful as a lid closure for an open faced tray having a sidewall fabricated with a peripheral flange and which supports the tray in a vertical position, comprising:

A. a first major face panel for overlaying the tray open face having inner and outer major surfaces and first and second ends;

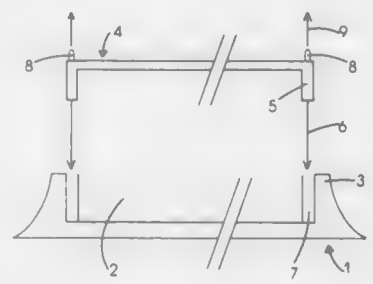
B. a stand tab hingedly connected to the first end of the face panel along a first common transverse fold line, said stand tab comprising

a base panel hingedly connected to the face panel along the first transverse fold line,

a rear panel hingedly connected to the base panel along a second common fold line,

at least one support panel hingedly connected to the rear panel along a third common fold line,

a tray index brace defined by an opposed pair of first and second laterally extending cut lines in the base panel and rear panels extending inwardly from the second, common transverse fold line and each cut line terminating at one end at a first minor transverse fold line in the base panel extending between the first and second cut lines and terminating at the second end at a second minor transverse fold line in the rear panel, said second common fold line extending between the first and second cut lines, and



C. a pull tab hingedly connected to the first end of the face panel along a fourth transverse common fold line.

CONTAINER

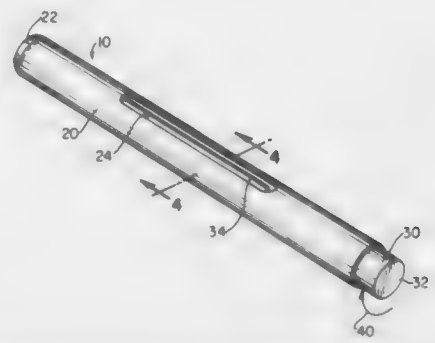
Barry P. Baker, Newtownards, Northern Ireland, assignor to Gallaher Limited, Surrey, England

Division of Ser. No. 324,975, Mar. 20, 1989, Pat. No. 4,934,125, which is a continuation of Ser. No. 108,053, Oct. 13, 1987, abandoned. This application Jan. 12, 1990, Ser. No. 464,521
Claims priority, application United Kingdom, Oct. 13, 1986, 8624480; Jan. 13, 1987, 8700705; Sep. 16, 1987, 8721745
Int. Cl.[5] A24F *15/00*
U.S. Cl. 206—242 **10 Claims**

1. In combination:

a container comprising rectangular bottom, top, front, rear and two side walls, of which at least said front, rear and side walls are formed of pliable sheets of non-shape sustaining fabric comprising woven polypropylene; and said top wall being connectable by a sliding clasp fastener along at least three edges thereof to adjacent upper edges of adjacent ones of said walls, said container having a length between its side walls of at least 80 cm, a width of at least 50 cm and a height of at least 35 cm; and

a compressed block of tobacco within said container;



said clasp fastener joining together said top wall three edges to said adjacent upper edges of adjacent ones of said walls.

5,011,009

CIGAR STORAGE AND TRANSPORTATION CONTAINER

Raymond Scheurer, Schoenenbuch, Switzerland, assignor to Davidoff of Geneva, Inc., New York, N.Y.

Filed Aug. 12, 1988, Ser. No. 231,572
Int. Cl.[5] B65D *85/10*
U.S. Cl. 206—270 **3 Claims**

1. A container for storing a and transporting cigars comprising:

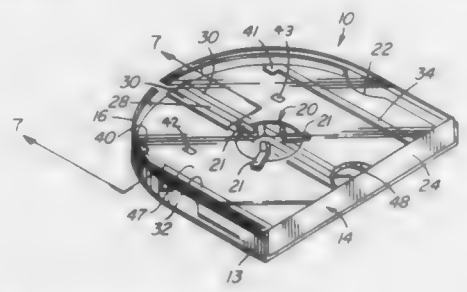
an outer tubular member having a closed end and open end;

an inner tubular member dimensioned to be telescoped within said outer tubular member and having an open end and a closed end opposite the closed end of said outer tubular member, said inner tubular member being slid into

said outer tubular member to a redefined stopped position, to define the closed position of said container, the tubular members overlapping over substantially their entire length in the closed position, with a portion of the inner tubular member protruding from the outer one;

said inner and outer tubular members having side openings which conform substantially in size and shape and are positioned so as to be capable of being brought into full alignment by relative rotation of said inner and outer tubular members, said openings being elongated and being smaller in the circumferential direction of said tubular members than the diameter of a cigar, said openings extending along the axes of said inner and outer tubular members for a substantial proportion of their length, the interior of said container being sealed from the exterior thereof when said openings are completely out of alignment, and various degrees of ventilation being provided to the interior of said container, when said openings are brought into various degrees of alignment.

5,011,010



COMPACT DISC CONTAINER

Nicholas J. Francis, 19545 Hammond Road, Pitt Meadows, B.C., Canada V3Y 1L5 , and Vernon E. Stewart, 12031 North Bonson Road, Pitt Meadows, B.C., Canada V3Y 1K6

Filed Jan. 30, 1990, Ser. No. 472,513

Int. Cl.[5] B65D *85/57*

U.S. Cl. 206—307 **19 Claims**

1. A disc container comprising:

(a) a sleeve having an enclosed cavity, said sleeve having an inner end and an open outer end;

(b) a disc-retaining tray having an inner end and an outer end, said tray being slidably displaceable within said cavity between a closed position whereat said tray is enclosed within said sleeve, and an open position whereat said tray extends outwardly from said sleeve outer end;

(c) locking means for releasably locking said tray in said closed position; and,

(d) release means extending through said sleeve inner end and operatively associated with said tray inner end for disengaging said locking means, whereby gravitational forces may slide said tray from said closed position to said open position when said container is oriented with said sleeve inner end above said sleeve outer end.

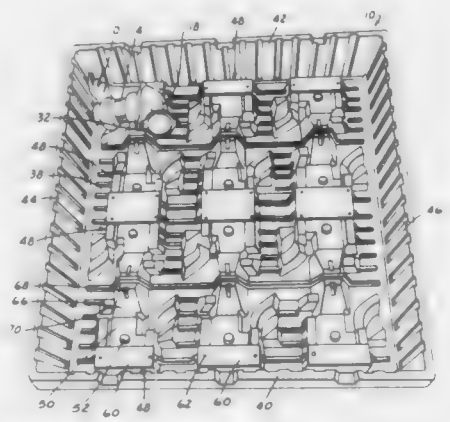
TRAY FOR TRANSPORTING VEHICLE TURBOCHARGERS



Garry B. Kidd, Novi, Mich., assignor to Chrysler Corporation, Highland Park, Mich.

Filed Jul. 26, 1990, Ser. No. 559,115

Int. Cl.[5] B65D *85/68*

U.S. Cl. 206—319 **6 Claims**

1. A tray for transporting vehicle turbochargers which comprise a generally cylindrical primary body portion having a longitudinal axis, a generally cylindrical secondary body portion extending outwardly from one end of the primary body portion having a longitudinal axis substantially perpendicular to the longitudinal axis of the primary body portion, a generally cylindrical first arm adjacent the other end of the primary body portion extending radially outwardly therefrom and having a longitudinally axis substantially perpendicular to the longitudinal axis of the primary body portion and oblique to the longitudinal axis of the secondary body portion, a generally cylindrical second arm having a longitudinal axis portion which extends axially outwardly from the primary body portions, a first bracket extending radially outwardly from one side of the outer periphery of the primary body portion intermediate the outer ends thereof, a second bracket extending radially outwardly from the opposite side of the outer periphery of the primary body portion intermediate the outer ends thereof, a projection extending radially outwardly from the outer periphery of the primary body portion intermediate the first and second brackets, the primary body portion having a recess extending radially inwardly from the outer periphery thereof between the first bracket and projection, and a flange

at the outer end of the secondary body portion extending radially outwardly; the tray comprising a generally rectangular tray body having a bottom wall, side and end walls extending upwardly from the bottom wall, a plurality of cradles each for receiving a turbocharger projecting upwardly from the upper surface of the bottom wall, each cradle including a first platform to support the turbocharger projection, an upwardly extending projection in the first platform for extending into the turbocharger recess, the first platform having a first recess adjacent the lastmentioned projection to receive the first turbocharger bracket, a second platform extending upwardly at an angle from the first platform, the second platform having a second recess to receive the second turbocharger bracket, the lastmentioned projection and first and second recesses restraining longitudinal and transverse movement of a turbocharger received in the cradle.

TOLERANCE COMPENSATING END PLUG

Harry C. Kattleman, Tempe, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Apr. 16, 1990, Ser. No. 509,264

Int. Cl.[5] B65D *85/30*

U.S. Cl. 206—328 **4 Claims**

1. A tolerance compensating end plug for use in a semiconductor device carrier, comprising: an elongated configuration having a first end, a body, and a second end, the first end being larger than the body so that the first end engages the semiconductor device carrier on its outside to prevent the first end from being inserted into the carrier, the body being large enough to provide a friction fit with the carrier's inside, and the second end having tolerance compensating means to compensate for variations in length of semiconductor devices located inside the carrier wherein the second end and its tolerance compensating means are unitary with the body and the first end said first end defining a cross-sectional area extending outwardly and transversely from said body in opposite directions, said body including resilient fins at an acute angle with the elongated direction of the body, said second end being hollow.

2. The combination of a tolerance compensating end plug plugging up an end of a semiconductor device carrier, the semiconductor device carrier being tubular in configuration and having an inside shaped to accommodate semiconductor devices, the tolerance compensating end plug, comprising: a first end and a second end, and a body portion located between the first and second ends; the first end being transversely larger than the inside of the semiconductor device carrier preventing any portion of the first end from entering the inside of the semiconductor device carrier; the body portion being large enough to provide a resilient friction fit with the inside of the semiconductor device carrier; and the second end being adopted to be resiliently longitudinally deformed to serve as a shock absorber for semiconductor devices located within the semiconductor device carrier and to compensate for tolerance differences of lengths of the semiconductor devices.

PORTABLE STORAGE CONTAINER

Edward Meisner, Short Hills; Michael P. Ballone, New Providence, and Young Park, Palisades Park, all of N.J., assignors to Waterloo Industries, Inc., Waterloo, Iowa

Filed Apr. 27, 1990, Ser. No. 516,031

Int. Cl.[5] B65D *21/02, 43/03*

U.S. Cl. 206—373 **24 Claims**

1. A portable storage apparatus comprising:

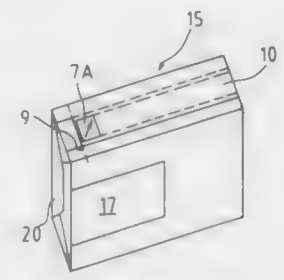
(a) a container;

(b) a cover removably mountable on the container and comprising a work surface thereon, a centrally disposed opening and a recess about the opening of sufficient size to enable entry of a hand; and

(c) a hand-holdable tray assembly removably insertable into the container in a nesting relationship thereiwth and comprising a first tray having a centrally positioned handle extending upwardly into the recess of the cover but not above the work surface, said handle adapted to be gripped by the user by placing the hand within the recess.

5,011,014

PACKAGING FOR ARTICLES, IN PARTICULAR THOSE HAVING A RIGHT PARALLELEPIPED SHAPE



Gerald-Wolfgang Borck, Ludwigshafen; Manfred Ell, Rheinau, and Hans-Dieter Erhardt, Renchen, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Continuation of Ser. No. 321,061, Mar. 9, 1989, abandoned. This application Apr. 24, 1990, Ser. No. 515,646

Claims priority, application Fed. Rep. of Germany, Mar. 10, 1988, 8803229[U]

Int. Cl.[5] B65D *85/672, 3/26, 65/26;* **B43M** *7/00*

U.S. Cl. 206—387 **13 Claims**

1. Packaging for articles consisting of film material which, in the form of a substantially closed film envelope, tightly encloses the articles, the film envelope being provided with tear means and being at least partially printed and being provided with heat-sealing means for joining unprinted surfaces of the film material,

wherein the tear means comprises a tear part which is integral with the film and carries printing, in a predetermined location, on the side of the film to be heat-sealed, such that the printing which inherently prevents heat-sealing in said location, substantially delineates the area over which the tear takes place, and

wherein one tear line is provided in the proximity of said tear part to initiate the tear.

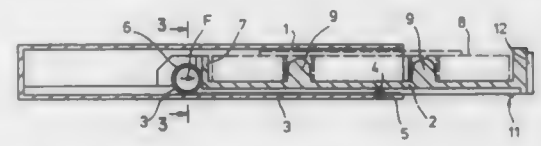
CONTAINER FOR MAGNETIC TAPE CASSETTES WITH SET DISPLACING SPRING MEANS

Manfred Ziegler, Dornstetten, and Edmund Koerner, Waldachtal, both of Fed. Rep. of Germany, assignors to Fischerwerke Artur Fischer GmbH & Co. KG, Waldachtal, Fed. Rep. of Germany



Filed Mar. 14, 1988, Ser. No. 167,833

Claims priority, application Fed. Rep. of Germany, Mar. 14, 1987[DE], 708356

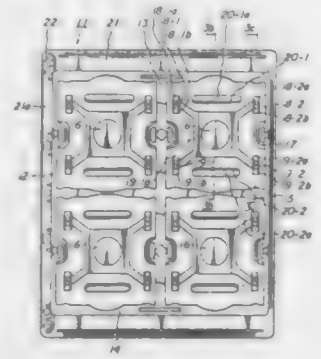
The portion of the term of this patent subsequent to Sep. 30, 2006, has been disclaimed.

Int. Cl.[5] B65D *85/672*

U.S. Cl. 206—387 **4 Claims**

1. Container for magnetic tape cassettes or similar information carriers, comprising a housing having an opening; a slide inserted into said opening of said housing and having a catch engageable in said housing, and receiving and holding a magnetic tape cassette; means to displace said slide after said catch has been released from said housing, between an inserted position in said housing and an extended position outwardly of said housing, said means including a spring strip formed so that it winds up automatically to displace said slide to said extended position, said strip having one end fastened to said housing in a region of said opening of said housing into which said slide is

inserted, and another end provided with a spring coil which engages said slide as said spring strip winds up; and guide means including a bottom guide provided on said housing and guiding said spring strip from below, and two lateral guides provided on said slide and guiding said spring coil therebetween said spring coil having a maximum diameter which is lesser than an internal height of said housing.



4. Container for magnetic tape cassettes or similar information carriers, comprising a housing having an opening; a slide inserted into said opening of said housing, said slide having a rear wall and having a catch engageable in said housing and receiving and holding a magnetic tape cassette; means to displace said slide after said catch has been released from said housing, between an inserted position in said housing and an extended position outwardly of said housing, said means including a spring strip engaging said rear wall of said slide and formed so that it winds up automatically to displace said slide to said extended position, said strip having one end fastened to said housing in a region of said opening of said housing into which said slide is inserted, and another end provided with a spring coil which engages said slide as said spring strip winds up; and guide means including a bottom guide provided on said housing and guiding said spring strip from below, and two lateral guides provided on said slide and guiding said spring coil therebetween, said spring coil having a maximum diameter which is lesser than an internal height of said housing, said strip having a predetermined width, said lateral guides being laterally spaced from one another by a distance so as to guide said spring coil in contact with the slide.

FILE SHEET FOR FILING INFORMATION RECORDING MEDIA

Jiro Ozeki, Tokyo, Japan, assignor to Slidex Corporation, Tokyo, Japan

Filed Sep. 28, 1989, Ser. No. 413,6[illegible]
Claims priority, application Japan, Sep. 30, 1988, 63-244371
Int. Cl.[5] B65D *1/24, 85/57*
U.S. Cl. 206—456 **5 Claims**

1. A file sheet for filing information recording media, said file sheet comprising

a rectangular sheet made of hard material and having a generally flat bottom surface, said sheet having the following parts formed integrally therewith:

a frame formed along each side of the sheet to divide the sheet into at least one lateral partition and at least one longitudinal partition, said frame being raised from a bottom surface of the sheet by a first distance;

a flange formed outside the frame;

said at least one lateral partition being raised from the bottom surface of the sheet by said first distance and extending in a lateral direction of the rectangular sheet;

said at least one longitudinal partition being raised from the bottom of the sheet by said first distance and extending in a longitudinal direction of the rectangular sheet,

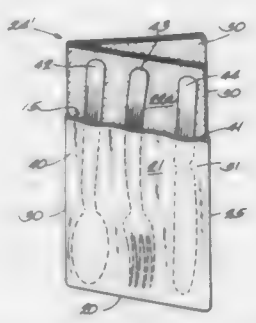
said frame, said at least one lateral partition and said at least one longitudinal partition dividing the space formed by the frame into a plurality of rectangular compartments for filing information recording media therein;

a plurality of lugs formed in the frame and said at least one longitudinal partition such that at least two lugs are positioned in each compartment, said lugs being raised from the bottom surface of the sheet by said first distance and projecting over the bottom surface;

a first pair of pad portions in each compartment raised from the bottom surface of the sheet by a second distance smaller than said first distance and positioned adjacent to the at least one lateral partition and the at least one longitudinal partition of the frame and separated from the at least one lateral partition and the at least one longitudinal partition of the frame by a portion of said bottom surface, each of said first pair of pad portions including inclined side walls viewed in the longitudinal direction of the frame;

a second pair of pad portions in each compartment raised from the bottom surface of the sheet by said second distance and positioned adjacent to the at least one lateral partition and the at least one longitudinal partition and separated from the at least one lateral partition and the at least one longitudinal partition by a portion of said bottom surface, each of said second pair of pad portions including inclined side walls viewed in the longitudinal direction of the frame; and

a plurality of holes formed in the flange along one longitudinal side of the sheet,



so that information recording media may be both inserted and withdrawn from opposite sides of said frame.

5,011,017

FOLDED PAPER NAPKIN WITH UTENSIL POCKET

William E. Giesen, Appleton, Wis., assignor to Wisconsin Tissue Mills Inc., Menasha, Wis.

Continuation-in-part of Ser. No. 355,231, May 22, 1989, abandoned. This application Feb. 12, 1990, Ser. No. 479,142
Int. Cl.[5] B65D *73/00*
U.S. Cl. 206—494 **4 Claims**

1. In a paper napkin comprising a square or rectangular sheet having a pair of opposed parallel first edges and a pair of opposed parallel second edges perpendicular to the first edges, the sheet being folded to define a folded napkin having a pocket for holding utensils,

the improvement wherein: the folded napkin includes:

(1) a first fold parallel to and spaced from one edge of the sheet,

(2) a second fold parallel to the first fold,

(3) a first panel defined between the first fold and said one edge, a second panel defined between the first fold and the second fold, and a third panel defined between the second fold and the edge of the sheet opposite from said one edge, the panels arranged with the first panel between the second and third panels,

(4) a first perpendicular fold perpendicular to the first and second folds to position the second panel exterior of the third panel, and

(5) a second perpendicular fold parallel to the first perpendicular fold; the folded napkin having a pocket including

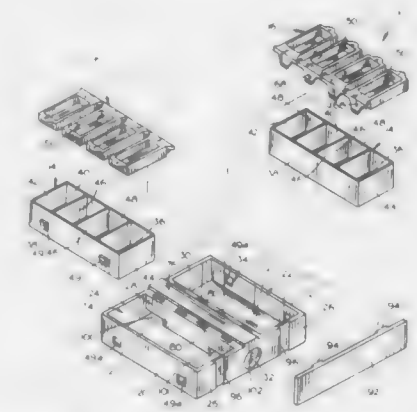
(6) a closed bottom portion defined by a section of the second fold,

(7) opposed closed side portions defined by the first and second perpendicular folds, and

(8) an open top portion defined by the first fold, and

(9) a front surface comprising a portion of the second panel;

a portion of the third panel extends beyond the open top portion of the pocket; and



the sheet includes first and second plies that have different colors, and the front surface of the pocket consists of part of the first ply and the front surface of the portion of the third panel extending beyond the open top portion of the pocket consists of part of the second ply.

MEDICATION DISPENSER WITH REMOVABLE LINER

Paul J. Keffeler, 9706 Brentwood Rd., Omaha, Nebr. [illegible]114

Filed Jul. 24, 1990, Ser. No. 557,197
Int. Cl.[5] B65D *83/04, 1/24*
U.S. Cl. 206—532 **1 Claim**

1. A medication dispenser, comprising,

a container comprising at least a pair of upstanding side walls, opposite upstanding end walls, and a pair of spaced apart divider walls extending between said end walls in spaced relation from said side walls to define a pair of spaced apart, generally trough-shaped cavities,

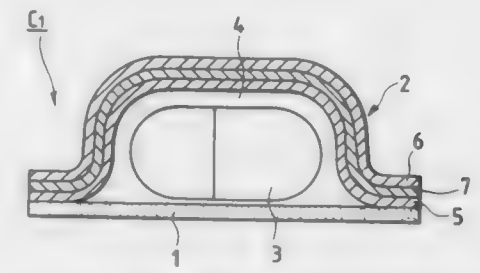
an elongated tab collection chamber positioned between said divider walls for collecting tabs fractured from said covers,

a multicompartment liner removably insertable into each of said cavities, each of said liners defining a plurality of open-topped compartments whereby medication placed within said compartments is maintained out of direct contact with said container,

a plurality of disposable compartment covers, each adapted to overlie and close a respective one of said compartments,

each cover including a separate integral fracturable tab adjacent to one end thereof,

coating lock means on said container and on the individual tabs for independently securing each tab in snap-fit locked relation onto said container, each cover being fractured from its respective tab in response to upward movement of the opposite end of said cover to open said compartment,



each of said divider walls having at least one opening formed therein which extends between said tab collection chamber and the cavity adjacent thereto to permit the fractured tabs to pass from said collection chamber into said cavity when the associated liner is removed therefrom to permit the fractured tabs in the dispenser to be removed therefrom.

CYTOTOXIC AGENT CONTAINMENT KIT

Kathleen R. Stevens, Sugar Land, and Thomas H. Connor, Dickinson, both of Tex., assignors to The Board of Regents, The University of Texas System, Austin, Tex.

Filed Jul. 19, 1989, Ser. No. 382,434
Int. Cl.[5] A61B *19/02*
U.S. Cl. 206—570 **8 Claims**

1. A disposable containment kit for drugs, including:

a bottom enclosure member;

a top enclosure member which is hingedly connected at one edge to the bottom enclosure, whereby the top enclosure and bottom enclosure can be closed to define a sealed enclosure;

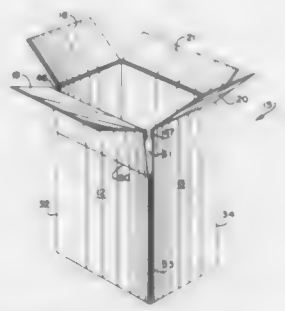
a sealable, substantially leakproof drug container which is impermeable to liquid and located within the enclosure defined by the top enclosure member and the bottom enclosure member and is capable of holding drugs and apparatus needed to administer the drugs;

a sealable waste container which is impermeable to liquid and located within the enclosure defined by the top enclosure member and the bottom enclosure member and is capable of holding used drug containers and apparatus;

at least one storage compartment which is located in the bottom enclosure;

a removable tray which is adapted to rest on top of the storage compartment, and which can be removed to provide an aseptic work surface on which to prepare drugs for administration; and

at least one absorbent pad on the removable tray;



which absorbent pad covers the upper surface of the tray and is removable from the tray, and which absorbent pad contains a chemical reagent which changes in color when a selected drug contacts it.

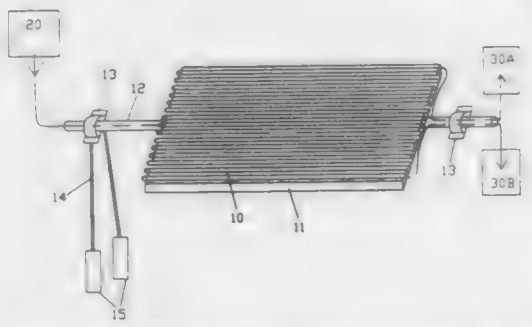
5,011,021

EASY UNPACKING DEEP CONTAINER

Jack D. Coltrane, Trinity, and Joseph R. Kushner, High Point, both of N.C., assignors to Burlington Industries, Inc., Greensboro, N.C.

Filed Feb. 7, 1990, Ser. No. 476,304
Int. Cl.[5] B65D *5/54*
U.S. Cl. 206—620 **20 Claims**

1. A cardboard container of generally a rectangular parallepiped shape, comprising four side panels defining the walls of said parallepiped and having a top and a bottom and connected together at generally vertically-extending corners, and means defining a bottom of said parallepiped; and



means defining a line of separation at least the corners on opposite sides of one of said panels, said lines of separation in said corners being adjacent, but spaced from, the top of said panel, and said lines of separation having sufficient length so that upon impacting or cutting the portions of said corners above said lines of separation the upper portion of said side panel may be readily detached at said corners, and folded over to allow ready access to the bottom interior of said parallepiped.

5,011,022

CYCLIC FLOW SLURRY FRACTIONATION

Prakash T. Palepu, 2541 Overlook Rd., Apt. No. 6, Cleveland, Ohio 44106; Cheng-Kuang Wu, 376 Balmoral Dr., Richmond Heights, Ohio 44143, and Robert J. Adler, 3068 Van Aken Blvd., Shaker Heights, Ohio 44120

Filed Nov. 15, 1988, Ser. No. 271,999
Int. Cl.[5] B03D *3/00;* **B01D** *21/00*
U.S. Cl. 209—155 **14 Claims**

1. Apparatus for fractionating a first and a second particle in a fluid, said first particle having a first sedimenting rate and said second particle having a second sedimenting rate less than said first sedimenting rate, said apparatus comprising

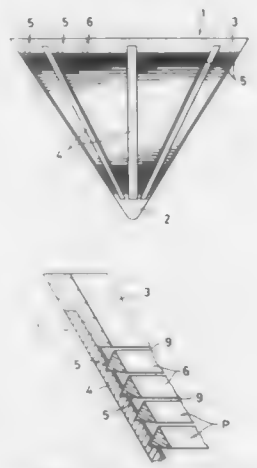
a tube having a generally lengthwise axis and being adapted to contain said mixture of particles in said fluid, said first and second particles having, respectively, first and second original axial positions, and said tube being so oriented that said particles are urged toward an inner surface of said tube;

first flow generation means to cause a first flow of said fluid in a first direction along said axis;

first flow control means to impose a first velocity and a first time period upon said first flow such that said first particle will be carried a substantial distance in said first direction from said first original position, and then will sediment at said inner surface during said time period of said first flow but said second particle will not sediment;

second flow generation means to cause a second flow of said fluid in a second direction opposite said first direction;

second flow control means to impose a second velocity and a second time period upon said second flow such that said first particle will remain sedimented and said second particle will be carried by said second flow a substantial distance in said second direction from said second original position, and then will sediment at said inner surface; and



resuspension means to resuspend said first and second particles without substantially dispersing them axially from their sites of sedimentation, said resuspension means comprising means independent of axial flows.

5,011,023

CONICAL ELEMENT FOR FILTERING AND SEPARATION

Koichi Arai, Kanagawa, Japan, assignor to Arai Machinery Corporation, Japan

Continuation of Ser. No. 184,080, Apr. 20, 1988, abandoned.
This application Dec. 8, 1989, Ser. No. 449,122
Claims priority, application Japan, Apr. 21, 1987, 62-096198
Int. Cl.[5] B07B *1/46*
U.S. Cl. 209—400 **13 Claims**

1. A frustro-conical filter for filtering various substances and separating particles, said frustro-conical filter including, in combination:

(a) a central member forming the apex of said filter and having at least a portion of a concave groove formed therein,

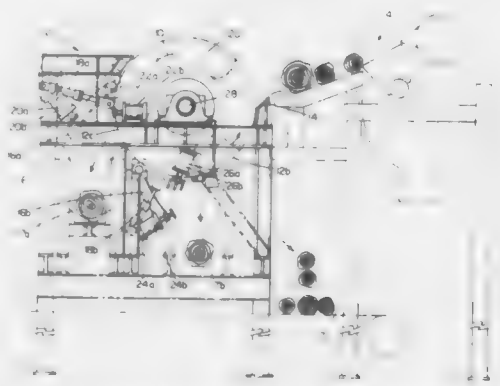
(b) an annular member coaxial with said central member and having at least a portion of a concave groove formed therein,

(c) a plurality of extending support frames connecting said central member and said annular member, and together forming a conically shaped frame,

(d) discrete locking grooves provided in said extending support frames and arranged to extend in a helical fashion along the support frames from the central member to the annular member,

(e) a wire of uniform cross section formed into a helix and extending from said concave groove in said annular member to said concave groove in said central member and engaging said locking grooves in said extending support frames, the interior of said wire forming a smooth conical curved surface,

(f) a locking device on said central member to fix said wire into said concave groove in said central member, and



(g) a locking device on said annular member to fix said wire into said concave groove in said annular member.

5,011,024

ROTARY LOG SORTER

Leroy R. Bunney, P.O. Box 1081, Everett, Wash. 98206

Filed Oct. 23, 1989, Ser. No. 425,673
Int. Cl.[5] B07C *5/14*
U.S. Cl. 209—517 **3 Claims**

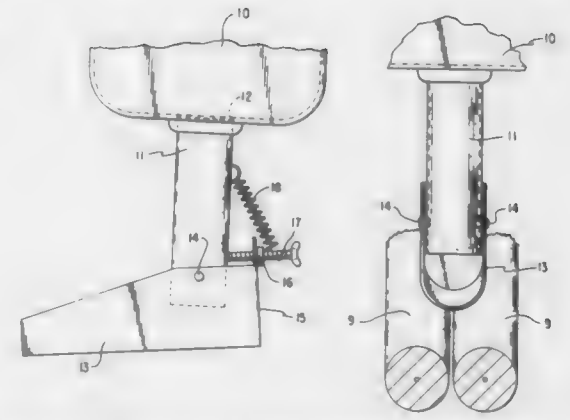
1. A rotary drum log sorter for sorting logs received from a log feeder adjacent to the log sorter comprising

a. a frame;

b. a rotating drum mounted to said frame, said drum being substantially circular in cross section and having circumferential pocket means adapted to receive logs;

c. gate means hingably mounted to said frame and adjacent to said rotating drum, said gate means having a closed position wherein a log in said pocket means of said rotating drum is prevented from leaving said pocket means as said pocket means rotates past said gate means in the closed position, said gate means having an open position wherein a log in said pocket means will exit from said pocket means as said pocket means rotates past said gate means in the open position, said gate means including an upper first gate and a lower second gate, said upper first gate and said lower second gate so arranged spatially that as said drum rotates about a horizontal axis, the first and second gates, when in a closed position, prevent the gravity discharge of the logs at respective first and second discharge positions, and there being a third discharge position, so located relative to the first and second gates, that any logs not discharged at the first and second discharge position are discharged at the third position; and

d. first shock absorbing means mounted to said frame for absorbing the shock of said gate means swinging open.



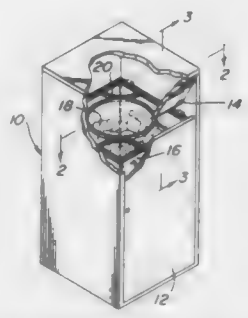
5,011,025

FEEDER FOR SEED CLEANER

Edward H. Lacey, P.O. Box 796, Trent, S. Dak. 57065

Filed Nov. 13, 1989, Ser. No. 435,597
Int. Cl.[5] B07B *13/16*
U.S. Cl. 209—618 **5 Claims**

1. For use with a seed cleaning machine having at least one pair of cleaning rollers, a feeding device comprising hopper means, a spout extending from said hopper means above each said pair of rollers, and chute means including a chute movably mounted on said spout adapted to receive seed from said hopper means through said spout for delivery to said rollers, screw means threadably engaged with said chute and adapted



to engage said spout and a spring engaged between said spout and said chute means to bias said screw means into engagement with said spout.

5,011,026

SOLID WASTE DISPOSAL SCREENING APPARATUS

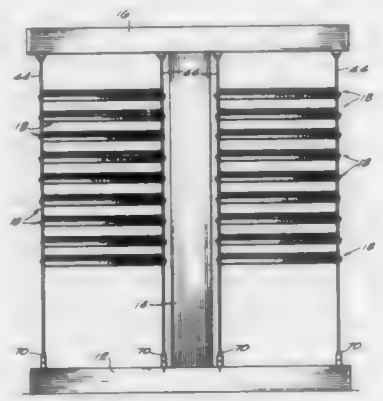
Ronald C. Hausman, and Judith A. Hausman, both of 202 Robert Rd., Emmaus, Pa. 18049

Filed May 15, 1989, Ser. No. 352,043
Int. Cl.[5] B07B *1/04, 1/46;* **B05D** *25/00*
U.S. Cl. 209—675 **8 Claims**

1. A screen or grid adapted to be placed substantially horizontally and in close proximity to the trash receiving end of a trash receptacle housed within an enclosure member having upstanding interior walls which permits smaller dimensioned trash to pass through openings in the screen or grid but will prevent larger dimensioned reusable objects, such as food carrying trays, from being mistakenly or inadvertently disposed of in the trash receptacle, said grid characterized by having a large central opening defined by an annular ring and being dimensioned smaller than the smallest dimension of the length or width of the larger dimensioned reusable objects, said opening supported centrally within an outer perimeter of the screen or grid by support members attached to the annular

ring at equidistant points along the circumference of the ring and to the perimeter at equidistant points along the perimeter.

5,011,027



SUSPENSION SYSTEM FOR DISPLAYING EYEGLASS FRAMES

Peter J. Van Slett, Wauwatosa, Wis., assignor to Eyecare One Corp., Wauwatosa, Wis.

Continuation of Ser. No. 272,229, Nov. 16, 1988, abandoned. This application Jan. 26, 1990, Ser. No. 474,622

Int. Cl.[5] A47F *7/00*

U.S. Cl. 211—13 **23 Claims**

1. A display device for displaying eyeglass frames, the display device comprising;

a frame having a base and an upper portion spaced above the base, the upper portion and the base defining a display area therebetween,

at least one elongated shelf adapted to support a plurality of pairs of eyeglass frames, and

means for supporting the shelf between the upper portion and the base, the means for supporting the shelf including at least a pair of spaced apart vertical support members each having an upper end and a lower end, the upper end of each vertical support member being fixed to the upper portion of the frame, and the lower end of each vertical support member being fixed to the base, and each vertical support member having a shelf support member selectively adjustably supported thereon, each shelf support member being releaseably fixed to the respective vertical support member, the shelf support members being adapted to be positioned under portions of the shelf to support the shelf, the elongated shelf including opposite ends, a pair of spaced apart frame members at the opposite ends of the shelf, each of the spaced apart frame members defining an aperture adapted to house a respective one of the vertical support members, and an elongated article supporting surface extending between the spaced apart frame members, the shelf support members each including a first portion adapted to be housed in a respective one of the apertures defined by a respective one of the spaced apart frame members, and an upwardly facing support surface adapted to support a respective one of the opposite ends of the frame members, the shelf support members and the respective one of the frame members being separable.

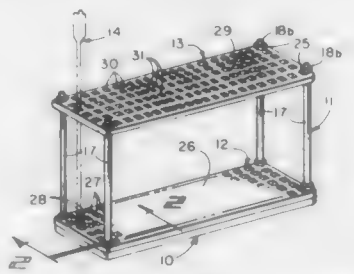
5,011,028

ADJUSTABLE ARROW HOLDER

Donald C. Sweeney, South 9417 Freeman Rd., Medical Lake, Wash. 99022

Filed Mar. 5, 1990, Ser. No. 487,535

Int. Cl.[5] A47F *7/00*



U.S. Cl. 211—60.1 **3 Claims**

1. A holder for archery arrows, that maintains individual arrows in spaced, vertical array, comprising in combination:

a base having a solid rigid, planar base plate defining at least four vertical support holes extending herethrough for releasable interconnection of a vertical support element;

at least four vertical support elements communicating with each vertical support element hole defined in the base to extend vertically upwardly a spaced distance above the base, each said vertical support having threaded upper and lower end portions, and each said threaded end portion carrying spacedly adjacent nuts;

a lower arrow head holder plate comprising a rigid planar holder plate defining a plurality of spacedly arrayed arrow head holding orifices with orifice defining septa between adjacent orifices, holes for passage of the vertical support elements therethrough, and a peripheral shape substantially the same as the base, said arrow head holder plate positioned immediately above the base with a first nut carried by the lower threaded portion of the vertical support elements on the undersurface of the base and the adjacent nut carried by the same threaded end portion of

the same vertical support element on the upper surface of the arrow head holder plate; and

an upper rigid arrow shaft holder plate having a rigid planar element defining a plurality of spaced arrow holding orifices defined by septa between adjacent orifices, said orifices arrayed similarly to the orifices defined in the lower arrow head holder plate to support an arrow extending between both said holder plates in substantially vertical orientation, holes for passage of the vertical support elements therethrough, and a peripheral shape substantially the same as the base, said arrow shaft holder plate carried by the vertical supports extending therethrough with a first nut carried by the upper threaded portion of the vertical support elements positioned on the undersurface and a second nut carried by the same upper threaded portion of the same vertical support element positioned on the upper surface of the arrow shank holder plate in fastening adjacency therewith.

5,011,029

COAT LIFT HANGER

Seiji Sugasawara; Ken Tsuneki; Kazuyoshi Ohshima; Yojiro Nakayama; Tatsuya Hayakawa, and Seiichiro Tamura, all of Tokyo, Japan, assignors to Sugatsune Industrial Co., Ltd., Tokyo, Japan

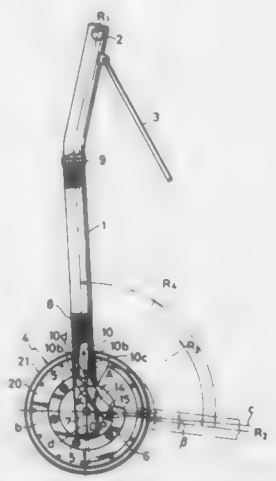
Filed Jun. 27, 1989, Ser. No. 372,080

Claims priority, application Japan, Jun. 30, 1988, 63-163070; Jun. 16, 1989, 1-153726

Int. Cl.[5] A47F *5/08*

U.S. Cl. 211—104 **2 Claims**

1. A lift coat hanger comprising



a hanger pipe for holding hangers,

an arm capable of being pivotally tilted downwardly forward and returned to its upright standing position for moving said hanger pipe up and down, wherein said hanger pipe is horizontally extending from and fitted to an upper end of said arm,

a rotary lever pivotally connected at one end to the upper end of said arm and extending along a length of said arm to a lower end of said arm in the upright position of said arm so as to be swung out when said arm in tilted forward and an opposite free end of said rotary lever being located adjacent to the lower end of said arm in the upright position of said arm for tilting and returning said arm by pulling and pushing the free end of said rotary lever.

a restoring spring means capable of restoring the arm from its forwardly tilted open position to its upright standing closed position by using the force stored in it by the arm when the arm is forwardly pivoted from the upright standing closed position to the forwardly tilted open position by pulling on the free end of said rotary lever,

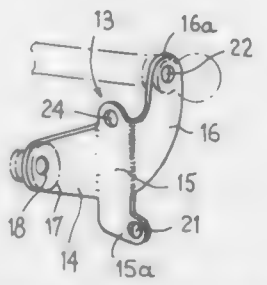
a damper connected with the lower end of said arm for damping the rotary motion of said arm transmitted thereto from said arm by means of a movable shaft so as to reduce

the rotational speed of said arm when pivoted between its upright standing closed position and its forwardly tilted open position, and

a transmission/disconnection mechanism provided between said movable shaft of the damper and the lower end of the arm to make said damper selectively operational only within a predetermined range where the arm is moved down and comes close to the forwardly tilted open position by pulling on the free end of said rotary lever and a corresponding range where the arm is moved up and reaches the upright standing closed position by pushing on the free end of said rotary lever.

5,011,030

FASTENING MEMBER FOR A CURTAIN TELESCOPIC ROD



Jacques Alaurent, 14 rue Villebois-Mareuil, Cormeilles-en-Parisis, France 95240

Continuation-in-part of Ser. No. 309,764, May 5, 1988, abandoned. This application Nov. 2, 1989, Ser. No. 430,604

Claims priority, application France, May 6, 1987, 87 06396

Int. Cl.[5] A47H *1/00*

U.S. Cl. 211—105.6 **7 Claims**

1. A fastening member for a telescopic rod having an internal spring for supporting a curtain on a window frame or door frame, said fastening member being adapted to be mounted to an end portion of the telescopic rod, and said fastening member comprising:

a first flat section extending in a first direction having a fixation portion at an end thereof for fixation to the frame;

a second flat section extending from said first flat section in a second direction substantially perpendicular to said first direction, said second flat section having a lower end, and said second flat section having at least at said lower end a support area, located below said fixation portion of said first flat section in use, said support area being adapted to bear on the frame; and

a third flat section extending from said second flat section upwardly therefrom in use and in a third direction parallel to said first flat section, said third section having an upper end portion thereof adapted to fit on the end portion of the telescopic rod which in use is located at a level higher than the level of said fixation portion of said first flat section, and said third section being laterally offset on said second flat section with respect to said first flat section such that said third flat section, when in use on a window frame, will be laterally located beyong the vertical edge of the window pane.

CROSSBAR SYSTEM FOR RACK

Anthony N. Konstant, 920 Fisher La., Winnetka, Ill. 60093

Filed Aug. 11, 1989, Ser. No. 392,540

Int. Cl.[5] A47B *47/00*

U.S. Cl. 211—191 **15 Claims**

1. A method of manufacturing a rack which comprises a pair of parallel side beams, each defining a groove facing the other side beam, which method comprises:

inserting between said side beams a crossbar with the opposed ends of said crossbar each occupying a side beam facing groove, to extend between said side beams, while flexing said side beams outwardly for said insertion; inserting between said side beams a spacer bar positioned along a central portion of said side beams, said spacer bar having opposed ends and being shorter than said crossbar; and tightly securing each said side beam to one of said opposed ends of said spacer bar to draw said central portion of each said side beam inwardly relative to said crossbar, to provide high constricting pressure securance between the ends of said crossbar and the side beams.

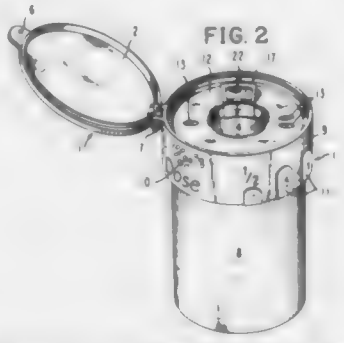
5,011,032

PATIENT DOSAGE REGIMEN COMPLIANCE BOTTLE CAP

Bruce L. Rollman, 662 Melvin Dr., Baltimore, Md. 21230

Filed Feb. 28, 1990, Ser. No. 486,298

Int. Cl.[5] B65D *51/24;* **G09F** *9/40*



U.S. Cl. 215—230 **7 Claims**

1. A closure cap adapted for attachment to the neck of a standard prescription medicine container to aid patient compliance of a dosage regimen of solid dosage units of medicine such as pills, capsules and tablets comprising a lid with a skirt integrally connected thereto by a living hinge wherein:

(a) said skirt is adapted to attach to a prescription medicine container open neck, said skirt having a ring attached on the inside surface thereof, said ring having a center hole of a diameter which permits one dosage unit to pass therethrough at a time and being attached on said skirt so that

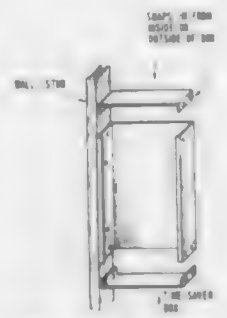
when said skirt is attached to said container neck, the ring opening is concentric with said open neck of said container, said ring having indicia on the top surface thereof which displays the number of times medicine is taken or is to be taken in a time frame, said ring also having on the top and bottom surfaces thereof a circumferential groove intermediate the center hole and the inside edge of the neck of the container and having movably attached thereto a U-shaped slide with a non-rigid upper leg and a lower leg wherein the upper leg has means to fit in the upper groove and the lower leg has means to fit in the lower groove, said upper leg having an opening therein enabling the user to see or feel the indicia on the top

FIG. 2

surface of said ring providing the number of the last dosage taken or remaining dosage to be taken in the reference time frame and said skirt having on its outer surface indicia displaying the number of medication units to be taken during each time period the medicine must be taken;

(b) said lid of said cap having a tab on the outside periphery thereof for the patient to pull said lid upward to the open position unsealing the opening of said container, the top surface of said lid having indicia thereon displaying the dosage regimen per unit time and the outer surface of said annular skirt having indicia displaying the number of medication units to take during each time period the medicine must be taken.

5,011,033



ELECTRICAL SERVICE CENTER

Thomas Roth, 91 Powhatan Trail, Medford, N.J. 08055

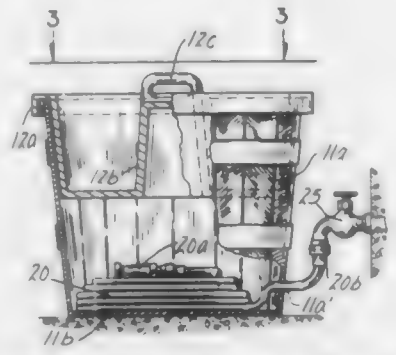
Continuation of Ser. No. 418,785, Sep. 16, 1982, abandoned. This application Mar. 7, 1989, Ser. No. 319,663

Int. Cl.[5] H02B *1/08*

U.S. Cl. 220—3.94 **4 Claims**

1. An electrical service box consisting of an enclosure body member comprising a back and two opposing sides, and a plurality of circuit breaker or fuse means mounted to said body means between said sides, said enclosure body member adapted to be mounted to building studs or building walls, a top enclosure member and a bottom enclosure member, each of which is adapted to be mounted in slidable contact with said enclosure body, said top enclosure member and said bottom enclosure member each provided with means of wire or cable openings as the primary access for electrical service into and out of said service box to said circuit breaker or fuse means, said enclosure body and said top and bottom members each provided with means for locking said top member and said bottom member when said top and bottom members are positioned within said enclosure in appropriate top and bottom positions.

5,011,034



GARDEN HOSE CONCEALING ARRANGEMENT INCLUDING INDEPENDENTLY USABLE LID

Don E. Abel, 4 Douglas Dr., Olney, Ill. 62450

Filed Jan. 29, 1990, Ser. No. 471,783

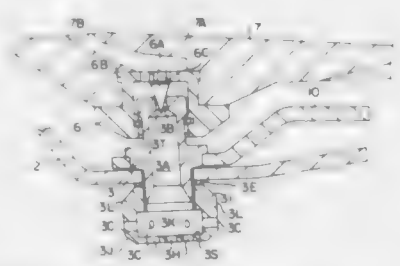
Int. Cl.[5] B65D *51/28*

U.S. Cl. 220—23.86 **4 Claims**

1. An arrangement for concealing a garden hose comprising, in combination, a receptacle and said garden hose, said receptacle having a side wall including an upper edge and a bottom wall, said garden hose received on said bottom wall in a coiled and layered relationship, and a lid including a side wall and a flat bottom wall received on and hanging from said upper edge of said side wall of said receptacle and defined by a centrally disposed post including an upper surface and presenting space therearound of sufficient depth to receive vegetation, where handle means are presented on said centrally disposed post, where said lid is usable independently of said receptacle, and where said flat bottom wall thereof selectively rests on a supporting surface.

5,011,035

PRESSURE REGULATING SYSTEM FOR USE IN PRESSURE COOKERS AND PRESSURE COOKER HAVING THE SAME



Naranammalpuram S. Subramanian, Maharashtra, India, assignor to Hawkins Cookers Limited, Maharashtra, India

Continuation of Ser. No. 235,458, Aug. 24, 1988, abandoned. This application May 22, 1990, Ser. No. 526,789

Claims priority, application India, Jul. 21, 1987, 231/87

Int. Cl.[5] B65D *51/16*

U.S. Cl. 220—203 **1 Claim**

1. An improved pressure regulating system for use in pressure cookers comprising of a vent tube adapted to be secured in a hole in the lid of the pressure cooker by a hollow holding nut and a vent weight adapted to be freely seated in the vent tube by a tapered pin at the top of said vent tube, said vent

weight being mounted on a fulcrumed lever which has a passage exposed to the atmosphere and in flow communication with one or more openings formed through the base section of the vent weight which extends laterally from said tapered pin, characterized by the improvement wherein said vent tube comprises of a plurality of sections including:

(a) a lowermost frusto conical section having an inward taper towards its top; and

(b) an upper cylindrical section having a narrow bore for receiving the tapered pin of the vent weight, and in flow communication with the narrow end of an upper frusto conical shaped channel having an inward taper toward the top end, said latter channel being disposed with its larger end of said taper being contiguous to the upper end of;

(c) an intermediate central cylindrical section, said intermediate cylindrical section having a central cylindrical passage of substantially larger diameter than the bore of aforesaid upper cylindrical section and communicating with:

(i) said upper frusto conical section and

(ii) said lowermost frusto conical section to provide a central steam passage between said bore and said lowermost frusto conical section,

(d) and wherein said hollow holding nut includes an enlarged lower cylindrical chamber having a planar bottom surface and a lateral side, a plurality of holes through said bottom surface and also through the lateral side, each hole in the lateral side being in alignment with a hole in the bottom planar surface, for the escape of steam from the pressure cooker through the vent tube, said lower cylindrical chamber of the holding nut being in flow alignment and communication through an upper cylindrical chamber in the nut which is in flow alignment and communication with said lowermost frusto conical section of said vent tube, the arrangement being such that when the vent tube is secured to the lid of the pressure cooker with the help of the holding nut and the vent weight is mounted on said vent tube through said tapered pin, the steam formed in the pressure cooker builds up to a predetermined pressure, initially assumes a laminar flow in said enlarged lower cylindrical section of the holding nut, and continues to flow as a laminar stream through said sections of the holding nut and the vent tube, and then escapes at a steady rate through the vent weight as dry steam without any appreciable quantity of condensed water.

5,011,036

FRONT LOADING, FOOT OPERATED REFUSE BIN

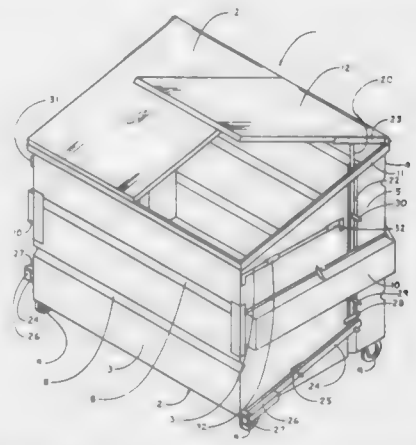
Dennis M. Souza, 1617 Carnelian Ct., and Tad E. Jakes, 505 Placer Dr., both of Woodland, Calif. 95695

Continuation-in-part of Ser. No. 535,026, Jun. 8, 1990, abandoned. This application Nov. 26, 1990, Ser. No. 618,[illegible]61

Int. Cl.[5] B65D *43/26*

U.S. Cl. 220—263 **5 Claims**

1. A front-end loading refuse bin having a floor, a front wall, back wall and side walls forming a box, the walls having upper edges terminating in a reinforced perimeter, the bin having a lift sleeve on each side wall, and the bin having a lid apparatus comprising:



a. a lid rotatably mounted to the rear portion of the perimeter extending above a side wall,

b. a support device on the underside of the lid adjacent the side wall,

c. a channel formed in the side wall, interior to perimeter and lift sleeve,

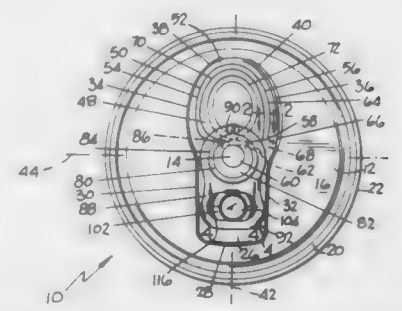
d. a push rod mounted to travel vertically within the channel and having a top end to contact the support device and having a stowed position in which the lid is closed and a open position in which the rod has been moved upward and the top has moved along the support device forcing an opening of the lid, and further the push rod having a bottom end pivotally attached to the rearward end of a swing arm,

e. the swing arm is pivotally secured to the side wall by an attaching means located near the lower central portion of

the side wall and having a pedal surface at the forward end of the swing arm,

---

5,011,037



CONTAINER END MEMBER

Bruce A. Moen, Golden, and Harold Cook, Jr., Evergreen, both of Colo., assignors to Adolph Coors Company, Golden, Colo.

Filed Nov. 30, 1989, Ser. No. 443,510

Int. Cl.[5] B65D *17/34*

U.S. Cl. 220—271 **11 Claims**

1. A container end member or the like for sealed association with a container member to provide a sealed container and which is provided with a system for forming openings therein comprising:

a one piece end member having a cylindrical peripheral end surface and a central axis;

an annular exterior rim portion on said end member for sealed association with the container member;

a central end wall portion integrally connected to said annular exterior rim portion and extending generally transversely to said central axis and having an outer surface and an inner surface;

a first severable tab portion in and integrally connected to said central end wall portion;

a first hinge portion integral with said central end wall portion and having spaced apart ends;

severable score line groove means having ends adjacent to said spaced apart ends of said first hinge portion and defining said first severable tab portion so that said first severable tab portion may be severed from said central wall portion in response to applied axially inwardly directed forces and form a pour opening in said central end wall portion;

force applying means for applying said axially inwardly directed forces on said severable tab portion;

pivot means permanently mounted on said central end wall

portion for pivotally mounting said force applying means on said central end wall portion;

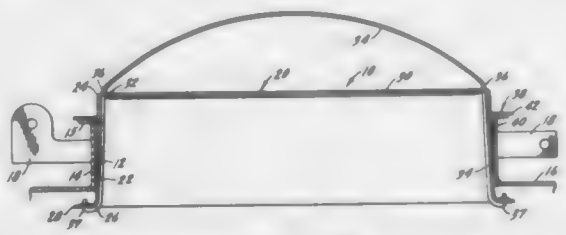
said force applying means having an abutment end portion for contacting said first severable tab portion and a handle end portion so that, when an axially outwardly directed force is applied to said handle portion, said force applying means will pivot about said pivot means so that said abutment end portion will apply said axially inwardly directed forces to said first severable tab portion to sever said first severable tab portion along said first score line groove means and form said pour opening in said central end wall portion;

a second severable tab portion in and integrally connected to said central end wall portion;

said second severable tab portion being located in said central end wall portion at a location spaced from said first severable tab portion;

a second hinge portion integral with said central end wall portion and said second severable tab portion;

said second severable tab portion having a raised surface projecting axially outwardly from said central end wall portion so that an axially inwardly directed force may be applied thereto to sever said second severable tab portion and form a vent opening in said central end wall portion; and



retaining means for retaining said first severable tab portion, said force applying means and said second severable tab portion on said end member after said pour and vent openings have been formed.

HOPPER CAR INLET OPENING PROTECTOR

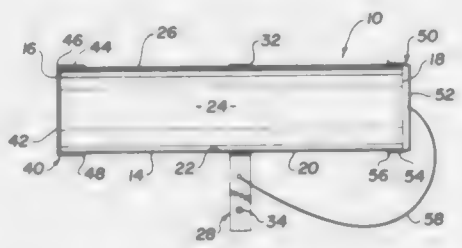
Francis R. Schultz, Woodridge, Ill., assignor to Salco Product Inc., Romeoville, Ill.

Filed Mar. 26, 1990, Ser. No. 498,430
Int. Cl.[5] B65D *45/32, 39/04, 39, 16*
U.S. Cl. 220—320 **13 Claims**

1. In a container having walls defining a compartment having an interior and exterior, with an inlet opening defined by a coaming, the inlet opening extending through at least one wall and providing communication between the interior and exterior of the compartment, the coaming having at least one internal dimension between opposite sides thereof, an improved inlet opening protector, comprising:

a throat liner adapted to be placed in the inlet opening and having an annular skirt of a height at least as great as the height of the coaming, the skirt defining spaced first and second edges each having an external dimension between opposite sides thereof, the skirt being sized and tapered such that the external dimension of said first edge is less than the internal dimension of the coaming and the external dimension of the second edge is greater than the internal dimension of the coaming whereby a portion of the skirt between said edges engages the coaming when the liner is placed coaxially in the inlet opening;

a plate member connected to the skirt and extending across the annular space defined by the skirt; and



a short liner having an annular ferrule and a radial collar attached to the ferrule, the ferrule defining an opening of a size permitting the first edge of the throat liner to fit through but not the second edge, the collar being engageable with the coaming when the short liner is positioned over the throat liner installed coaxially in the inlet opening.

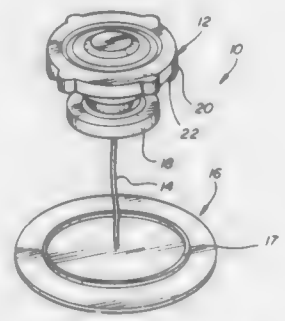
DEVICE TO SUPPORT AND PROTECT DOCUMENTS

Tommi L. Crow, 804 Ramblewood, Lewisville, Tex. 75067

Filed Mar. 9, 1989, Ser. No. 320,995
Int. Cl.[5] B61D *21/00*
U.S. Cl. 220—357 **20 Claims**



1. A device to support and protect documents, which may be damaged when contacted with water, comprising: a tubular body being constructed of a material sufficiently transparent to allow visual observation of the documents when disposed within a chamber in said body, said body having first and second ends and a wall extending between the first and second ends and circumscribing the chamber; attaching means connected to said body for attaching said body to a support member; first stopper means connected to said body for preventing moisture from gaining access through the first end into the chamber in said body; and second stopper means selectively connected to said body for preventing moisture from gaining access through the second end into the chamber in said body when connected to said body and for permitting access to the chamber in said body when inserting the documents into said body when said second stopper means is disconnected from said body, said second stopper means having a blocking wall and at least one side wall connected to and extending away from said blocking wall, the side wall being sufficiently flexible to engage and slide over an exterior surface of the wall of said body, the wall of said body being made from a material and having a thickness chosen to provide sufficient resiliency so that the wall will not tear when said second stopper means is connected to said body.

5,011,040

RADIATOR SAFETY CAP

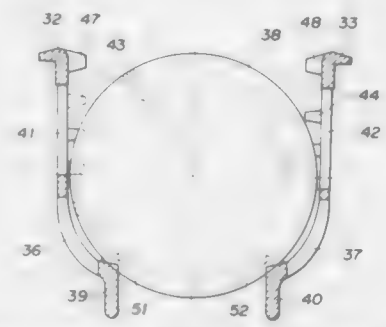
Leonard L. Kinast, 39239 Polo Club Dr., Apt. 105, Farmington Hills, Mich. 48124

Filed Jul. 13, 1990, Ser. No. 554,188
Int. Cl.[5] B65D *55/16*
U.S. Cl. 220—375 **11 Claims**

1. A radiator cap assembly comprising:

a cap having means adapted for securing the cap to a fill tube;

tether means for providing attachment to said cap, said tether means adapted to be positioned within a radiator; and



seal means adapted for sealing the fill tube, said seal means coupled with said tether means and adapted to be positioned within a radiator, said seal means adapted to float in a cooling fluid within the radiator and said seal means being responsive to increased pressure within the radiator such that if the cap is removed from the radiator in an increased pressure situation, said seal means will seal the fill tube preventing rapid escape of pressurized fluid from within the radiator.

BASKET FOR PROCESSING THIN PLATES

Takeyoshi Kakizaki, Houya, Japan, assignor to Kakizaki Mfg. Co., Ltd., Tokyo, Japan

Filed Sep. 13, 1989, Ser. No. 406,569
Claims priority, application Japan, Sep. 14, 1988, 63-228450
Int. Cl.[5] B65D *85/57*
U.S. Cl. 220—507 **11 Claims**

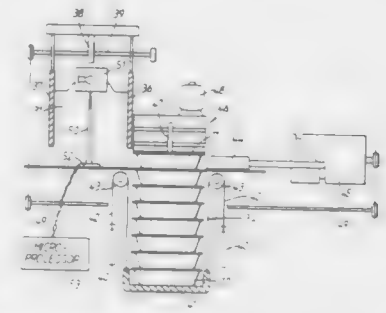
1. In a basket for processing thin plates, said basket comprising

a rectangular container having an upper and a lower opening and parallel side walls interconnected by parallel end walls for use in storing said thin plates,

each of the parallel side walls including space holding members engaged with opposite sides of each of the thin plates to align the thin plates in side-by-side relation and to space the thin plates apart,

each of said side walls including a foundation block located to define said lower opening therebetween and to support with minimal contact a lower portion of the thin plates, said foundation block projecting inwardly toward a central region of said container, and a plurality of vertical slits located above said foundation block defining flowthrough openings,

an inner surface of each of said side walls located between said vertical slits being provided with plural rod-like projections extending inwardly in opposite directions to each other toward the central region to form the space holding members,



said rod-like projections being arranged in spaced-apart relation along an inserting direction of the thin plates so as to form a group of said rod-like projections, and said group of said rod-like projections being arranged in spaced side-by-side relation along a longitudinal direction of the container for receiving the thin plates between adjoining groups of said rod-like projections.

VENDING SYSTEMS FOR HOT FOODS

Martin C. Bunce; David W. Helps, both of London; Leonard A. Jenkins, Southmoor, and Adrian C. Noke, Wantage, all of England, assignors to CMB Foodcan plc, Corcester, England

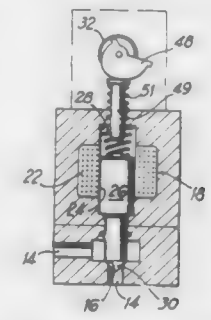
Filed Apr. 11, 1989, Ser. No. 336,062
Claims priority, application United Kingdom, Apr. 11, 1988, 8808456; Apr. 28, 1988, 8810140
Int. Cl.[5] G07F *11/72*
U.S. Cl. 221—150 A **64 Claims**

1. A vending system for dispensing containers of hot food, comprising:

a plurality of stacks of food-containing trays containing a corresponding number of different varieties of food, each tray carrying machine readable heating instructions on a lateral extension of a horizontal flange extending outward from an upwardly extending wall of the tray,

a microwave oven whose horizontal dimensions are those of the trays and exceed them only by up to 10 mm, the vertical dimension of the microwave oven to ensure that a resonant cavity, bounded by one of the trays, is produced for microwave radiation of the wavelength used;

a reading head adapted to read the heating instructions and to supply a corresponding control signal to the microwave oven; and



means for feeding one of said trays into the microwave oven on demand.

5,011,043

POST-MIX BEVERAGE DISPENSER VALVE WITH CONTINUOUS SOLENOID MODULATION

Roger C. Whigham, Atlanta, and John H. Bearden, Marietta, both of Ga., assignors to The Coca-Cola Company, Atlanta, Ga.

Division of Ser. No. 58,448, Jun. 5, 1987, Pat. No. 4,884,720.
This application Jun. 23, 1989, Ser. No. 370,371
Int. Cl.[5] B67D *5/08*
U.S. Cl. 222—63 **1 Claim**

1. A beverage dispenser valve comprising:

(a) a water conduit and a separate syrup conduit, each including a valve seat;

(b) a solenoid valve associated with each of said conduits for controlling the flow therethrough, at least one of said solenoid valves being adapted for continuous modulation

and including an armature with a graduated flow control valve member on its distal end adapted to contact a valve seat to close the respective conduit to flow therethrough when said solenoid valve is de-energized;

(c) means for energizing said solenoid valves to open them when it is desired to dispense a drink from said dispenser valve;

(d) at least one of said solenoid valves including continuously movable stop means for positioning said armature at any position between its two end positions when said solenoid valves are energized, such that the area of the flow opening through said valve seat can be continuously controlled by moving said stop means any desired distance;

(e) means for moving said movable stop means any desired amount to control the flow through at least one solenoid valve; and

(f) said moving means including a motor, a cam connected to said motor, and a linearly movable stop spring biased into contact with said cam.

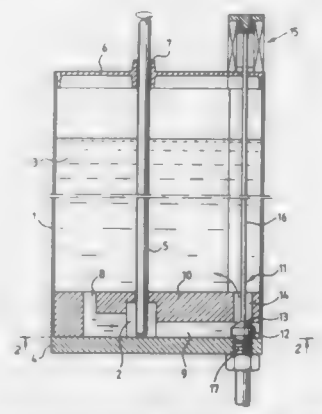
PAINT TONER DISPENSING MACHINE

Anssi Tammi, Vanha Ulvila, Finland, assignor to Cimcorp Oy, Ulvila, Finland



PCT No. PCT/FI88/00039, § 371 Date Sep. 14, 1989, § 102(e) Date Sep. 14, 1989, PCT Pub. No. WO88/06980, PCT Pub. Date Sep. 22, 1988

PCT Filed Mar. 17, 1988, Ser. No. 401,436

Claims priority, application Finland, Mar. 20, 1987, 871239

Int. Cl.[5] B65D *88/54*

U.S. Cl. 222—318 1 Claim

1. A paint toner dispensing machine for dispensing solvent-diluted color pastes in particular, comprising

at least one paste container having a bottom and a side wall and provided with

a cover preventing the evaporation of the solvent of the color paste;

a gear-type color paste pump for pumping paste for the selective dispensing or circulation thereof and comprising a drive shaft which is led through the cover of the container;

a dispensing valve located within the container for the dispensing of the color paste; and

a floor positioned above said bottom;

said pump being arranged completely within the paste container between the bottom thereof and said floor essentially below the surface of the color paste when the color paste is contained in the container, said floor forming together with said bottom therebetween a suction conduit, pressure conduit, return conduit and dispensing conduit for the pump, all within the container; and

said pressure conduit being by means of said dispensing valve selectively connectable within the container either to the return conduit or the dispensing conduit.

PUMP DISPENSER HAVING VALVED PRESUCTION CHAMBER AND OUTLET

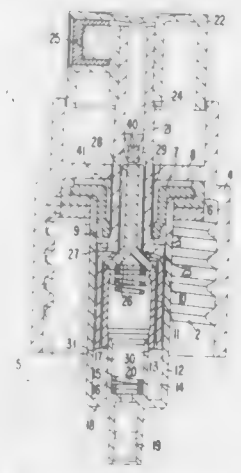
Lothar Graf, Rielasingen-Worblingen, and Karl-Heinz Fuchs, Radolfzell, both of Fed. Rep. of Germany, assignors to Ing. Erich Pfeiffer GmbH & Co. KG, Fed. Rep. of Germany

Filed Feb. 27, 1989, Ser. No. 316,083

Claims priority, application Fed. Rep. of Germany, May 8, 1987, 3715301

Int. Cl.[5] G01F *11/04*

U.S. Cl. 222—321 24 Claims



1. A dispenser for manually dispensing media, said dispenser comprising:

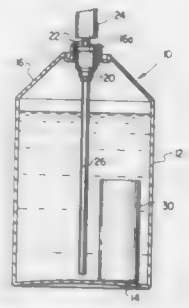
at least one manually operable thrust piston pump having a casing and at least one piston unit with at least one pump piston, the piston unit being movable in at least one pump cylinder along a cylinder path over a pump stroke from an initial position to a stroke end position;

a pump chamber being defined between said pump cylinder and said pump piston, said pump chamber being connectable to an inlet for filling the pump chamber from a reservoir, and for discharge purposes being connected to an outlet duct leading to an outlet port;

a presuction chamber with a presuction piston associated with an inlet side of said pump chamber, overflow means being provided for ductively connecting said presuction chamber to said pump chamber, and means being provided for closing said presuction chamber during the pump stroke with respect to the pump chamber; and,

an outlet valve associated with said outlet duct, and further comprising means for positively at least partially opening said outlet valve substantially at stroke end position.

5,011,047



DISPENSING APPARATUS

Rudiger Cruysberghs, Rijkevorsel, Belgium, assignor to I.P.R.S., Luxembourg

Filed Sep. 5, 1990, Ser. No. 577,900

Int. Cl.[5] B65D *83/66*

U.S. Cl. 222—396 42 Claims

1. Apparatus for maintaining a constant predetermined pressure in a pressurized container for dispensing product contained in the container from the container at said constant pressure, said apparatus comprising:

a vessel disposed in said container,

a cylinder member disposed in said vessel and defining with said vessel a first chamber for containing pressurized gas;

a piston member disposed in said vessel and defining with said cylinder member a second chamber;

one of said members being exposed to the pressure in said container for moving to a first position relative to the other member in response to said predetermined pressure in said container;

means in said second chamber for moving said one member to a second position relative to said other member in response to the pressure in said container decreasing below said predetermined pressure; and

means responsive to said one member moving to said second position for connecting said first chamber with said container to permit said pressurized gas to pass from said first chamber to said container, said latter means being responsive to said one member moving to said first position for disconnecting said first chamber with said container to prevent said passages of said gas.

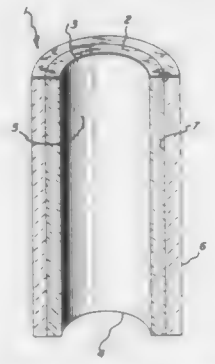
MOLTEN METAL TRANSFER TUBE

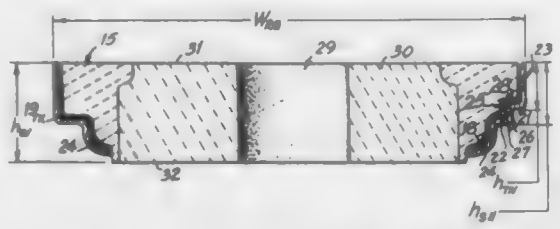
Marcus P. Borom, Schenectady; Lawrence E. Szala, Scotia; Milivoj Brun, Ballston Lake; Steven A. Miller, Amsterdam, all of N.Y., and David P. Mourer, Danvers, Mass., assignors to General Electric Company, Schenectady, N.Y.



Filed Apr. 17, 1989, Ser. No. 339,460

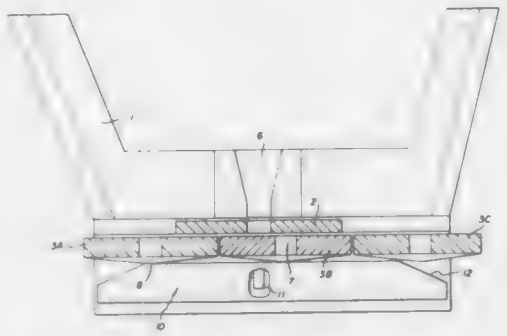
Int. Cl.[5] B22D *37/00*

U.S. Cl. 222—590 9 Claims



1. A process for producing a transfer tube useful for transfer of molten metal comprised of a high density hollow tube having directly bonded to its outer surface wall a continuous polycrystalline shell with a maximum density of about 80% of theoretical which comprises providing a high density polycrystalline hollow tube comprised of ceramic oxide material, said high density tube having a density of at least about 90% of its theoretical density, providing particulate ceramic oxide material which sinters to form said shell, providing a mold having a closed end portion and an open end portion and an inner wall sufficient to enable formation of said transfer tube, disposing said high density tube in said mold with its outer

surface wall spaced from said inner wall of said mold thereby forming a space for receiving said shell-forming particulate material, depositing said shell-forming particulate material in said space between said high density tube and inner wall of said mold to form a body of freely deposited particulate material, said shell-forming particulate material being deposited in an



amount sufficient to form said shell, heating the resulting assembly to a temperature at which said shell-forming material sinters to produce said transfer tube, said sintering being carried out in an atmosphere or a partial vacuum which has no significant deleterious effect on said assembly, said mold having no significant deleterious effect on said transfer tube.

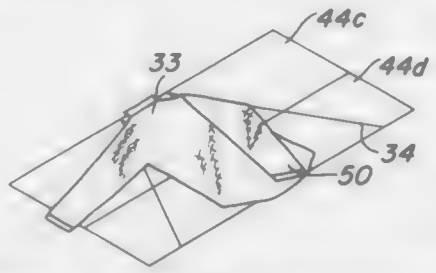
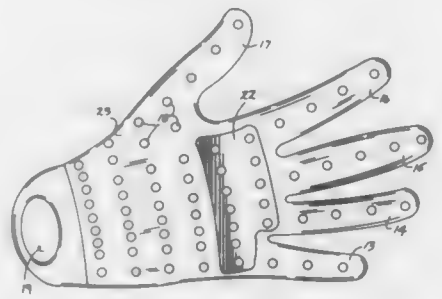
STEPPED GATE SAFETY ARRANGEMENT
Edward A. Verel, Valparaiso, Ind., assignor to Leco Corporation, St. Joseph, Mich.
Filed Oct. 31, 1990, Ser. No. 606,764
Int. Cl.[5] B22D *41/34*
U.S. Cl. 222—600 **14 Claims**



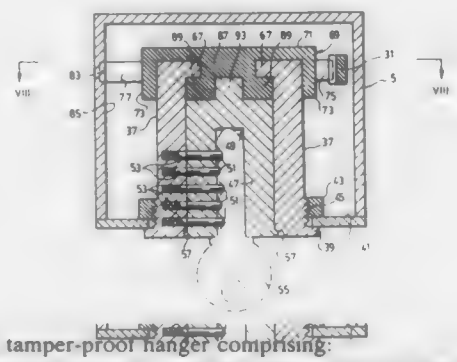
1. A gate for use in a valve mechanism where the gates are loaded into the mechanism along a loading path to a loaded position, said gate having a generally rectilinear shape; defining a generally planar sealing surface thereon adapted to form a seal in said valve mechanism when said gate is in the operative position in said valve mechanism; defining a loading axis along said sealing surface to be oriented generally in registration with the loading path in the valve mechanism during the loading of said gate to the loaded position in the valve mechanism; and including a pair of opposed sides thereon extending parallel said loading axis, one of which has a first thickness and the second of which has a second thickness greater than said first thickness so that said gate will load into the valve mechanism with only one orientation.

5,011,051
METALLURGICAL VESSEL SLIDE VALVE
Schmuel Kleeblatt, Strassen, Luxembourg, assignor to Cerafer S.A.R.L. Co., Luxembourg
Filed Oct. 20, 1989, Ser. No. 424,097
Claims priority, application Fed. Rep. of Germany, Oct. 20, 1988, 3835687
Int. Cl.[5] B22D *37/00*
U.S. Cl. 222—600 **15 Claims**



1. A metallurgical vessel slide valve comprising:
a fixed closure plate defining a closure plate passage bore; a displaceable refractory material slide plate adjacent to and facing said closure plate defining a slide plate passage bore;
guide rails each exhibiting a bearing culmination point connected to said slide plate;
spring supported contact rails positioned to support said guide rail bearing culmination points;
an axle pivot supporting each contact rail aligned transversely to an axis of said closure plate passage bore and connected to support springs.

5,011,052
FOLDING DEVICE FOR APPAREL
Jason S. Craig, 413 Bonnie La., Lansdale, Pa. 19446
Filed Oct. 12, 1989, Ser. No. 420,306
Int. Cl.[5] A41M *33/00*
U.S. Cl. 223—37 **8 Claims**



6. A manually operated shirt folding device comprising:
(a) a flat and rectangular shaped member,
(b) said member being dimensioned for receiving a dress shirt upon its upper surface,
(c) a plurality of creases formed in said member which are oriented in a vertical, horizontal and diagonal manner,
(d) said diagonal creases allowing the members to fold the sleeves of said shirt upon the body portion of said shirt,
(e) said vertical creases allowing said member to fold the sides of said shirt to reduce its width dimension after said sleeves have been folded,
(f) said horizontal creases allowing said member to fold said shirt in half to reduce the vertical dimension of said shirt, and
(g) whereby the horizontal, vertical and diagonal creases allow said member to uniformly package said dress shirt in a repetitive manner.

5,011,053
GLOVE SUPPORT APPARATUS
Donald C. Davies, 2305 N. 44th St. #257, Phoenix, Ariz. 85008
Filed Feb. 5, 1990, Ser. No. 475,235
Int. Cl.[5] F26B *5/00;* **A41D** *19/00*
U.S. Cl. 223—78 **4 Claims**

1. A glove support apparatus comprising,
a curvilinear glove shaped body member including a top surface and a bottom surface, and
five finger projections, and
a matrix of openings formed throughout the body member, and
a flexible loop member fixedly mounted to a rear portion of the body member remote from the finger projections, and
wherein the bottom surface of the body member includes a cavity directed interiorly of the body member adjacent the five finger projections.

5,011,054
TAMPER PROOF HANGER WITH IMPROVED RATCHET ARM IN LOCK
Claude Mauffette, Montreal, Canada, assignor to Quada Internationale Ltd., Québec, Canada
Filed Feb. 27, 1990, Ser. No. 485,527
Int. Cl.[5] A47G *25/30, 25/14*
U.S. Cl. 223—88 **4 Claims**

1. A tamper-proof hanger comprising:
a garment support member having a central casing with inner walls and a pair of garment support arms extending from one end of said casing and projecting laterally on either side thereof,
a garment gripping member having a central portion slidable in said central casing, axially thereof, and having a pair of gripping arms extending laterally from said central portion and out of said central casing, said gripping arms being provided at the ends thereof with means adapted for pressing and locking a garment onto said support arms when said gripping member is moved toward said garment support arms into garment locking position; said garment gripping member having a rack inserted and movable within said central casing, and
means within said casing, engageable with said rack for selectively holding said gripping member into and out of said garment locking position; the improvement wherein said selectively holding means comprises;
a cylinder lock within said central casing; an outer lock cylinder solid with said casing;
a rotary lock barrel within said outer cylinder; and tumbler and peg means operatively connecting said lock cylinder and said lock barrel;
a key removably insertable in said lock barrel for rotating said lock barrel;
an operating member rotatably mounted on said outer lock cylinder within said central casing;
coupling means on said operating member and on said lock barrel for allowing rotation of said operating member when said lock barrel is key-operated into rotation;
a pawl integrally and radially projecting from said operating member and having a free end operatively engaging said rack of said gripping member;
a resilient lever integrally and radially projecting from said rotary operating member and having a free end resiliently applied against one of said inner walls of said central casing to press said pawl against said rack;
wherein the distance between said casing inner wall and said rack is preselected for said resilient lever to bias said pawl into said operative engagement with said rack;
wherein said operating member is cup-shaped, having a circular bottom wall sitting over the casing inner end of said lock cylinder, and having a cylindrical skirt surrounding said lock cylinder, said pawl and resilient lever projecting radially from said skirt;
wherein said lock barrel has a key-insertion end and an operating end within said outer lock cylinder; and wherein said coupling means comprises;
a coupling cylinder projecting from said bottom wall; coaxially therewith, and having a free end;
a pair of outwardly projecting radial collars at said free end, diametrically opposing one another;
a pair of inwardly projecting lugs at the casing inner end of said lock cylinder, diametrically opposing one another; said collars being disposed beneath said lugs for holding said operating member captive on said lock cylinder;
a pair of inwardly projecting radial ears at the free end of said coupling cylinder, diametrically opposing one another and each having a tenon-engaging face; and
a tenon extending from said lock barrel and having opposing surfaces in operative engagement with said tenon engaging faces of said radial ears, constructed so that rotation of said lock barrel causes rotation of said cup-shaped operating member.

5,011,055
BICYCLE PUMP BRACKET
John J. Neugent, 20751 Circulo Durango, Yorba Linda, Calif. 92686
Filed Nov. 8, 1989, Ser. No. 433,588
Int. Cl.[5] B62J *7/00*
U.S. Cl. 224—39 **11 Claims**

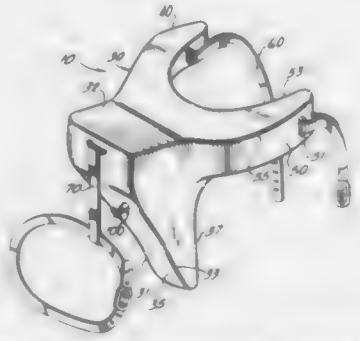
1. A bicycle pump bracket for detachably securing an elongated cylindrical bicycle pump body to a bicycle tubular frame member, said bracket comprising:

an elongated base having an inner surface concavely curved about a firs axis and adapted to fit a tubular frame member of a bicycle,

first and second hooks fixed to and projecting from an outer side of said base, said hooks being mutually spaced along the length of said base, said first hook having an opening lying in a transverse plane substantially perpendicular to said first axis and opening laterally of said base in a first direction, said second hook having an opening lying in a plane substantially parallel to and spaced from said transverse plane, and opening laterally of said base in a second direction opposite said first direction, each said hook being formed of a continuous U-shaped rod having ends fixed to said base and having a bight defining one side of the hook opening.

5,011,056

INFLATABLE CHILD HOLDER



Fred E. Larreategui, Ed. Banco de los Andes, Av. Amazonas 477 y Roca 8 piso, of. 806, Quito, Ecuador

Continuation-in-part of Ser. No. 315,976, Feb. 27, 1989, Pat. No. 4,915,277. This application Apr. 6, 1990, Ser. No. 505,621

The portion of the term of this patent subsequent to Apr. 10, 2007, has been disclaimed.

Int. Cl.[5] A61G *1/00*

U.S. Cl. 224—159 **6 Claims**

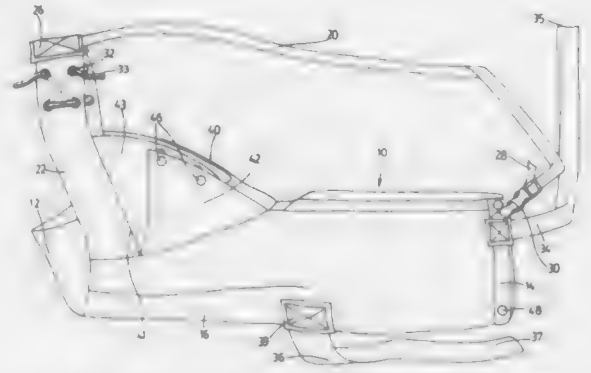
1. A holder for children removably mounted on a person, comprising:

A. saddle seat means having a downwardly extending leg member that is positioned against the person's upper thigh and having two slightly curved arm members, substantially perpendicular to said leg member, that conform and embrace the waistline of the person; and one of said arm members conforms to the contour of the lower back area of the person and it has a less pronounced curvature than the other arm member, and wherein said saddle means further includes an inwardly extending flange member that is positioned below said arm members so that it rests on the person's hip bone thereby keeping said holder in place and said saddle seat means is made out of an inflatable material;

B. belt means for removably securing said saddle seat means to said person's waist and said belt means being mounted to the ends of said arms; and

C. strap means for partially supporting the weight of said saddle seat means and said strap means being of sufficiently large dimensions to extend over the neck and shoulder area opposite to the side of the person where said saddle seat means is mounted.

5,011,057



BABY CARRIER

Cathleen Perruzza, 35 Croteau Cresc., Thornhill, Ont., Canada L4J 5S7 , and Anne Briggs, 28 Cranbrooke Avenue, Toronto, Canada M5M 1M4

Filed May 30, 1990, Ser. No. 530,528

Int. Cl.[5] A47D *13/02*

U.S. Cl. 224—158 **7 Claims**

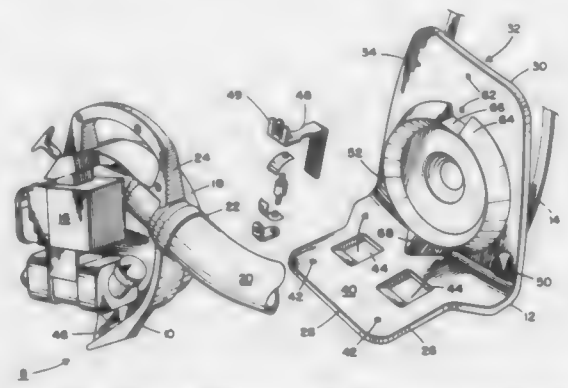
1. A baby carrier for supporting a baby in prone position at least in front of a person carrying the baby, said baby carrier comprising:

an elongate pouch of flexible material to accommodate a prone baby, said pouch having a head end, a foot end and elongate sides adapted to upstand to each side of said baby, each said elongate side having a respective head portion toward said head end;

a harness connected to said pouch at said foot end, and connected to each said elongate side in the region of said head end, and adapted to pass over one, or alternatively the other, shoulder of said person, to locate said respective head portions of said elongate sides adjacent respective breasts of said person when said carrier is in use; and

an openable panel in each of said head portions to provide a baby in the said carrier access to the respective breast wherein each panel can be opened independently of the other panel.

5,011,058



LEAF BLOWER BACK PACK FRAME

Michael D. Sapp, Rockwell, and Donald R. Gaskey, Jr., Monroe, both of N.C., assignors to Textron Inc., Providence, R.I.

Filed Jan. 30, 1990, Ser. No. 472,653

Int. Cl.[5] B05B *3/10*

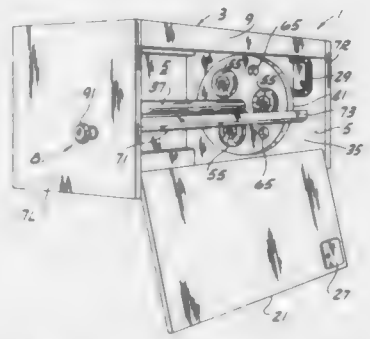
U.S. Cl. 224—261 **12 Claims**

1. A back pack for use in carrying a blower, the back pack having a frame and straps for removably supporting the back pack and blower on an operator, said frame comprising:

a first portion adapted to, at least partially, removably support a blower thereon; and

a second portion fixedly connected to said first portion and having a first side and a second side, said first side being adapted to be removably supported on an operator's back, said second side having an intake restrictor suitably sized, shaped, and located relative to said first portion for operably cooperating with an air intake of a blower mounted to the back pack to provide a restrictive air flow space between the blower and said second side and, said restrictor is adapted to substantially prevent intrusion of foreign objects into a blower air intake, to reduce noise emanating from a blower air intake, and to nonetheless allow proper air flow through the space into the blower air intake.

5,011,059



DEVICE FOR HOLDING ROLLS OF WRAPPING MATERIAL

Harold Jennings, Jr., and Carol A. Jennings, both of 5831 Bristlecone Ct., St. Louis, Mo. 63129

Continuation of Ser. No. 246,343, Sep. 19, 1988, abandoned. This application Jul. 20, 1990, Ser. No. 556,559

Int. Cl.[5] B26F *3/02*

U.S. Cl. 225—35 **12 Claims**

1. A device for holding a plurality of rolls of wrapping material and for cutting a selected length of wrapping material pulled from a selected roll, comprising:

a housing having a front, a back and opposite side walls;

a rack between the side walls of the housing for holding said plurality of rolls of wrapping material with the rolls extending generally horizontally between the side walls, each roll being rotatable on the rack about an axis extending longitudinally of the roll;

bearings attached to the side walls of the housing mounting the rack for rotation of the rack relative to the housing on a generally horizontal axis, said rack being rotatable on said axis for moving a selected roll of wrapping material into a dispensing position adjacent the front of the housing;

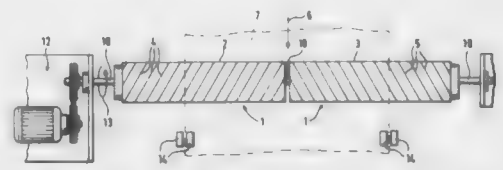
means for locking the rack against rotation relative to the housing when a selected roll is in said dispensing position;

cutting means extending generally horizontally at the front of the housing for cutting a length of wrapping material pulled from a selected roll in said dispensing position; and

a door at the front of the housing movable between an open position wherein wrapping material may be pulled from a respective roll and cut to length, and a closed position for concealing said rolls from view, said rack comprising a shaft having opposite ends rotatable in said bearings, a pair of support members on the shaft adjacent opposite ends of the shaft, and trunnions on the support members receivable in the ends of the rolls to enable rotation of the rolls on their respective axes, said shaft being removable from said bearings without detaching the bearings from the side walls of the housing to enable the rack to be readily removed from the housing, and at least one of said support members being removable from the shaft when the rack is removed from the housing to permit rolls to be mounted on and dismounted from said trunnions.

5,011,060

ROLL FOR SPREADING AND GUIDING A FABRIC WEB



Hans Cramer, Aachen, Fed. Rep. of Germany, assignor to H. Krantz GmbH & Co., Aachen, Fed. Rep. of Germany

Filed Nov. 7, 1989, Ser. No. 432,467

Claims priority, application Fed. Rep. of Germany, Nov. 23, 1988, 3839473

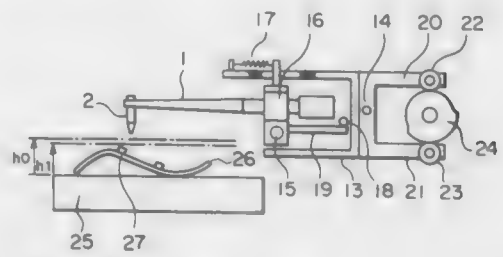
Int. Cl.[5] B23Q *16/00;* **B06C** *3/06;* **B21B** *1/22*

U.S. Cl. 226—15 **3 Claims**

1. An apparatus for spreading and guiding a fabric web positively advanced in a selected direction comprising a shaft, first and second cylinders coaxially mounted on said shaft for rotation relative to said shaft and to each other, said cylinders having end portions said end portions of said cylinders being disposed in proximate spaced relation adjacent the center of said shaft, said cylinders including helical configurations on the periphery thereof positioned to support said web, the pitches of said configurations being arrayed in opposite directions, means for rotating said shaft in a direction opposite said selected direction, and first and second clutch means interposed between said shaft and said first and second cylinders respectively for selectively coupling said cylinders to said shaft for rotation therewith for shifting said fabric web laterally of said shaft in a selected direction in accordance with which of said clutch means is energized, said web being spread in a widthwise direction by said cylinders when said cylinders are decoupled from said shaft.

5,011,061

WIRE BONDING DEVICE



Kazuyuki Funatsu, Fukuoka, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Jul. 18, 1989, Ser. No. 381,249

Claims priority, application Japan, Jul. 22, 1988, 63-184309

Int. Cl.[5] H01L *21/60;* **B23K** *20/00*

U.S. Cl. 228—1.1 **6 Claims**

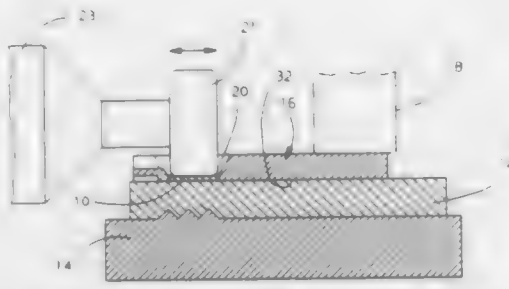
1. A wire bonding device including:

a capillary means for causing a wire to make press-contact with a bonding face at at least a first bonding position and a second bonding position thereof;

a driving motor means for raising and lowering said capillary;

a storage means for storing capillary contact data indicating a height of said capillary relative to said bonding face at which said capillary comes in contact with said bonding face at said first bonding position; and

a control means, responsive to said data stored in said storage means, for causing said capillary to be lowered at said second bonding position at a first predetermined velocity down to said height of said capillary relative to said bonding face at which said capillary contacts said bonding face at said first bonding position, and subsequently, if said



capillary is not in contact with said bonding face at said second bonding position, for lowering said capillary at a second predetermined velocity which is lower than said first predetermined velocity until said capillary makes contact with said bonding face at said second bonding position.

5,011,062

ULTRASONIC WELDING MASK

Todd G. Nakanishi, and Matthew F. Taylor, both of Kokomo, Ind., assignors to Delco Electronics Corporation, Kokomo, Ind.

Filed May 9, 1990, Ser. No. 520,907
Int. Cl.[5] B23K *20/10;* **H01L** *21/48*
U.S. Cl. 228—1.1 **8 Claims**

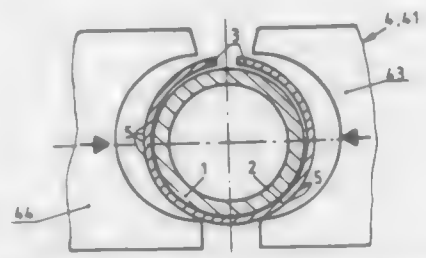
1. A welding mask for use in the ultrasonic welding of a first metallic part to a second metallic part comprising, a bore extending through said mask for receiving said first part when a lower surface of said mask is engaged with an upper surface of said second part, said bore having a first positioning surface that is complementary to the outer edge configuration of said first part and which can contact the outer edges of said first part when said first part is located inside said positioning surface and during vibration of said first part by ultrasonic welding apparatus, said bore having a second surface that extends from the lower end of said first positioning surface to said lower surface of said mask, said second surface being located outwardly of said positioning surface whereby said second surface does not contact said first part during ultrasonic welding of said first part to said second part.

5,011,063

METHOD OF BONDING A CERAMIC COMPOSITE BODY TO A SECOND BODY AND ARTICLES PRODUCED THEREBY

Terry D. Claar, Newark, Del., assignor to Lanxide Technology Company, LP, Newark, Del.

Continuation of Ser. No. 296,837, Jan. 13, 1989, abandoned. This application Jul. 23, 1990, Ser. No. 560,491
Int. Cl.[5] B23K *31/00, 103/16;* **C22C** *1/02;* **C04B** *35/58*
U.S. Cl. 228—122 **15 Claims**



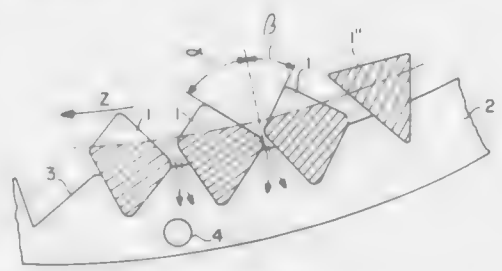
1. A method of producing a self-supporting body comprising producing a first composite body by:
selecting a parent metal;
heating said parent metal in a substantially inert atmosphere to a temperature above its melting point to permit infiltration of molten parent metal into a mass comprising boron carbide and to permit reaction of molten parent metal with said boron carbide to form at least one boron-containing compound;
continuing said infiltration reaction for a time sufficient to produce said first composite body comprising at least one parent metal boron-containing compound;
providing a quantity of excess metal to at least a portion of at least one surface of said first composite body wherein said quantity is sufficient to permit bonding of said first composite body to a second body; and
bonding said first composite body to said second body thereby forming a self-supporting body.

5,011,064

METHOD OF MANUFACTURING A DOUBLE-WALLED TUBE

Heinrich Fuss, Schorenweg 44, D-4788 Warstein 1, Fed. Rep. of Germany

Continuation of Ser. No. 72,262, Jun. 19, 1987, abandoned. This application Mar. 29, 1990, Ser. No. 501,971
Int. Cl.[5] B23K *31/02, 37/04;* **B21D** *39/04*
U.S. Cl. 228—151 **19 Claims**



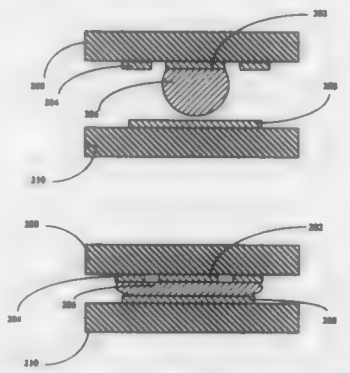
1. A method of manufacturing a double-walled tube comprising the steps of:
(1) providing a wear-resistant prefabricated nonslotted inner pipe having a predetermined outer diameter and a predetermined wall thickness;
(2) arranging around said prefabricated inner pipe a shock and impact resistant previously bent sheet metal single-wall slotted tube which has longitudinal edges and a longitudinally extending slot defined by the longitudinal edges;
(3) applying pressing forces along at least three unchanging lines extending longitudinally along the wall of the slotted tube for holding substantially stationary and pressing the slotted tube tightly against said prefabricated nonslotted inner pipe for eliminating gaps between the prefabricated inner pipe and the slotted tube so that the inner diameter of the slotted tube substantially attains the predetermined outer diameter of the prefabricated inner pipe for bringing the longitudinal edges into an abutting relationship to define a longitudinal welding gap and for forming the outer pipe of the double-walled pipe without changing the predetermined outer diameter and the predetermined pipe wall thickness of the inner pipe; and
(4) welding along the longitudinal welding gap of the slotted tube while the slotted tube is held tightly against the prefabricated inner pipe during said step of applying pressing forces.

5,011,065

SCREEN BASKET AND METHOD OF MANUFACTURE

Walter Musselmann, Heidenheim, Fed. Rep. of Germany, assignor to J.M. Voith GmbH, Fed. Rep. of Germany

Filed Nov. 14, 1988, Ser. No. 270,261
Claims priority, application Fed. Rep. of Germany, Nov. 14, 1987, 3738746; May 11, 1988, 3816152
Int. Cl.[5] B23K *31/02*
U.S. Cl. 228—170 **11 Claims**



1. A screen basket comprising:
a plurality of rods each positioned approximately parallel to the rotational symmetrical axis of said basket, each rod having a cross-section in the shape of a polygon or a triangle or a circle;
a plurality of rings for connecting said plurality of rods, wherein said plurality of rods form screen slots therebetween, each of said plurality of rings has a recess, formed by a gear-cutting machine, in the shape of a section of the cross-section of said plurality of rods and adapted to receive the plurality of rods therein; and,
means for fastening said plurality of rods to said plurality of rings, wherein said fastening means is either soldering or welding.

5,011,066

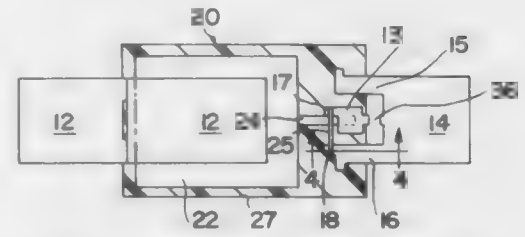
ENHANCED COLLAPSE SOLDER INTERCONNECTION

Kenneth R. Thompson, Sunrise, Fla., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Jul. 27, 1990, Ser. No. 558,939
Int. Cl.[5] B23K *31/02;* **H05K** *3/34*
U.S. Cl. 228—180.2 **11 Claims**

1. An enhanced collapse solder interconnect assembly comprising:
a pair of substrates having solderable surfaces on opposing faces, at least one solderable surface on at least one of the substrates including an associated closely spaced solderable surface; and
solder interconnecting the solderable surfaces of the substrates: the solder connecting to the associated closely spaced solderable surface upon melting and collapsing.

4. A method of manufacturing an enhanced collapse solder interconnect assembly comprising the steps of:
providing a first substrate having at least one solder pad having an associated substantially peripheral closely spaced solderable surface;
providing a second substrate having at least one solder pad;
providing a solder bump on at least one of the solder pads;
positioning the substrates into an adjacent location with the solder pads in register;
reflowing the solder bump to interconnect the solder pad of the first substrate to the associated substantially peripheral closely spaced solderable surface, and to the solder pad of the second substrate.



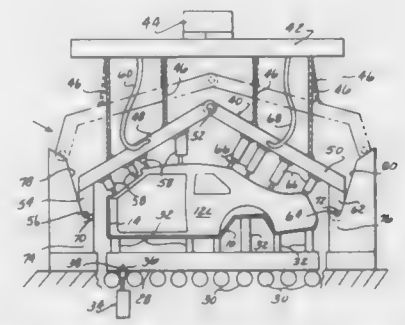
5,011,067

METHOD FOR ATTACHING A FUSE WIRE TO A LEAD FRAME

Robert L. Foisy, Sanford, Me., assignor to Sprague Electric Company, North Adams, Mass.

Filed Mar. 26, 1990, Ser. No. 500,351
Int. Cl.[5] B23K *23/00*
U.S. Cl. 228—241 **6 Claims**

1. A method for attaching a fuse wire to a lead frame comprising:
(a) providing a lead frame having a patterned metallic layer comprised of contiguous parts, two of said parts being a first pair of tabs having one space therebetween and a second and third space on either side thereof;
(b) positioning a fuse strand across and in contact with said first pair of lead-frame tabs extending into said second and third spaces, said fuse strand comprised of two separate but mutually adjacent lengths respectively of two exothermically alloyable metals; and
(c) heating points in said fuse strand in said second and third space respectively to initiate exothermic alloying at each said point and to cause the portions of said fuse strand between each of said points and the adjacent one of said first pair of tabs to progressively alloy and melt to carry a hot liquid ball of alloyed fusestrand metal to each of said first-pair tabs where the tab heat-sinks and reduces the temperature of said fuse strand to stop said progressive alloying, and to form a metallurgical connection between an unfused middle segment of said fuse strand and said each of said first-pair tabs leaving the ends of said middle fuse strand segment metallurgically bonded to said first-pair tabs so that said middle segment electrically bridges said first-pair tabs.



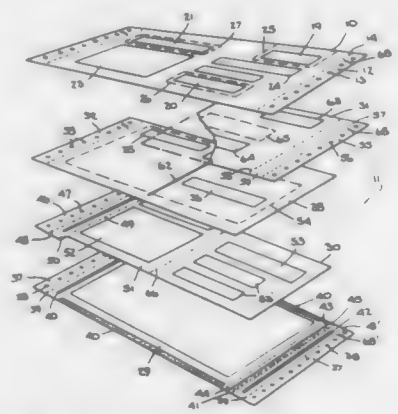
5,011,068

AUTOMOTIVE BOD. FRAMING SYSTEM

Robert R. Stoutenburg, South Lyon; Michael R. Dugas, Brighton, and Mark W. Hazelton, West Bloomfield, all of Mich., assignors to Progressive Tool & Industries Co., Soughfield, Mich.

Filed Dec. 5, 1989, Ser. No. 446,131
Int. Cl.[5] B23K *37/04*
U.S. Cl. 228—4.1 **10 Claims**

1. Framing apparatus for clamping the loosely assembled floor panel, side panels and header members of a vehicle body subassembly having a front to rear axis in an accurately oriented relationship to said front to rear axis and to each other for welding into a permanently assembled substantially rigid subassembly, said apparatus comprising conveyer means including a carrier movable along a predetermined path to and from a welding station, floor panel support means on said carrier for supporting the floor panel of said body subassembly in a predetermined fixed relationship to said carrier with said front to rear axis of said body subassembly parallel to said path, means at said welding station for locating said carrier and the body subassembly thereon in a predetermined welding pattern, a clamping frame assembly including a front frame section having a front and a rear end and a rear frame section having a front and a rear end, pivot means pivotally connecting the rear end of said front frame section to the front end of said rear



frame section for pivotal movement about a horizontal axis overlying and normal to said predetermined path, support post means engageable with the front end of said front frame section and the rear end of said rear frame section and operable when said carriage and the body subassembly by therein is at said welding position to support said clamping frame assembly in an operating position overlying said body subassembly from front to rear, releasable clamp means on said front and rear frame sections operable when said clamping frame assembly is in said operating position to clamp said side panels and said header members into said accurately oriented relationship to each other and to said floor panels, and clamping frame actuating means operable where said clamp means are released for pivoting said front and rear frame sections upwardly away from said body subassembly to locate said clamping assembly in a transfer position clear of said body subassembly.

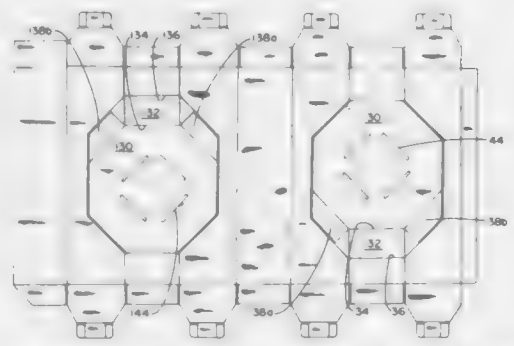
5,011,069

CONTINUOUS MAILER ASSEMBLY

Charles G. Bowen, La Grangeville, and Anthony B. Dolce, Pleasant Valley, both of N.Y., assignors to Transkrit Corporation, Brewster, N.Y.

Filed Jun. 26, 1990, Ser. No. 545,340
Int. Cl.[5] B65D *27/06, 27/10*
U.S. Cl. 229—69 **17 Claims**

1. A mailer unit comprising
a front ply of predetermined width;
a back ply secured to said front ply on three sides thereof to define an open-ended pocket therewith;
at least one removable insert ply within said pocket between said front and back plies;
a cover ply removably secured to said front ply in overlying relation, said cover play having a front surface to receive an outgoing address thereon; and
an image transfer means on at least one of said front ply and said cover ply for imprinting of a reply address on said front ply under said cover ply.



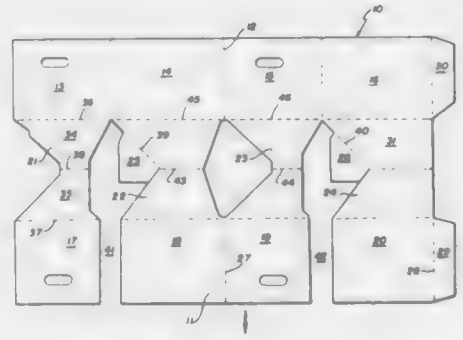
5,011,070

DISPLAY CARTON

Robert L. Plunkett, Harrington Park, N.J., assignor to Accurate Box Company, Inc., Paterson, N.J.

Filed Dec. 7, 1989, Ser. No. 447,565
Int. Cl.[5] B65D *5/42*
U.S. Cl. 229—109 **9 Claims**

1. A display container for holding and displaying articles of manufacture, said container comprising a front, side, a back, a bottom panel between said front, sides and back, and a top panel opposite said bottom panel and between said front, sides and back, said front, sides and back defining an interior, said bottom panel being formed from a cut-out section partially cut from and connected to at least said front, said cut-out section having been folded into said interior to thereby form said bottom panel and a front display window exposing said interior, said top panel being formed from a second cut-out section partially cut from and connected to at least said back, said



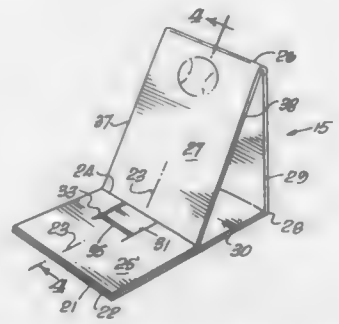
cut-out section having been folded into said interior to thereby form said top panel and a back display window exposing said interior.

5,011,071

CARTON

Louis Lopez, 214 Pleasant St., Leominster, Mass. 01453

Filed Jul. 10, 1989, Ser. No. 377,726
Int. Cl.[5] B65D *5/36*
U.S. Cl. 229—117 **4 Claims**



1. Carton comprising:
(a) inner and outer snugly nesting tubular shells of corrugated board having lines of corrugation, the outer shell consisting of four side wall panels, each panel having two side edges hingedly connected to the side edges of other panels lengthwise of the said lines of corrugation, the inner tubular shell also having four side wall panels, the shells being movable lengthwise into and out of a set-up relatonship in which the side wall panels of the shells are in overlying relationship in sets of two to provide for a double-walled construction,
(b) a plurality of foldable strips hingedly connecting adjacent bottom edges of each said set of overlying side wall panels, said strips being unfolded and extensions of their respective side wall panels when the inner shell is noncoextensive with the outer shell, said strips extending transversely of the side wall panels to form a carton floor when said shells are telescoped into set-up relationship, and
(c) reinforcing tabs hingedly connected to each of two alternate strips, each tab being fastened to one of the two non-tabbed strips.

5,011,072

SPORT CARD STABILIZER

Henry F. Ludwig, Fullerton, Calif., assignor to Morris Reisman, Villa Park, Calif.

Filed Aug. 13, 1990, Ser. No. 566,142
Int. Cl.[5] B65D *1/24*
U.S. Cl. 229—120.23 **8 Claims**

1. A stabilizer for holding sport cards or other cards in a vertical to an angled position so that the user can easily view a group of cards, said stabilizer being collapsible for compact storage, said stabilizer comprising:
an elongated, rectangular, unitary sheet having a longitudinal axis, a first end, a second end and two longitudinal edges and having three folds perpendicular to said longitudinal axis extending between the longitudinal edges and two cuts, said unitary sheet including:
a first fold in an upward direction separated from said first end forming a first panel between the first end and the first fold;
a second fold in a downward direction separated from said first fold forming a second panel between said first fold and said second fold;
a third fold in a downward direction separated from said second fold and said second end forming a third panel between said second fold and said third fold and a fourth panel between said third fold and the second end of the elongated rectangular unitary sheet;
a first cut formed in one of said first and fourth panels, said first cut being in a generally "U" shape with the base of the "U" lying parallel to said folds and the arms of the "U" pointing away from the second and third folds and forming a tab from the panel; and
a second cut being in a straight line parallel to said folds, one of the cuts being in the first panel and the other of the cuts being in the fourth panel and said unitary sheet being folded so that said first panel is entirely supported on said fourth panel.

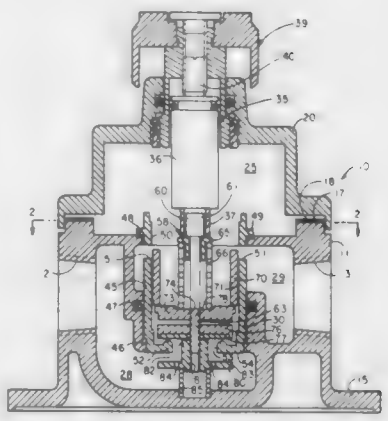
CONTROL TO OPERATE A FORCED AIR BLOWER

Lowell F. Izaguirre, Sr., and Jose M. Perotti, both of Miami, Fla., assignors to Cam-Stat, Inc., Hialeah, Fla.

Filed Nov. 3, 1989, Ser. No. 431,291
Int. Cl.[5] F23N *3/00*
U.S. Cl. 236—11 **9 Claims**

1. A control circuit for controlling an electric motor operated air blower responsive to a control signal from a thermostat comprising:
(a) ON-OFF control means operatively connected to said blower motor;
(b) input means for receiving an ON control signal from said thermostat; and
(c) delay means connected between said input means and said ON-OFF control means, said delay means having a first adjustment means for selecting a turn-on delay when said ON control signal is received, and a second adjustment means for selecting a turn-off delay when said ON control signal ceases,
said input means including:
(d) a rectifier for rectifying an ac ON control signal; and
(e) an amplifier circuit for receiving said rectified control signal;
said first adjustment means of said delay means including
(f) a first adjustable resistor connected between said amplifier circuit and a first diode to a capacitor, said capacitor receiving a charging current from said amplifier circuit via said first resistor and said first diode when said rectified control signal is present at said amplifier circuit,



whereby a first selected voltage of said capacitor turns on said control means;
said adjustment means of said delay means including
(g) a second adjustable resistor connected between said amplifier circuit and a second diode to said capacitor, said capacitor discharging through said second diode, said second resistor and said amplifier circuit upon cessation of said rectified control signal, whereby a second selected voltage on said capacitor turns off said control means.

5,011,074

THERMOSTATIC MIXING VALVE WITH THERMOSTAT FAILURE COMPENSATION

Kevin B. Kline, Indianapolis, Ind., assignor to Lawler Manufacturing Co., Inc., Indianapolis, Ind.

Filed Jul. 20, 1990, Ser. No. 556,128
Int. Cl.[5] G05D *23/13*
U.S. Cl. 236—12.13 **6 Claims**

1. A thermally controlled mixing valve assembly comprising:
a valve body defining:
a hot fluid inlet;
a cold fluid inlet;
a fluid mixing chamber; and
a fluid outlet communicating with said fluid mixing chamber;
a thermally responsive control member disposed at least partially within said fluid mixing chamber and movable, in a normal operating condition, in response to the temperature of fluid in said mixing chamber;
flow control means actuated by said con ol member for

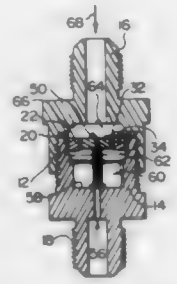
controlling the flow of a hot fluid from said hot fluid inlet and a relatively colder fluid from said cold fluid inlet to said fluid mixing chamber in relation to movement of said thermally responsive control member; and

failure responsive means for substantially restricting flow of the hot fluid from said hot fluid inlet to said mixing chamber upon failure of said thermal responsive control member, said failure means including:

a first valve member, separate from said flow control means, connected to said control member and disposed between said hot fluid inlet and said mixing chamber, wherein said valve member is movable with said control member in said normal operating condition without substantially restricting flow between said hot fluid inlet and said mixing chamber; and

biasing means for biasing said valve member to a closed position substantially restricting hot flow between said hot fluid inlet and said mixing chamber upon failure of said control member.

5,011,075



VARIABLE FLOW VALVE

Robert L. Vandiver, 9 Murifield Dr., Siloam Springs, Ark. 72761

Filed Jan. 22, 1990, Ser. No. 468,244

Int. Cl.[5] G05D *23/10*

U.S. Cl. 236—48 R **10 Claims**

1. A temperature-responsive fluid flow control device comprising:

(a) a body portion defining an enclosed chamber, and inlet and outlet passages or predetermined cross-sectional areas for flow of a fluid into and out of said chamber, respectively;

(b) flow control means positioned within said chamber and movable between first and second positions, wherein flow through said body portion is established through passages of first and second cross sectional areas, respectively, said flow control means comprising an elongated stem member having an axial bore extending therethrough and an end portion movable into and out of engagement with an internal wall of said enclosed chamber when said control means is in said first and second positions, respectively, said end portion being in covering relation to one of said inlet and outlet passages with said axial bore in alignment therewith when in engagement with said internal wall to limit flow through said covered passage to that flowing through said axial bore;

(c) a circular disc positioned within said chamber and movable between two distinct positions with a snap action in response to the temperature of said disc as determined by the temperature of fluid within said chamber, said disc being supported at its periphery in a substantially fixed position, whereby movement of said disc between said two distinct positions occurs at the center of said disc; and

(d) means connecting said disc at its center to said flow control means to move said control means between said first and second positions in response to respective movement of said disc between said two distinct positions thereof.

PNEUMATIC TEMPERATURE CONTROL

Ike Wurtz, R 2, Box 105, Wecota, S. Dak. 57438

Filed Feb. 16, 1990, Ser. No. 480,848

Int. Cl.[5] F24F *13/08*

U.S. Cl. 236—49.4 **2 Claims**

1. A pneumatic temperature control comprising:

a frame;

a fluid receptacle mounted to said frame containing a fluid therein capable of expanding or contracting with temperature, and further having a surface capable of movement responding to said fluid expansion or contraction;

a spring positioned on said frame to exert a force on said receptacle surface, said spring having adjusting means for selectively controlling the force exerted on said receptacle surface, said force being calibrated to achieve a desired movement of said receptacle surface at a preselected temperature;

an elongated trigger mounted to said frame having a first end movable by movement of said receptacle surface and a second end movable in response to movement of said first end; and

a module attached to said frame having air valve means for controlling the flow of air between an air supply port and an air output port, said air valve means in communication with said second end of said trigger, whereby expansion and contraction of said fluid actuates said air valve means to control the flow of air to operate a pneumatic device, said air valve means including a diaphragm fixed to said module, a rod extending through said diaphragm, a first end of said rod being in movable communication with said second end of said trigger, a variable air inlet valve fixed to said module being in communication with a second end of said rod, an air output port in said module, the air flow through said output port being dependent on the displacement of said variable air inlet valve.

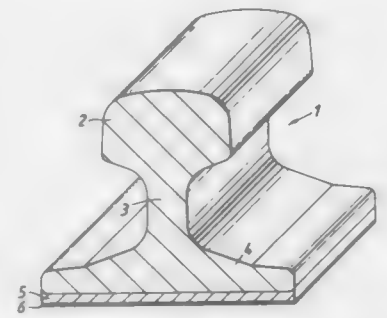
RAILWAYS

William H. Hodgson, Braithwaite; Colin G. Stanworth, Marchington, and David J. Thompson, Derby, all of England, assignors to British Steel plc and British Railways Board, both of London, England



Filed Sep. 18, 1989, Ser. No. 409,568

Claims priority, application United Kingdom, Sep. 22, 1988, 8822293

Int. Cl.[5] E01B *9/68*

U.S. Cl. 238—283 **18 Claims**

1. A steel rail having secured to it a composite body for absorbing vibrational energy generated by vehicular traffic on said rail, the composite body comprising a viscoelastic material bonded to, and sandwiched between, both the rail and a constraining member substantially stiffer in tension than the viscoelastic material.

5,011,078

SURFACE MARKING METHOD TO OBTAIN UNIFORM COATING

Charles A. Eisterhold, Star Rte. 2, Jefferson City, Mo. 65101

Continuation of Ser. No. 155,903, Feb. 16, 1988, abandoned. This application Feb. 22, 1989, Ser. No. 314,309

Int. Cl.[5] B05B *17/00*

U.S. Cl. 239—1 **1 Claim**

1. A method for spraying a generally flat surface with a spray material, the method comprising the steps of:

(a) defining a grid on the flat surface, the grid including a plurality of marks on the flat surface,

(b) spacing the plurality marks to correspond to a spray frequency within a corresponding portion of the grid,

(c) pumping the spray material from a spray material reservoir to a spray means for directing the spray material on to the generally flat surface,

(d) generating a signal corresponding to a desired amount of the spray material pumped to the spray means,

(e) transmitting the signal to a spray operator,

(f) spraying the generally flat surface within the portion of the grid by the spray operator in response to the transmitted signal, whereby the spray operator puts down a desired amount of spray material on the generally flat surface.

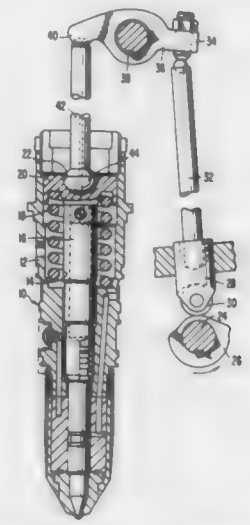
5,011,079

UNIT INJECTOR AND DRIVE TRAIN WITH IMPROVED PUSH ROD-PLUNGER CONNECTION

J. Victor Perr, Greenwood, Ind., assignor to Cummins Engine Company, Inc., Columbus, Ind.

Continuation of Ser. No. 315,612, Feb. 27, 1989, abandoned. This application Aug. 16, 1990, Ser. No. 568,633

Int. Cl.[5] F02M *51/20*



U.S. Cl. 239—95 **9 Claims**

1. A fuel injector assembly adapted to be operated intermittently by an injector drive train having a pivotable arm comprising:

an injector body having a bore;

a plunger assembly mounted for reciprocal movement within said injector body bore, said plunger assembly including a lower portion mounted for sliding movement within a lower section of said injector body bore and an upper portion mounted for sliding movement within an upper section of said injector body;

a push rod having a first end and a second end, said first end

connected to one side of the pivotable arm, said second end of said push rod having a spherical portion;

a connection means for pivotally joining said push rod to said upper portion of said plunger assembly in a manner to minimize wear between said push rod and said plunger assembly, said connection beans having a concave portion complimentary in shape to said spherical portion for receiving said spherical portion, said concave portion and said spherical portion having a diameter equal to at least the outer diameter of said lower portion of said plunger assembly.

5,011,080

CONVERGENT/DIVERGENT NOZZLE CONSTRUCTION

William K. Barcza; Curtis W. Berger, both of Stuart, and Luke A. Hmiel, Jupiter, all of Fla., assignors to United Technologies Corporation, Hartford, Conn.

Filed Apr. 18, 1990, Ser. No. 510,755

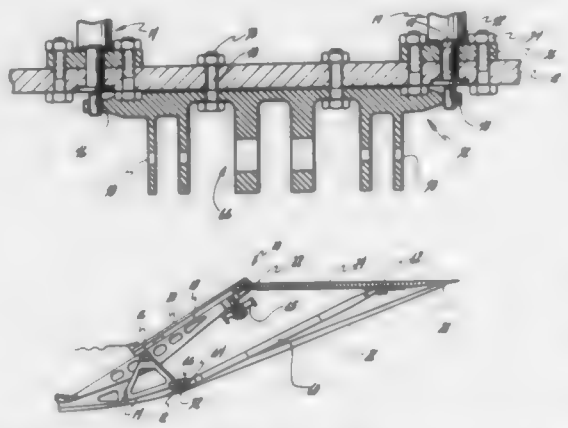
Int. Cl.[5] F02K *1/08*

U.S. Cl. 239—265.39 **1 Claim**

1. A convergent/divergent nozzle construction for an engine having a support frame for supporting a plurality of annularly spaced flap portions, each portion comprising:

a pair of A-frames;

a convergent flap pivotally mounted at one corner of each A-frame;



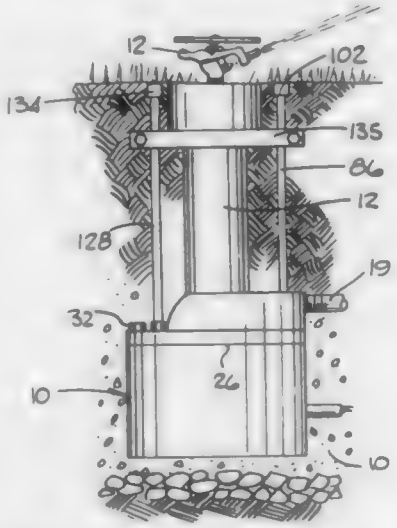
a divergent flap pivotally mounted to said convergent flap at two transversely spaced locations;

a mode strut bracket having a mode strut slot;

a mode strut pivotally mounted to said divergent flap and pivotally mounted in said mode strut slot;

an external flap pivotally connected to said divergent flap at two transversely spaced locations and pivotally mounted to said mode strut bracket at two transversely spaced locations;

said A-frames pinned to said mode strut bracket at a plurality of locations with tight tolerance pins and openings; and



said A-frame and said mode strut bracket each bolted to said support structure with bolts and loosely toleranced bolt holes.

5,011,081

IRRIGATION SYSTEM HAVING UNDERHEAD SPRINKLER VALVE

Carl J. Bentley, 1321 S. Bowen, Longmont, Colo. 80501

Filed Aug. 11, 1989, Ser. No. 393,668
Int. Cl.[5] F16K *31/12*
U.S. Cl. 239—569 **16 Claims**

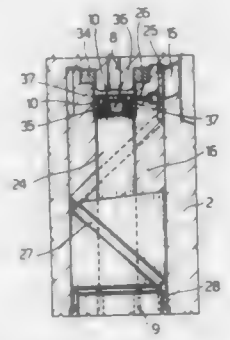
1. In an improved irrigation system of the type having a sprinkler head and fluid supply means for supplying the sprinkler head with fluid, wherein the improvement comprises a remote controllable valve assembly including:

a housing having interior walls defining an inner chamber, an inlet in fluid communication with said inner chamber, an outlet in fluid communication with said inner chamber and a valve seat surrounding the entrance of said outlet, said inlet also being in fluid communication with said fluid supply means, said outlet also being in fluid communication with said sprinkler head;

a flexible diaphragm extending across said inner chamber and being attached to said interior walls thereof so as to divide said inner chamber into an upper chamber and a lower chamber wherein said upper chamber is in fluid communication with said inlet and said outlet;

valve closing means located in said upper chamber and attached to said diaphragm for sealing engagement with said valve seat to stop fluid flow through said outlet to said sprinkler head;

means for remotely controlling fluid pressure in said lower chamber to deflect said diaphragm upwardly and downwardly for purposes of moving said valve closing means in and out of sealing engagement with said valve seat, thereby opening and closing said valve assembly; and



diaphragm deflection control means for controlling the deflection of said diaphragm into said lower chamber to control fluid flow through said valve assembly.

PERFECTED DIESEL ENGINE ELECTROMAGNETIC FUEL INJECTOR

Francesco P. Ausiello, Bologna, and Mario Ricco, Bari, both of Italy, assignors to Weber S.r.l., Torino, Italy

Filed Feb. 27, 1990, Ser. No. 485,617
Claims priority, application Italy, Mar. 3, 1989, 67146 A/89
Int. Cl.[5] F02M *59/00, 47/02*
U.S. Cl. 239—585 **4 Claims**

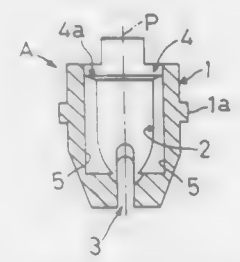
1. A Diesel engine electromagnetic fuel injector comprising:

a plunger (1) sliding inside the injector body (2), for controlling fuel passage between an injection chamber (3), supplied with fuel under pressure, and at least one injection orifice (4) formed in an injection nozzle (5) secured to said body (2);

an electromagnetic fuel metering valve (6) for controlling fuel passage, through a drain orifice, between a control chamber (8), supplied with fuel under pressure, and a low-pressure chamber, so as to reduce the pressure of the fuel in said control chamber (8) by draining the same through said orifice;

surface portions of said plunger being exposed to the fuel inside said injection chamber (3) and said control chamber (8), so that the pressures inside said chambers and acting on said surface portions displace said plunger (1) when the pressure in said control chamber (8) falls to a given value;

said fuel under pressure being supplied to said injection chamber (3) and said control chamber (8) by means of a single fitting (13) connected to a supply pipe (14) and coming out inside a supply orifice (15) formed in said body (2) and communicating with said control chamber (8) and with a supply duct for feeding fuel into said injection chamber (3) and substantially formed inside a series of sleeves (16,17) housed inside an axial hole (19) in said body (2) and inside which said plunger (1) slides axially;



characterised by the fact that said fuel supply orifice (15) comes out inside an annular chamber (25) formed between the outer surface of the top sleeve (16) in said series and said axial hole (19) in said body (2); said annular chamber (25) communicating with said control chamber (8) via at least one radial hole (26) formed in said sleeve (16), and with a helical groove (27) formed on the outer surface of said sleeve (16) and defining the first portion of said duct supplying fuel to said injection chamber (3).

5,011,083

LIQUID-SPRAYING NOZZLE

Kozo Matsumoto, and Hiroyoshi Asakawa, both of Nishinomiya, Japan, assignors to Kyoritsu Gokin Mfg. Co., Ltd., Japan

Filed May 3, 1989, Ser. No. 347,074
Int. Cl.[5] B05B *1/02*
U.S. Cl. 239—590.5 **4 Claims**

1. A liquid-spraying nozzle comprising:

a bottom-equipped tubular nozzle body 1, including;

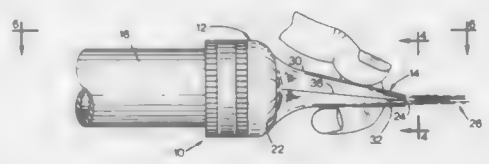
an inner peripheral face 2 formed at an inner bottom portion of the body 1 and coaxial or substantially coaxial with a nozzle axis P,

a laterally-elongated orifice 3 defined at least in a part of the bottom portion of said nozzle body normal or substantially normal to the nozzle axis P when viewed from the direction of the nozzle axis, said orifice substantially crossing the nozzle body 1 and having a uniform width over its entire lateral extent;

a large-diameter peripheral face 4 formed upstream of said inner peripheral face 2 and having a larger inner diameter than said inner peripheral face 2;

a stepped portion 4a formed and connecting between said inner peripheral face 2 and said large-diameter peripheral face 4, and

a pair of elongated grooves 5 disposed along the inner peripheral face extending in the direction of the nozzle axis P and having substantially parallel opposing faces facing each other, each said elongated groove 5 having an arcuate cross section, a downstream end in the vicinity of said orifice 3 and an upstream end opened at said stepped portion 4a;



whereby liquid flowing from said large-diameter peripheral face 4 and liquid flowing from said pair of elongated grooves flows in a continuous downstream direction into said orifice 3.

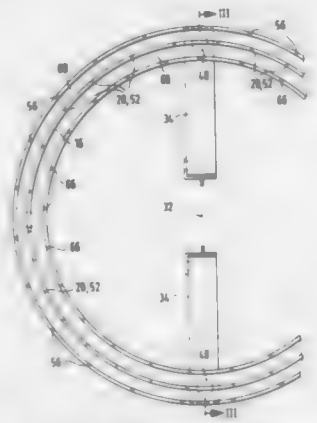
APPARATUS IN A POWDER SPRAYER

Ingemar Lööf, Skillingaryd, Sweden, assignor to AC Greiff Ytbehandling AB, Nacka, Sweden

PCT No. PCT/SE88/00199, § 371 Date Nov. 16, 1989, § 102(e) Date Nov. 16, 1989, PCT Pub. No. WO88/08332, PCT Pub. Date Nov. 3, 1988
PCT Filed Apr. 18, 1988, Ser. No. 424,308
Claims priority, application Sweden, Apr. 28, 1987, 8701776
Int. Cl.[5] B05B *5/47*
U.S. Cl. 239—690 **5 Claims**

1. An apparatus in a powder sprayer comprising an annular friction charging channel (9) defined by an inner, longitudinal body (8) with a surface of electrically insulating material, and a tubular body (7) surrounding the inner body with an inner surface of electrically insulating material, the channel being surrounded, radially beyond the insulating material of the tubular body, by an outer electric conductor (14), characterised in that there is disposed, inside the annular channel (9) and inside the insulating material of the longitudinal body (8), an inner electric conductor (11) which is electrically connected (12) to the outer conductor (14) and that the inner electric conductor extends along substantially the whole length of the charging channel (9).

5,011,086



SPRAY COATING DEVICE FOR ELECTRICALLY CONDUCTIVE COATING LIQUIDS

Adolf H. Sonnleitner, Offenbach, and Karl H. Bergmann, Wacholderberg, both of Fed. Rep. of Germany, assignors to Ransburg Corporation, Indianapolis, Ind.

PCT No. PCT/US88/02107, § 371 Date Nov. 30, 1989, § 102(e) Date Nov. 30, 1989, PCT Pub. No. WO88/10152, PCT Pub. Date Dec. 29, 1988
PCT Filed Jun. 13, 1988, Ser. No. 438,495
Claims priority, application Fed. Rep. of Germany, Jun. 16, 1987, 3720201; European Pat. Off., Mar. 15, 1988, 88104055.4
Int. Cl.[5] B05B *5/00*
U.S. Cl. 239—691 **33 Claims**

1. An electrode assembly for an atomizer, the atomizer including an atomizer axis along which material dispensed by the atomizer migrates toward an article to be coated thereby, a plane generally perpendicular to the atomizer axis, the location from which material to be atomized by the atomizer is dispensed lying generally in the plane, and the material dispensed by the atomizer being projected generally along the axis in a first direction away from a first side of the plane, the electrode assembly comprising an electrode holder defining a plane curve, a plurality of electrodes, the electrode holder holding the electrodes in spaced orientation to each other, the electrode holder including first and second surfaces inclined toward each other in the first direction toward the plane,

means defining first openings therein on a side thereof facing in the first direction from a second side the plane opposite the first side thereof toward the plane, the first openings being spaced along the electrode holder, means providing a second opening or second openings in the electrode holder to direct a second stream or second streams of a gas or mixture of gases at superatmospheric pressure across the first surface, means providing a third opening or third openings in the electrode holder to direct a third stream or third streams of a gas or mixture of gases at superatmospheric pressure across the second surface, the second and third streams of a gas or mixture of gases encountering each other in the vicinity of the first openings, means for fixing the electrodes to the electrode holder with the electrodes extending into the first openings, means for supporting the electrode holder on the second side of the plane adjacent the atomizer with the electrodes extending in the first direction toward the plane and for substantially insulating the electrodes electrically from the atomizer, an electrostatic potential supply, means for coupling the electrodes to the electrostatic potential supply, and the electrode holder including means for feeding a gas or mixture of gases at low superatmospheric pressure to the first openings.

METHOD OF AND APPARATUS FOR CONTINUOUSLY TREATING COMMINUTED SYNTHETIC PLASTIC CONTAINERS AND PRODUCTS HAVING CONTAMINANTS BONDED THERETO FOR RECYCLING PURPOSES

Larry D. Richardson, 5755 Wade Rd., Coleman, Mich. 48618, and Tommy M. Pohlman, 3525 N. Branch Dr., Beaverton, Mich. 48612

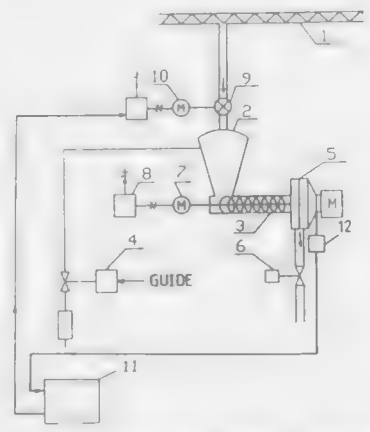
Filed May 14, 1990, Ser. No. 522,637
Int. Cl.[5] B02C *19/00*
U.S. Cl. 241—5 **30 Claims**

1. A method of continuously treating comminuted synthetic plastic containers and products, having cellulosic or resin labels or other contaminants adhered thereto, wherein the containers have been reduced to flakes of plastic and/or flakes of plastic which have parts of the contaminant bonded thereto, comprising the steps of;

a. passing the flakes in a continuous stream through a separator to remove any loose fluff and fines from the flake stream;

b. receiving the stream continuously and passing the flakes in a continuous flow stream through a cryogenic housing subjecting the flow stream to cryogenic brittlizing temperatures;

c. separating flakes from the flow stream and hurling them with bond disintegrating force individually against an impacting wall to impact each flake individually, without interference from other flakes of a nature which might shield the flake, to thereby yield a discharge stream comprising flakes and any contaminant fines or fluff; and



d. continuously passing the discharge stream from step c continuously through a separator to remove any fines and/or fluff produced from the discharge stream while discharging the flakes, free of contaminants, in a flow stream.

5,011,088

CONTROL METHOD FOR A CHIP REFINER

Aslak Savonjousi, Espoo, Finland, assignor to ABB Strömberg Teollisuus OY, Helsinki, Finland

Filed Jan. 3, 1990, Ser. No. 460,585
Int. Cl.[5] B02C *25/00*
U.S. Cl. 241—21 **5 Claims**

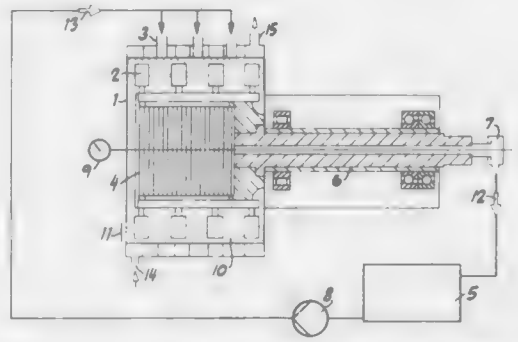
1. A method for controlling feed rate of a chip refiner comprising the steps of:

metering chip stock from a chip stock meter to a refiner for refining:

feeding metered chips by a chip feeder to refiner disks, said refiner disks being mounted on an axial bearing;

adding water to the chips prior to feeding the chips between the refiner disks;

measuring temperature of the axial bearing of the refiner disks; and



controlling a quantity of chip stock metered to the chip feeder in response to measured temperature of the axial bearing whereby temperature of the axial bearing is regulated to a generally constant level.

5,011,089

DISPERSING PROCESS AND STIRRED BALL MILL FOR CARRYING OUT THIS PROCESS

Friedrich Vock; Gerd Kissau, and Klaus Warnke, all of Münster, Fed. Rep. of Germany, assignors to BASF Lacke+Farben AG, Münster, Fed. Rep. of Germany

Continuation of Ser. No. 298,783, Jan. 17, 1989, abandoned, which is a continuation of Ser. No. 893,302, Jun. 16, 1986, abandoned. This application May 4, 1990, Ser. No. 518,273
Claims priority, application Fed. Rep. of Germany, Oct. 16, 1984, 3437866
Int. Cl.[5] B02C *17/16, 23/10, 23/36*
U.S. Cl. 241—21 **20 Claims**

1. A method of dispersing solids in a liquid phase comprising the steps of:

feeding a mill base comprising solids and a liquid phase into a hollow body having a substantially cylindrical inner surface and containing a grinding medium and a sieve means, said mill base being fed radially inwardly with respect to said hollow body into said hollow body;

rotating said grinding medium relative to said hollow body and sieve means at such a speed that the grinding medium forms an annular charge in contact on an outer side with said cylindrical inner surface and defining on an inner side a cylindrical space essentially free of said grinding medium in which cylindrical space is situated the sieve means, such that the annular charge rotates around the sieve means without substantially colliding with said sieve means;

conveying said mill base radially inwardly with respect to said hollow body through said charge toward the sieve means so that a fluidized bed is formed with respect to said grinding medium; and

passing said mill base radially inwardly with respect to said hollow body through said sieve means, thereby separating said mill base from any residual grinding medium.

CELLULOSE FIBERIZATION APPARATUS

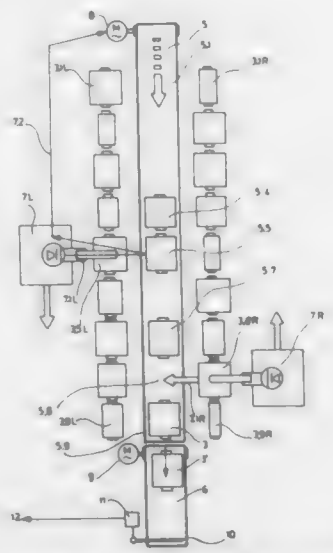
Ivyl D. Kopecky, Ypsilanti, N. Dak., assignor to Haybuster Manufacturing Inc., Jamestown, N. Dak.

Filed Aug. 10, 1989, Ser. No. 392,742
Int. Cl.[5] B02C *7/06*
U.S. Cl. 241—259.1 **11 Claims**

1. A fiberization apparatus for breaking waste paper into fibers comprising a housing, a rotor disc mounted in said housing for rotation about an axis, at least one stator disc mounted in said housing adjacent one side of said rotor disc, said rotor disc having a plurality of teeth formed in at least the one side surface thereof said teeth extending generally radially outward to an outer periphery edge, and said stator disc having a plurality of teeth formed in the surface thereof that faces the rotor, said stator disc having a material feed opening in the center thereof defining a periphery spaced outwardly from the axis of rotation of the rotor, and the teeth on the rotor disc extending inwardly toward the axis of rotation so that the opening on the stator disc leaves a portion of the teeth on the rotating disc exposed.

5,011,092

METHOD OF RANDOM DOFFING WOUND PACKAGES FROM TWO SIDES OF A TEXTILE YARN PROCESSING MACHINE



Jürgen Kallmann, Kaarst, Fed. Rep. of Germany, assignor to Palitex Project Company GmbH, Krefeld, Fed. Rep. of Germany

Filed Mar. 27, 1990, Ser. No. 499,772

Claims priority, application Fed. Rep. of Germany, Apr. 17, 1989, 3912513

Int. Cl.[5] B65H *54/26, 67/06*

U.S. Cl. 242—35.5 A **3 Claims**

1. Method of random doffing wound packages with an automated handling device from parallel successive takeup zones on two sides of a textile yarn processing machine onto a driven conveyor belt extending centrally of the machine between the successive parallel takeup zones, said method being characterized by providing a vacant position on the conveyor belt for doffing a wound package from a desired takeup zone regardless of previously doffed wound packages on the conveyor belt; said method comprising the steps of:

successively sensing with the automated handling device whether the position on the conveyor belt adjacent the takeup zone having a wound package to be doffed is vacant or occupied by a doffed wound package, and signaling the drive of the conveyor belt;

advancing the conveyor belt in stepwise movements is a signal is received that the position is occupied and until the signal indicates that the position is vacant;

providing a buffer zone device at the forward end of the conveyor belt and transferring wound packages from the forward end of the conveyor belt as such wound packages reach the forward end of the conveyor belt during stepwise advancing movements of the conveyor belt; and

successively doffing the wound packages with the automated handling device from the desired takeup zones onto the vacant positions on the conveyor belt.

5,011,093

DEFLECTABLE MEDIA GUIDES FOR ASSISTING IN MEDIA TRANSPORT

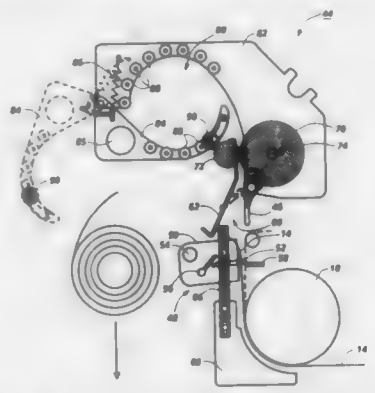
David M. Mayer, Fremont, and Jay J. Cisneroz, San Jose, both of Calif., assignors to Xerox Corporation, Stamford, Conn.

Filed Mar. 14, 1990, Ser. No. 493,252

Int. Cl.[5] B65H *19/20;* **G03B** *27/32;* **B26D** *5/20*

U.S. Cl. 242—56 R **4 Claims**

1. A media transport apparatus comprising



means for supplying a recording medium,

means for collecting sections of said recording medium,

means for driving said recording medium from said means for supplying to said means for collecting along a transport path,

means for severing said recording medium into said sections, said means for severing being located between said means for driving and said means for collecting,

means for moving said means for severing in a plane substantially parallel to the plane of said recording medium and in

a direction substantially transverse to the direction of movement of said recording medium, and

deflectable means for defining a portion of said transport path in interference relationship with said means for severing, said deflectable means being readily displaced by said means for severing and providing a rigid guide for said recording medium when not displaced.

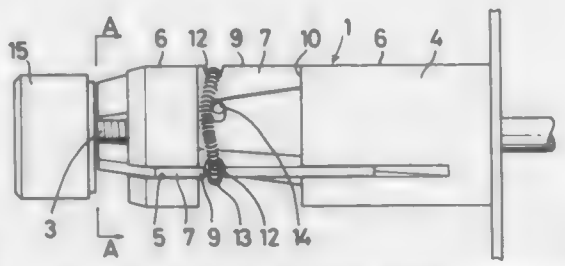
SHAFT FOR MOUNTING ARTICLE



Yoshifumi Azuma, Wakayama, Japan, assignor to Noritsu Kenkyu Center Co., Ltd., Osaka, Japan

Filed Mar. 10, 1987, Ser. No. 24,156

Claims priority, application Japan, Mar. 10, 1986, 61-35154

Int. Cl.[5] B65H *17/02*

U.S. Cl. 242—72.1 **5 Claims**

1. A device for supporting an article having a center hole, said device comprising:

a core shaft;

a boss concentrically mounted on and secured to said core shaft and extending in an axial direction thereon, said boss having a plurality of grooves each of which extends in and is tapered in said axial direction, and said grooves being spaced from one another around said boss;

a plurality of sliders for fixing the article relative to said core shaft and each of which is slidably mounted and guided in a respective one of said grooves, each of the sliders having a bottom edge contacting said boss at the bottom of the respective said groove in which it is mounted and a top edge opposite the bottom edge, each of the sliders movable in said axial direction along the respective said groove in which it is mounted between a first position at which the top edge thereof is disposed below the outer circumferential surface of said boss and a second position at which the top edge thereof protrudes radially outward from the outer circumferential surface of said boss;

urging means for exerting a biasing force in a direction opposite to said axial direction that biases said sliders toward said first position; and

a rotatable knob disposed at one end of said core shaft and abutting each of said sliders for moving each of said sliders from said first position to said second position, and said knob being movable along and fixable relative to said core shaft for adjustably maintaining said sliders in respective fixed positions against the biasing force exerted by said urging means.

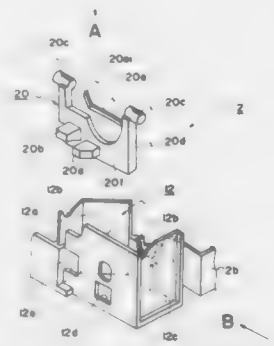
TAPE CASSETTE



Harushige Nagai, Ishioka; Masato Kiryu, Mito; Takeshi Sasaki, and Akira Saotome, both of Ibaraki, all of Japan, assignors to Victor Company of Japan, Ltd., Yokohama, Japan

Filed Apr. 14, 1989, Ser. No. 337,818

Claims priority, application Japan, Apr. 20, 1988, 63-53337[U]

Int. Cl.[5] G11B *23/087*

U.S. Cl. 242—199 **2 Claims**

1. A tape cassette comprising a cassette body in which a pair of tape reels are mounted, a protective lid pivotally mounted on a front end of the body for movement between open and closed positions, and a locking mechanism for the lid for releasably locking the lid in the closed position, the locking mechanism including a lock plate pivotally mounted in a chamber at one side of the cassette body and having a locking claw with a locking position wherein the claw extends through an opening in one wall of the body defining said chamber to lock the lid, the lock plate being movable inwardly to retract the claw in said opening and release the lid, wherein the plate is provided with a position limiting member of elasticly deformable material and the lid is formed with a projection extending into said chamber to cooperate with said limiting member, said projection being moved between first and second positions when the lid is opened and closed respectively, said limiting member and said projection being relatively configured and disposed for (a) providing clearance therebetween when the lid is closed and the claw is in locking position (b) providing engagement therebetween when the plate is moved inwardly dot release the lid, and (c) providing disengagement between the limiting member and the projection when the lid is opened and the projection is moved from the second position to the first position.

VEHICLE STEERING DEVICE

Bruce W. Travor, Holland, and Roger A. Holler, Warminster, both of Pa., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Aug. 30, 1990, Ser. No. 579,921

Int. Cl.[5] F41G *7/00*

U.S. Cl. 244—3.21 **8 Claims**

1. A vehicle steering device, that is joined to an air-dropped component, comprising:

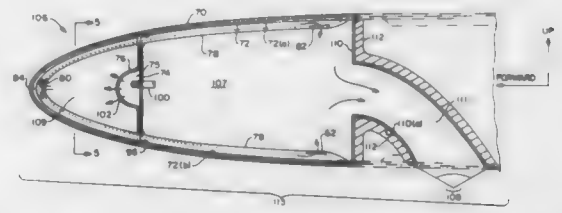
a. aerodynamic housing means, including a front tip end, to provide necessary structure to join to the component;

b. nose cavity means in said housing means carrying orientation means that causes the device to assume proper longitudinal orientation with respect to the earth's gravitational field;

c. gravity reaction means located inside said housing means adjacent said nose cavity to force the device to seek the earth's surface; and

d. guiding means connected to said reaction means to adjust the flight path of the device during free-fall.

5,011,098



THERMAL ANTI-ICING SYSTEM FOR AIRCRAFT

Douglas McLaren, Seattle, and William W. Orr, Mercer Island, both of Wash., assignors to The Boeing Company, Seattle, Wash.

Filed Dec. 30, 1988, Ser. No. 292,541

Int. Cl.[5] B64D *15/04*

U.S. Cl. 244—134 B **12 Claims**

1. The combination of an aircraft structure having a leading edge and a system for heating said structure to inhibit the formation of ice on said leading edge, said structure having an outer skin with spaced apart, exposed surface defining segments and said heating system including:

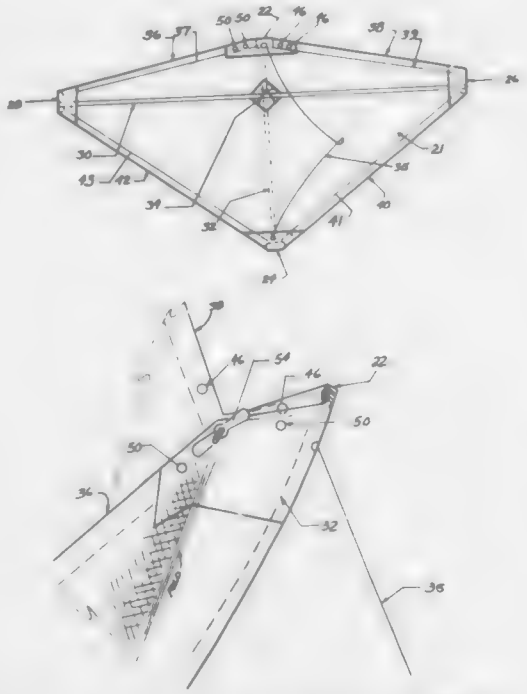
a. an inner skin with a segment of complementary configuration adjacent a segment of said outer skin and cooperating therewith to form a series of flow passages which: are disposed in side-by-side relationship, extend from the leading edge of said structure toward the rear thereof, and have inlets at the leading edge of the structure and outlets to the rear of said inlets;

b. a bulkhead so extending spanwise of said structure between the inlets and outlets of said flow passages and from one side to the other of said structure as to form a heated fluid inlet plenum that keeps fluid from escaping toward the rear of the structure;

c. a heated fluid supply manifold: located in said structure on the forward side of said bulkhead, spanning said series of fluid flow passages, and having outlet passages at intervals

along the length of the manifold through which the heated fluid can flow into the inlet plenum;

d. means bonding said outer skin to said inner skin and said manifold to said bulkhead; and



e. means for effecting a flow of a heated fluid: into said supply manifold, from said manifold toward the leading edge of said structure, through said inlets into said flow passages, through said passages, and from said outlets to thereby affect a transfer of thermal energy from said fluid to the outer skin of said structure to heat said skin and thereby inhibit the formation of ice on that skin.

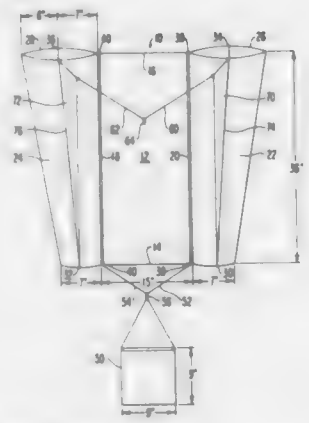
KITE WITH SELF INDUCED DIHEDRAL ADJUSTABLE KEEL AND STABILIZING SAIL TURBINES

Rudolph W. Harburg, 1020 Mapleton Ave., Boulder, Colo. 80302

Filed Sep. 7, 1989, Ser. No. 404,[illegible]2
Int. Cl.[5] B64C *31/06*
U.S. Cl. 244—153 R **15 Claims**

1. A wind responsive kite comprising in combination:



a diamond shaped flexible flight skin having four corners, a top corner, a bottom corner, a right corner and a left corner; a horizontal wing spar which attaches to the flight skin at its right and left corners where the horizontal wing spar is positioned on the windward side of the flight skin, and where the horizontal wing spar is longer than the distance measured along the flight skin between the two points of attachment at its aforementioned right and left corners causing the horizontal wing spar to bow into an initial dihedral due to the tension in the flight skin; and a vertical spar which attaches to the flight skin at its top and bottom corners where the vertical spar is positioned on the leeward side of the flight skin.

5,011,100

KITE

Richard Gerstein, 2711 Euclid St., #B, Santa Monica, Calif. 90405

Filed Jan. 10, 1990, Ser. No. 463,174
Int. Cl.[5] B64C *31/06*
U.S. Cl. 244—153 R **8 Claims**

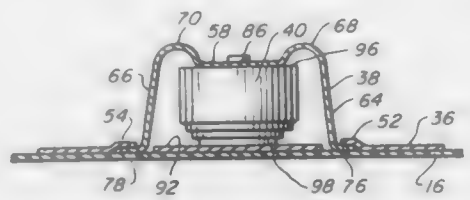
1. A foldable kite, comprising;

a flexible panel having at least four sides formed by a top edge, a bottom edge, and two side edges;

an equal number of flexible tubes adjacent each of said side edges of said flexible panel, each of said tubes having a respective central axis generally parallel to said adjacent side edges of said flexible panel, and said flexible tubes having an opening at each end configured to allow air to flow therethrough about said central axis while in flight;

flexible diaphragm contained within each of said flexible tubes, dividing said flexible tube into at least two portions;

support means for said flexible panel generally extending parallel to side edges; and



at least two flexible wings, each positioned along a respective one of said flexible tubes each of said wings being generally triangular in shape and having one side which is generally of the same length as a respective one of said flexible tubes.

5,011,101

SURFACE MOUNTING SPRING CLIP

William J. Buchser, Marrs Township, Posey County, Ind., assignor to Whirlpool Corporation, Benton Harbor, Mich.

Continuation of Ser. No. 224,457, Jul. 26, 1988, abandoned, which is a division of Ser. No. 115,207, Nov. 2, 1987, Pat. No. 4,776,178. This application Jul. 13, 1989, Ser. No. 380,692
Int. Cl.[5] G12B *9/00*
U.S. Cl. 248—27.3 **8 Claims**

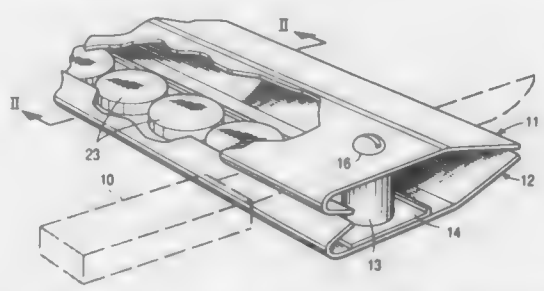
1. A mounting assembly for surface mounting a device comprising:

a wall having a substantially flat surface portion and a pair of opposed spaced openings with raised wall portions above said openings to provide raised sockets; and

a spring clip, including a body of resilient strip material including a flat central portion for facially engaging a flat upper surface of the device, said central portion defining opposite ends,

first and second side portions each having an upper end and a lower end and a length between said upper and lower ends preselected to space said central portion in use away from the wall less than the height of the device, the spacing between said sides portions being greater than the width of the device to permit inward movement of said side portions when the device is disposed therebetween,

first and second resilient yieldable semicircular, downwardly opening connecting portions connecting said opposite ends of said central portion to said upper ends of said first and second side portions respectively, said connecting portions being constructed to cause said side portions to diverge downwardly, and



first and second flat tabs turned outwardly from said lower ends of said side portions below said central portion and removably received in the sockets and having said central portion bearing downwardly on the upper surface of the device and resiliently urge the device into facial contact with the flat surface portion of the wall, said tabs extending outwardly sufficiently to remain in the sockets notwithstanding the device urging said central portion resiliently outwardly and thereby cause said side portions to be urged resiliently inwardly, said tabs maintaining said flat central portion accurately parallel to the outer surface of the device.

MAGNETIC KNIFE HOLDER

Walter J. Kiellr, 1137 N. Patterson, Santa Barbara, Calif. 93111

Filed Apr. 30, 1990, Ser. No. 516,6[illegible]
Int. Cl.[5] A47G *21/14*
U.S. Cl. 248—37.3 **2 Claims**

1. A magnetic knife holder having a front and rear comprising:

(a) a pair of spaced elongated cowlings each having a front curved nose and a guide strip projecting rearwardly from the nose and inclined toward each other;

(b) an elongated strip of magnetic material disposed between the cowlings and having a rear flange;

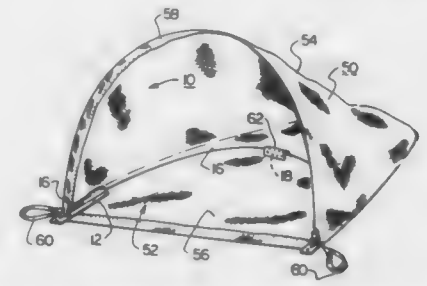
(c) and a plurality of disc magnets disposed on the strip of magnetic material between the flange and the rear edge of one of the guide strips to underlie the rear edge of said one guide strip.

5,011,103

LEAF BAG AND COLLAPSIBLE FRAME

Franklin A. Hayes, and Harold E. Sexton, both of Asheboro, N.C., assignors to A.R.T. of Asheboro, Ltd., Asheboro, N.C.

Filed Apr. 5, 1990, Ser. No. 505,936
Int. Cl.[5] B65B *67/00*
U.S. Cl. 24[illegible]—[illegible] **8 Claims**



1. A trash and leaf collection container comprising:

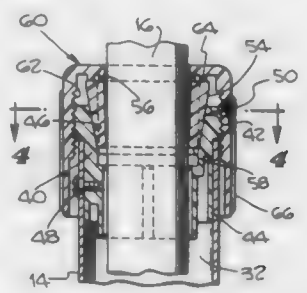
(a) a flexible bag-like container having an open end and a closed end, said open end having a minor portion and a major arcuate portion, a rod receiving means extending around said major arcuate portion;

(b) a self-supporting frame for receiving said open end of said flexible container and comprising:

(i) an arch lying in a substantially upright plane formed by a rod means extending through said rod receiving means with the central portion thereof flexed and the opposite ends of said rods means protruding downwardly and outwardly of each end of said rod receiving means;

(ii) a pair of spaced elongated stabilizing feet, each of said stabilizing feet being placed at one end of said minor portion and extending into said bag in a direction paral-

lel to the longitudinal axis thereof, means associated with each of said feet for connecting one end of said rod means thereto and maintaining said arch in said vertical plane;



(c) whereby said flexible bag-like container with its rod receiving means cooperates with said stabilizing feet to establish and maintain the trash and leaf collection container in an open upright position without any supplemental struts extending from said arch into said container which interfere with the filling and emptying of said container.

5,011,104

ADJUSTABLE FRAME

Roger C. Fang, Alhambra, Calif., assignor to Tatung Company of America, Inc., Long Beach, Calif.

Filed May 7, 1990, Ser. No. 519,915
Int. Cl.[5] A47G *29/00*
U.S. Cl. 248—125 **4 Claims**

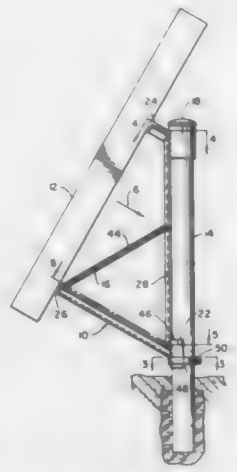
1. An adjustable frame comprising:

an outer tubular member and an inner cylindrical frame member adapted to be disposed in longitudinally adjustable relation with and end of said inner frame member projecting within said outer tubular member, said frame member being of substantially smaller diameter than the interior surface of said outer member so as to provide an annular space therebetween;

a collet holder extending partially within said tubular member and having throughout most of its length an exterior cylindrical surface which fits rather closely within the interior surface of said tubular member, said collet holder having an externally threaded outer end portion which extends longitudinally beyond the end of said tubular member, said collet holder also having a tapered interior wall surface which is of largest diameter at said outer end, said externally treaded portion of said collet holder being

of larger diameter than the external surface of said tubular member;

a collet circumdisposed about said frame member in a normally loose relation therewith and having an inner end extending partially within said collet holder and said tubular member, said collet having a cylindrical interior surface and its outer surface being longitudinally tapered with its smallest radial wall thickness at said inner end, the exterior surface of said collet and the interior surface of said collet holder thus providing longitudinally tapered mating cam surfaces;



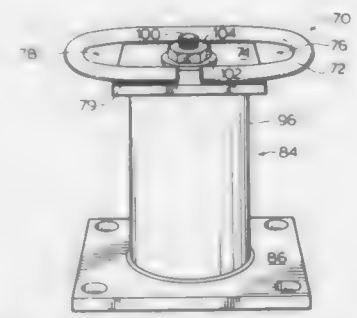
said collet being made of a resilient material, said collet having a circumferentially gap therein so that it may be radially compressed against the outer surface of said frame member; and

a sleeve member having a cup-shaped end with an opening therein which is circumdisposed about said frame member, having a circumferential ledge inside said cup-shaped end which engages the outer end of said collet, having internal threads which threadedly engage the external threads of said extended portion of said collet holder, and having a knurled exterior surface adapted for rotating said sleeve in one direction so as to drive said collet into said collet holder and thereby radially compress said collet against said frame member and create a radial expansion force within said annular space for locking said frame member in a selected position of longitudinal adjustment relative to said tubular member.

5,011,105
COLLECTOR STAND

John L. Sobieski, and Edward W. Bottum, both of Brighton, Mich., assignors to Refrigeration Research, Inc., Brighton, Mich.

Filed Aug. 13, 1979, Ser. No. 66,045
The portion of the term of this patent subsequent to Aug. 30, 2003, has been disclaimed.
Int. Cl.[5] E04G *5/06*
U.S. Cl. 248—219.1 **4 Claims**



1. A vertical post, one end of which is stationarily mounted, a solar collector positioned adjacent said post and at an oblique angle thereto, a frame secured to the collector including a pair of parallel collector angle iron members fastened to the collector, the lower of which is positioned adjacent the lower edge of the collector and the upper of which is positioned above the center of gravity of the collector, a post angle iron member extending adjacent to and parallel to the post, an upper iron channel member extending between the upper end of the post angle iron member at one end and the upper collector angle iron member at the other end, a pair of upper angle iron bracing members extending at one end from the upper end of the post angle iron member to the upper collector angle iron member at the other end in spaced relation to the other end of the upper channel iron member, a bottom channel iron member extending at one end from the other end of the post angle iron member to the lower collector angle iron member at the other end thereof, a pair of lower angle iron bracing members extending at one end from the lower end of the post angle iron member to the lower collector angle iron member at the other end thereof in spaced relation to the other end of the lower channel iron member, and a pair of central angle iron bracing members extending from the post angle iron member at one end to the lower collector angle iron member at the other end adjacent to the other end of the lower angle iron bracing members an end cap in the form of a cylinder closed at one end secured to the frame adjacent the upper end of the post angle iron member and sleeved over the upper end of the post, a semi-cylindrical abutment member secured to the other end of the post angle iron member adapted to abut the post in spaced relation to the end cap, and a collar securing the semi-cylindrical abutment member to the post.

5,011,106
ROOF SAFETY ANCHOR

Parvaneh Cody, Don Mills, Canada, assignor to Stanford Cody Limited, Woodbridge, Canada

Filed Mar. 27, 1990, Ser. No. 499,966
Int. Cl.[5] A62B *35/02, 37/00*
U.S. Cl. 248—237 **10 Claims**

1. A safety anchor for mounting on the roof of a building comprising

an anchor member;

a base supporting said anchor member;

said anchor member being a C shaped bar having two closed loops extending to either side of said base, and an elongate securing member defined by the portion of said anchor member in contact with said base, said closed loops being defined by the interior periphery of the portion of said anchor member extending from said base and the exterior periphery of the base between the portion of said anchor member in contact with the surface of said base,

said anchor member being attached to said base by a plurality of points of attachment between said elongate securing member and said surface of said base extending substantially and continuously across said surface of said base, said plurality of points of attachment being provided by a continuous weld between said portion of said anchor in contact with said base and said surface of said base.

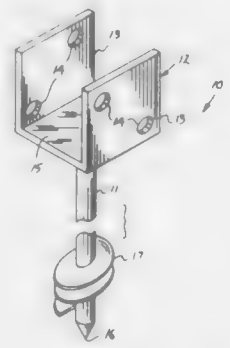
5,011,107
POST ANCHOR APPARATUS

Roger R. Reece, 9415 E. 500 S., Upland, Ind. 46989

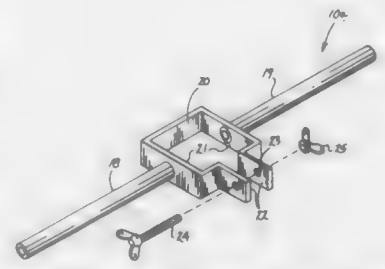
Filed Mar. 15, 1990, Ser. No. 493,850
Int. Cl.[5] F16M *13/00*
U.S. Cl. 248—545 **1 Claim**

1. A post anchor apparatus comprising,

a rigid, elongate cylindrical support shaft including a lower terminal end and an upper terminal end, the upper terminal end including a mounting head integrally secured to the upper terminal end, the mounting head configured for reception of a lower terminal end of a fence post therewithin, and



first helical web integrally mounted about the post shaft adjacent the lower terminal end, and



wherein the lower terminal end is pointed, and

wherein the mounting head includes a rigid planar floor, the rigid planar floor integrally and orthogonally mounted to the upper terminal end of the support shaft, and the floor including spaced parallel webs integrally and orthogonally mounted to opposed sides of the floor, with the webs including a plurality of apertures therethrough for receiving fasteners to secure the webs to the lower terminal ends of the fence post, and

wherein the mounting head further includes further webs integrally mounted to the floor to define an enclosed socket to receive the lower terminal end of the fence post, and

further including a further helical web integrally formed about the support shaft formed between the helical web

and the mounting head, and the further helical web defined by a predetermined pitch, and the helical web defined by a first pitch, wherein the predetermined pitch is greater than the first pitch, and

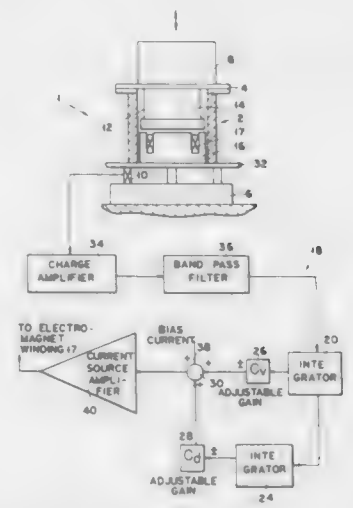
further including a torque member, the torque member including spaced, coaxially aligned handles, the handles integrally and orthogonally mounted to spaced side walls, the side walls integrally and orthogonally mounted to a rear plate, and the side walls integrally and orthogonally mounted to "L" shaped brackets at their forward terminal ends, the "L" shaped brackets including an aperture formed through each "L" shaped bracket, wherein the aperture of each "L" shaped bracket is aligned relative to one another, and a threaded member received through the apertures, and a fastener securable to the threaded member to clamp the "L" shaped brackets together, and clampingly enclose the post within the member to effect rotation of the post to secure the post within the support surface.

5,011,108
ACTIVE MOUNTS

Hsiang M. Chen, Latham; Paul Lewis, Scotia, and Donald S. Wilson, Clifton Park, all of N.Y., assignors to Mechanical Technology Incorporated, Latham, N.Y.

Filed Aug. 10, 1989, Ser. No. 392,197
Int. Cl.[5] F16M *13/00*
U.S. Cl. 248—550 **17 Claims**

1. An active mount system comprising:



a relatively low stiffness resilient mount for supporting a load in compression from a machine supporting base to a supporting structure;

sensing means for sensing a level of vibrational force transmitted from said load through said resilient mount;

control signalling means for transmitting a signal in response to the level of vibrational force sensed by said sensing means; and

force transducing means for providing a force to attenuate said vibrational force transmitted through said resilient mount in response to said signal from said control signalling means;

wherein said force transducing means includes an electromagnetic device in parallel with said resilient mount, and

means for providing a D.C. bias current to preload the electromagnetic device;

wherein said sensing means includes means for determining displacement and velocity of the load; and

wherein said force transducing means, in response to said means for determining displacement and velocity of the load, provides a force to change stiffness and damping characteristics, respectively, of said resilient mount.

5,011,109
SUSPENSION DEVICE FOR SEAT

Kojiro Nagata, Akishima, Japan, assignor to Tachi-S Co., Ltd., Tokyo, Japan

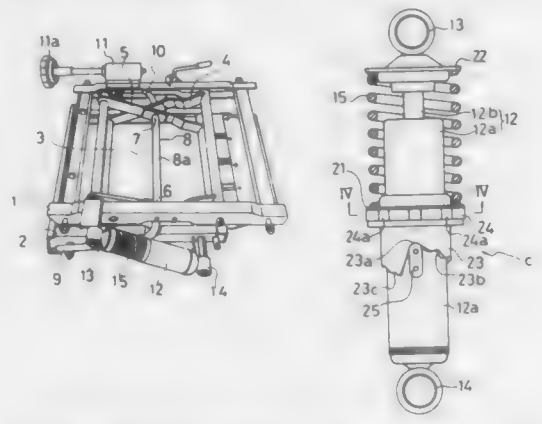
Filed Mar. 16, 1989, Ser. No. 324,076
Int. Cl.[5] F16M *13/00*
U.S. Cl. 248—564 **3 Claims**

3. A suspension device for seat, comprising:

an upper movable frame;

a lower base frame fixed to a floor;

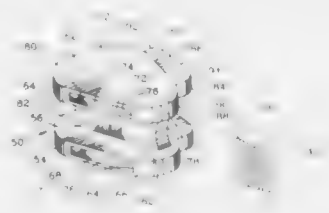
an X-shaped link means provided between said upper movable and lower base frames;



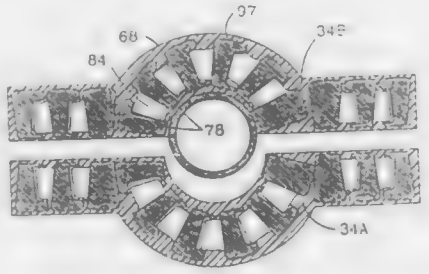
a torsion bar connected with and disposed between said upper and lower base frames, by means of which said upper movable frame is given a repercussive force to resiliently resist against a weight of an occupant thereon;

a shock absorber connected with and disposed between said upper movable and lower base frames, such that said shock absorber is located outwardly of said two frame;

an adjusting means for adjusting said repercussive force of said torsion bar, said adjusting means being provided at said shock absorber, and

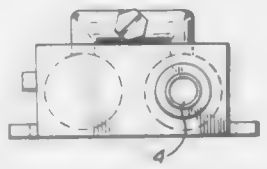


wherein said adjusting mechanism comprises a rotatable ring attached idly about said shock absorber, a cylindrical guide piece integral with said rotatable ring, said cylindrical guide piece being idly attached about said shock absorber, whereby both rotatable ring and cylindrical guide piece are free to move in a coaxial, longitudinal direction of said shock absorber and to rotate about said shock



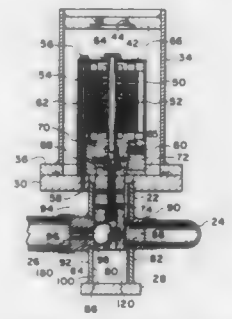
absorber, and said engagement portions of said adjusting mechanism comprise a plurality of irregular, wavy

notches which are formed at a lower end of said cylindrical guide piece and are varied in level of their valleys.



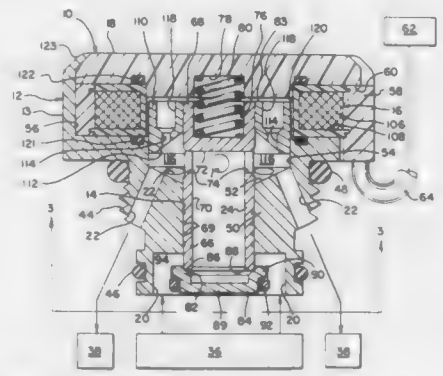
5,011,110
BOP SEAL WITH IMPROVED METAL INSERTS
Tri C. Le, Sugar Land, Tex., assignor to Baroid Technology, Inc., Houston, Tex.
Filed Aug. 16, 1990, Ser. No. 568,600
Int. Cl.[5] E21B *33/06*
U.S. Cl. 251—1.1 **20 Claims**

1. A sealing assembly for a ram block of a blowout preventer for sealing with a pipe or the like within a well bore, the sealing assembly comprising:
- a resilient seal having a generally semi-circular portion adapted for engagement with the pipe;
- a plurality of rigid inserts each at least substantially embedded within the seal and circumferentially arranged about the semi-circular portion of the seal;
- each insert including an upper flange having an upper radially innermost surface for pressing the seal into sealing engagement with the pipe, a lower flange, and a rib fixedly interconnecting the upper and lower flanges;
- each insert having a slot within at least one of the upper and lower flanges, the slot having an opening adjacent a side of the flange and forming a cavity defined by the flange; and
- each insert further having a male interconnecting member extending circumferentially outward from an opposing side of the flange for sliding engagement within the slot of an adjacent member, such that the circumferentially spaced inserts are independently movable with respect to each other and are interconnected while the blowout preventer closes about the pipe.



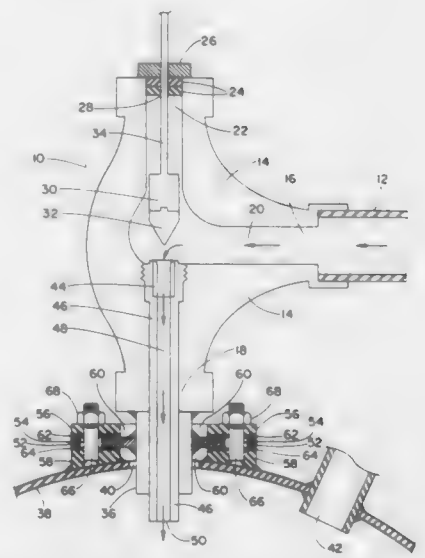
5,011,111
DAMPING CONTROL DEVICE
Marvin I. Nelson, 613 N. Washington, Dell Rapids, S. Dak. 57022, and John S. Reedy, 1604 Keystone, Brandon, both of S. Dak. 57005
Continuation of Ser. No. 375,039, Jul. 3, 1989, abandoned. This application Feb. 20, 1990, Ser. No. 481,866
Int. Cl.[5] F16K *31/383*
U.S. Cl. 251—54 **4 Claims**

3. A damping control device, comprising:
- a. a first cylinder;
- b. A first piston located within said first cylinder which traverses said first cylinder;
- c. a second cylinder which communicates with said first cylinder;
- d. a free floating piston located within said second cylinder which moves transversely along the entire length of said second cylinder to expel a constant volume of fluid by one side of said free floating piston into the first cylinder on one side of said first piston, and to expel a constant volume of fluid by an opposite side of said first piston into said second cylinder on an opposite side of said free floating piston, causing a movement thereby of said free floating piston in response to a movement of said first piston, wherein said free floating piston sealingly engages the cylinder walls of said second cylinder so that said free floating piston acts to keep a constant volume of fluid on each side of said free floating piston and corresponding side of said first piston;
- e. a connecting channel which connects one end of said first cylinder with a corresponding end of said second cylinder, and which transports fluid to and from said first cylinder and said second cylinder as said first piston traverses said first cylinder;
- f. an additional connecting channel which connects an opposite end of said first cylinder with an opposite end of said second cylinder, and which transports fluid to and from said first cylinder and said second cylinder as said first piston traverses said first cylinder; and
- g. a control means which causes said first piston to traverse said first cylinder, and to transport said fluid into and out of said first cylinder and into and out of said second cylinder.



5,011,112
INCREMENTAL ELECTRICALLY ACTUATED VALVE
Paul R. Glamm, La Crosse, Wis., assignor to American Standard Inc., New York, N.Y.
Division of Ser. No. 286,683, Dec. 20, 1988, Pat. No. 4,928,494. This application Sep. 11, 1989, Ser. No. 405,160
Int. Cl.[5] F16K *31/04, 3/32*
U.S. Cl. 251—129.11 **24 Claims**

1. A variable flow rate valve comprised of:
- A valve body defining an internal metering chamber having a substantially planar outlet surface, said valve body having a first wall defining an inlet aperture for permitting fluid flow into said metering chamber and a second wall defining an outlet aperture for permitting fluid flow from said metering chamber;
- a rectilinear metering piston disposed in said metering chamber in sliding engagement with said planar outlet surface, said metering piston having a metering orifice and a closure cavity spaced from said metering orifice, said metering piston further having a bore connecting said metering orifice and said closure cavity;



- a closure member disposed in said closure cavity for sealingly engaging said second wall of said valve body;
- means for sealingly biasing said metering piston against said planar outlet surface of said valve body metering chamber; and
- means for incrementally moving said metering piston in said metering chamber.

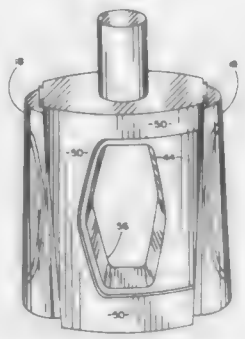
5,011,113
FLUID CONTROL VALVE
Thomas J. Stobbs, West Allis; Kishor J. Patel, Mukowonago; Frank M. Fritz, Milwaukee; Dale A. Knutson, Nashotah, and James P. Janecke, Waukesha, all of Wis., assignors to Applied Power Inc., Butler, Wis.
Continuation-in-part of Ser. No. 290,374, Dec. 29, 1988. This application Apr. 27, 1990, Ser. No. 515,553
Int. Cl.[5] F16K *31/06*
U.S. Cl. 251—129.16 **16 Claims**

1. A valve, comprising:
- a housing having a main bore, inlet and outlet ports in communication with the main bore, and an end portion;
- a poppet slidably mounted in the main bore, the poppet having:
  - a sealing end;
  - an opposite end;
  - a longitudinal central bore open at the sealing end and terminating in a pressure wall; and
  - a radial cross bore providing fluid communication between the central bore and the outlet port;
- a valve seat sized to receive the sealing end of the poppet and prevent fluid communication between the inlet port and the central bore when the sealing end of the poppet is in contact with the valve seat;
- means for biasing the poppet so that the sealing end contacts the valve seat and the opposite end is spaced apart from the end portion of the housing, the space between the opposite end of the poppet and the end portion of the housing forming a damping chamber;
- means for channeling fluid between the central bore and the damping chamber; and
- an actuator operable in response to an input current to produce a magnetic flux path tending to move the poppet out of contact with the valve seat;
- wherein:
  - the sealing end of the poppet has an outer beveled edge; and
  - the valve seat has a frusto-conical surface, the surface designed to accept the beveled edge to prevent fluid communication between the inlet port and the central bore when the beveled edge is in contact with the surface.

5,011,114
CONTROL VALVE WITH DISPLACEMENT-COMPENSATING SEAL
Kent T. Depuydt, Bevent, and Joseph S. Tikalsky, Weston, both of Wis., assignors to Zimpro Passavant Environmental Systems, Inc., Rothschild, Wis.
Filed Feb. 5, 1990, Ser. No. 475,[illegible]6
Int. Cl.[5] F16K *51/00*
U.S. Cl. 251—144 **8 Claims**

1. A pressure reducing control valve with displacement-compensating exterior seal apparatus, said valve and seal apparatus comprising;
- a valve body with an inlet and an outlet and a fluid passageway therebetween, said valve body having an opening therein on the side opposite said outlet;
- a sealing means within said opposite side opening with an aperture therein;
- an outlet nozzle member connected to said valve body outlet, said nozzle member extending into a discharge receiving vessel through an aperture therein;
- a valve seat and support assembly with longitudinal aperture therein, said seat and support assembly positioned within said passageway between said inlet and said outlet, said support assembly extending from said passageway, through said outlet and beyond the end of said outlet nozzle member into said discharge receiving vessel;
- a valve member in said passageway between said inlet and said outlet, said valve member movable toward said valve outlet for seating against said valve seat for sealing said passageway against fluid flow therethrough, said valve member extending through said aperture in the sealing

means within said opening opposite the outlet, and extending beyond said valve body; and



sealing means between said outlet nozzle and said discharge receiving vessel adapted to allow displacement of said valve body and nozzle relative to said receiving vessel, while preventing escape of fluid entering said receiving vessel from said valve.

5,011,115

SELF SUPPORTING PLUG FOR A DOUBLE BLOCK AND BLEED PLUG VALVE

Gordon M. Smith, Brookshire, and Hans M. Van Der Wiel, Fulshear, both of Tex., assignors to Johnston Pump/General Valve Inc., Brookshire, Tex.

Filed Dec. 29, 1989, Ser. No. 459,224
Int. Cl.[5] F16K *5/04*
U.S. Cl. 251—161 **4 Claims**

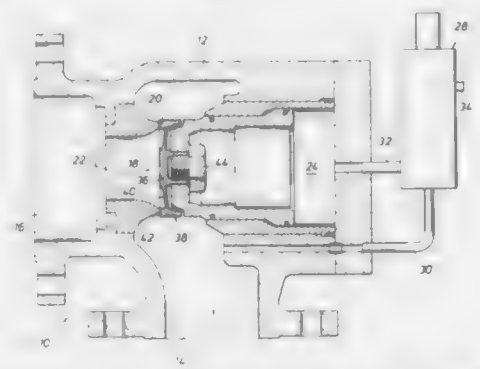
1. An improved double block and bleed plug valve of the type having retractable slips, a tapered cylindrical plug and a stem for opening and closing the valve by rotation of the plug to control the position of a passage through the plug and by axial movement of the plug to control the seating of the slips against an interior surface of a valve body for blocking and unblocking the inlet and outlet of the valve; the improvement comprising:

said plug having an outer diameter of at least a first portion of a radial surface thereof which is substantially equal to an inner diameter of said interior surface of said valve body adjacent said plug surface portion for radially supporting said plug within said valve body, said radial surface of said plug having a pair of second surface portions relieved relative to said first portion for spacing said second surfaces from said interior surface of said valve body, each of said pair of second surfaces being disposed adjacent an opening of said passage formed through said plug and extending on at least one side therefrom to a slip and defining a shoulder about said opening, thereby substantially preventing scuffing an interior surface portion of said valve body defining a seating area of said slip.

5,011,116

SHOCK ABSORBING SEALING MEANS FOR FLOW CONTROL DEVICES

Jack B. Alberts, and Michael D. McNeely, both of Houston, Tex., assignors to Keystone International Holdings Corp.



Filed Mar. 30, 1990, Ser. No. 502,047
Int. Cl.[5] F16K *25/00, 31/122, 17/04*
U.S. Cl. 251—334 **30 Claims**

1. In a fluid operated valve having a valve body including a flow passage and a hard annular seat ring mounted within the valve body about the flow passage;

an improved fluid pressure responsive reciprocable valve member mounted within the valve body for movement between open and closed positions relative to said flow passage and adapted to seat in closed position on said hard seat ring and to exert an impact force against said hard seat ring when seating thereon in response to fluid pressure changes, said improved valve member comprising:

a central hub;

a hard outer annular seal ring having radially inner and outer peripheral surfaces and spaced radially from said central hub for seating in face-to-face contact relation with said seat ring in the closed position of said valve member; and

a flexible connecting member extending in a generally radial direction between said hub and said radially inner peripheral surface of said seal ring, said connecting member flexing between said hub and said inner peripheral surface of said outer seal ring after initial contact of said hard seal ring with said hard seat ring to absorb impact loads resulting from contact of said hard seal ring against said hard seat ring without substantial movement of said hard seal ring.

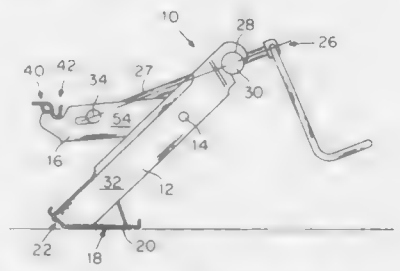
POST PULLER

Dale Youngblood, P.O. Box 245, La Sal, Utah 84530, and Harry L. Hutchins, 2780 Desert Rd., Moab, Utah 84532

Filed Apr. 16, 1990, Ser. No. 509,728
Int. Cl.[5] B66F *3/06;* **E21B** *10/02*
U.S. Cl. 254—30 **1 Claim**



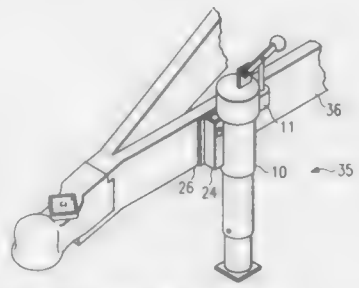
1. A metal post puller apparatus, wherein the post has a T cross-section: said apparatus comprising a single thickened plate having a post-encircling hole therethrough; said hole having the same T cross-sectional shape as the post but with a slight edge clearance therearound to facilitate downward motion of the plate on the post; said hole having edges thereof acutely angled to the plane of the thickened plate whereby the plate assumes a tilted condition on the post; and a lifter chain attached to said plate; said lifter chain comprising a plural number of separate spaced chain sections, and enlarged circular rings interconnecting the chain sections; each chain section comprising a plurality of endless egg-shaped chain links interlocked together; each enlarged circular ring having a diameter substantially larger than the length of each chain link, whereby each circular ring can serve as a device for attaching the chain to a lifter mechanism.

5,011,118

JACK

Peter Brosius, Ayl, Fed. Rep. of Germany, assignor to August Bilstein GmbH & Co. KG, Ennepetal, Fed. Rep. of Germany

Filed Jun. 29, 1990, Ser. No. 546,107
Claims priority, application Fed. Rep. of Germany, Jul. 3, 1989, 3921826
Int. Cl.[5] B66F *3/12*
U.S. Cl. 254—126 **7 Claims**



1. A jack comprising: at least one leg; an arm pivotably connected to said leg; height adjusting means supported by said leg and connected to said arm for raising and lowering said arm; said arm having an outer free end; a supporting plate on said outer free end of said arm; a horizontal shaft on said outer free end, said supporting plate pivoting on said horizontal shaft; said supporting plate having at least one eye for securing said supporting plate to said shaft, said eye being stamped out of said supporting plate; said eye having ends integral and in one piece with said supporting plate, said plate supporting a load stably and safely in every angular position of said plate that said plate may assume when supporting said load without damaging said plate even when said plate is loaded only on one side of said plate.

5,011,119

CONVENIENTLY ATTACHED HYDRAULIC TRAILER JACK

Robert L. Harrington, P.O. Box 9448, Midland, Tex. 79708

Filed Jan. 25, 1990, Ser. No. 470,098
Int. Cl.[5] B60S *9/02*
U.S. Cl. 254—420 **21 Claims**

1. A hydraulic trailer jack, comprising:

a flange plate;

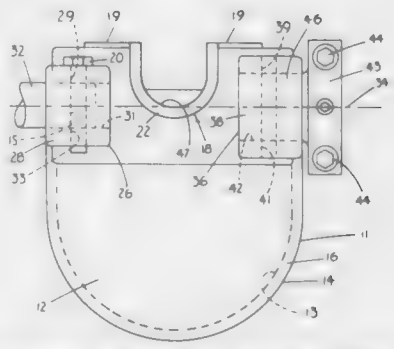
a bracket rotatably connected to the flange plate;

a hydraulic fluid circuiting body mechanically connected to the bracket comprising,

a plurality of chambers formed in the circuiting body for receiving fluid, including a reservoir chamber which is capped by a flexible bellows, a pumping cavity chamber, and an actuator containment tube chamber;

a valve system for establishing a directional flow of fluid through the chambers;

a pump actuator slidably engaged within the pumping cavity chamber to thereby form a pump for differentially pressurizing the various chambers; and



an extension member slidably engaged within at least one of the chambers of the circuiting body.

5,011,120

METAL CASTING LADLE

Philip N. Bear, Rosemount, Minn., assignor to Versa Companies, Minneapolis, Minn.

Filed Oct. 2, 1989, Ser. No. 416,268
Int. Cl.[5] B22D *41/06*
U.S. Cl. 266—240 **7 Claims**

1. A metal casting ladle used on a metal casting machine having either a left or right mounting connector for picking up and transferring by rotational motion about a horizontal pour axis a preselected amount of a flowable fluid metal to a casting mold which comprises:

a. a bowl having a wall with inner and outer surfaces and terminating in a top rim;

b. said bowl having a spout formed at a first side of said bowl said spout having a lip positioned below the said rim of said bowl and extending beyond said bowl to provide an outlet opening for metal to be poured from said bowl;

c. the wall of said bowl forming uniform curved inner and outer surfaces at the interface between said spout and the wall of said bowl to provide a uniform inner surface for the flow of molten metal;

d. a left mounting block connected to the outer surface of said wall at the interface with said spout;

e. a right mounting block connected to the outer surface of said wall at the interface with said spout and opposite the left mounting block;

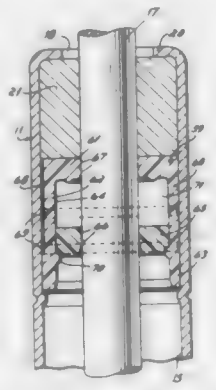
f. said left and right mounting blocks providing independent and alternative mounting attachments for metal casting machines having either left or right mounting connector; and

g. a bracket adapted to interconnect one of said mounting blocks of said ladle and said metal casting machine such that the pour axis falls through said lip.

5,011,121

SEAL FOR GAS SPRING

Ralph Oriola, Danielson, Conn.; Charles F. Romine, Atlantic Beach, N.C., and Edward O. Meisner, Elkhart, Ind., assignors to Eagle-Picher Industries, Inc., Cincinnati, Ohio



Filed Apr. 15, 1987, Ser. No. 38,829
Int. Cl.[5] F16F *5/00*
U.S. Cl. 267—64.11 **5 Claims**

1. In a gas spring having a cylinder, a piston reciprocable in said cylinder, a rod connected to said piston and projecting out of one end of said cylinder, and a rod guide fixed in said one end of said cylinder and having a bore slidably receiving said rod, a seal between said rod and said cylinder comprising,

a cup-shaped element having a transverse wall, said transverse wall slidably engaging said rod and forming a gas-tight seal with said rod,

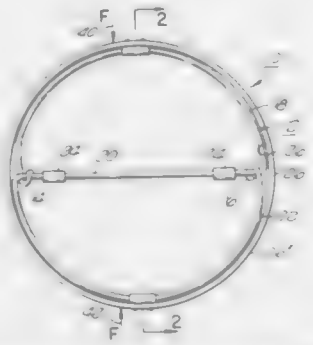
an axially-extending skirt integral with said transverse wall,

said skirt engaging the inner surface of said cylinder and forming a one-way check valve therewith,

and passageway means molded in the outer surface of said cup-shaped element through which gas under pressure flows to said skirt to fill said gas spring.

5,011,122

RESILIENT TORSION ARRANGEMENT



Frank Meyers, 317 Calle Mayor, Redondo Beach, Calif. 90277, and Lawrence L. Rutstrom, Torrance, Calif., assignors to Frank Meyers, Redondo Beach, Calif.

Filed Aug. 23, 1982, Ser. No. 410,854

The portion of the term of this patent subsequent to Aug. 30, 2006, has been disclaimed.

Int. Cl.[5] F16F *1/14*

U.S. Cl. 267—154 **32 Claims**

1. A resilient torsion arrangement, comprising, in combination,

a wire-like body member having a first end, a second end, and an elongated length between said first end and said second end thereof, and formed to define:

an upper portion having a first predetermined open geometrical configuration;

a transverse portion extending across said first predetermined open geometrical configuration;

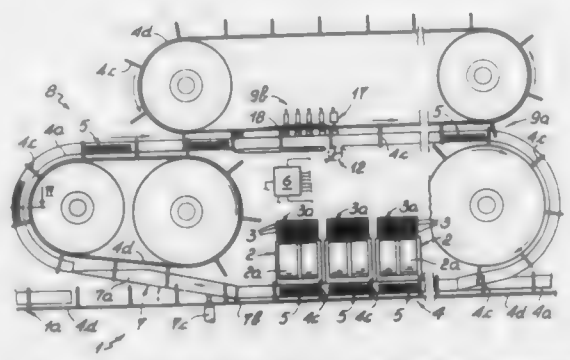
a lower portion having a second predetermined open geometrical configuration;

said upper portion resiliently movable toward said lower portion to put said transverse portion into torsion; and

said first end and said second end of said body member are restrained at a preselected spaced-apart location on said transverse portion.

5,011,123

SYSTEM AND METHOD FOR COLLATING BOOK AND PAMPHLET SIGNATURES AND THE LIKE



Vittorio Vigano, Verdellino, Italy, assignor to Plastiver S.A.S. Di Giovanni e Vittorio Vigano & C., Ciserano-Zingonia, Italy

Filed Apr. 12, 1989, Ser. No. 337,227

Claims priority, application Italy, Apr. 13, 1988, 20187 A/88

Int. Cl.[5] B65H *39/02*

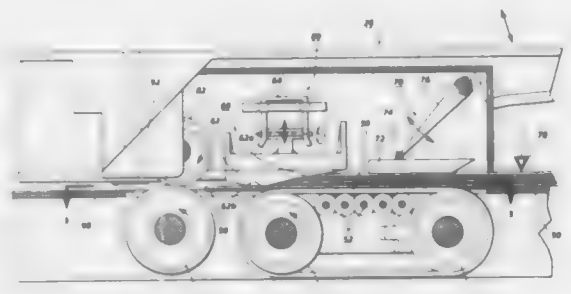
U.S. Cl. 270—54 **23 Claims**

1. A system for collating signatures for books, pamphlets, and the like, comprising: a plurality of consecutively arranged stations (2) adapted to deliver said signatures (3), a transport (4) adapted to pick up said signatures (3) and take them from said stations (2) to form growing stacks (5) of said signatures (3), and a diverting device (7) adapted to convey said stacks (5) out of said transport (4), said system being characterized in that it has a reclaiming apparatus comprising:

a reclaim belt (9*a*) extending from said diverting device (7) to a position of said transport (4) upstream of said diverting device (7) and at least some of said stations (2), and

a monitoring means (6) effective to detect anomalies in the delivery of said signatures (3) and the locations of said stacks (5) affected by said anomalies, and effective to control the activation and deactivation of said stations (2), said diverting device (7) being linked operatively to said monitoring means (6) and operative to divert said stacks (5) affected by anomalies toward said reclaim belt (9*a*).

5,011,124



RETARD FEEDER RETARD PAD MOUNTING

Peter A. Sardano, Fairport, and Irvin J. Kazmierczak, Rochester, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.

Filed Feb. 6, 1990, Ser. No. 475,530

Int. Cl.[5] B65H *3/04*

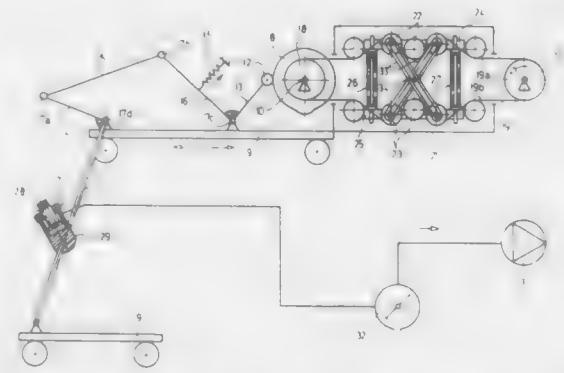
U.S. Cl. 271—35 **9 Claims**

1. In a retard type sheet separating and feeding apparatus for separating and sequentially feeding individual sheets of paper or the like from a sheet stack in a sheet feeding direction through a sheet feeding path including a large area retard nip defined by a large area retard member and an opposing large area frictional sheet feeding belt member positioned to oppos-

ingly engage opposite sides of said sheet stack, the improvement comprising a limited movement mounting system for said retard member for providing desired mobility on desired axes of movement and preventing undesired movement on undesired axes of movement, said retard member mounting system comprising means for precluding tilting of said retard member in said sheet feeding direction and for providing free lateral tilt of said retard member laterally of said sheet feeding direction relative to the opposing sheet feeding member for self-leveling of said retard member relative to the opposing sheet feeding member in the direction laterally of said sheet feeding direction, and cooperative means for maintaining and supporting a large generally planar surface area of said frictional sheet feeding belt member surface operatively opposing a substantial area of said retard member on said opposite side of said sheet stack to optimize said sheet separation and feeding while minimizing varying, uneven or localized high pressure points which could induce image smearing and the like sheet separation and feeding difficulties.

5,011,125

DELIVERY SHEET BRAKE FOR A SHEET-FED PRINTING PRESS



Nikolaus Spiegel, Walldorf; Karl-Heinz Filsinger, Wiesloch, and Roland Hirth, Römerberg, all of Fed. Rep. of Germany, assignors to Heidelberger Druckmaschinen AG, Heidelberg, Fed. Rep. of Germany

Filed Oct. 25, 1989, Ser. No. 426,936

Claims priority, application Fed. Rep. of Germany, Oct. 25, 1988, 3836254

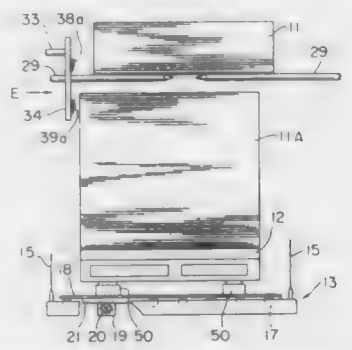
Int. Cl.[5] B65H *29/68*

U.S. Cl. 271—183 **9 Claims**

1. Delivery sheet brake for a sheet-fed printing press having a suction element for gripping a sheet at a trailing edge thereof, the suction element being disposed on an adjustable slide for format adjustment and being guidably movable on a closed path loop extending through a transfer position and a release position for the sheet, and a step-up transmission connecting the suction element to a uniformly revolving drive element disposed likewise on the slide, said transmission including an articulated lever for accelerating the suction element to sheet travel speed before it reaches the transfer position and decelerating the suction element after sheet transfer until the suction element reaches the release position, comprising a chain wheel connected to the drive element disposed on the adjustable slide, a drive chain directly connecting said chain wheel with a chain wheel of a drive for the printing press, and a chain-storage device for said drive chain, said chain-storage device being in cooperative engagement with said drive chain so as to compensate for changes in length of said drive chain without any phase displacement of said chain wheels.

5,011,126

AUTOMATIC SHEET STACK LOADING MECHANISM OF SHEET FEEDING APPARATUS



Daiji Suzuki, Yokohama, and Yasuhiro Sudo, Shinjuku, both of Japan, assignors to Dai Nippon Insatsu Kabushiki Kaisha, Tokyo, Japan

Filed Jul. 7, 1989, Ser. No. 376,621

Claims priority, application Japan, Jul. 13, 1988, 63-172694

Int. Cl.[5] B65H *7/02*

U.S. Cl. 271—227 **5 Claims**

1. An automatic sheet stack loading mechanism of a sheet feeding apparatus, comprising:

a main lift adapted to support thereon a stack of sheets to be fed;

a sheet separator disposed over the main lift to act on the uppermost sheet of the stack of sheets so as to separate the sheets one by one from the stack, said main lift being movable upwardly to bring the uppermost sheet of the stack thereon to a predetermined height position relative to the sheet separator;

horizontally extending parallel spits for insertion under the stack of sheets supported by the main lift to support the load of the stack from below thereby to enable the main lift to be lowered to receive a new stack of sheets thereon while the uppermost sheet of said first stack is held at said predetermined height;

a pair of vertically movable carriages disposed at both sides of the main lift with respect to the direction transverse to the direction of feed of the sheets from said first stack, each of said carriages carrying thereon the parallel spits so that the parallel spits extend in said transverse direction and are shiftable toward and away from the stack on the main lift;

shifting means for shifting the spits toward and away from the stack on the main lift;

sheet stack aligning means disposed at both transverse sides of the main lift for aligning the side faces of the stacks; and

motive power means for moving the aligning means towards and away from the stacks, said aligning means and said motive power means being mounted on the carriages.

5,011,127

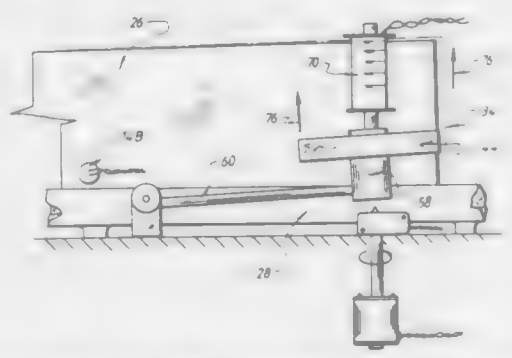
MULTIPLE DOCUMENT DETECTOR

Thomas A. Hamilton, Fife, Scotland; Michael M. Kerrigan, Rogerstown Rush, Co., Ireland, and John A. Wilson, Livingston, Scotland, assignors to Unisys Corporation, Blue Bell, Pa.

PCT No. PCT/US89/00766, § 371 Date Jan. 17, 1990, § 102(e) Date Jan. 17, 1990, PCT Pub. No. WO89/08068, PCT Pub. Date Sep. 8, 1989

PCT Filed Feb. 27, 1989, Ser. No. 477,905

Claims priority, application United Kingdom, Mar. 4, 1988, 8805180



Int. Cl.[5] B65H *7/12*

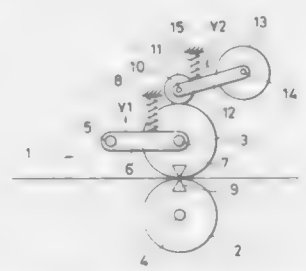
U.S. Cl. 271—262 **12 Claims**

1. A document detector for detecting multiple documents moving along a track, said detector comprising:

a driven wheel having a peripheral velocity equal to the velocity of a document in the track;

an idler wheel, means for supporting said idler wheel in a manner to permit its movement in a transverse direction relative to the direction of movement of a document, said supporting means urging said idler wheel against said driven wheel to form a nip to accept a document; said idler wheel having a preferred position relative to said driven wheel;

displacement means operative to urge said idler wheel away from said preferred position in said transverse direction, said displacement means permitting said idler wheel to remain in said preferred position in the presence of a single document in said nip and causing said idler wheel to deviate from said preferred position in response to the presence of multiple document in said nip; and



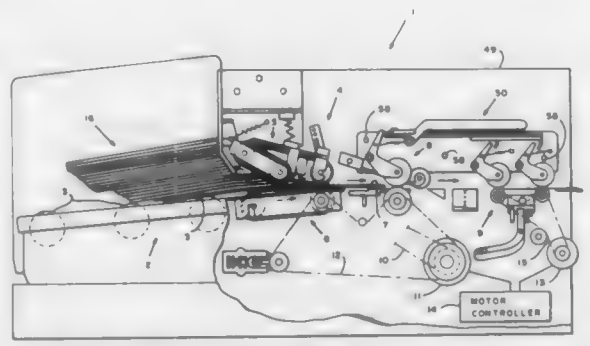
sensor means for detecting a deviation of said idler wheel from said preferred position.

5,011,128

APPARATUS FOR DETECTING THE THICKNESS OF SHEETS

Keiji Tsuji, Tokyo, Japan, assignor to Laurel Bank Machines Co., Ltd., Tokyo, Japan

Filed Apr. 25, 1989, Ser. No. 342,797
Claims priority, application Japan, Apr. 26, 1988, 63-102905
Int. Cl.[5] B65H *7/12*
U.S. Cl. 271—263 **22 Claims**



1. An apparatus for detecting the thickness of sheets by detecting displacement of one of a pair of rollers disposed so as to face each other across a transporting path of the sheets, said pair of rollers being driven by driving means, said pair of the rollers essentially consisting of a reference roller rotatable about a fixed shaft and a movable roller abuttable against said reference roller and rotatably mounted on a movable shaft displaceable with respect to said reference roller, said apparatus comprising timing signal generating means for generating timing signals synchronized with rotation of said reference roller and said movable roller, displacement detecting means for detecting an amount of displacement of said movable roller by detecting an amount of displacement of said movable shaft in synchronism with said timing signals, sheet detecting means for detecting whether or not the sheets are present at a portion where said reference roller and said movable roller face each other, sheet thickness calculating means for calculating the thickness of the sheet by deducting, in accordance with the timing signals, the amount of displacement of said movable roller detected by said displacement detecting means when said sheet detecting means do not detect any sheet at the portion where said reference roller and said movable roller face each other from the amount of displacement of said movable roller detecting by said displacement detecting means when said sheet detecting means detect the sheet at the portion where said reference roller and said movable roller face each other, a ratio of the diameter of the reference roller and the movable roller is M, wherein M is not less than 1, and the least common multiple between M and 1 is not more than 10, and correction data memory means for storing the amount of displacement of the movable roller detected when said sheet detecting means do not detect any sheet at the portion where the reference roller and the movable roller face each other as correction data, deducting means for deducting said correction data stored in said correction data memory means when a corresponding timing signal was output in the last cycle, a cycle being defined as the rotation cycle of the one of the reference roller and the movable roller which has a diameter not less than that of the other, from the amount of displacement of the movable roller detected when said sheet detecting means detect at least one sheet at the portion where the reference roller and the movable roller face each other to obtain the sheet thickness data, sheet thickness data memory means for storing said sheet thickness data, and sheet thickness calculating means for calculating the thickness of the sheet based upon said sheet thickness data stored in the sheet thickness data memory means.

5,011,129

JAM CLEARANCE APPARATUS FOR SHEETFEEDING DEVICE

Russell W. Holbrook, Middlebury, Conn., assignor to Pitney Bowes Inc., Stamford, Conn.

Filed Nov. 14, 1989, Ser. No. 435,906
Int. Cl.[5] B65H *5/02, 5/04*
U.S. Cl. 271—274 **2 Claims**

1. A jam clearance device for a sheetfeeding device, said sheetfeeding device having a deck and registration wall, a plurality of drive rollers rotatively mounted within said sheetfeeding device such that a portion of said drive rollers extend through respective slots in said deck slightly above the transport surface of said deck, said jam clearance device comprising:

a support frame fixably mounted to said sheetfeeding device;

a plurality of biasing wheels rotatively mounted to said support frame such that said biasing wheels are biased in a home position against a respective one of said drive rollers and are positionable to a second position vertically displaced from said respective drive rollers;

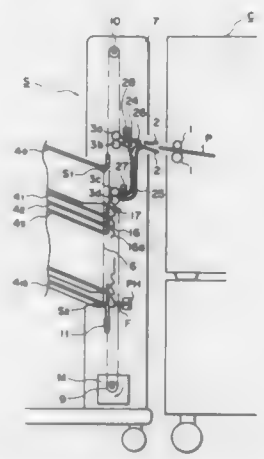
handle means for positioning said biasing wheels in said home position or said second position;

said support frame having a first frame section fixably mounted to said registration wall having a plurality of pivot shafts pivotally mounted to said first frame section, each of said pivot shafts having a plurality of linking arms fixably mounted generally perpendicular along its length to said pivot shaft, a plurality of wheel shafts fixably mounted to one end of said linking arms of said respective pivot shaft, said biasing wheels rotatably mounted to said respective wheel shaft;

biasing means for causing said linking arms to bias said biasing wheels against said rollers in said home position;

said handle means being positionable from a home position to a second position or causing said linking arms to pivot said pivot shaft, in said second position, and thereby causing said linking arms to raise said biasing wheels, said handle means including a second frame slidably mounted to said first frame such that said second frame may be positioned from a first position to a second position, said second frame having cross beam members respectively aligned opposite said linking arms of said respective pivot shaft such that displacement of said second frame causes said cross beam members to abuttingly displace said respective linking arms;

a handle pivotally mounted to said first frame such that said handle may be positioned from a first position to a second position over center; and



buckle means pivotally mounted to said second frame and said handle for causing said second frame to displace in response to displacement of said handle.

5,011,130

SHEET SORTER

Masataka Naito, Kawasaki; Masakazu Hiroi, and Kimiaki Hayakawa, both of Yokohama, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 2, 1989, Ser. No. 305,093
Claims priority, application Japan, Feb. 4, 1988, 63-25443
Int. Cl.[5] B65H *39/11*
U.S. Cl. 271—288 **6 Claims**

1. A sheet sorter for use with an apparatus having a sorting mode and a non-sorting mode, said sorter comprising:

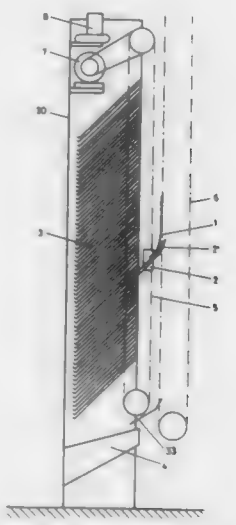
first sheet discharging means for discharging sheet materials exclusively during operation in said non-sorting mode;

second sheet discharging means for discharging sheet materials during operation in said sorting mode;

a single bin for receiving sheet materials from said first sheet discharging means during operation in the non-sorting mode;

a plurality of bins for use during the sorting mode operation, a first bin of said plurality of bins being single bin is opposed to said first sheet discharging means;

wherein during operation in the sorting mode, the plural bins are sequentially opposed to said second sheet discharging means; and



supporting means for supporting said single bin and said sorting bin with a predetermined positional relation to move them together.

5,011,131

SORTING APPARATUS

Willy Maier, Kloten, and Thomas Bachmann, Zurich, both of Switzerland, assignors to Daverio AG, Zurich, Switzerland

Filed May 3, 1989, Ser. No. 347,150
Claims priority, application Switzerland, Jul. 11, 1988, 2641/88
Int. Cl.[5] B65H *39/06*
U.S. Cl. 271—289 **12 Claims**

1. A sorting device for flexible printing plates comprising:

a frame receiving a plurality of shelves placed one above another, for receiving said printing plates therein;

transport means for moving the printing plates along the shelves and located in front of the shelves adjacent to insertion openings of the shelves; and

at least one sorting carriage positioned between the shelves and the transport means, which is movable along the shelves and which includes means for selectively transferring printing plates from the transport means to the shelves;

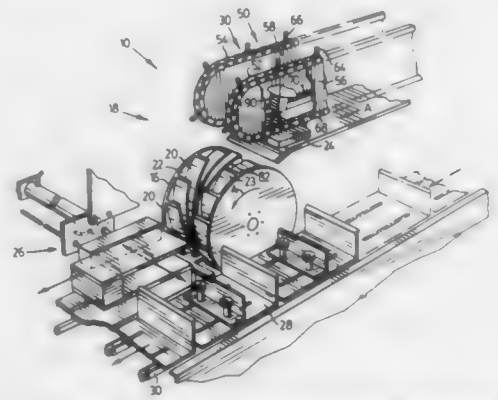
wherein each of the shelves is pivotally mounted at a lower edge thereof, and the sorting carriage has retractable means for slightly lifting a second shelf located above a first shelf which is to receive a printing plate to define an enlarged insertion opening between the first and second shelves; and

wherein the sorting carriage has a pivotal flap which in one position engages the printing plates conveyed by the transport means for deflection toward the shelves, and which can be pivoted into another, bypass position.

5,011,132

LOAD ACCUMULATOR HAVING POSITIVE DRIVE CONVEYOR

Peter Guttinger, 862 Cabot Trail, Milton, Canada L9T 3S8 , and Marinus J. M. Langen, 21 Chilcot Avenue, Toronto, Ontariro, Canada M9W 1T9



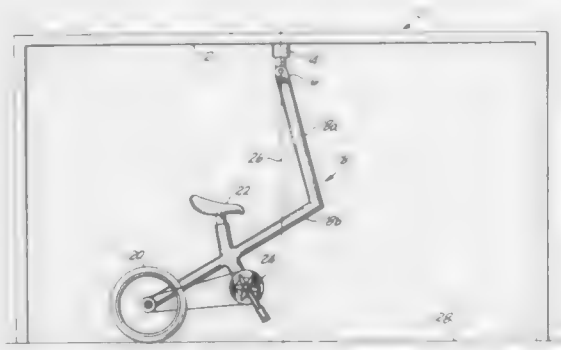
Filed May 29, 1990, Ser. No. 530,197
Int. Cl.[5] B65H *29/20*
U.S. Cl. 271—315 **2 Claims**

1. In a load accumulator which has a stacking wheel mounted for high speed rotation, the stacking wheel having a plurality of spirally extending load receiving pockets which open tangentially therefrom at circumferentially spaced intervals and conveyor means for conveying load items one at a time to a transfer station in which the load items are transferred into a pocket of the stacking wheel, the improvement wherein said conveyor means comprises;

(a) a platform that extends toward the stacking wheel in a plane that extends above the stacking wheel, the platform

having a discharge edge located in the transfer station in a transferred relationship with respect to the pockets of the stacking wheel,

(b) an endless conveyor mounted above the platform and having a forward run located in close proximity to the platform and extending toward the discharge end of the platform, and



(c) a plurality of load pushing fingers mounted on the endless conveyor and projecting outwardly therefrom so as to extend from the forward run toward the platform and be operable to provide a positive drive for pushing load items along the platform to and over the discharge edge.

PEDAL DRIVEN SWIVEL TOY

Raymond T. Myers, Sr., 2609 So. El Camino Real, San Clemente, Calif. 92672

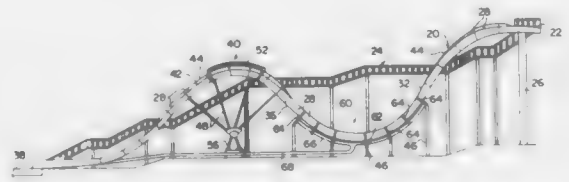
Filed Jul. 16, 1990, Ser. No. 552,771
Int. Cl.[5] A63G *1/28*
U.S. Cl. 272—33 B **7 Claims**

1. A toy suspended from a support structure over a horizontal surface, the toy comprising:

attachment means having a rotating pivot with two degrees of freedom;

an angle member depending from the attachment point, the angle member having an overall length greater than the height of the support structure from the horizontal surface and traversing a vertical axis extending downward from the attachment point;

a rotational means attached to an end of the angle member distal the attachment means, the rotation member adapted for frictional engagement of the horizontal surface;



drive means for providing rotational force to the rotation means; and,

a seat attached to the angle member to support a child proximate the drive means to allow operation of the drive means by the child.

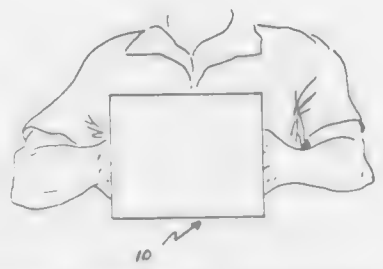
5,011,134
WATERSLIDE WITH UPHILL RUN AND FLOTATION DEVICE THEREFOR

Frederick Langford, 212 Crest Rd., Cape May Court House, N.J. 08210

Filed Mar. 26, 1990, Ser. No. 499,622
Int. Cl.[5] A63G *21/10*
U.S. Cl. 272—56.5 R **12 Claims**

1. A waterslide, comprising:

an elongated trough defining a rider path proceeding generally from a higher elevation to a lower elevation, the trough having a downward gradient whereby a rider can traverse the path substantially by force of gravity, and at least one downhill section followed by an uphill section;



a first means for injecting water into the trough adjacent a point of relatively higher elevation of the trough along the path, thereby establishing a gravity flow of water in a forward direction relative to the rider path along the downhill section of the trough toward an area of relatively lower elevation between the downhill section and the uphill section;

a water extraction means disposed adjacent the area of relatively lower elevation for removing water from the trough.

5,011,135
THERAPEUTIC HAND EXERCISER

Robert M. Patik, 823 Reservoir St., Mt. Pleasant, Pa. 15666

Continuation-in-part of Ser. No. 199,862, May 25, 1988, abandoned. This application Jul. 10, 1989, Ser. No. 377,258
Int. Cl.[5] A63B *23/16*
U.S. Cl. 272—67 **6 Claims**

1. A therapeutic hand exerciser which comprises:

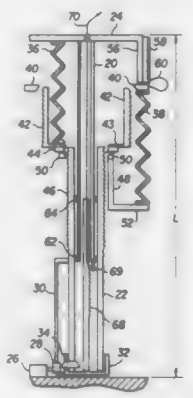
a. a body of pliable material;

b. opposing end surfaces on said body;

c. elongate finger holes extending through each opposing end surface toward the other opposing end surface;

d. said finger holes sized so as to closely encompass said fingers when inserted through said finger holes and into said body.

5,011,136
ENERGY-EFFICIENT RUNNING BRACE



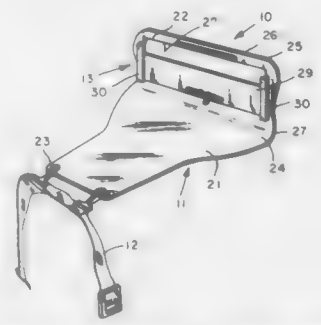
Brian G. Rennex, 2332 Antiqua Ct., Reston, Va. 22091

Filed Nov. 9, 1988, Ser. No. 269,174
Int. Cl.[5] A63B *23/04;* **A61H** *3/00*
U.S. Cl. 272—70 **6 Claims**

1. In an energy-efficient running brace the improvement comprising:

a harness worn by the user of said running brace;

asymmetric travel means coupled to the harness for absorbing said user's downward momentum over an impact travel distance during impact of said user's foot on a surface and for imparting thrust to said user during thrust off of said surface over a thrust travel distance greater than said impact travel distance;



augmented foot-lift means rotatably attached to the user's foot for lifting the user's foot an additional height beyond that permitted by said asymmetrical travel means during a stride recovery period when the user's foot is not in contact with said surface.

5,011,137
VARIABLE RESISTANCE DEVICE FOR USE IN TRAINING SWIMMERS

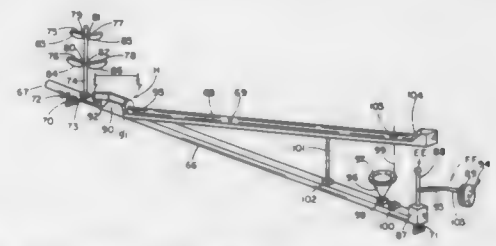
Steven J. Murphy, 203 Avenue A, Redondo Beach, Calif. 90277

Filed Jan. 29, 1990, Ser. No. 471,868
Int. Cl.[5] A63B *69/12*
U.S. Cl. 272—71 **3 Claims**

1. A variable resistance device for use in training a swimmer, said variable resistance device comprising:

a. a belt which is disposable around the swimmer's torso and securable thereto;

b. an L-shaped scoop member which is integrally formed out of a relatively non-reflexible sheet of plastic material having a support portion which is substantially in the shape of a truncated triangle with a top edge and a bottom edge and a resistance portion which has a flat surface area and which is substantially in the shape of a rectangle with a frist edge and a second edge which is contiguous with said bottom edge of said support portion;



b. attaching means for loosely attaching said L-shaped scoop member to said belt so that said L-shaped scoop member may move in response to the swimmer's movement; and

c. surface area varying means for varying said flat surface area of said resistance portion of said L-shaped scoop member so that effective resistance of said flat surface area to the swimmer is variable.

SPORTS DEVICE

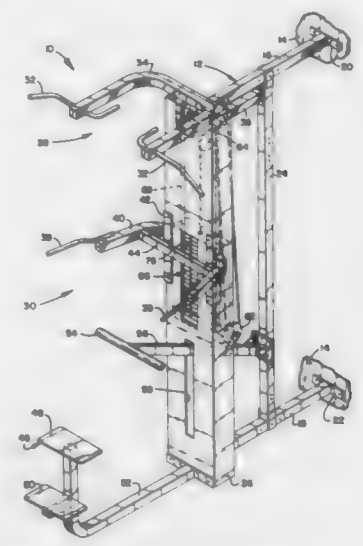
J. Cameron Rankin, 212 Burgwyn Rd., Montgomery, Ala. 36105

Filed Jan. 19, 1990, Ser. No. 468,224
Int. Cl.[5] A63B *21/06, 67/22*
U.S. Cl. 272—117 **61 Claims**

1. A sports device comprising:

an unconstrained elongated support means freely liftable manually from its resting place, and disposed for tilting movement while in its lifted position;

a handle fixed to said elongated support means for gripped relation by an individual to effect said lifting and tilting movement;



weight shifting means responsive to said tilting movement for changing the balance point of said elongated support means to vary the difficulty of manually tilting said elongated support means; and

weight receiving means fixed adjacent to one end of said elongated support means to receive and support said weight shifting means during said manual tilting of said elongated support means.

ASSISTED DIP/CHIN EXERCISE DEVICE

Carl K. Towley, III, Owatonna, Minn., assignor to Lumex, Inc., Bay Shore, N.Y.

Filed Mar. 9, 1990, Ser. No. 491,000
Int. Cl.[5] A63B *21/062*
U.S. Cl. 272—118 **18 Claims**

1. Exercise apparatus, which comprises:

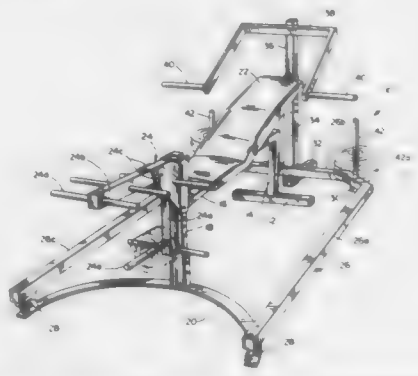
a frame;

a chin bar mounted on said frame:

an assist bar positioned below said chin bar;

an arm pivoted at one end to said frame, said assist bar being secured to the other end of said arm for pivotal movement in an arcuate path toward and away from said chin bar; and

means including a pulley and cable system and selective weight stack connected between said arm and frame for



normally urging said assist bar upwardly toward said chin bar.

MULTI-PURPOSE SAFETY EXERCISE APPARATUS

Alfred A. Adessi, 2129 NE. 44th St., Fort Lauderdale, Fla. 33308

Filed Sep. 21, 1990, Ser. No. 586,428
Int. Cl.[5] A63B *21/062, 21/00, 21/06*
U.S. Cl. 272—118 **1 Claim**

1. A safety weight lifting exercising apparatus which provides for free lift weight resistance without requiring an assistant comprising:
a padded elongated bench;
a rigid horizontal first frame support member connected to said bench;
first vertical support member connected to one end of said horizontal support member;
first horizontally disposed floor support member connected to said first vertical support member;
second vertical support member connected at the opposite end of said first horizontal support member;
second horizontally disposed floor support member connected to said second vertical support member;
a horizontally disposed U-shaped rigid support frame pivotally connected at the free ends of said U-shape to said second floor support, said U-shaped frame including a pair of elongated parallel frame members disposed parallel to said bench, and extending in length past the end of said bench, and a U-shaped transverse support frame member connecting said elongated frame members at the base of said U-shape and situated near a user's upper body;
a third vertical support member connected to a central point of said U-shaped transverse frame member;
a weight lifting handle connected to one end of said third vertical support member;
a set of weights;
a pair of weight receiving rods vertically disposed on each side of the ends of said U-shaped transverse frame member for receiving said weights; and
supporting means mounted to bottom side of said U-shaped transverse frame member for elevating said frame above the ground in the down position;
whereby, upon raising said weight lifting handle, the U-shaped frame is pivoted upwards and said weights on said weight receiving rods are also lifted.

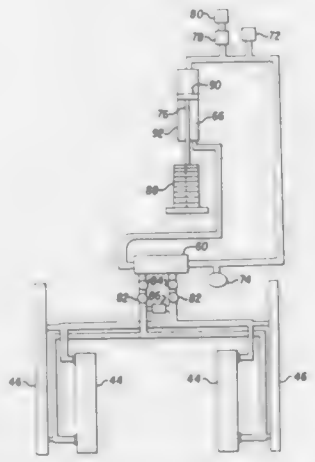
BENCH PRESS WITH ADJUSTABLE SAFETY/RANGE LIMITING BARS

Carl K. Towley, III, and Dennis C. Johnson, both of Owatonna, Minn., assignors to Lumex, Inc., Bay Shore, N.Y.

Filed Feb. 28, 1990, Ser. No. 486,119
Int. Cl.[5] A63B *21/078*
U.S. Cl. 272—123 **11 Claims**

1. A safety/catch bar assembly for use with an exercise device, which comprises:
an upright having spaced apart inclined front and back walls, the front wall having an elongate slot therein;
a bar having an inner end and an opposite upwardly curved outer end, the inner end being adapted to extend through the slot in the front wall of said upright;
a pair of spaced apart front and back stops secured to the inner end of said bar for wedging engagement between the front and back walls of said upright;



the slot in the front wall of said upright including an enlarged portion dimensioned for passage of said stops therethrough; and
a locator pin secured to the inner end of said bar for selective registration with a column off spaced apart holes in the back wall of said upright.

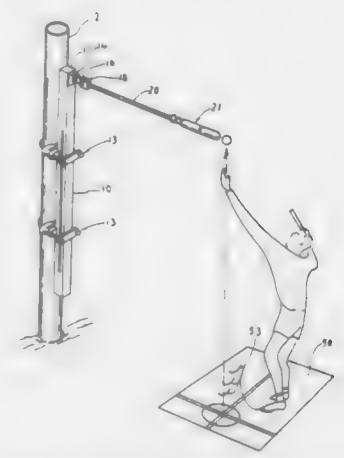
EXERCISE CONTROL SYSTEM

Christopher Eckler, P.O. Box 564, Nashua, N.H. 03061

Filed Nov. 20, 1989, Ser. No. 438,097
Int. Cl.[5] A63B *21/008*
U.S. Cl. 272—130 **4 Claims**

1. An exercise machine comprising:
a frame;



a user force point whereupon a user can exert forces while exercising;
at least one movable member connecting said frame to said user force point;
a first fluid motion means connecting said frame to said user force point, containing a variable volume of fluid, and moving said user force point relative to said frame upon variation of the volume of fluid therein;
a weight capable of vertical motion;
a second fluid motion means containing a variable volume of fluid, attached to said weight in such a way that the volume of fluid contained in said second fluid motion means varies upon vertical motion of said weight;
an adjustable constriction for fluid friction;
flow means for transferring fluid between said first and second fluid motion means, and through said constriction;
control means for regulating the flow of fluid through said flow means; whereby
the user may exert forces in lifting and lowering said weight and in forcing fluid through said constriction.

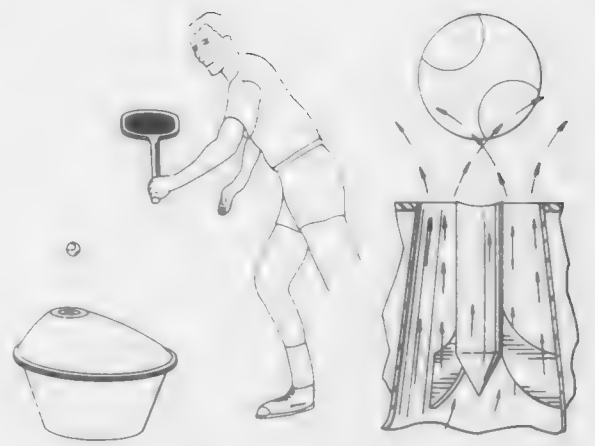
TENNIS TRAINING DEVICE

Raymond Jones, 2 Loombah Avenue, Lindfield, New South Wales, Australia

PCT No. PCT/AU88/00260, § 371 Date Apr. 12, 1989, § 102(e) Date Apr. 12, 1989, PCT Pub. No. WO89/00441, PCT Pub. Date Jan. 26, 1989
PCT Filed Jul. 18, 1988, Ser. No. 340,177
Claims priority, application Australia, Jul. 16, 1987, PI3151
Int. Cl.[5] A63B *61/00*
U.S. Cl. 273—29 A **9 Claims**



1. A device for practising a racquet shot and ball placement for a tennis serve comprising a first support member, a second support member extending from the first support member, hinge means connecting the second support member to the first support member and target means on the second support member;
said hinge means including a first mounting secured to the first support member, a second mounting secured to the second support member and a hinge piece connected between the first and second mountings, said hinge piece being a flexible planar material; the arrangement being such that when the target means is struck by a racquet, the second support member will pivot horizontally about the hinge means and then return to its original position,
said first support member being a height adjustable upright, said second support member extending substantially horizontally from said upright;
a clamp for securing the upright to a post, said clamp comprising a device and further including a clamp for securing the upright to a post, said clamp comprising a base plate adapted to be positioned against the post, a U-bolt passing around the post and through the base plate, said base plate having outwardly directed spacer means for receiving a tennis court mesh therebetween, a first clamp plate mounted on the U-bolt and secured to the base plate, a second clamp plate mounted on the U-bolt spaced from the first clamp plate so as to receive the upright therebetween, and means for securing the second clamp plate to the U-bolt.

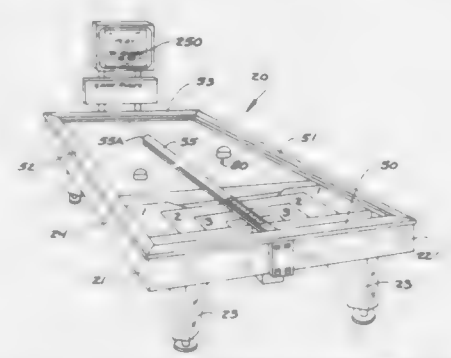
VIDEO CARD GAME
Stewart M. Lamle, 3 Fordham Hill Oval, Suite 15F, Bronx, N.Y. 10468
Filed Aug. 28, 1989, Ser. No. 399,227
Int. Cl.[5] A63F *1/00, 9/22*
U.S. Cl. 273—85 CP 6 Claims

1. A game apparatus for playing a video version of a game in which one or more card decks comprise two-sided cards having indicia on the front and back sides thereof in which N forms of indicia are used, each deck comprises N^2 cards, and each indicia combination occurs twice in each deck except for twin indicia combinations which occur only once, and in which the cards are shuffled and presented two at a time to a player who views the indicia on the front side of a Left and a Right card and bets on the Left card or the Right card having a higher indicia value on the back side thereof, or on both cards having the same value on the back sides thereof, the apparatus comprising:

a central processing means for storing the front and back face values of the one or more decks of cards which have been shuffled into a random order;

display means for displaying the indicia on the front side of the Left and the Right card;



means for betting that the indicia on the back side of the Left car has a higher or lower value than the indicia on the back side of the Right card;

means for betting that the indicia on the back sides of the Left and Right cards are equal in value;

means for displaying the indicia on the back sides of the Left and Right cards; and

means for indicating the outcome of the bet.

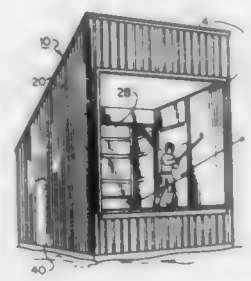
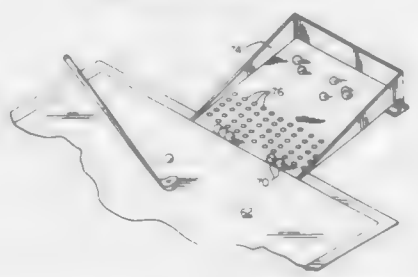
WEIGHT DISTRIBUTION FOR GOLF CLUB HEAD
Anthony J. Antonious, 205 E. Joppa Rd., Towson, Md. 21204
Filed Sep. 6, 1989, Ser. No. 403,494
Int. Cl.[5] A63B *53/04*
U.S. Cl. 273—164 8 Claims

1. In a perimeter weighted iron type golf club head including a hosel, a heel portion, toe portion, a sole portion a striking face to hit a ball along an intended line of flight, a top ridge, a longitudinal axis bisecting the striking face, a peripheral mass projecting rearwardly from said golf club head and forming a cavity including a rear face defining a bottom of said cavity and located behind said striking face, wherein the improvement comprises:



a toe counterweight having an upper portion formed as an upper and rearward extension of said peripheral mass and located generally adjacent an upper toe portion of said club head, said toe counterweight formed rearwardly from a plane defined by said rear face at said rear cavity and located below said top ridge said toe counterweight having a rear surface;



said toe counterweight having a rearwardly extending, downwardly sloping, parabolic surface, a lower portion of which is integrally formed with said peripheral mass adjacent a lower toe portion of said club head;

said toe counterweight bulging immediately away from said rear face at said upper toe portion and having a substantial portion of its mass located above said longitudinal axis of said club head.

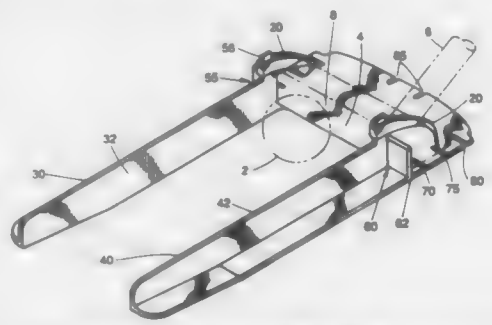
STALL ENCLOSURE FOR ALL-WEATHER GOLF DRIVING RANGE

Harvey W. Hugunin, 114 Myers Rd., Liverpool, N.Y. 13088
Continuation-in-part of Ser. No. 224,115, Jul. 26, 1988, Pat. No. 4,889,342. This application Oct. 2, 1989, Ser. No. 415,855
The portion of the term of this patent subsequent to Dec. 26, 2006, has been disclaimed.
Int. Cl.[5] A63B *69/36; F24F 9/00, 13/00*
U.S. Cl. 273—176 R **21 Claims**



1. A stall-type enclosure for use by a golfer at a driving range during inclement weather, said enclosure comprising:
(a) a roof and side, back and front walls, said front wall having an opening through which a ball may be driven by a golfer standing within said enclosure and executing a full swing;
(b) a floor within said enclosure elevated above ground level to provide an enclosed space beneath said flooring;
(c) an air plenum positioned within said enclosed space, said plenum having an open top of first, predetermined outline;
(d) means providing heated air to said plenum;
(e) a predetermined section of said flooring comprising an open grating, having a second, predetermined outline, larger than said first outline, a first portion of said grating being positioned directly above said open top of said plenum, in fully covering relation thereto; and
(f) a mat adapted for supporting said golfer and ball, said mat being positioned upon said first portion of said open grating and having a third, predetermined outline, smaller than said first outline, whereby said heated air may rise through said open grating in an area at least partially surrounding said mat.

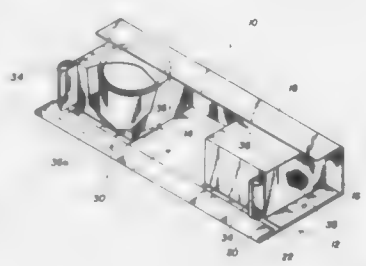
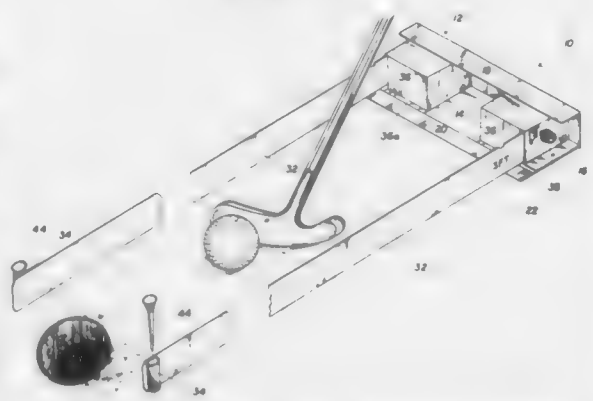
GOLF PUTTING AID AND TEACHING DEVICE



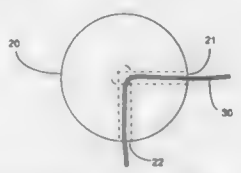
Thomas H. Watkins, 9513 Steinbeck La., Bakersfield, Calif. 93311
Filed Jul. 13, 1990, Ser. No. 552,622
Int. Cl.[5] A63B *69/36*
U.S. Cl. 273—186 A **12 Claims**



1. A golf ball putting aid comprising:
a generally U-shaped bracket having a cross brace and two projection s positioned in a spaced parallel relationship with each other and at a generally right angular position to said cross brace;
a generally U-shaped opening formed by said cross brace and said two projections, and having an open end opposite that to said cross brace;
vertical abutment means positioned on said cross brace for engaging the face of a putter which is demountably secured to said putting aid;
an elastic securement means for temporarily securing the putter head to said putting aid whereby when said putting aid is mounted to the golfer's putter and while stroking the golf ball during the putting process, said spaced projections visually indicate to the golfer how squarely the golfer is hitting the golf ball with the putter.

5,011,154
PUTTING PRACTICE DEVICE

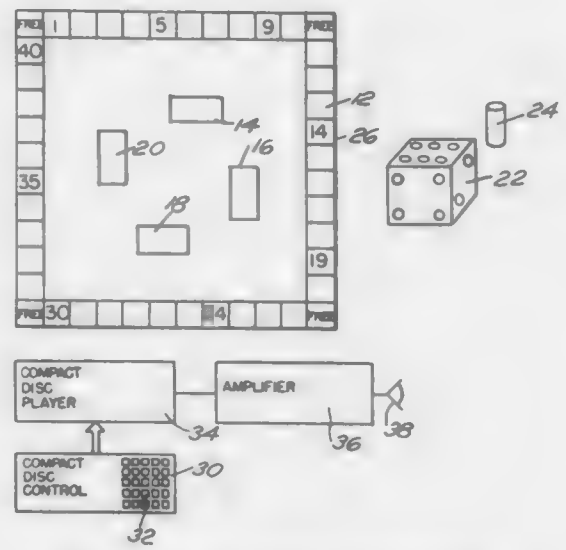
Sandy W. Ruwen, 228 E. 5th St., Red Springs, N.C. 28377
Filed Oct. 15, 1990, Ser. No. 598,837
Int. Cl.[5] A63B *69/36*
U.S. Cl. 273—192 **13 Claims**



1. A golf putting teaching and practice aid comprising:
(a) a frame structure;
(b) a pair of extendable and retractable putting guides mounted on the frame structure, each putting guide being moveable between an extended position and a retracted position and each putting guide including an elongated strip that assumes a coiled position when in the retracted position;
(c) wherein the extended position the putting guides form a pair of parallel retainers that defines an elongated putting area there between; and
(d) means for laterally adjusting at least one of the putting guides on the frame structure such that the width of the putting area can be varied to accommodate various putter head widths.

5,011,155
GOLF PRACTICE DEVICE

Suraphol Udomkesmalee, and Phaichitr Tiemsanjai, both of 3323 W. 134th St., Hawthorne, Calif. 90250
Filed Nov. 13, 1990, Ser. No. 612,930
Int. Cl.[5] A63B *69/36*
U.S. Cl. 273—200 A **2 Claims**



1. A golf practice device comprising a golf ball having an opening passing therethrough, a flexible cord passing through said opening and having first and second ends, means for anchoring each of said ends to substantially spaced apart locations on a base member from which said golf ball may be driven with a golf club, and said opening through said ball defining a continuous pathway which is not straight throughout its entire length whereby said golf ball may be placed upon said base member with the opposite ends of said cord anchored to said base member, and a clear point of contact on said golf ball is available for an impact with the striking face of a golf club which causes said ball to travel along said cord.

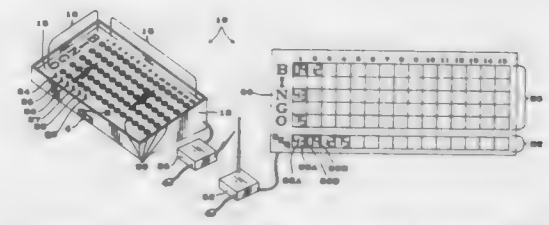
BOARD GAME APPARATUS

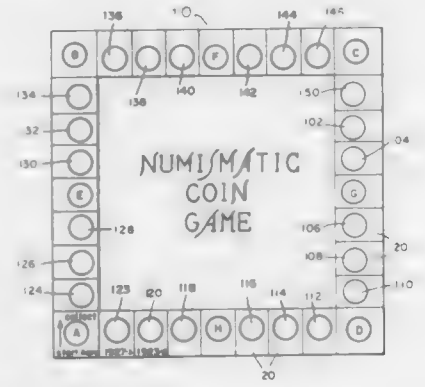


Robert J. LaChance, Jr., and Nancy LaChance, both of 38 Kensington Rd., Cranston, R.I. 02905
Filed May 7, 1990, Ser. No. 520,037
Int. Cl.[5] A63F *3/00;* **G09B** *5/00*
U.S. Cl. 273—237 **4 Claims**

1. A game apparatus comprising in combination:
a. a plurality of recorded tracks on a recordable medium;
b. a playback apparatus for converting the recorded tracks to an audio signal;
c. a control apparatus coupled to the playback apparatus for selecting a recorded track;
d. a game board having at least a path of spaces thereon;
e. tokens for each player for moving along the spaces;
f. chance means for determining the number of spaces a player may advance; and
g. means including specific indicia on some spaces to determine in part the track to be selected for instruction of additional movement of a player's tokens.

5,011,157
ELECTRONIC GAME DISPLAY DEVICE

John G. Lovell, Sr., Knoxville, and Garry W. Owens, Morristown, both of Tenn., assignors to Bonus Games, Knoxville, Tenn.
Filed Mar. 8, 1990, Ser. No. 490,293
Int. Cl.[5] A63F *3/06*
U.S. Cl. 273—238 **20 Claims**



1. A device for displaying numerical digits in both a coordinate location area, and in a sequence of selection order area, together with a control unit and electronic circuitry appropriate to the encoding, sending, receiving, and decoding of data representative of said digits, comprising:
an operator's console fitted with a plurality of receptacles uniquely identified by row-column coordinates for receiving balls with encoded identification markings imprinted thereon, said markings corresponding to said uniquely identified receptacles;
means for registering both the unique coordinate location identification data and the sequential occurrence data of selected said encoded balls automatically upon the deposit of said encoded balls into the appropriate said receptacle on said console;
data encoding means for preparing said coordinate and sequential data for transmission;
means for transmitting said encoded coordinate and sequential data between said data encoding means and a receiver;
means for receiving and decoding said transmitted coordinate and sequential data into displayable information;
at least one display board for displaying said displayable information consisting of numerical digit indicating portions, which digit portions, when selected, are illuminated in both a coordinate location order portion of said at least one display board, and in a sequential order of selection portion of said at least one display board; and
means for selectively activating multiple light bulb portions of said at least one display board, said light bulb portions revealing, when lighted, patterns which correspond with the numerical digits represented by said decoded coordinate and sequential data.

NUMISMATIC COIN GAME

Rose H. Roberts, and James M. Roberts, both of 7525 Sherman Hoyt Ave., Twenty-Nine Palms, Calif. 92277

Filed Jul. 16, 1990, Ser. No. 552,863
Int. Cl.[5] A63F *3/00*
U.S. Cl. 273—256 2 Claims

1. A coin game comprising:

a. a game board having a multiplicity of sequentially arranged landing spaces arranged along a path thereon;

b. a multiplicity of playing pieces for movement along the game board, a selected playing piece assigned to each player of the game;

c. random movement selection means for causing each playing piece to be moved along the path of the sequentially arranged landing spaces and to land on a specific one of the landing spaces;

d. play money, gold shares and silver shares;

e. a selected subset of said sequentially arranged landing spaces representing 24 coins of a Peace Dollar Series, with a specific one coin from the Peace Dollar Series assigned to a selected one of the landing spaces;

f. one of said landing spaces being a start square for positioning the playing pieces at the start of the game;

g. two of said landing spaces each being a bonus square wherein a player whose playing piece lands on the space may collect a sum of money or any one of said Peace Dollar Series coins;

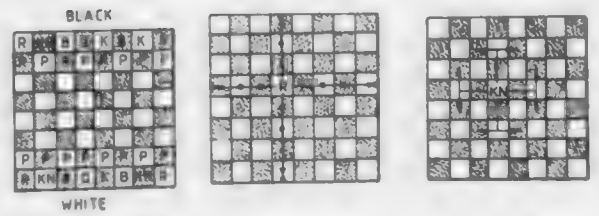
h. two of said landing spaces each being a buy or sell gold or silver space wherein a player whose playing piece lands on the space may purchase or sell gold and silver shares;

i. one of said landing spaces being a buy any coin space wherein a player whose playing piece lands on the space may buy any coin of the 24 Peace Dollar Series except one 1928-P coin;

j. one of said landing spaces being an auction space wherein a player whose playing piece lands on the space may purchase the 1928-P coin of the 24 Peace Dollar Series;

k. one of said landing spaces representing a 1927-D $ 20 St. Gaudin gold coin space wherein a player whose playing piece lands on the space may buy the 1927-F $ 20 St. Gaudin gold coin; and

a coin board given to each player to receive coins purchased during the game which represent the 24 coins of the Peace Dollar series and individualized coins representing each coin of the Peace Dollar Series;



m. wherein each player is given a sum of play money at the start of the game and the the rules of the game require the player to invest wisely in gold shares, silver shares and retained play money as the player's playing piece is moved around the board and lands on the landing spaces, and the object of the game is to either collect all 24 coins of the Peace Dollar Series or to be able to purchase the 1927-D $ 20 St. Gaudin gold coin.

5,011,159

METHOD OF PLAYING A CHESS GAME

Michael Fortunato, and Michael A. Fortunato, both of 1659 Barbara Ct., East Meadow, N.Y. 11554

Filed Jan. 16, 1990, Ser. No. 465,976
Int. Cl.[5] A63F *3/02*
U.S. Cl. 273—260 1 Claim

1. A method of playing a board game comprising the steps of:

providing a game board having a grid of spaces on the surface thereon;

providing a plurality of playing pieces, said piece divided into two opposing sets, each set of pieces having distinguishing means thereon to visually distinguish one set of pieces from the opposing set pieces, each set of pieces having six differently configured playing pieces;

providing a conventional pair of six-sided dice, the faces of each die having a number from 1 to 6;

providing money in a money pot;

assigning a different predetermined movement capability to each of the six differently configured pieces;

assigning a number on a die face to a differently configured piece, wherein each number on a die corresponds to a differently configured piece; assigning one of the differently configured pieces of each set as the superior piece;

assigning a set of pieces to each player;

placing the pieces on the board;

each player in turn rolling the dice, moving two pieces which correspond to the two numbers appearing one the dice, wherein movement is limited to the assigned movement capability;

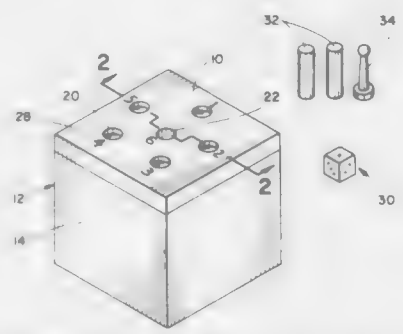
capturing an opposing piece when a piece lands on a space occupied by said opposing piece;

providing an objective to the game wherein players move their pieces to a position wherein the opposing superior piece is held in check or capable of being captured upon the next move of the pieces;

assigning a different monetary amount to each of the six different pieces, wherein when a player capture an opposing piece, that player is rewarded the corresponding monetary amount from the money pot;

rewarding a player : monetary amount from the money pot whenever his/her pieces are positioned to hold an opposing superior piece in check;

penalizing a player by requiring the player to place a predetermined amount of his/her own money in the money pot every turn his/her playing pieces are unable to move or unable to capture an opposing playing piece;



penalizing a player by requiring the player to place a predetermined amount of his/her own money in the money pot every turn his/her superior piece is unable to get out of check.

METHOD OF PLAYING A PROBABILITY GAME

Joseph Lacza, 27303 Westown Blvd., Westlake, Ohio 44145

Filed Oct. 11, 1989, Ser. No. 420,012
Int. Cl.[5] A63F *3/00*
U.S. Cl. 273—268 5 Claims

1. A method for playing a game by two or more players on a playing board having a plurality of spaced playing positions which are each identified by a different indicium, the game further including two sets of movable pieces, one set for each player, and a random indicium generator, the method comprising:

a first player obtaining an indicium;

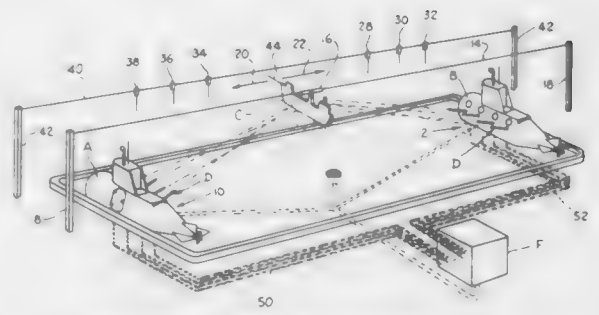
the first player positioning one of his pieces in the board playing position identified by the indicium obtained;

the first player obtaining a second indicium and positioning another of his pieces at the board playing position identified by the second indicium, wherein if the second indicium is the same as the first indicium the first player has to remove said one of his pieces from the board and give way to a second player, and wherein the first player keeps playing until a) he runs out of pieces or b) he has to remove one of the pieces on the board or c) he decides to give way to the second player;

the second player obtaining an indicium;

the second player positioning one of his pieces at the board playing position identified by the indicium obtained, wherein if the playing position identified is already filled by a player piece, it is removed and added to the second player's supply of pieces, thereupon the second player must give way to the next player;

otherwise, the second player obtaining a second indicium and positioning another of his pieces in the board playing position identified by the second indicium obtained, wherein if the second indicium obtained is the same as the first indicium the second player has to remove said one of his pieces from the playing board and give way to the next player, wherein the second player keeps playing until a) he runs out of pieces or b) he has to remove one of the pieces on the board or c) he decides to give way to the next player;



wherein the winner of the game is the player who first runs out of pieces.

WATER AMUSEMENT GAME

Marion C. Galphin, P.O. Box 34, Ninety-Six, S.C. 29666

Filed Sep. 25, 1989, Ser. No. 412,011
Int. Cl.[5] A63B *71/02*; A63H *23/00*
U.S. Cl. 273—349 30 Claims

1. A water amusement game comprising:

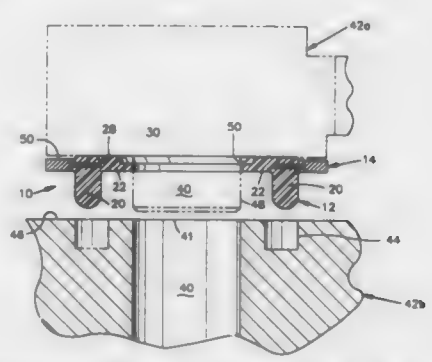
a first player station at which at least a first player is stationed, a second player station at which at least a second player is stationed, and said first and second stations being spaced from one another;

at least one water cannon at each of said first and second stations operable by said players, said water cannons emitting a water jet which impinges upon said target in response I0 to the operation of said water cannons by said players in accordance with the manipulation and skill of said players;

a target;

sensing means for detecting a condition of said target in response to the impingement of said water jet on said target;

water dispensing means for dispensing water on said players at said first and second stations; and



control means for activating said water dispensing means in response to signals received from said sensor means in response to said detection of said target condition to dispense water at said first and second stations in accordance with the skill of said players at said first and second stations to accurately hit said target with said water jet.

5,011,162

BI-LOBED SEALING ELEMENT AND RETAINER

Jerry G. Jelinek, La Habra, Calif., assignor to Parker Hannifin Corporation, Cleveland, Ohio

Filed Jul. 20, 1989, Ser. No. 382,458
Int. Cl.[5] F16J *15/12*
U.S. Cl. 277—11 5 Claims

1. An elastomeric sealing device for sealing a fluid passageway at the interface of two mateable parts wherein each of said mateable parts has a flat sealing surface which is in a close paraliel facing relationship with the other sealing surface when the parts are mated together, and wherein one of said mateable parts has a groove formed in the sealing surface thereof which

surrounds the fluid passageway and either one of said mateable parts has a boss which extends from the sealing surface thereof into the fluid passageway of the other part when the parts are mated together, said sealing device comprising: a bi-lobed elastomeric seal integrally molded on a relatively rigid retainer, said retainer and seal having a central opening therethrough which closely conforms to the shape of the fluid passageway at the interface of the mateable parts, said retainer being generally planar in construction with a load bearing peripheral portion that is clamped between the sealing surfaces of the mated parts, and a thinner flange portion which extends inwardly from the inner edge of said peripheral portion towards said central opening, said bi-lobed seal being of unitary construction molded about said retainer flange portion, said seal having a first lobe which extends perpendicularly from one surface of said retainer flange portion and is shaped and sized to be received in said groove and to sealingly fill most of the void in said groove when the parts are mated together, said seal having a second lobe which extends from said flange transverse said first lobe and defines said central opening, said second lobe being sized and shaped to have an interference fit with said boss to position said first lobe in said groove when the parts are mated together, said second lobe having a flat portion closely spaced from said retainer load bearing peripheral portion to seal the surface of the mated part which faces said groove.

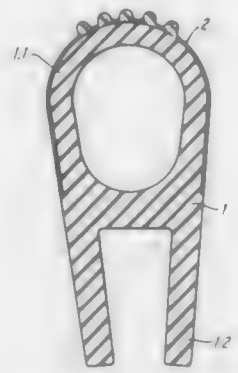
FLAME-RESISTANT ELASTIC SEALING MEMBER



Dietmar Hermann, Garbsen, and Helmbrecht Schmidt, Niestetal-Sandershausen, both of Fed. Rep. of Germany, assignors to Continental Aktiengesellschaft, Hanover, Fed. Rep. of Germany

Filed Sep. 20, 1989, Ser. No. 410,072

Claims priority, application Fed. Rep. of Germany, Sep. 20, 1988, 3831894

Int. Cl.[5] F16J *9/00;* **F02F** *11/00*

U.S. Cl. 277—26 **9 Claims**

1. A flame-resistant, elastic sealing member comprising: a strip-like body of a given length and made from a material selected from the group consisting of rubber and rubber-like synthetic material, said body having opposing side surfaces that extend the length of the body and are spaced apart by a given width, said body having a bottom for supporting the body on a support surface, said body further having a top surface that bridges said opposing side surfaces, said body further defining an upper sealing portion and a lower base portion, said side surfaces being divided into an upper section and a lower section, said upper sealing portion including said top surfaces and said upper section of said opposing side surfaces, said lower base portion including said bottom and said lower section of said opposing side surfaces, said lower base portion being for disposal in a groove having said support surface and wherein said groove is defined by opposing side walls, said upper sealing portion having a continuous fire protecting surface layer thereover covering said top surface and said upper section of said opposing side surfaces, said protecting surface layer containing therethrough flame-retarding additives to make said upper sealing portion flame-resistant, said layer ending at a location defining the demarcation between said upper sealing portion and said lower base portion so that said lower section of said side surfaces is devoid of said fire protecting surface layer, said sealing member being for disposal in said groove so that said lower base portion from said bottom to said demarcation is covered and thereby protected by said side walls of said groove along said lower section of said side surface.

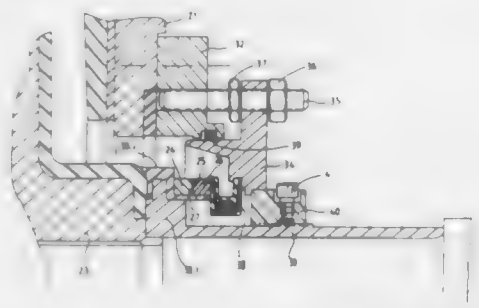
DOUBLE-DISK, SPRING-BIASED MECHANICAL SEAL ASSEMBLY



Raymond W. Hinks, Transvaal, South Africa, assignor to Terratech Mining Services (PTY) Ltd., Bryanston, South Africa

Filed Oct. 17, 1989, Ser. No. 423,207

Claims priority, application South Africa, Oct. 18, 1988, 88/7762

Int. Cl.[5] F16J *15/34*

U.S. Cl. 277—40 **6 Claims**

1. A mechanical seal arrangement for use in association with a pump casing structure and a drive shaft for driving a pump impeller which is housed in the pump casing structure, the seal arrangement comprising:

a rotatable seal ring having a seal face mountable concentrically on the drive shaft for rotation with the drive shaft;

a non-rotatable seal ring having a seal face mountable in axial alignement with the rotatable seal ring; and

biasing means for providing a biasing force to urge the rotatable and non-rotatable seal rings axially towards each other for effecting sealing engagement of the seal faces thereof; the arrangement being characterized by the biasing means comprising at least two disk spring elements spaced apart and encapsulated in an elastomeric body, which defines in use a pressure surface against which a fluid may exert a force complementary to the biasing force of the biasing means, the biasing means being locatable in a tensioned state between either one of the seal rings and the pump casing structure; and by the non-rotatable seal ring being bonded directly to the elastomeric body of the biasing means, with the rotatable seal ring being bonded directly to a shaft sleeve fitted over the drive shaft.

SEALING DEVICE ESPECIALLY FOR HARD DISK DRIVES

Heinrich Cap, Peterzell, Fed. Rep. of Germany, assignor to Papst-Motoren GmbH & Co. KG, St. Georgen, Fed. Rep. of Germany

Filed May 1, 1989, Ser. No. 345,932

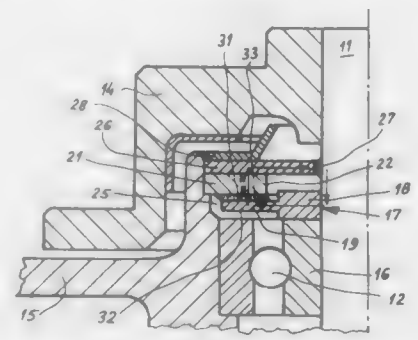
Claims priority, application Fed. Rep. of Germany, Apr. 29, 1988, 8805661[U]; Aug. 18, 1988, 3828081

Int. Cl.[5] F16J *15/40, 15/54*

U.S. Cl. 277—80 **8 Claims**

1. A seal in which a permanent magnet provides excitation, comprising:

a rotatable shaft having a straight cylindrical outer surface



and supported in a ball bearing system, each ball bearing having an inner race and an outer race;

a magnetically conductive bearing ring mounted on the shaft immediately adjacent one end of the bearing system, the bearing ring having two radial portions,

a sleeve portion immediately surrounding the shaft and having a given axial dimension and

a disk portion radially outwardly of the sleeve portion having an axial dimension less than that of the sleeve portion, the axial center of both portions lying in the same radial plane;

a permanent magnet ring axially adjacent the bearing ring, the magnet ring having an inner diameter greater than the outer diameter of the sleeve portion of the bearing ring,

the magnet ring opposing a substantial portion of the disk portion of the bearing ring;

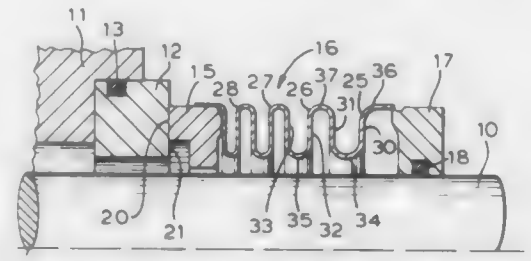
a labyrinth gap defined between the bearing system and the permanent magnet ring on both sides of the disk portion of the bearing ring radially extending therebetween;

a ring pole having an inner diameter concentric with and greater than the shaft and located axially adjacent the permanent magnet ring on the side opposite the bearing system, the ring pole extending radially inwardly toward the shaft parallel to the sleeve portion of the bearing ring; and

an active pole gap defined between the inner diameter of said ring pole and said shaft and filled with magnetically conductive fluid.

5,011,166

MECHANICAL FACE SEALS



Christopher J. Watts, Slough, United Kingdom, assignor to John Crane UK Limited, United Kingdom

Filed Apr. 13, 1990, Ser. No. 509,018

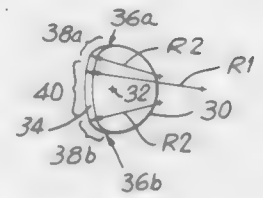
Claims priority, application United Kingdom, Apr. 24, 1989, 8909289

Int. Cl.[5] F16J *15/36*

U.S. Cl. 277—88 **15 Claims**

1. A mechanical face seal including a seal face member which is secured in fixed rotational relationship and sealed with respect to one of a pair of relatively rotatable components by means of a resilient bellows unit, said bellows unit being attached at one end to the associated component and at the other end to the seal face member, the seal face member being biassed into sealing engagement with a second seal face member associated with the other component by compression of the bellows unit, the bellows unit defining a plurality of convolutions, each convolution having a pitch which is the axial separation between a point on one convolution and a corresponding point on the next convolution and a depth which is the radial separation between the extremity of the crown and the extremity of the root of the convolution, wherein at least one of the pitch and depth of the convolutions differs along the length of the bellows.

5,011,167



CHUCK JAW

Paul T. Jordan, Seneca, S.C., assignor to Jacobs Chuck Technology Corporation, Wilmington, Del.

Filed Mar. 12, 1990, Ser. No. 491,729

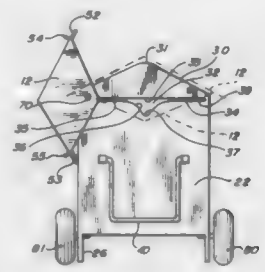
Int. Cl.[5] B23B *31/12*

U.S. Cl. 279—62 **6 Claims**

1. In a chuck having (1) a main body having a longitudinal axis, (2) a plurality of longitudinal jaws disposed in said main body and spaced around the longitudinal axis of said main body, each of said jaws having a longitudinal axis which is inclined relative to the longitudinal axis of said main body, and (3) a nut mounted on said main body for rotation relative to said main body about the longitudinal axis of said main body, said nut being threadedly engaged with thread segments on each of said jaws for causing each of said jaws to move relative to said main body parallel to the longitudinal axis of said jaw when said nut is rotated relative to said main body, the thread segments on each of said jaws extending transverse to the longitudinal axis of said jaw from a first end edge to a second end edge and having a first portion intermediate said end edges which is curved to substantially conform to the thread on said nut, the improvement comprising:

a second portion of said thread segments on each of said jaws, said second portion extending from one of said end edges to said first portion and having curvature which is in the same direction as but greater than the curvature of said first portion.

5,011,168



PORTABLE GARBAGE CONTAINER

Ferdinando Deamicis, 9560 John St Rd., Thunder Bay, Ontario P7B 4E2, Canada

Filed Oct. 20, 1989, Ser. No. 408,549

Int. Cl.[5] B62B *1/00*

U.S. Cl. 280—47.26 **10 Claims**

10. A portable garbage container comprising:

a housing with sidewalls, front and rear end walls, and a floor, each of the end walls having an apex formed by

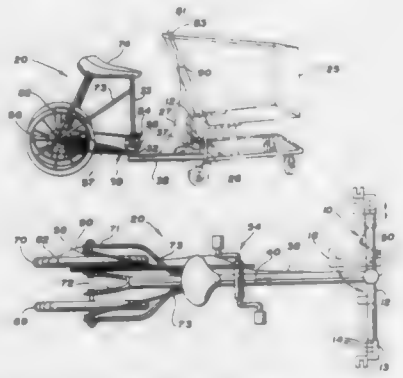
upper angled edges, each of the sidewalls having upper linear edges,

a pair of rear wheels affixed to the floor of the housing,

a pair of front legs affixed to the floor opposite the wheels,

a swingable handle affixed to the front end wall for lifting and pulling the container,

an angled cover mountable on the upper angled edges of the end walls and upper linear edges of the sidewalls, the cover having eaves overhanging the end walls and sidewalls of the housing and diamond shaped supports affixed on each end of the cover and exteriorly of the end walls, each of the supports including a roller about which the cover is tiltable, each of the eaves including a pair of handles for aiding in tilting and sliding the cover, and



a transverse slot formed in each of the end walls of the housing, each of the slots including a first, centrally disposed seat for receiving the roller when the cover is in a closed position, a pair of second seats disposed in side portions of each of the end walls for receiving the rollers when the cover is in an open position, and a pair of curved, downwardly extending edge portions leading into the first seat for facilitating the sliding of the cover into the closed position whereby the rollers are slidable in the slots between the seats and the cover is tiltable simultaneously to allow the cover to be efficiently opened and closed.

5,011,169

HUMAN POWER SHOPPING CART PROPULSION DEVICE

Harold Henderson, 3566 Whiporwill Dr., Austin, Mich. 48467, and Larry Henderson, 1933 S. Pinnebog Rd., Bad Axe, Mich. 48413

Filed Jun. 5, 1989, Ser. No. 361,643
Int. Cl.[5] B62K *7/00, 27/12*
U.S. Cl. 280—202 **4 Claims**

1. A human-powered shopping cart propulsion device, comprising:

a wheeled propulsion unit including pedals;

a yoke which extends forwardly from said propulsion unit;

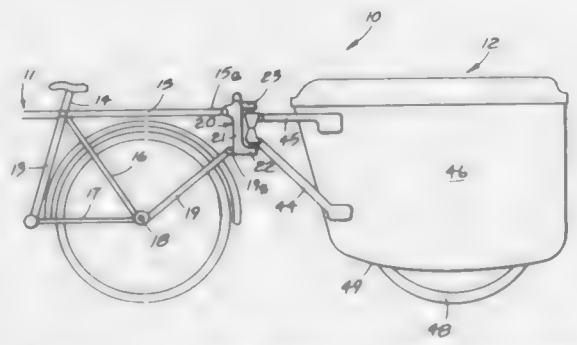
an adjustable length crossbar means for attaching said yoke to a shopping cart;

said adjustable length crossbar includes attachment members at each end adapted to engage a shopping cart post;

one of said attachment members is attached to a levered sleeve;

said levered sleeve is pivotally attached to a connecting arm;

said connecting arm is pivotally attached to a lever pivotally attached to said crossbar; and



rotation of said lever causes said levered sleeve to engage and disengage a shopping cart post.

PEDAL CYCLE AND MOTORCYCLE TRAILER

Alexander D. Forbes, and Sheena C. Forbes, both of 11 Millburn Park, Baltasound, Shetland, Scotland ZE29EB

Filed Mar. 26, 1990, Ser. No. 500,528
Int. Cl.[5] B62K *27/00;* **B62J** *7/04*
U.S. Cl. 280—204 **5 Claims**

1. A bicycle and trailer apparatus comprising, in combination,

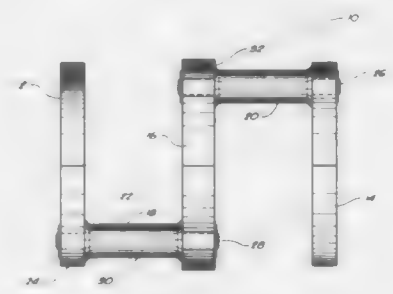
a bicycle including forward and rear wheels mounted within the bicycle including a vertical main support telescopingly receiving a bicycle seat support therewithin at an upper end of the main support, and

a link member extending horizontally and overlying the rear wheel and a further link member extending from an axle of the rear wheel upwardly and spaced from a rear terminal end of the link member, and

the rear terminal end of the link member and an upper terminal end of the further link member secured in a spaced relationship to a mounting yoke, and

a trailer housing including a hitch pin means mounted within a hitch pin housing for vertical and horizontal rotation relative to the hitch pin housing, the hitch pin housing including a plurality of trailer links to secure the trailer housing to the hitch pin housing, the trailer housing including a tire member rotatably mounted therewithin, and

the hitch pin selectively secured to the mounting yoke for limited vertical and horizontal rotation of the hitch pin relative to the mounting yoke, and



wherein the mounting yoke comprises an "L" shaped member including a horizontal lower leg and a vertical upper leg extending orthogonally and integrally from the horizontal leg, wherein the horizontal leg includes a bifurcated upper end to pivotally receive a cup member therewithin, the bifurcated upper end includes a first leg spaced from and parallel to a second leg, wherein the second leg extends upwardly and beyond the first leg, and an "L" shaped cup member pivotally mounted between the first and second legs, the "L" shaped cup member including a first cup leg including a semi-cylindrical recess directed within a lower surface of the first cup leg, and a lock aperture directed through the second cup leg, the lock aperture aligned with a further lock aperture directed through an upper end of the second leg of the "L" shaped cup member is in a lowered position, and a lock pin selectively receivable through the lock aperture and the further lock aperture when the "L" shaped cup member is in the lowered second position, and a further cup shaped recess directed interiorly within an upper surface of the vertical leg of the "L" shaped yoke, the further semi-cylindrical recess aligned with the semi-cylindrical recess when the "L" shaped cup member is in the lowered second position, and the first and second semi-cylindrical recesses spaced a distance equal to a predetermined length defined by the hitch pin.

SELF-PROPELLED VEHICLE

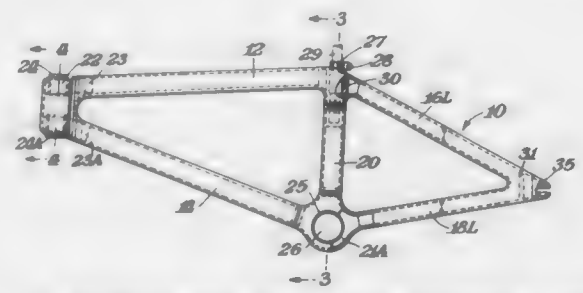
Walter R. Cook, Rt. 3, Box 14, Port Lavaca, Tex. 77979

Filed Apr. 20, 1990, Ser. No. 512,168
Int. Cl.[5] B62K *1/00*
U.S. Cl. 280—221 **20 Claims**

1. A self-propelled vehicle comprising:

a first wheel;

a second wheel; and



a third wheel of greater diameter than said first and second wheels, said third wheel having a center of rotation aligned with said first and second wheels, said third wheel connected to said first wheel by a first pedal, said third wheel connected to said second wheel by a second pedal, said first and second wheels located on opposite sides of said third wheel.

5,011,172

LIGHTWEIGHT BICYCLE WITH IMPROVED FRONT AND REAR WHEEL FORK AND METHOD OF CONSTRUCTING SAME

August T. Bellanca, and August T. Bellanca, Jr., both of Wilson Point Rd., Galena, Md. 21635

Filed Jan. 30, 1989, Ser. No. 302,948
Int. Cl.[5] B62K *19/02, 19/16, 19/30*
U.S. Cl. 280—281.1 **9 Claims**

1. a lightweight, rigid bicycle frame comprising left and right subassemblies which; (a) are the mirror image of each other; each subassembly has a "C" shaped cross-section; each subassembly has a forward and rear end and said subassemblies are attached to each other at the forward ends to form a front portion of the frame comprising:

(a) a head tube;

(b) a crank housing;

(c) a rear fork;

(d) a top hollow member having a front end and a rear end wherein said front end is attached to the head tube;

(e) a down hollow member having a forward and a rear end wherein said forward end is attached to the head tube;

(f) a down seat hollow member having a top end and a bottom end wherein said top end is attached to the rear end of the top hollow member and the bottom end is attached to the crank housing; said rear ends of said left and right subassemblies being separated from each other to form a cavity to which is inserted and attached;

(g) a rear "C" shaped subassembly in the shape of an oval folded about its minor axis and mounted in said cavity and attached to said rear ends of said left and right subassemblies with the C-shape of said rear subassembly complementing the C-shape of the respective left and right subassemblies to form said rear fork; and

(h) said rear fork of the frame comprising:

(i) two seatstay hollow members each having a forward end and a rear end wherein the forward ends are attached to the top of the down seat hollow member;

(ii) two chainstay hollow members each having a forward end and a rear end wherein the forward end is attached to the crank housing and the rear end of each of the chainstay hollow members is attached to the rear end of a respective seatstay hollow member; and

(iii) the rear "C" shaped subassembly is in the shape of an oval fold 160 to 166 degrees about its minor axis.

ADJUSTABLE HEIGHT BICYCLE SEAT MECHANISM

Robert A. Ross-Clunis, 2900 Vista Del Rey, NE. Unit 28D, Albuquerque, N. Mex. 87112

Filed Oct. 30, 1989, Ser. No. 428,776
Int. Cl.[5] B62K *1/06*
U.S. Cl. 280—287 **25 Claims**

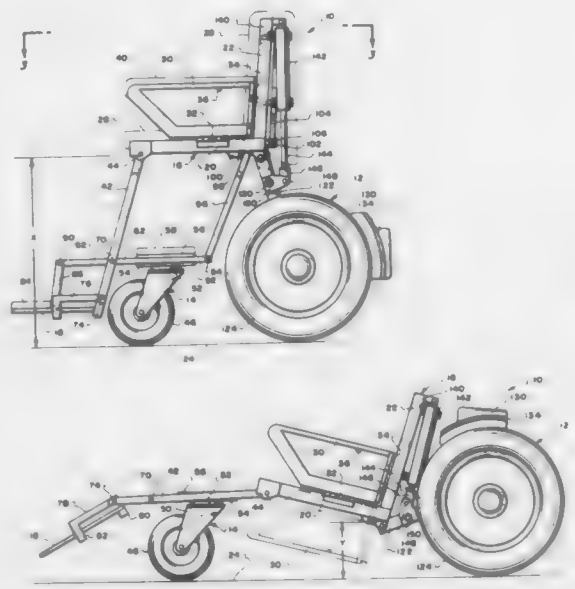
1. A height adjustable device for mounting a bicycle seat onto the frame of a bicycle, comprising:

a hollow lower tube member;

spring means for providing both a torsion and a compressive biasing force, said spring means having a first end and a second end, said first end of said spring means being secured relative to said lower tube member;

an upper member installed in and extending from said lower tube member, said upper member being longitudinally slidable and rotatable with respect to said lower tube member, said second end of said spring means being secured relative to said upper member;

first guide means mounted on said lower tube member; and



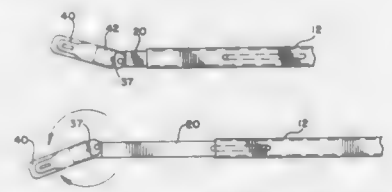
second guide means mounted on said upper tube member, said first and second guide means cooperating to limit the longitudinal movement of said upper member with respect to said lower tube member between a raised position and a lowered position, said first and second guide means allowing relative rotation of said upper member with respect to said lower tube member between locked and unlocked positions at either said raised position or said lowered position.

5,011,175

WHEELCHAIR

J. Dudley Nicholson, 9715 Elizabeth Lake Rd., and Stanley Secretan, 9211 Elizabeth Lake Rd., both of Leona Valley, Calif. 93551

Continuation of Ser. No. 361,390, Jun. 5, 1989, abandoned. This application Aug. 13, 1990, Ser. No. 566,266
Int. Cl.[5] B62M 1/14
U.S. Cl. 280—304.1 3 Claims



1. A wheelchair comprising:
a chair-like frame having a seat section adapted to support a buttocks of a human being, said seat section having longitudinal opposite edges defined as a forward edge and a rearward edge, said seat frame including a back section adapted to support a back of a human being, said back section being fixedly mounted onto said seat section;
a leg rail assembly pivotally mounted to said seat section at said forward edge;
a linkage assembly connected between said leg rail assembly and said seat section at said rearward edge;
a front wheel assembly being mounted on said linkage assembly, said front wheel assembly to continually rest on a supportive surface;
a rear wheel assembly pivotally mounted to said seat section at said rearward edge, said rear wheel assembly to continually rest on the supportive surface;
an actuator assembly connected to both said rear wheel assembly and said linkage assembly, said actuator assembly for causing movement of said seat frame between an upper position and a lower position, said lower position being located substantially nearer the supportive surface than said upper position, with said seat frame in said upper position said front wheel assembly being located nearest said rear wheel assembly with both said front wheel assembly and said rear wheel assembly being located between said seat frame and the supportive surface, with said seat frame in said lower position said front wheel assembly being located furthest from said rear wheel assembly with said seat frame being located substantially between said front wheel assembly and said rear wheel assembly, both said front wheel assembly and said rear wheel assembly being movable relative to each other and movable relative to said seat frame; and
a footplate pivotally mounted to the free outer end of both said leg rail assembly and said linkage assembly, during movement of said seat frame from said upper position to said lower position said footplate is simultaneously moved from a substantially horizontally oriented position through an angle below the horizontal to an inclined position.

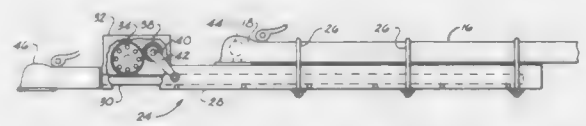
5,011,176

ADJUSTABLE TRAILER COUPLING

Horace Eppinette, Galena, Mo., assignor to Flexi-Hitch, Inc., Crane, Mo.

Filed Oct. 23, 1989, Ser. No. 421,110
Int. Cl.[5] B60D 1/40
U.S. Cl. 280—479.3 6 Claims

1. A coupling device mounted to a towed vehicle for connecting a towing vehicle to a towing bar mounted on the towed vehicle when the two vehicles are not aligned with each other comprising:
a trailer hitch at one end of the coupling device for connection to the towing vehicle;
a telescopic arm received in telescopic relationship within the towing bar located at the other end of the coupling device, the telescopic arm having opposite ends with one end protruding from the towing bar, the telescopic arm extendable between a retracted, locked position to a fully extended position;
locking means for selectively locking and unlocking the telescopic arm with respect to the towing bar comprising a locking pin which passes through locking pin receiving holes in the towing bar and telescopic arm when the telescopic arm is in the retracted position;
an articulating arm having one end connected to the trailer hitch and the other end pivotally connected at a pivot point to the one end of the telescopic arm for allowing the articulating arm to pivot with respect to the telescopic arm, the other end of the articulating arm having a locking pin receiving hole which is in alignment with the locking pin receiving holes in the towing bar and telescopic arm when the telescopic arm is in the retracted, locked position whereby the locking pin is received by all three locking receiving holes.
an anti-pivot collar which can be selectively positioned with respect to the pivot point to either not encircle or encircle the pivot point for respectively permitting or restraining pivotal movement between the articulating arm and telescopic arm; and
means associated with the trailer hitch for positioning the anti-pivot collar with respect to the pivot point for the selective positioning of the anti-pivot collar.



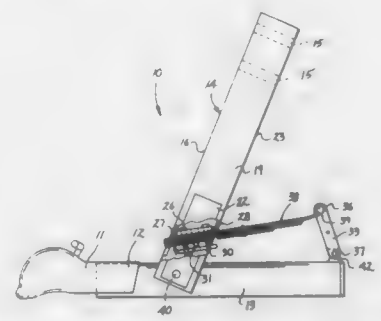
5,011,177

AUXILIARY TRAILER EXTENSION TONGUE

Farrell Grice, Star Rte. Box 68, Swansea, S.C. 29160

Filed Feb. 26, 1990, Ser. No. 485,147
Int. Cl.[5] B60D 1/14, 1/62
U.S. Cl. 280—482 8 Claims

1. An auxiliary trailer extension kit adapted to be operatively and detachably interconnected between a trailer tongue of a conventional trailer having a ball-type hitch at one end thereof, and a conventional swivel hitch ball mounted on a trailing vehicle, said auxiliary trailer extension kit comprising:
an elongated tubular member adapted to be detachably secured to the trailer tongue;
releasable attachment means secured to said elongated tubular member for detachably interconnecting said elongated tubular member in a fixed relationship with the trailer tongue;
a conventional swivel hitch ball mounted on the top surface of said elongated tubular member and upon which the ball-type hitch of the conventional trailer is adapted to be applied;
an elongated extension member adapted for telescoping relative said elongated tubular member, said extension member comprising an upturned toothed gear rack journaled in said elongated tubular member and having a ball-type hitch attached adjacent one end thereof for application to a conventional swivel hitch ball mounted on a trailing vehicle; and



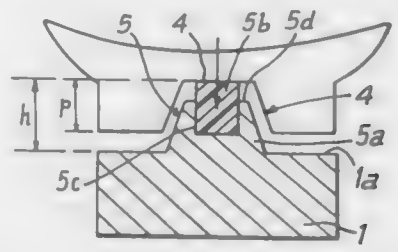
drive means for selectively alternately extending and retracting said extension member relative to said elongated tubular member for effecting controlled elongation of the trailer tongue, said drive means including a housing received on the distal end of said elongated tubular member at an upper surface thereof and having a relatively enlarged gear rotatably supported in said housing and engaged with said upturned toothed gear rack through an opening therein, so that controlled rotation of said relatively enlarged gear results in corresponding controlled relative movement between said extension member and said elongated tubular member.

5,011,178

TRAILER HITCH APPARATUS

Stanley W. Sanderson, 312 Sanderson Rd., Newport, N.C. 28570

Filed Feb. 26, 1990, Ser. No. 484,978
Int. Cl.[5] B60D 1/14
U.S. Cl. 280—483 6 Claims



1. A trailer hitch apparatus comprising, in combination,
a trailer ball socket mounted to and integrally aligned with a socket support tube, the socket support tube coextensive with and mounted in an aligned relationship to a primary support tube at its forwardmost end, the primary support tube pivotally receiving a secondary support tube rearward of the socket support tube, and
a pivot pin transversely directed through spaced side walls of the primary support tube and is directed through spaced forward flanges of the secondary support tube, and
a biasing means for biasing vibration directed through the trailer ball socket mounted at its forward end interiorly of the secondary support tube and at its rear end to the primary support tube, and
wherein the secondary support tube includes a top wall spaced from and parallel to a bottom wall, the top wall including a "U" shaped forward end spaced rearwardly of the forward flanges, and the bottom wall including a bottom wall "U" shaped forward end spaced rearwardly of the "U" shaped forward end of the top wall to receive the biasing means therethrough.

5,011,179

LATERAL GUIDE APPARATUS FOR CROSS-COUNTRY SKI, SKI SHOE OPERABLE THEREWITH, AND IMPROVED SKI-COUNTRY SKI

Alain Bejean, La Clusaz, and Gerard Graillat, Annecy, both of France, assignors to Salomon S.A., Annecy Cedex, France

Continuation of Ser. No. 246,791, Sep. 20, 1988, abandoned. This application Apr. 25, 1990, Ser. No. 513,023
Claims priority, application France, Nov. 18, 1987, 87 15951
Int. Cl.[5] A63C 5/04
U.S. Cl. 280—615 15 Claims

1. Apparatus for a cross-country ski-shoe whose toe is attached to the top surface of a cross-country ski for effecting displacement of the heel of the shoe relative to the ski, said shoe having a longitudinal groove in its sole at least in the front portion thereof, said groove being defined by a bottom and a pair of spaced, lateral guide faces, said apparatus comprising:
(a) a longitudinal guide rib adapted to be attached to the upper surface of the ski at a location where said groove receives said rib when the sole of the shoe seats flat on the ski;
(b) said rib including an elastic element that is engaged by the bottom of said groove in the shoe when the heel seats flat on the ski, and that is resiliently deformed thereby;
(c) said elastic element being constructed and arranged so that, in response to downward movement of the heel of the shoe into engagement with the ski, energy stored in the elastic element by reason of its resilient deformation is sufficient to create a force on the sole of the shoe that imparts an upward rebound to the heel of the shoe; and
(d) wherein the longitudinal guide rib is formed in two portions, a relatively rigid lower portion, and an upper elastic portion embedded in a longitudinal groove in the upper surface of the lower portion, said elastic portion projecting above said upper surface so as to be elastically compressed by the bottom of the groove of the sole of the shoe when the heel seats flat on the ski, said rigid portion engaging and guiding the lateral guide faces of the groove in the sole of the shoe when the heel seats flat on the ski.

DIGITAL SUSPENSION SYSTEM

Andrew B. Dunwoody, Richmond, Canada, assignor to The University of British Columbia, Canada

Filed Feb. 2, 1990, Ser. No. 473,748
Int. Cl.[5] B60G 13/08
U.S. Cl. 280—707 7 Claims

1. A suspension system for a wheeled vehicle having a body portion comprising means for sensing lateral and longitudinal acceleration of said body portion, a digital hydraulic actuator supporting said body portion from each of said wheels, each said actuator including a plurality of different effective area actuator sections, a first source of hydraulic fluid at a first pressure, a second source of hydraulic fluid at a second pressure, said second pressure being significantly different from said first pressure, valve means for selectively connecting

either one or the other of said first and said second sources to selected of said actuator sections thereby to vary the number of said actuator sections and thereby the amount of said effective area of each said actuator subjected to said first and said second pressures to selectively vary the force applied by each said actuator independent of the extension of said actuator, com-

puter means for controlling said valves to adjust the number of said actuator sections of each said digital hydraulic actuator subjected to said first and said second pressured based on anticipated forces at each said actuator as determined by said computer means based on conditions sensed by said means for sensing lateral and longitudinal acceleration thereby to maintain said body portion substantially stable.

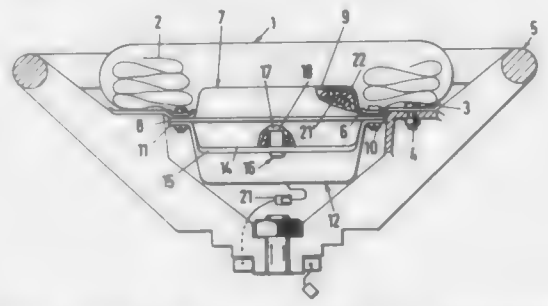
STEERING WHEEL MOUNTED AIR BAG MODULE INCLUDING ELECTROMAGNETICALLY SHIELDED SENSOR

Horst Laucht, Bruckmuehl; Richard Baur, Pfaffenhofen; Bernd Werner, Schliersee; Karl E. Nilsson, Ottobrunn, and Peter Hora, Schrobenhausen, all of Fed. Rep. of Germany, assignors to Messerschmitt-Boelkow-Blohm GmbH, Ottobrunn and Bayern-Chemie Gesellschaft fuer Flugchemische Antriebe, Aschau/Inn, both of, Fed. Rep. of Germany



PCT No. PCT/EP89/00680, § 371 Date Jan. 31, 1990, § 102(e) Date Jan. 31, 1990

PCT Filed Jun. 16, 1989, Ser. No. 458,730

Int. Cl.[5] B60R *21/20, 21/32*

U.S. Cl. 280—731 **5 Claims**

1. A safety device for motor vehicles for protecting a person against impact injuries, comprising air bag means fastened to a steering wheel of the vehicle for protecting a person, gas generator means including a gas generator housing with a first mounting flange for generating an inflating gas for said air bag means, electronic ignition means for starting a gas generation in response to an impact, sensor means for activating said electronic ignition means, a sensor housing having a second mounting flange attached to said first mounting flange of said gas generator housing, support means and attachment elements for securing said first and second mounting flanges in a position on the steering wheel in such a way that said sensor housing and said gas generator housing form a complete electromagnetic shielding for said sensor means and said electronic ignition means, and wherein said first mounting flange and said

second mounting flange are integral flanges of the respective gas generator housing and sensor housing, said first and second mounting flanges having a matching form so that their exact position relative to each other is fixed by said attachment elements.

VELOCITY CHANGE SENSOR WITH CONTACT RETAINER

Harald S. Husby, Budd Lake; Allen K. Breed, Boonton Township, Morris County, and Ted Thuen, Morris Plains, all of N.J., assignors to Breed Automotive Technology, Inc., Boonton Township, Morris County, N.J.

Filed Oct. 6, 1989, Ser. No. 417,914

Int. Cl.[5] B60R *21/32;* **H01H** *35/02, 35/14*

U.S. Cl. 280—735 **12 Claims**

1. An accelerometer for sensing velocity changes comprising:

a housing with a first end a second end opposite said first end and defining a chamber therebetween;

a pair of flexible contact means disposed at said first end and having contact ends extending into said chamber;

retaining means disposed in said housing for biasing said contact ends to a preselected position with respect to said first end;

a sensing element movably disposed in said housing; and

biasing means for generating a biasing force on said sensing element for urging said sensing element toward a first position, said sensing element being constructed and arranged to move toward a second position away from said first position in response to a deceleration force exceeding said biasing force, for contacting said contact ends in said preselected position.

BAG, AIRBAG, AND METHOD OF MAKING THE SAME

Peter B. Thornton, Bronxville; Fred P. Woodworth, Arkpport, and Stanley H. Cone, Hornell, all of N.Y., assignors to Stern & Stern Industries, Inc., New York, N.Y.

Filed Jun. 8, 1990, Ser. No. 535,772

Int. Cl.[5] B60R *21/20*

U.S. Cl. 280—743 **19 Claims**

1. A bag suitable for use in an airbag comprising:

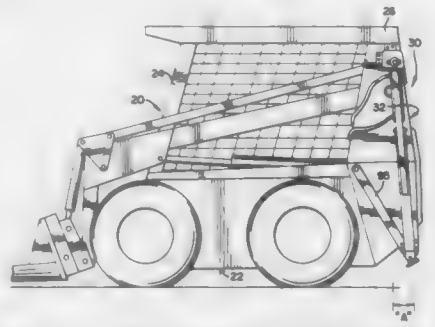
a seamless bag of integral, unitary, one-piece woven construction, said bag defining:

(i) a pair of opposed panels of substantial area formed in a plain weave of a first yarn density;

(ii) a single intermediate margin of slight width joining the peripheries of said opposed panels together, said intermediate margin being formed in a plain interweave of a second yarn density greater than said first yarn density; and

(iii) a single outer margin of substantially greater width than said intermediate margin extending about the periphery of said intermediate margin, said outer margin being formed in a weave looser than said plain interweave.

5,011,184



STABILIZER SYSTEM

Robert W. Loudon, 26011 N. Fairfield Rd., Lake Zurich, Ill. 60042

Filed Sep. 28, 1989, Ser. No. 413,781

Int. Cl.[5] B60S *9/12*

U.S. Cl. 280—766.1 **20 Claims**

1. A system for a utility vehicle having generally vertically oriented longitudinal and lateral walls, dimensional profile space, and undercarriage clearance space, said system comprising:

a. a stabilizer unit, said unit mounted in close conformity to the generally vertically oriented walls, said unit comprising:

(i) a leg, said leg including an angular-shaped straight tube, said leg extending generally groundward and mounted in close conformity to said vertically oriented walls of said vehicle;

(ii) a sleeve, said sleeve including an angularly shaped hollow tube within which said leg may slidably travel;

(iii) a pad, said pad connected to a groundward end of said leg and carried exterior to said sleeve, said pad including a ground engaging surface;

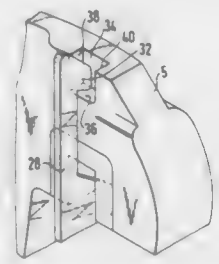
(iv) hydraulic means, said hydraulic means including a fluid actuated piston cylinder, said piston cylinder including a piston having a groundward-oriented end affixed to an end of said leg, said piston cylinder further including a cylinder secured to said vehicle and extending generally external of said sleeve;

(v) securement means for attaching said stabilizer unit to the vehicle, said securement means including a housing by which one end of said cylinder is secured to said vehicle; and

b. means for controlling said stabilizer unit and by which said hydraulic means may be actuated to extend said piston and thereby said leg within the dimensional profile of said vehicle and downwardly until said ground engaging surface of said pad contacts the ground and to retract said piston and thereby said leg upwardly to a non-ground engaging position at which no part of said leg and said pad extend into said undercarriage clearance space.

5,011,185

LOCKING MEANS FOR A DRIVE MEMBER OF A PASSIVE SAFETY-BELT SYSTEM



Michael Stütz, Spraitbach, and Thomas Mödinger, Vordersteinenberg, both of Fed. Rep. of Germany, assignors to TRW Repa GmbH, Fed. Rep. of Germany

Filed Aug. 31, 1989, Ser. No. 401,052

Claims priority, application Fed. Rep. of Germany, Sep. 6, 1988, 3830288

Int. Cl.[5] B60R *22/06, 22/24*

U.S. Cl. 280—804 **1 Claim**

1. In a passive safety belt system for vehicles, comprising:

a guide member secured on a vehicle bodywork,

a drive member slidably mounted in said guide member and having a safety belt fitting mounted thereto, said drive member being movable along said guide member between a belt wearing position and a belt stowing position,

a locking member pivotally mounted adjacent to said guide member for engaging said drive member in said belt wearing position,

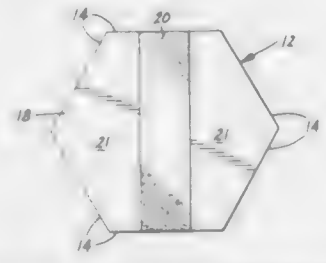
the improvement wherein:

said locking member is a plate-like elongated ratchet hook pivotally mounted at one end thereof about an axis and comprising at its other end a nose extending laterally from the ratchet hook in a direction substantially opposite to the direction of travel of the vehicle and perpendicular to the drive member,

said ratchet hook being arranged on a side of said drive member to which tensile force occurring at said drive member upon a vehicle frontal crash is directed,

said drive member comprises on a side thereof facing said ratchet hook a recess into which said nose portion of said ratchet hook dips to lock said drive member,

said recess of said drive member is rectangular, as viewed in a direction opposite to the normal direction of travel of the vehicle, and comprises two parallel boundary walls which are perpendicular to the pivot axis of said ratchet hook and spaced from each other by a predetermined spacing which is substantially greater than the thickness of said plate-like ratchet hook, so that the side faces of said



nose portion of said ratchet hook remain at a distance from said boundary walls when said nose portion is engaged into said recess.

HEXAGONAL PAD

Douglas P. Bodziak; Ray A. Hunder; Steven P. Roth; Steven L. Grovender, and Robert P. Molenda, all of St. Paul, Minn., assignors to Minnesota Mining & Manufacturing Company, St. Paul, Minn.

Filed Feb. 14, 1990, Ser. No. 479,841
Int. Cl.[5] B42D *1/00*
U.S. Cl. 281—12 **5 Claims**

1. A pad comprising a plurality of flexible sheets each having a regular hexagonal peripheral edge defined by six straight edge portions, a front surface adapted to be written on, a rear surface, and a coating of repositionable pressure sensitive adhesive over a portion of said rear surface extending across the rear surface of said sheet between opposite straight edge portions releasably adhering said sheet to an underlying sheet in said pad with the straight edge portions of the peripheral edges of said sheets in alignment, said rear surface of each sheet having a portion free of adhesive adjacent the intersection of two straight edge portions on one side of said opposite straight edge portions to afford removal of said sheets from said pad by peeling the uppermost sheet from underlying sheets in the pad,

whereby a user may write information on the front surfaces of a plurality of the sheets, remove said plurality of the sheets, and adhere the removed sheets to a planar surface in side by side relationship with straight edge portions of up to six adjacent sheets in contact to represent relationships between the information on the sheets.

5,011,187

BINDING SYSTEM FOR CONNECTED FAN FOLDED SHEETS

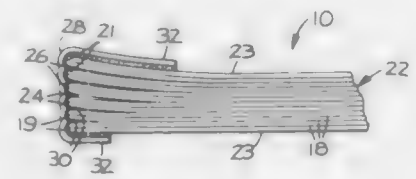
Ray A. Hunder; Larry A. Bettenhausen; Alden R. Miles; William A. Mittelstadt; Stephen H. Dwyer, and Gary R. Hanson, all of St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Continuation of Ser. No. 144,420, Jan. 14, 1988, abandoned. This application Jan. 4, 1989, Ser. No. 294,936
Int. Cl.[5] B42D *1/04, 3/02;* **B42C** *11/04, 13/00*
U.S. Cl. 281—15.1 **17 Claims**

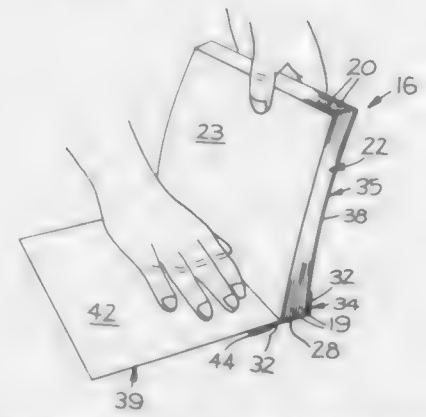
1. A bound document comprising:

a multiplicity of similarly sized sheets each having a spine edge, an outer edge opposite said spine edge, and opposite major side surfaces, said sheets being disposed in a stack having opposite sides with the spine edges of said sheets aligned to define a generally planar surface at generally a right angle to said opposite sides, each of said sheets, except for the outermost sheets in the stack which are each joined only along one of said edges, being joined at both of said edges to sheets adjacent its major side surfaces with the spine edges of the sheet being joined to the spine edge of the sheet along one of said side surfaces, and the outer edge of the sheet being joined to the outer edge of the sheet along the other of said side surfaces;

a pair of cover plates disposed on opposite sides of said stack and each having a spine edge aligned with the spine edges of the sheets in said stack;



a highly flexible strong backing having low resilience; and



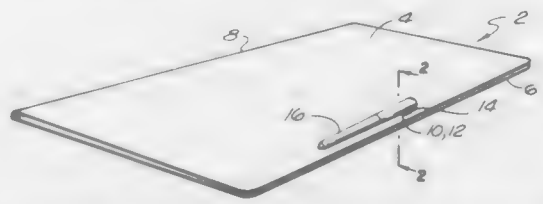
a layer of pressure sensitive adhesive adhered to said backing, which layer of pressure sensitive adhesive has been adhered across the aligned spine edges of said sheets and cover plates and along narrow side surface portions adjacent said spine edges on corresponding sides of said sheets when said sheets were disposed to expose said narrow side surface portions relative to said adjacent sheets;

said layer of pressure sensitive adhesive and said backing being pleated by retained adhesion of said layer of pressure sensitive adhesive to said spine edges and said narrow side surface portions contacted by the layer of pressure sensitive adhesive when said sheets were disposed to expose said narrow side surface portions relative to said adjacent sheets;

said layer of pressure sensitive adhesive adhering to narrow side surface portions of the sheets adjacent the narrow side surface portions of the sheets contacted by the layer of pressure sensitive adhesive when said sheets were disposed to expose said narrow side surface portions relative to said adjacent sheets;

said backing having end portions adhered to portions of said cover plates adjacent said spine edges;

said backing being a sheet material having a flexibility/stiffness of less than about 200 grams resistance to flexing when measured in accordance with the International Nonwoven Disposable Association Handle-O-Meter Stiffness Standard Test, IST 90.0-75 R-82 using a test sample of said sheet material 20.32 centimeter by 20.32 centimeter and having a slot into which said test sample of sheet material is pressed adjusted to be 0.635 centimeter wide and said test sample of sheet material is caused by the test to bend in an arc extending in the same direction along the test sample of material as the arcs around which the sheet material will have to bend to form pleats; and



said pressure sensitive adhesive having a minimum adhesion of 30 ounces per inch, when tested in accordance with ASTM D 3330-81 by adhering a piece of white bond paper to a glass plate with double coated tape, adhering a ½ inch wide strip comprising the pressure sensitive adhesive to be tested on a backing to the surface of the paper opposite the glass plate, and peeling one end of the strip from the paper by bending the strip 180 degrees and pulling it parallel to the surface of the paper so that the adhesive is pealed from the paper at a speed of 12 inches per minute; resists dead load peel for at least 500 minutes when tested by adhering a piece of the same white bond paper to a stainless steel plate with double coated tape, adhering a ½ inch wide strip comprising a layer of the pressure sensitive adhesive to be tested on a backing to the surface of the piece of paper opposite the stainless steel plate along a ¾ inch length at one end of the strip, positioning the plate vertically, bending the strip 180 degrees away from the plate, and hanging a 100 gram weight from the end of the strip opposite its adhered end length so that the weight tends to peel the strip from the piece of paper; and achieves a value of at least 15 ounces per inch when tested by the test identified as Quick Stick PSTL-5, which is Test number 5 of Pressure Sensitive Tape Counsel.

FOLDER

Martin Zoland, 7 Mandeville Crescent, Toorak, Victoria, Australia 3142 , and Mark Rossato, 15 Leslie Street, Richmond North, Victoria, Australia

Filed May 23, 1990, Ser. No. 528,041
Int. Cl.[5] B42D *3/12*
U.S. Cl. 281—30 **12 Claims**

1. A folder and writing instrument combination, said writing instrument including a clip and an elongated portion, said clip having first and second ends with said first end affixed to said elongated portion, said folder including a front cover with an inside portion and an outside portion, and a back cover with an inside portion and an outside portion, said front cover and said back cover being joined at one side thereof so as to form a spine, said front and back covers having first and second edges adjacent said spine and a third edge opposite said spine, said combination comprising:

(a) a first hole disposed adjacent said third edge of said front cover opposite said spine;

(b) a second hole disposed adjacent said third edge of said back cover opposite said spine, wherein said first hole and said second hole are in alignment when said folder is in a closed position, and wherein said second end of said clip is adapted to be inserted into said aligned holes such that said clip is adjacent to outside portion of one of said front and back covers, and said elongated portion is adjacent the outside portion of the other of said front and back covers,

whereby said front and back covers are secured in a closed position when said clip engages said first and second holes, and said front and back portions may be opened when said clip is disengaged from said first and second holes.

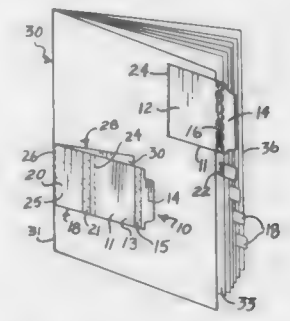
PUBLICATION REFERENCE-AID SYSTEM APPARATUS THEREFOR



Craig W. Olson, P.O. Box 302, Fontana on Geneva Lake, Wis. 53125

Continuation-in-part of Ser. No. 147,366, Jan. 25, 1988, abandoned, which is a continuation-in-part of Ser. No. 940,422, Dec. 11, 1986, abandoned. This application Jul. 31, 1989, Ser. No. 388,319
Int. Cl.[5] B42D *15/00, 1/00;* **B42F** *21/00;* **B32B** *5/16*
U.S. Cl. 283—81 **14 Claims**

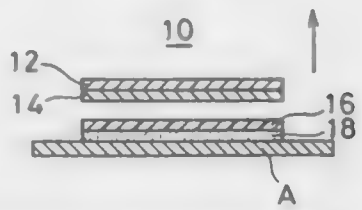
1. A reference-aid apparatus adapted for use with and temporary securement to a publication, said apparatus comprising:

a substrate formed of sheet stock, said substrate comprising a primary marker member and at least one secondary marker member with said at least one secondary marker member being releasably attached to said primary marker member by a line of separations;

said primary marker member further comprising a head tab portion with said portion being adapted to receive first indicia thereon for identifying a publication, said primary marker member further comprising on one face thereof a directory area with said directory area having second indicia thereon defining at least one inscribable entry area with third indicia located adjacent to and being specific to each of the said at least one inscribable areas on said primary marker member, the other face of said primary marker member comprising an attaching means area with

a releasable and reusable pressure sensitive adhesive permanently attached thereto and covered by a removable protective sheet;

said at least one secondary marker member containing on one face thereof fourth indicia defining at least one inscribable entry area thereon with fifth indicia located adjacent to and being specific to each of the said at least one inscribable entry areas on said secondary marker member, the other face of said secondary marker member comprising an attaching means area with a releasable and reusable pressure sensitive adhesive permanently attached thereto and covered by a removable protective sheet; and



said third and fifth indicia having a predetermined associative relationship.

FLEXIBLE PIPE CONNECTING DEVICE FOR HIGH TEMPERATURE FLUID

Shigemitsu Nitta, Kakogawa, Japan, assignor to Kawasaki Jukogyo Kabushiki Kaisha, Japan

Filed Oct. 5, 1989, Ser. No. 417,271
Claims priority, application Japan, Oct. 8, 19[illegible], 63-131991[U]
Int. Cl.[5] F16L *53/00*
U.S. Cl. 285—41 **3 Claims**

1. A pipe fitting device which passes high temperature fluid therein, and connects pipings with dynamic relative dislocation to each other of longitudinal and lateral directions, comprising:

a first cylindrical block (2) which has a cylindrical ring portion (24) having a through hole (20) at a center for passing said fluid, and a flange (21) formed on an outside of one end of said ring portion (24) facing to an end of one of said pipings;

a second cylindrical block (3) which has a flange (31) one surface thereof faces to an end of the other of said pipings, and an annular edge member defining an opening (34) incorporating with play the ring portion (24) of said first cylindrical block (2), said edge member is formed on the opposite surface of said flange (31);

a follower ring (5) which is disposed between the ring portion (24) of said first cylindrical block (2) and the edge member of the opening (34) of said second cylindrical block (3), in contact with the outer circumferential surface of the ring portion (24) of the first cylindrical block (2) and has a bent end portion (51) in sliding contact with a edge member end surface of the opening (34) of the second cylindrical block (3);

a spring (7) which pushes said follower ring (5) to the second cylindrical block (3) side;

flexible connection sleeves (9,8) which respectively connect the flanges (21,31) of said first cylindrical block (2) and the second cylindrical block (3), as well as the ring portion (24) of the first cylindrical block (2) and the edge member end portion of the opening (34) of the second cylindrical block (3); and

through holes (22,32) which are respectively drilled into the first and second cylindrical blocks (2,3) to communicate with the gap between said connection sleeves (8,9) so as to flow cooling medium.

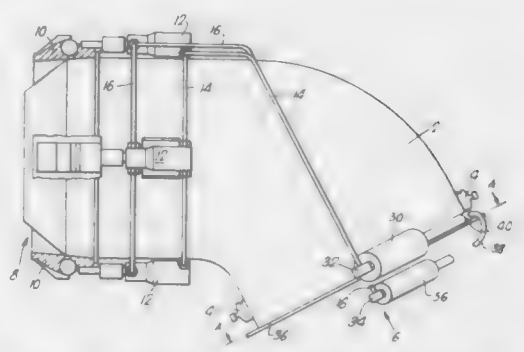
CONSTANT VOLUME CONNECTOR

Douglas J. Nightingale, Jonesboro, Ga., assignor to Rolls-Royce Inc., Atlanta, Ga.

Filed Dec. 18, 1989, Ser. No. 452,278
Int. Cl.[5] F16L *27/00*
U.S. Cl. 285—302 **15 Claims**



1. A constant volume connector for providing a constant volume fluid path joining two conduits having compound relative movement therebetween in any direction, said connector comprising:

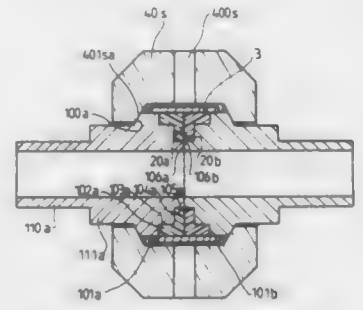
a telescoping assembly comprising a plurality of hollow members which define a first internal fluid path of variable length;

swivel means at either end of the telescoping assembly for connecting said first internal fluid path with the moveable conduits;

cylinder means moveable with one of said plurality of hollow members of the telescoping assembly;

piston means moveable with another of said plurality of hollow members, said piston means being slidably engaged with said cylinder means to define a second internal fluid path having a volume which varies according to the length of the telescoping assembly and in inverse proportion to the volume of said first internal fluid path; and

transfer means connecting said second internal fluid path with said first internal fluid path;



whereby for a change in length of the telescoping assembly, the change in volume of said second internal fluid path by displacement of the piston means is equal to the opposite change in volume of the first internal fluid path due to the compound relative movement of the conduits in any direction.

5,011,196

UNION FOR FLUID CONDUITS, IN PARTICULAR FOR HIGH PURITY GAS

André Sabatier, 83, avenue du Président Kennedy, 94190 Villeneuve Saint-Georges, and Raymond Depraetere, 1, rue des Coquelicots, 91000 Evry, both of France

Filed Apr. 9, 1990, Ser. No. 506,110
Claims priority, application France, Apr. 12, 1989, 89 04836
Int. Cl.[5] F16L *19/02*
U.S. Cl. 285—367 **16 Claims**

1. A union for fluid conduits comprising:

(A) two end fittings, each having:

(a) a fixing end intended to join to at least one respective conduit;

(b) a free connecting face;

(c) a coaxial metallic body, having an internal bore whose diameter is continuous with that of the conduit to be connected to it and presenting externally thereon, starting from a proximal point at said fixing end, a conical bearing surface flaring outwardly towards a cylindrical bearing surface, said cylindrical bearing surface being followed by at least one flat shoulder radially inwardly recessed towards and connected to a central projecting

cylindrical portion, said central projecting cylindrical portion projecting in a direction axially away from said fixing end and terminating in an annular radially inwardly extending polished distal section where said internal bore issues;

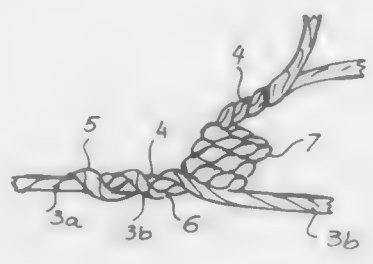
(d) a washer having an external cylindrical shape and made of a deformable synthetic material, said washer being contact-fitted on the central cylindrical portion to abut against said flat shoulder, and having a flat annular radial face which, together with said polished section, forms the free connecting face,

(B) a metallic elongate cylindrical ring internally accommodating with a contact fit the two washers and a part at least of each of the two cylindrical bearing surfaces of said two end fittings when placed face to face, so that the two free connecting faces come to be opposite each other;

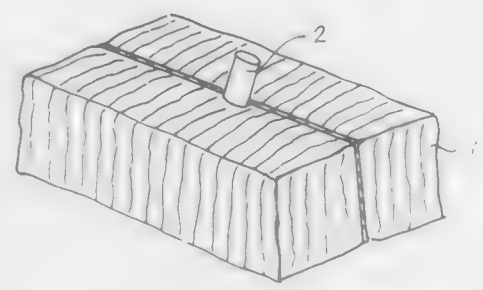
(C) two half-shells having two conical bearing surfaces similar to the two respective conical bearing surfaces of the two metallic coaxial bodies, and

(D) means for clamping these two half-shells together to ensure the connection of the fluid conduits.

5,011,197



METHOD FOR TYING TWINES INTO CLOSED LOOPES



Joseph Molitorisz, 1506 13th St., Ames, Iowa 50010

Filed Jan. 31, 1990, Ser. No. 472,853

Int. Cl.[5] B65H *69/04*

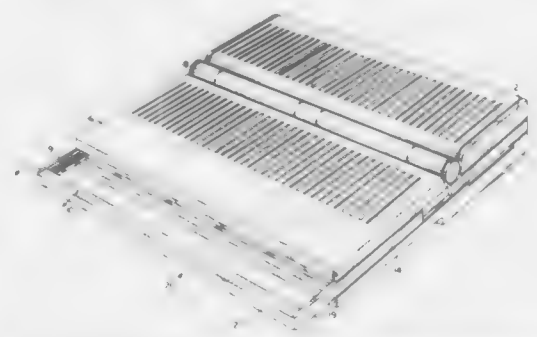
U.S. Cl. 289—1.5 **1 Claim**

1. A method to secure a twine including a pair of strands tightly wrapped in a closed loop around an object comprising the steps of, placing the twine around an object in suitable length to form a loop around the object,

placing ends of the pair of strands which includes two single strands together, twisting the two single strands into a double strand forming a tightly wrapped closed loop of the twine around the object,

continuing the twisting action and causing a portion of one of the single strands of the twine forming the tightly wrapped loop around the object to be twisted together with a portion of the double strand, forming a triple strand of the twine with the direction and sense of the winding of the double strand and one of the single strands being opposite to the direction and sense of the twisting of the two single strands into a double strand, resulting in the overlapping twisting of the single and the double strands of the said twine, producing a knotting effect on the looped twine, preventing the reversal of the twisting of the strands of the twine under the action of the tensile forces acting on the looped twine securing the looped twine around the object, continuing the twisting action of the portion of the double strand of the twine not being twisted into the triple strand to form a coiled configuration while moving the ends of the pair of strands toward the object following the changes in the length of the twisted strands during the twisting process, and releasing the twine.

5,011,198



HANDLE LATCH ASSEMBLY

Eric I. Gruenberg, Soquel; James R. Stewart, San Jose, and James J. Halicho, Sunnyvale, both of Calif., assignors to Apple Computer, Inc., Cupertino, Calif.

Filed Apr. 20, 1989, Ser. No. 341,048

Int. Cl.[5] E05C *9/02;* **B65D** *25/28*

U.S. Cl. 292—41 **13 Claims**

1. An improved handle and latch assembly for a portable personal computer comprising:

a handle means slideably coupled to a cover of said computer;

a latching means moveably disposed with said cover and extending partially out of said cover, said latching means engaging with an opening disposed on said computer such that when said latching means is engaged with said opening said cover is locked in a first position;

wherein when said handle slides in a first direction, said handle contacts and moves said latching means thereby disengaging said latching means from said opening and allowing said cover to be moved away from said first position.

PANIC EXIT DEVICE HAVING AN EXIT-DELAYING MECHANISM

Peter E. Lowe, San Francisco; Peter H. Muller, Los Gatos, both of Calif.; Michael D. Coleman, Zionsville, and Paul J. Haeck, Indianapolis, both of Ind., assignors to Von Duprin, Inc., Indianapolis, Ind.

Filed Dec. 28, 1989, Ser. No. 458,194

Int. Cl.[5] E05C *3/08*

U.S. Cl. 292—92 **30 Claims**

1. A panic exit device having an exit-delaying mechanism, comprising:

an elongated frame;

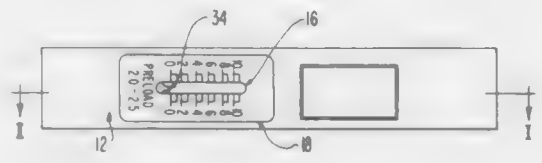
a latchbolt mounted to said frame for movement relative thereto between a first, latched position in extension, outwardly, from said frame, and a second, unlatched position retracted, and substantially confined, within said frame;

manually-actuated linkage means having (a) a linkage coupled to said latchbolt and mounted to said frame for movement relative to, and only lengthwise of, said frame, for moving said latchbolt from said first position to said second position, and (b) an arm, pivotally mounted to said frame, and coupled to said linkage, for moving said linkage lengthwise of said frame;

first means mounted to said frame, and movable relative to said frame between a first disposition thereof (a) for obstructing movement of said linkage means, and a second disposition thereof (b) for obstructing movement of said linkage means; and

second means mounted to said frame operative in response to, and with a specific time delay following, manual actuation of said linkage means, for moving said first means from said first disposition thereof to said second disposition thereof.

5,011,200



LATCH WITH PRELOAD INDICATION

Jerry L. Glancy, Wichita, and John C. Birch, Derby, both of Kans., assignors to The Boeing Company, Seattle, Wash.

Filed Nov. 21, 1989, Ser. No. 439,337

Int. Cl.[5] E05C *5/00*

U.S. Cl. 292—113 **15 Claims**

1. A latch for selectively securing together a pair of relatively movable panels in an aircraft, said latch comprising:

a latch keeper attached to one of the panels;

a latch handle pivotally attached to the other panel and moveable between open and closed positions;

a latch hook connected to said handle and disposed to selectively engage said keeper; and

means for visually indicating the relative value of a preload engagement force between said hook and said keeper, said force existing when said latch is closed.

5,011,201

FRONT STRUCTURE OF VEHICLE BODY

Hisao Takahashi, Higashihiroshima; Kaoru Yamane, Hiroshima; Kiyomi Hirakami, Hiroshima, and Kazuo Ikeda, Hiroshima, all of Japan, assignors to Mazda Motor Corporation, Hiroshima, Japan

Filed Jul. 7, 1988, Ser. No. 216,660

Claims priority, application Japan, Jul. 10, 1987, 62-106895

Int. Cl.[5] B62D *23/00*

U.S. Cl. 296—203 **6 Claims**

1. A front structure for a vehicle body having an engine room at its front end, said front structure comprising:

(a) front side frames, each extending in a longitudinal direction of the vehicle body along opposite sides of an engine room and formed of an outer member and an inner member forming a closed cross section,

(b) a dashboard lower panel extending vertically and disposed near rear edges of said front side frames,

(c) a floor panel extending rearwardly from a lower edge of said dashboard lower panel,

(d) side sills, each extending in the longitudinal direction of the vehicle body along opposite sides of the floor panel and formed of an outer panel and an inner panel forming a closed cross section,

(e) a projection extending from the front end of each of said side sills, each projection extending inwardly from the front end of each of said side sills relative to said vehicle body and having a front surface extending in a transverse direction of said vehicle body and an inner surface extending generally in a longitudinal direction of said vehicle body,

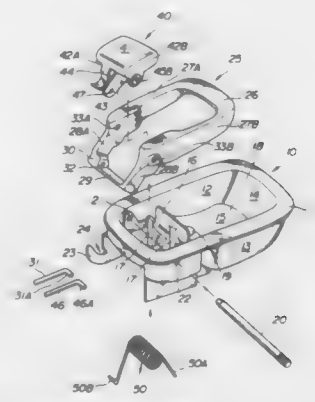
(f) a pair of connecting members, each of said pair of connecting members affixed to one of said front surfaces of

said projections and extending inwardly beyond said inner surface and affixed to a rear part of the outer member of one of said front side frames, and

(g) a pair of reinforcing members, each of said reinforcing members interposed between said dashboard lower panel and one of said connecting members and affixed to said dashboard lower panel and said one of said connecting members.

5,011,202

HANDLE ASSEMBLY FOR USE WITH DOOR LOCKING DEVICE



Yuichi Kato, and Masazumi Miyagawa, both of Yokohama, Japan, assignors to Ohi Seisakusho Co., Ltd., Yokohama, Japan

Filed Mar. 7, 1989, Ser. No. 320,060

Claims priority, application Japan, Mar. 24, 1988, 63-37686[U]

Int. Cl.[5] E05B *5/00*

U.S. Cl. 292—336.3 **16 Claims**

1. A handle structure comprising:

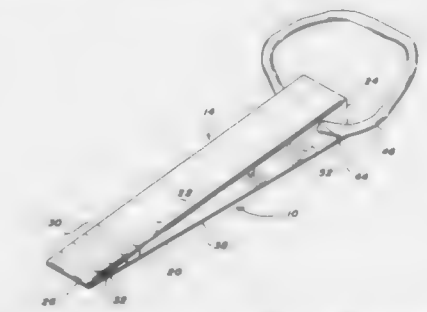
a body having a recess formed therein;

an integral handle proper comprising a bent rectangular frame and including a first U-shaped part and a second U-shaped part which is inclined relative to said first U-shaped part, each of said first and second U-shaped parts comprising two generally parallel legs and a cross portion, said cross portion of said second U-shaped part defining a bridge portion which includes a connecting part to which an operating member is connected;

means for pivotally connecting said frame of said handle proper in such a manner that said second U-shaped part is kept received in said recess of said body even when, due to a pivotal movement of said handle proper, said first U-shaped part is pivoted outside said body;

a knob received in and pivotally held by said frame of said handle proper; and

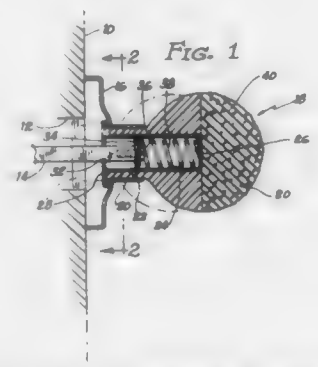
biasing means for biasing said handle proper in such a direction as to draw said first U-shaped part toward a bottom wall of said recess of said body;



wherein pivotal connection between said handle proper and said body and pivotal connection between said knob and said handle proper are achieved through a common hinge pin which is pivotally supported by opposed side walls of said body;

wherein said hinge pin passes through aligned openings which are formed at a junction of said first U-shaped part and said second U-shaped part;

wherein said biasing means comprises a coil spring which is disposed about said hinge pin having one end engaged to said body and the other end engaged to said second U-shaped portion; and



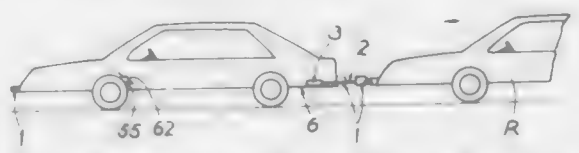
wherein said second U-shaped part is formed with a bored thicker portion which is thicker in cross section than the cross section of the rest of said second U-shaped part and to which a hook portion of a first operating rod is pivotally connected.

5,011,203
SECURITY DOOR BLOCK
Donald L. W. Tackett, R.R. 4, Box 317, Salem, Ill. 62881
Filed Oct. 4, 1990, Ser. No. 592,961
Int. Cl.[5] E05C *17/54*
U.S. Cl. 292—343 **12 Claims**

1. A security door block comprising a wedge shaped body member adapted to be inserted between the lower edge of a closed door and a floor and having a floor engaging side and a door engaging side converging from a rear end towards an apex end, said door engaging side inclined at a low angle to the floor engaging side between 4 degrees and 10 degrees to maximize the mechanical advantage of the wedging action between the lower edge of the door and the wedge shaped body, said floor engaging side having a floor engaging surface composed of a material the frictional resistance of which with the floor is appreciably greater than the frictional resistance of the lower edge of the door with the door engaging side of the wedge shaped body, said apex end of the wedge shaped body including means for manually and selectively truncating the apex end whereby the wedge shaped body can be trimmed for use with doors of different thicknesses and doors hung at different spacings between the lower edge of the door and the floor such that the apex end does not extend beyond the outside lower edge of the door where it could be kicked.

5,011,204
RESILIENT DOOR KNOB
Randall C. Labrum, 2862 Via del Alazan, Bonita, Calif. 92002
Filed Apr. 30, 1990, Ser. No. 516,806
Int. Cl.[5] E05C *21/02*
U.S. Cl. 292—347 **7 Claims**

1. A resilient doorknob assembly for engaging the doorlatch structure of a door having a transverse shaft which operates a latch element when rotated, said doorknob comprising:



(a) a knob body;

(b) a shaft mounting which mounts said knob body and slidably engages said shaft in operation;

(c) limit means defining limits to the travel of said knob body as it travels toward and away from said door; and

(d) bias means biasing said knob body away from said door such that upon said doorknob impacting an obstacle, it will yield axially on the end of said shaft against said bias means.

5,011,205
TELESCOPICALLY-OPERATED SAFETY VEHICLE BUMPER
Shiu-Yen Liu, P.O. Box 55-47, Taipei, Taiwan
Filed Jul. 9, 1990, Ser. No. 549,754
Int. Cl.[5] B60R *19/02*
U.S. Cl. 293—5 **2 Claims**

1. A telescopically-operated vehicle bumper comprising:

a bumper secured on two guide rods reciprocatively held on a chassis of a car body;

a driving means operatively extending said bumper outwardly for preventing a direct hit on the cat body by an external impact force acting on said bumper, and operatively retracted to be approximate to the car body;

a driving fluid booster producing a high pressure fluid for driving said driving means for extending or retracting said bumper; and

a control means having a sensor operatively trodden by a brake pedal for actuating an electrical control circuit for controlling the extending or the retraction of said bumper, the improvement which comprises:

said driving means including at least one set of twin cylinders having a primary cylinder and a secondary cylinder respectively provided with two pistons in said two cylinders secured on two opposite ends of a piston rod connected to one said guide rod, said primary cylinder having a left hole formed in a left end portion of the primary cylinders for directing driving fluid therethrough, said secondary cylinder having a right hole formed on a right end portion of the secondary cylinder for directing fluid therethrough opposite to the primary cylinder, said piston rod reciprocating through a right rod hole formed on a right end portion of the primary cylinder and through a left rod hole formed on a left end portion of the secondary cylinder, whereby when directing a driving fluid into said primary cylinder to push two said pistons and releasing the fluid in said secondary cylinder, said piston rod, said guide rod, said bumper can be extended outwardly, and upon a flowing of the driving fluid into the secondary cylinder and releasing of the fluid from the primary cylinder, the bumper can be retracted; and

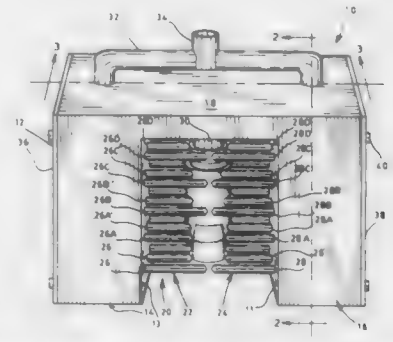
said control means including a first solenoid valve normally closed and provided in a first pipe operatively open for directing fluid into said primary cylinder, a second solenoid valve normally closed and provided in a seccond delivery pipe operatively opened for directing fluid into said secondary cylinder, a third solenoid valve normally closed and provided in a vent pipe branched from said first delivery pipe operatively opened for releasing fluid from said primary cylinder, and a fourth solenoid valve normally closed and provided in another vent pipe branched from the second delivery pipe operatively opened for releaasing fluid from said secondary cylinder, and a first microswitch provided in said sensor operatively depressed by a brake pedal for extending the bumper, a second microswitch provided at a left dead point of the pistons to be operatively actuated by an actuating roller secured on an inner end portion of the guide rod for switching off an extension indicator lamp when retracting the bumper, a third microswitch provided at a right dead point of the pistons to be operated by said actuating roller for closing said first and fourth solenoid valves for stopping the outward extending of the bumper, and a fourth microswitch provided at the left dead point of the pistons to be operatively depressed by said roller for closing said second and third solenoid valves for stopping the inward retraction of the bumper, said extension indicator lamp being lit when powered by the electrical control circuit through said second microswitch normally closed upon an extension of the bumper.

5,011,206
DEVICE FOR EXTRACTING FOREIGN PIECES OR PARTICLES FROM FUEL ASSEMBLIES OF A NUCLEAR REACTOR
Louis Guironnet, Lyons, France, assignor to Framatome, Courbevoie and Cogema, Velizy Villacoublay, both of, France
Filed Jun. 30, 1989, Ser. No. 373,554
Claims priority, application France, Jul. 4, 1988, 88 9025
Int. Cl.[5] G21C *19/26*
U.S. Cl. 294—86.41 **6 Claims**

1. Device for extraction of foreign particles from fuel assemblies of a core of a nuclear reactor which fuel assemblies are placed under water in a pool, said device comprising

(a) a vertical pole having an upper end and a lower end;

(b) a manipulating member at said upper end of said pole for displacing said pole in horizontal and vertical directions;



(c) a gripper support mounted pivotally about a horizontal axis at said lower end of said pole;

(d) a gripper of a shape and size adapted to an extraction to be performed and being fastened to one end of said gripper support;

(e) elastic return means cooperating with said pivoting gripper support so as to return said gripper into a grasping position distant from a vertical axis of said pole; and

(f) a control mechanism for opening and closing said gripper, said gripper support comprising a flexible element passing through a sheath connected directly, at a first end of said sheath, to a movable nose of said gripper and connected, at a second end of said sheath, to means for exerting a pull and a push on said flexible element, making it possible to open and close said gripper.

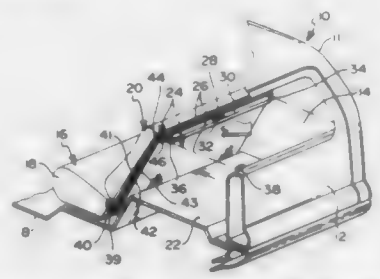
ROBOTIC END EFFECTOR FOR GRASPING OBJECTS
S. Scott Stevens, Rte. 1, Box 302A, Harriman, Tenn. 37748
Continuation-in-part of Ser. No. 80,616, Aug. 3, 1987, Pat. No. 4,896,914. This application Nov. 20, 1989, Ser. No. 439,776
The portion of the term of this patent subsequent to Jan. 30, 2007, has been disclaimed.
Int. Cl.[5] B25J *9/14*
U.S. Cl. 294—88 **2 Claims**

1. A device for grasping an object having a surface, which comprises:

a substantially hemispherical housing defining a central cavity for at least partially receiving said object;

a plurality of arcuate finger units carried by said housing, said finger units each having a distal end for engaging said surface, and a further end positioned within said housing, said plurality of finger units being sufficient in number to support said object when said object is grasped by said distal ends of said finger units;

guide means for each of said finger units, said guide means providing for movement of said finger units along fixed arcuate paths relative to said housing into and out of said central cavity; and



movement means operatively associated between said housing and each of said finger units for selective reciprocative movement of said finger units along their individual axes in said fixed arcuate paths from a first position substantially stored within said housing to a second position within said central cavity to engage said surface of said object with said distal ends, and for selective movement to return to said first position and release said surface of said object.

CONCEALED INTEGRATED SEAT CARGO SCREEN

Sandra Lewallen, Rochester Hills, Mich., assignor to General Motors Corporation, Detroit, Mich.

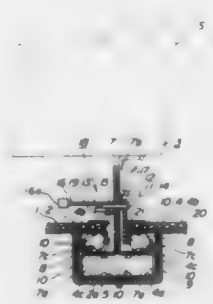
Filed Feb. 23, 1990, Ser. No. 488,818
Int. Cl.[5] B60R 5/04
U.S. Cl. 296—37.16 4 Claims

1. In a vehicle body having a cargo floor accessible through a vehicle body door and a rear seat having a seat back that folds forwardly to extend the cargo floor, a cargo screen for covering the cargo floor comprising;

a flexible screen having a forward and rearward end;

means for removably attaching the rearward end of the flexible screen to the vehicle body aft of the rear seat;

a reel means mounted on the vehicle body below the cargo floor level for mounting the forward end of the flexible screen; and



guide means mounted on the seat back of the rear seat above the cargo floor for guiding the flexible screen from the reel means towards the means for removably attaching whereby the reel means is concealed beneath the cargo floor and the screen is suspended above the cargo floor to conceal the cargo floor.

5,011,209

ARRANGEMENT FOR MOUNTING SEAT SLIDING DEVICE ON VEHICLE FLOOR

Isamu Takarabe; Mikio Honma, and Hatsuo Hayakawa, all of Yokohama, Japan, assignors to Ohi Seisakusho Co., Ltd., Yokohama, Japan

Filed Jul. 25, 1989, Ser. No. 384,703
Claims priority, application Japan, Jul. 26, 1988, 63-184496
Int. Cl.[5] B60N 1/08
U.S. Cl. 296—65.1 13 Claims

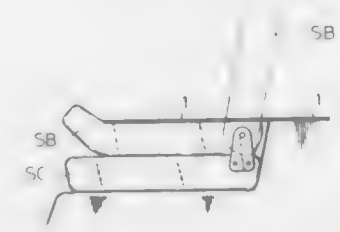
1. In a motor vehicle, a sliding seat arrangement, comprising:

a groove in said vehicle floor;

a seat sliding device which comprises two units, each including a stationary rail, a movable rail slidably interlocked with said stationary rail and movement smoothing means for smoothing the movement of said movable rail relative to said stationary rail, one unit of said seat sliding device being tightly received in said groove having a given part of said movable rail projecting upward from said groove;

a rug spread on said vehicle floor in a manner to cover said groove, said rug having an elongated slit through which said given part of said movable rail is projected upward, said elongated slit extending along said groove of said floor, so that the sliding movement of said movable rail relative to said stationary rail causes said given part of the movable rail to move in and along said elongated slit; and

second means connecting said given part to said seat,



wherein the length of said stationary rail is longer than that of said movable rail.

5,011,210

STRUCTURE FOR FIXING THE TERMINAL END OF CARPET IN AUTOMOTIVE SEAT

Nobuhiro Inoue, Akishima, Japan, assignor to Tachi-S Co. Ltd., Tokyo, Japan

Filed Apr. 10, 1990, Ser. No. 507,163
Int. Cl.[5] B60R 5/00
U.S. Cl. 296—69 6 Claims

1. A structure for fixing a terminal end of a carpet in an automotive seat, in which a seat back of said seat has a rear side as part of said seat back to be used as a load-carrying platform and the carpet is attached to said rear side of said seat back, and said structure comprising:

a recessed area formed in said rear side of said seat back, in which recessed area has a projecting member;

an anchor member of a generally T-shaped configuration in section, which is fixed to an end of a covering member affixed over a frontal side of said seat back, said anchor member comprising a horizontal plate area and an engagement portion projecting from said horizontal plate area, said horizontal plate area having a securing part for securing a terminal end of said carpet in said recessed area;

wherein, said engagement portion of said anchor member is engaged with said projecting member at said recessed area, said terminal end of said carpet is pressed down by said securing part of said anchor member, so as to secure said end of said covering member and terminal end of said carpet into said recessed area, whereby the carpet is positively fixed to said rear side of said seat back.

SUN VISOR AND SUPPORT STRUCTURE FOR MOTOR VEHICLES

Lothar Viertel, Altforweiler, Fed. Rep. of Germany, and Patrick Welter, Lachambre, France, assignors to Gebr. Happich GmbH, Fed. Rep. of Germany

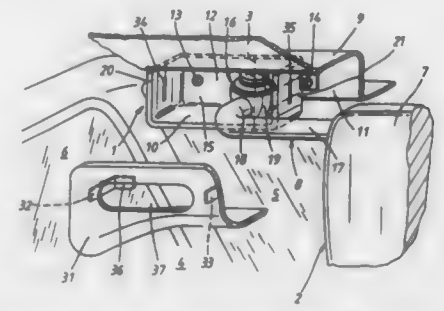
Filed Nov. 9, 1989, Ser. No. 435,031
Claims priority, application Fed. Rep. of Germany, Nov. 10, 1988, 3838117
Int. Cl.[5] B60J 3/00
U.S. Cl. 296—97.9 3 Claims

1. A sun visor and support structure for a motor vehicle, which comprises:

a sun visor body having a longitudinal edge extending from a first side edge of the body to a second, opposed side edge, the sun visor body further having a recess defined in the longitudinal edge adjacent to the second side edge and a bore substantially parallel to the longitudinal edge and disposed adjacent to such longitudinal edge;

a support shaft extending across the recess approximately parallel to the longitudinal edge and connected at the ends thereof to the sun visor body;

an L-shaped arm having a first portion rotatably received within the bore of the sun visor body and having a second portion extending substantially perpendicular from the first portion; and



an elongated support member adapted to be mounted over a front windshield of the motor vehicle and having a length approximately equal to a length of the longitudinal edge of the sun visor body, the support member having an integral bracket at one end for rotatably receiving the second portion of the L-shaped arm so that the sun visor body may rotate about a first axis passing through the second portion and having an integral bracket at another end for detachably and rotatably receiving the support shaft so that the sun visor body may rotate about a second axis which is substantially perpendicular to the first axis and which passes through the first portion of the L-shaped arm.

SWIVEL BEARING FOR A SUN VISOR

Gerhard Zweigart; Ferdinand Greiner, both of Aidlingen; Heinz Baumert; Peter Scheiffele, both of Sindelfingen, and Manfred Nowak, Solingen, all of Fed. Rep. of Germany, assignors to Daimler-Benz AG, Fed. Rep. of Germany

Filed Sep. 5, 1989, Ser. No. 402,537
Claims priority, application Fed. Rep. of Germany, Sep. 3, 1988, 3829976
Int. Cl.[5] B60J 3/02
U.S. Cl. 296—97.13 13 Claims

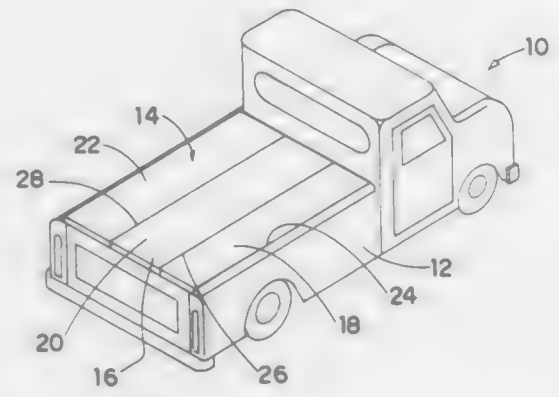
1. Swivel bearing for a vehicle sun visor, which sun visor can be swivelled about a vertical axis of the vehicle into a covering position oriented approximately horizontally in its longitudinal extension, in front of either a front or a side window, which bearing has a curved bearing rod which is accommodated in a sun visor body of the sun visor and is swivellably mounted in a bearing bracket fixed to a vehicle windscreen frame extending transversely about a front vehicle window, wherein the bearing bracket exhibits a hollow space open towards the vehicle interior, said bearing bracket being fixable in recessed fashion in a recess of the windscreen frame, and wherein the hollow space of the bearing bracket is covered by a covering part mounted at the bearing bracket, said covering part having a slot-shaped swivel opening for the curved bearing rod.

5,011,214

TRUCK BOX COVER

Randolph K. Friesen, 702-351 Saguenay Drive, Saskatoon, Saskatchewan, Canada S7K 5T4 , and J. David A. Wight, General Delivery, Hughenden, Alberta, Canada T0B 2E0

Filed Jun. 25, 1990, Ser. No. 543,097
Int. Cl.[5] B60P 3/32
U.S. Cl. 296—100 21 Claims



1. In combination with a truck box having parallel side walls and an open top therebetween, a cover for the open top of the box, said cover comprising:

a panel including plurality of panel segments hinged together side by side for folding of the panel segments about parallel hinge axes between an extended condition with the panel segments arranged side by side and substantially coplanar and a folded condition with the panel segments arranged face to face;

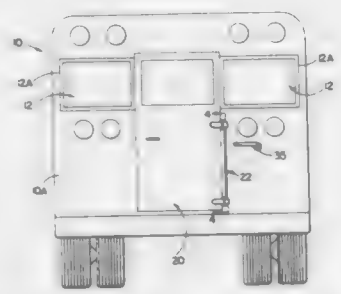
mounting means mounting an edge of the panel on one side

of the truck box for pivotal movement about a mounting axis parallel to the hinge axes;

linkage means connecting the panel segments for causing simultaneously movement of the panel segment between the extended and folded conditions; and

support means supporting the panel above the open top of the box such that in the extended condition the panel closes the open top of the box and in the folded condition the panel segments are arranged along said one side of the truck box in an upright orientation.

5,011,215



ESCAPE DOOR SYSTEM

Benjamin F. Kalina, Box 377, Bowman, N. Dak. 58623

Filed Jul. 20, 1990, Ser. No. 556,649

Int. Cl.[5] B60J *9/02*

U.S. Cl. 296—146 **19 Claims**

1. An escape door system for a bus having an upright wall member with an escape opening therein, wherein said door system comprises:

(a) an escape door having first and second opposite side edges; wherein said door encloses said escape opening;

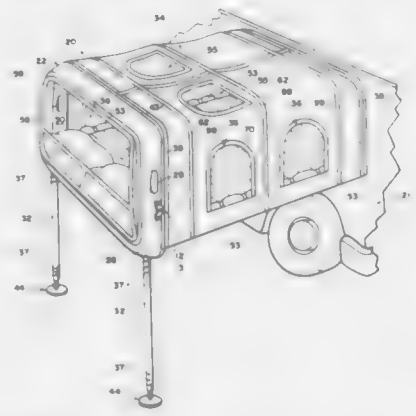
(b) at least one aperture in said wall member adjacent said escape opening;

(c) at least one tab member carried by said first side edge of said door, wherein said tab member includes first and second opposite side edges, wherein said first side edge of said tab member is hingedly connected to said first side edge of said door; wherein said second side edge of said tab member projects through said aperture;

(d) retention means interiorly of said bus for retaining said tab member in said aperture; wherein said retention means is movable between a first position in which said tab member is locked in said aperture, and a second position in which said tab member is unlocked;

wherein said escape door can be separated from said wall member when said tab member is unlocked.

5,011,216



EXPANDABLE SLEEPING COMPARTMENT FOR VEHICLES

Milo Baughman, 24 South 600 East, Salt Lake City, Utah [redacted]102

Filed Jun. 15, 1989, Ser. No. 3[redacted],553

Int. Cl.[5] B60P *3/39*

U.S. Cl. 296—164 **32 Claims**

1. In combination:

a vehicle comprising a side opening; and

a closure segment/sleeping compartment comprising:

housing means which in a closed position comprises means circumscribing the vehicle opening, means spanning across the vehicle side opening and means releasibly securing the housing means in the closed position against inadvertent relocation, the housing means further comprising means releasing the housing means from the closed position and means accommodating substantially rectilinear generally horizontal displacement of the released housing means from said closed position to an open position above a ground location;

vertical support means selectively interposable between the housing means when in the open position and the ground location; and

canopy means comprises substantially rectilinearly displaceable sheet means interposed between the vehicle adjacent to the opening and the housing means to define a tent-like structure in the open position and which collapses in a folded pattern between the vehicle and the housing means in the closed position, the canopy means further comprising substantially rectilinearly foldable base means upon which sleep-accommodating means is supported in generally horizontal relation.

5,011,217

UNIFIED FRAME/BODY ASSEMBLY FOR VEHICLE

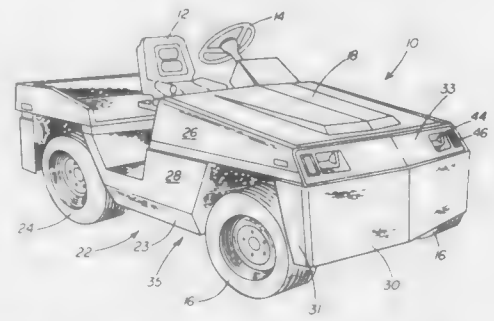
Clark C. Simpson, Martin, Mich., and Paul C. Weirs, Lexington, Ky., assignors to Clark Equipment Company, South Bend, Ind.

Filed Feb. 27, 1990, Ser. No. 489,735

Continuation of Ser. No. 244,288, Sep. 15, 1988, abandoned.

Int. Cl.[5] B62D *23/00;* **B60R** *11/24*

U.S. Cl. 296—203 **13 Claims**



1. A unified frame/body assembly for supporting the weight of a vehicle with suspension means and connected to ground engaging wheels, comprising:

a reinforced center body section;

flexible suspension means;

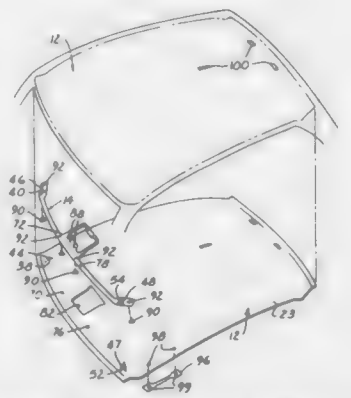
a bumper member;

means for mounting the flexible suspension means to said body section, both said reinforced center body section and said mounting means having a forward terminus spaced from said bumper member;

means for connecting said flexible suspension means to said bumper member so that said flexible suspension means extends directly between and bridges said mounting means of said body section and said bumper member; and

quarter panel means and hood means structurally bridging between said body section and said bumper member.

5,011,218



HEADLINER

Edward L. Danner, Warren, and Alan D. Picken, Pontiac, both of Mich., assignors to Van Dresser Corporation, Troy, Mich.

Filed Jan. 17, 1989, Ser. No. 297,492

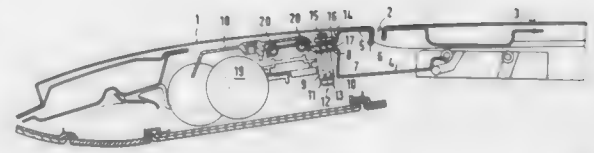
Int. Cl.[5] B60J *7/00*

U.S. Cl. 296—214 **9 Claims**

1. A headliner and retainer assembly adapted to be installed in a vehicle adjacent the roof thereof, said assembly comprising a headliner panel, headliner accessory components, and an elongated retainer bar, said retainer bar extending along one edge portion of said headliner panel on the side thereof which, when said assembly is installed, faces the roof of the vehicle, said components being disposed on the opposite side of said headliner panel and secured to said retainer bar by fasteners extending through said headliner panel to provide a sandwich assembly which is capable of being installed as a unit in the vehicle, and means for securing said retainer bar to the roof structure of the vehicle.

5,011,219

SLIDING RAISABLE ROOF OF FLAT CONSTRUCTION FOR MOTOR VEHICLES



Karl Bauhof, Weinsberg, Fed. Rep. of Germany, assignor to Karosseriewerke Weinsberg GmbH, Weinsberg, Fed. Rep. of Germany

Continuation-in-part of Ser. No. 274,202, Nov. 21, 1988, abandoned. This application Jun. 5, 1990, Ser. No. 534,312

Claims priority, application Fed. Rep. of Germany, Nov. 21, 1987, 8715439[U]

Int. Cl.[5] B60J *7/05, 7/053*

U.S. Cl. 296—221 **4 Claims**

1. A raisable sliding roof for a motor vehicle roof with a cutout therein, comprising:

a roof reinforcement disposed on the vehicle roof so as to peripherally surround the roof cutout;

a slidable rigid cover having a front end and a rear end, and which is slidable into a closed position in which the roof cutout is covered, said cover being selectively displaceable into an opening position, in which said cover is released from the roof cutout, and a ventilation position in which the rear end of the cover is raised relative to the roof so as to allow ventilation;

a casing having two halves hinged together so as to be articulated about an axis transverse to the sliding direction of said cover, the casing halves each having outer ends;

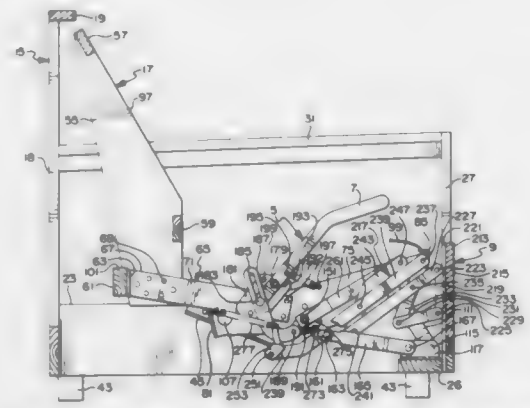
elastic joints provided so as to connect the outer end of each of the casing halves to the vehicle roof so that the casing halves are each pivotable at their outer ends about an axis transverse to the cover sliding direction;

lifting and lowering means supported at the vehicle roof for swiveling the casing halves so that the casing is shifted from a substantially horizontally normal position into a downwardly bent position relative to the vehicle roof;

guide rails provided in said casing;

sliding shoes provided in said guide rails and connected to said cover so as to support the front end of said cover;

additional sliding shoes provided in said guide rails, and supporting arms having one end hinged to said additional sliding shoes and another end attached to said cover so as to support the rear end of said cover;

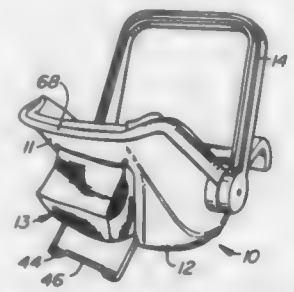


blocks of resilient elastic material and pressure springs arranged so as to support at least one of the casing halves at a horizontal extension region of the roof reinforcement at least partially surrounding the roof opening;

a strip-shaped angle beam which is outwardly directed relative to the roof cutout, and is connected horizontally to an upper edge area of a front wall of said at least one casing half so that said beam and said at least one casing half rest against said blocks of resilient elastic material;

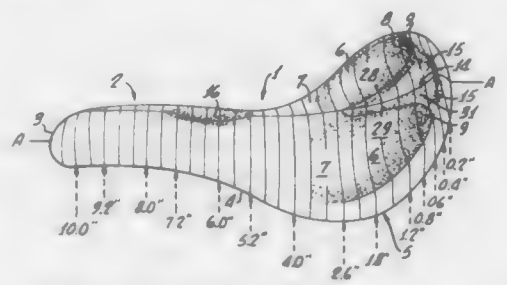
a plurality of screw bolts including one bolt passing through each block so that the block abuts a head of the screw bolt; and

a nut and one of said pressure springs being arranged on each of said plurality of bolts at an end opposite said head so as to support said bolt, said nut and spring being on an upper side of the roof reinforcement relative to the vehicle roof.



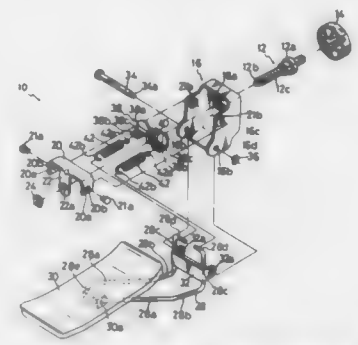
5,011,220
CHAIR MECHANISM
Larry P. LaPointe, Temperance, Mich., assignor to La-Z-Boy Chair Company, Monroe, Mich.
Continuation of Ser. No. 220,558, Jul. 18, 1988. This application Aug. 16, 1990, Ser. No. 568,631
Int. Cl.[5] A47C *1/02*
U.S. Cl. 297—89 **16 Claims**

1. A chair comprising a base, a seat and back frame, support means movably mounting the frame on the base for translatory movement between an upright first position and a recline second position, a transverse shaft mounted at opposite ends on opposite sides of the frame for angular movement in a first direction and for angular movement in a second direction opposite to the first direction and for translatory movement with the frame, connection means connecting the shaft to the base so that said shaft moves in the first direction when said frame moves from the upright first position to the recline second position and said shaft moves in its second direction when said frame moves from the recline second position to the upright first position, said connection means including frame positioning means for holding the frame in the upright first and recline second positions, a leg rest assembly mounted on the frame for movement between a retracted first position and an extended second position, said leg rest assembly being supported on said frame and connected to said shaft so that movement of the shaft in its first direction moves the leg rest assembly from its retracted first to its extended second position, said leg rest assembly being connected to said shaft so that movement of the leg rest assembly from its extended second position to its retracted first position moves said shaft in its second direction and in a translatory direction and thereby moves the frame from its recline second position to its upright first position.



5,011,221
BABY CARRIER
Robert D. Wise, Akron, Ohio, assignor to Century Products Company, Macedonia, Ohio
Continuation of Ser. No. 550,261, Nov. 8, 1983, Pat. No. 4,634,175. This application Jun. 20, 1986, Ser. No. 876,960
Int. Cl.[5] A47D *13/02*
U.S. Cl. 297—191 **10 Claims**

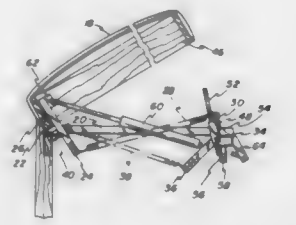
1. A shell type baby carrier comprising:
a shell type seat defining an inside area for holding a baby and including sides forming arm rests, a back, a foot and a head;
a pair of hub gears, one each on the outside of respective arm rests;
a U-shaped support having ends rotatably connected by said hub gears to said arm rests and lockable by said hub gears in a limited number of predetermined positions;
an underside of the seat forming a pair of integral rockers with floor contacting surfaces;
a pouch, having an access opening, sized to fit beneath the underside of the shell, below the head, and between the rockers; and



means for releasably securing said pouch to and against the underside of said seat with the access opening at the back of said seat to allow user access to the access opening from the back of the seat.

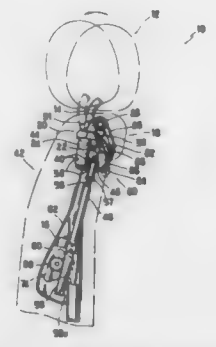
5,011,222
ORTHOTIC CYCLE SADDLE
Paul M. Yates, 1922 Waltonia Dr., Montrose, Calif. 91020; George R. Yates, 17591 Collins La., Huntington Beach, Calif. 92647, and George Yates, Jr., 151 Cumberland Rd., Glendale, Calif. 91202
Filed Jul. 11, 1989, Ser. No. 378,018
Int. Cl.[5] B62J *1/00*
U.S. Cl. 297—195 **11 Claims**

1. A cycle saddle comprising:
a shell having a single, compound upper seating surface, said seating surface including a forwardly disposed horn member having a generally horizontal upper surface and a rearwardly disposed laterally flaring cantle thrust plate member, the cantle thrust plate member including means, defining a pair of forwardly facing bilateral concavities matching the rise to near vertical portion of the right and left rear ischii of a rider when seated upon said shell, for providing bilateral anatomic support for the ruse to near vertical potion of the right and left ischium including corresponding musculature and tissue, said concavities rising above the generally horizontal upper horn surface;
means defining a forwardly projecting central coccyx support member raised above the generally horizontal upper horn surface, located between said forwardly facing raised bilateral concavities, for supporting the coccyx of the rider and preventing the forward facing concavities from intersecting the coccyx, said central coccyx support member comprises a substantially flat plane having an inclination in the range of about 25 degrees to about 45 degrees relative to said upper horn surface.



5,011,223
LUMBAR SUPPORT DEVICE FOR VEHICLE SEAT
Sakae Kato, Akishima, Japan, assignor to Tachi-S Co., Ltd., Tokyo, Japan
Filed Aug. 29, 1989, Ser. No. 399,809
Claims priority, application Japan, Jul. 11, 1988, 63-091035
Int. Cl.[5] A47C *3/00*
U.S. Cl. 297—284 **2 Claims**

1. A lumbar support device for a vehicle seat, comprising:
a support arm including a lumbar support plate which is rockable upon and end of said support arm;
a drive shaft which is free to be rotated by a handle fixed thereto; and
a spring means for biasing said support arm in a given direction, said spring means being disposed between said support arm and drive shaft such that said spring means is operatively connected with both said support arm and drive shaft,
whereby operation of said handle causes rotation of said drive shaft which in turns causes expansion and contraction of said spring means so as to adjust a biasing force of said support arm, thus adjusting a lumbar support force at said lumbar support plate; wherein
said drive shaft is formed with a male threaded portion, wherein there is provided a slider means which has a female threaded hole in which is threadedly engaged said male threaded portion of said drive shaft, such that said slider means is movable in a longitudinal direction of said drive shaft, and, wherein said spring means comprises a pair of tension springs which are disposed on opposite sides of and in symmetrical relation to said drive shaft; said spring means being provided between said slider means and support arm;
wherein a container-like bracket is fixed to a lower portion of a seat back frame of said seat, and
wherein said support arm is rotatably connected to a lower part of said bracket by means of a support pin, wherein a support bracket having a hole formed therein, in which one end of said drive shaft is rotatably secured, is fixed in an upper part of said bracket, and wherein said bracket has a hole through which the other end portion of said drive shaft is rotatably supported, in such a manner that said drive shaft is free to be rotated and prevented against movement in a longitudinal direction thereof.



5,011,224
ARISE-ASSIST CHAIR
Gerald S. Paul, 201 E. Westcott, Liberty, Ind.
Filed Nov. 20, 1989, Ser. No. 439,218
Int. Cl.[5] A47C *1/02*
U.S. Cl. 297—339 **15 Claims**

1. An assist chair for assisting a person in rising from a sitting to a standing position, the improvement comprising:
a frame,
a seat attached to said frame at a pivot point for pivotal movement upward and downward relative to said frame,
pivot means extending from a lower portion of said seat wherein said pivot means is attached to said seat in stationary relationship thereto,
attachment means supported by mounting means mounted to said frame, said attachment means defining an attachment point thereon and said attachment point on said attachment means being supported for movement toward and away from said pivot point and pivot means,
first biasing means connecting said pivot means and said attachment point on said attachment means for biasing said pivot means toward said attachment means and causing said seat to pivot upwardly,
second biasing means operatively connected to said attachment means and said frame for biasing said attachment point on said attachment means away from said pivot point and pivot means, and

said second biasing means allowing said attachment point on said attachment means to move toward said pivot point as said seat moves downwardly to assume a downwardly pivoted position, and said second biasing means causing said attachment point on said attachment means to move away from said pivot point as said seat moves upwardly to assume an upwardly pivoted position, such that said first biasing means applies a lesser biasing force when said seat is in a downwardly pivoted position and said first biasing means applies a greater biasing force when said seat is in an upwardly pivoted position than if said attachment point on said attachment means were in a fixed position relative to said pivot point and pivot means.

5,011,225
STRUCTURE OF A MOVABLE HEADREST
Akira Nemoto, Akishima, Japan, assignor to Tachi-S Co. Ltd., Tokyo, Japan
Filed Mar. 16, 1990, Ser. No. 495,272
Int. Cl.[5] A47C *7/36*
U.S. Cl. 297—408 **7 Claims**

1. A structure of a movable headrest, in which said headrest is connected upon a seat back of a seat and movable between a use position where it sits on top of the seat back for supporting the head of an occupant sitting on the seat and a non-use position where said headrest is located, permitting said occupant to attain a good field view without hindrance of said headrest, said structure comprising:
a removable headrest body having a pair of headrest stays which are attached atop said seat back;

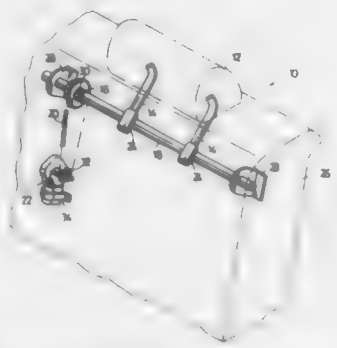
a shaft which is rotatably supported between a pair of spaced-apart support brackets in an upper area of said seat back;

a headrest stay holder in which each of said pair of headrest stays is received, each of said headrest stay holders being fixed to said shaft, and including a locking means for locking and unlocking said headrest stays, said locking means having a lock release means for placing said locking means in an unlocked state, to thereby release a locked state of said headrest stays against said holder;

a lock actuating means for selectively locking and unlocking said release means associated with said headrest stay holder; and

a headrest drive mechanism for causing rotational movement of said headrest body between said use position and non-use position, said mechanism being operatively connected with a drive means so as to impart a drive force to said shaft, thereby causing seat headrest body to rotate; and

a means for allowing removal of said headrest stays that allow removal of said headrest body from said top of said seat back,



whereby said headrest body is moved between said use and non-use positions through said headrest drive mechanism, and said headrest body is removable from said top of said seat back by operation of said means for actuating said lock release means associated with said headrest stay holder.

5,011,226

HEADREST

Tetsuo Ikeda, and Akira Nemoto, both of Akishima, Japan, assignors to Tachi-S Co., Ltd., Tokyo, Japan

Filed Jan. 5, 1990, Ser. No. 461,518
Int. Cl.[5] A47C *1/10*
U.S. Cl. 297—403 **3 Claims**

1. A headrest, which is provided on a seat back of a seat, comprising:

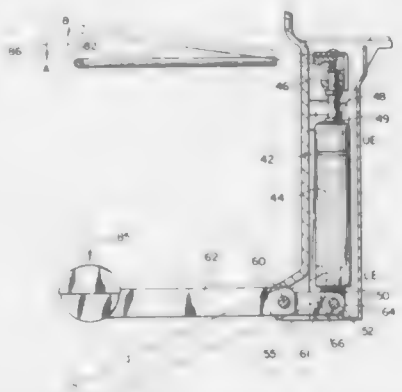
a pair of spaced support brackets fixed within said seat back;

a shaft which is rotatably extended between said pair of support brackets, said shaft being provided with a first sprocket;

a headrest body which is fixed via a stay to said shaft;

a motor fixed in said seat back, said motor being disposed at a lower part of a lateral side of said seat back and having a second sprocket; and

an endless chain extended between said first and second sprockets,



wherein an operation of said motor causes cyclic movement of said endless chain to rotate said shaft, thereby displacing said headrest body in a direction forwardly and backwardly relative to said seat back.

5,011,227

ADJUSTABLE FOOTREST FOR A CHAIR

Hendrik R. van Hekken, Allentown, and Thomas L. Latone, Quakertown, both of Pa., assignors to Knoll International, Inc., New York City, N.Y.

Filed Jan. 16, 1990, Ser. No. 465,341
Int. Cl.[5] A47C *7/50*
U.S. Cl. 297—434 **22 Claims**

1. An adjustable footrest mechanism for a chair having a base and a seat supported thereon, said footrest mechanism comprising:

an elongated housing;

means for securing said housing to the underside of said seat;

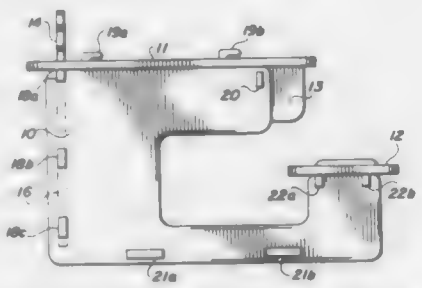
an elongated hydraulic gas cylinder having first and second ends, said cylinder being positioned within said housing;

a movable piston slidably mounted within said cylinder and emerging from said first end, said piston being mounted to said housing;

an elongated leg terminating at one end in a footrest and at the other end in a connection point;

means for pivotally mounting said elongated leg to said housing with said other end being positioned within said housing;

means for pivotally mounting said connection point to the second end of said cylinder; and



actuator means for operating said gas cylinder to permit movement of said cylinder relative to said piston thus altering the position of said footrest.

5,011,228

COLLAPSABLE/STACKABLE ARTICLE OF FURNITURE

Gerald Marcantel, 4708 S. Irving Ave., Tucson, Ariz. 85714

Filed Sep. 22, 1989, Ser. No. 411,318
Int. Cl.[5] A47C *4/00*; A47B *3/06*
U.S. Cl. 297—442 **10 Claims**

1. A portable shooting bench capable of being disassembled comprising:

(a) two side panels, each of said side panels having,

(1) a table support portion having a front edge, a top edge, and a rear edge, said front edge having at least two female attachment slots, said rear edge having at least one female attachment slot, and said top edge having at least two male extensions,

(2) a seat support portion having at last one male extension thereon along a top edge, and

(3) a bottom portion connecting a lower part of said table support portion and a lower part of said seat support portion and having, at least two female attachment slots therein;

(b) a seat panel having at least one female attachment slot at each end, each of said female attachment slots of said seat panel mating with one of said male extensions of said seat support portion of each side panel;

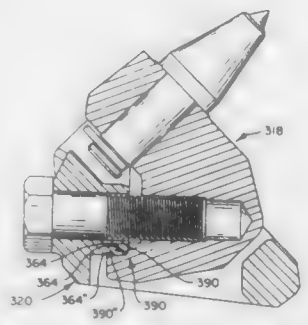
(c) a table top panel having at least two female attachment slots at each end, each of said female attachment slots of said table top panel mating with said male extensions of said top edges of said table support portion of each side panel;

(d) a front panel having at least two male extensions at each end, each of said male extensions of said front panel mating with one of said female attachment slots of the front edges of said table support portion of each side panel;

(e) a top support panel member having,

(1) at least two male extensions of each end mating with one of said female attachment slots of said rear edges of said table support portion of each side panel,

(2) at least four male extensions located along side edges of said top support panel member being mateable, in the disassembled state, to said at least two female attachment slots of said bottom portion of each side panel; and,



(f) a locking key formed from an elongated member having at least one locking mechanism along each side and for selectively securing at least one male extension of each of said side panels whereby in the disassembled state, the two side panels, the top support panel, and the locking key form an envelope for storage of the remaining panels.

5,011,229

MINER CUTTING BIT HOLDING APPARATUS

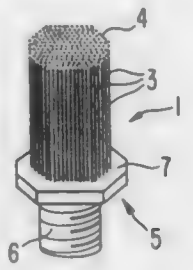
Michael L. O'Neill, Lucinda; Stephen P. Moore, Sandy Lake, and Eugene F. Pendolino, Franklin, all of Pa., assignors to Joy Technologies Inc., Pittsburgh, Pa.

Continuation-in-part of Ser. No. 269,381, Nov. 9, 1988, Pat. No. 4,915,455. This application Feb. 5, 1990, Ser. No. 475,063
Int. Cl.[5] E21C *35/18*
U.S. Cl. 299—91 **23 Claims**

1. Apparatus for supporting a cutting bit on a moveable cutting head at a predetermined cutting angle, said cutting bit having an extended shank and a central axis passing through said shank, comprising:

a. a bit holder having an upper body portion and a lower shank portion where said body portion includes an aperture for receiving said shank of said cutting bit for supporting said cutting bit at said predetermined cutting angle, and at least one rear upper first abutment surface disposed substantially perpendicular to the axis of said cutting bit, and said shank portion includes a rear lower second abutment surface having a substantially horizontal primary area;

b. a mounting base which may be attached to said cutting head, said mounting base having a cavity therein for receiving the shank portion of said bit holder, said mounting base having a rear member having at least one forward upper abutment surface disposed substantially perpendicular to the axis of said cutting bit and engaged by said at least one first abutment surface and a forward lower abutment surface having a substantially horizontal secondary area which is engaged by the horizontal primary area of said second abutment surface; and



c. means for urging said at least one first abutment surface into engagement with said at least one forward upper abutment surface of said mounting base and said horizontal primary area of said second abutment surface into engagement with said horizontal secondary area of said forward lower abutment surface of said mounting base.

5,011,230

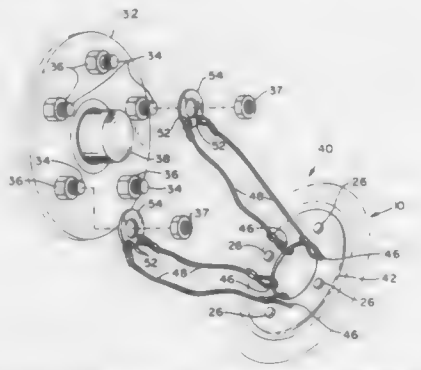
PROCESS FOR THE PRODUCTION OF BRUSHWARE

Georg Weihrauch, Waldmichelbach, Fed. Rep. of Germany, assignor to Coronet-Werke Heinrich Schlerf GmbH, Waldmichelbach, Fed. Rep. of Germany

Continuation of Ser. No. 823,648, Jan. 29, 1986, abandoned. This application Nov. 23, 1987, Ser. No. 123,887
Claims priority, application Fed. Rep. of Germany, Jan. 31, 1985, 3503223
Int. Cl.[5] A46D *3/00*
U.S. Cl. 300—21 **16 Claims**

1. A process for the production of brushware comprising a bristle carrier and at least one thermoplastic material bristle bundle fixed thereto, the method comprising the steps of melting ends of the at least one bristle bundle to form a solid attachment means, advancing the at least one bristle bundle in correspondence to a melt advance, shaping the melted ends of the bristle bundle into a bolt having at least a portion which has a greater size than free ends of the at least one bristle bundle, shaping a contour on the bolt for enabling fastening to the bristle carrier, and providing a corresponding contour in the bristle carrier.

5,011,231



CHEVROLET RALLY CAP KEEPER

David S. Weber, 141 Maple St., Lake Ronkonkoma, N.Y. 11779

Filed Aug. 22, 1990, Ser. No. 571,511
Int. Cl.[5] B60B *7/16*
U.S. Cl. 301—37 AT **6 Claims**

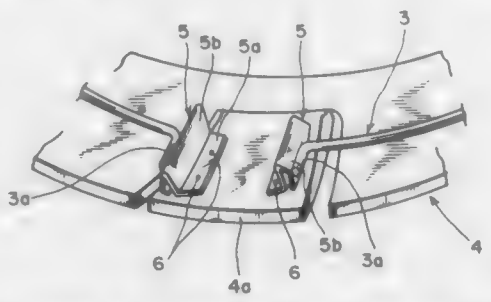
1. In combination with an automotive vehicle wheel, a rally cap having means for frictionally engaging said wheel to enclose the lug studs of said wheel, said rally cap constructed of at least two parts held together by threaded members, an anti-theft device comprising a ring, means in said ring for permitting all of said threaded members to attach said ring to said rally cap, a plurality of extended flexible members each attached at one end to said ring, and washer means to the other end of each of said flexible members for engagement with the lug studs of said wheel and retained by a second set of said nuts on said lug studs, said flexible members being of sufficient length to permit said second set of stud nuts to be removed to mount said washer means on said lug studs and mount said stud

nuts while said ring remains attached to said rally cap, permitting said rally cap to be mounted on said vehicle wheel com-

pletely enclosing and hiding said anti-theft device and effectively deterring the theft of said rally cap.

5,011,232

MOUNTING MECHANISM OF WHEEL CAP



Toshio Itoh, and Yasuhide Narita, both of Aichi, Japan, assignors to Kabushiki Kaisha Tokai Denki Seisakusho, Aichi, Japan

Filed Nov. 1, 1989, Ser. No. 430,155

Claims priority, application Japan, Nov. 4, 1988, 63-144493[U]

Int. Cl.[5] B60B *7/06*

U.S. Cl. 301—37 P **4 Claims**

1. A mounting mechanism of a wheel cap comprising:

engaging claws arranged at specified portions of a rear surface of a wheel cap body of the cap;

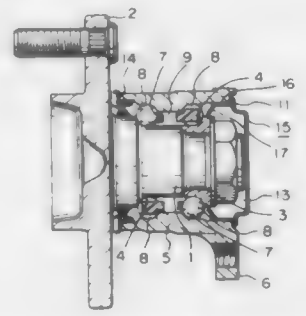
a flexible ring arranged on the rear surface of the body and on the inner side of each claw in a radial direction of the body for applying an urging force thereof on the inner surface of each claw while said ring contacts with the inner surface thereof under pressure, said claws being outwardly pressed in a radial direction of said ring by the urging force;

a closing lid for moving between a ring engaging position where said lid closes into engagement with free ends of said ring and a ring releasing position where said lid is away from the free ends of said ring; and

a projection arranged on a rear surface of said lid and contacting with free ends of said ring in the ring engaging position of said lid so that said projection maintains the urging force on said flexible ring in the engaging position whereby said claws engage with a hump portion of a disc wheel so that the cap is mounted on the disc wheel to be capable of being dismounted therefrom.

5,011,233

CAP FOR HUB UNIT AND HUB UNIT FOR AXLE OF AUTOMOBILE



Yasunori Nomura, and Naoki Mitsue, both of Kanagawa, Japan, assignors to Nippon Seiko Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 13, 1989, Ser. No. 435,866

Claims priority, application Japan, Nov. 18, 1988, 63-149650[U]; Jul. 20, 1989, 1-84519[U]

Int. Cl.[5] B60B *27/00, 7/00*

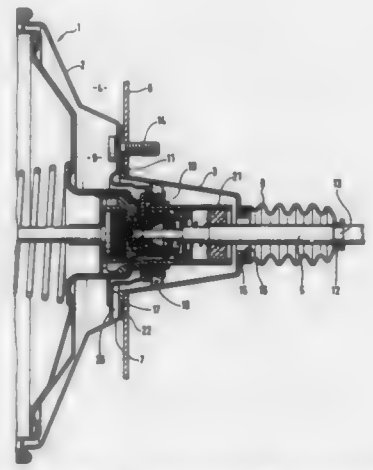
U.S. Cl. 301—108 R **4 Claims**

1. A cap for use in a hub unit including an inner ring member having an outer peripheral surface with an outward race way thereon, an outer ring member having an inner peripheral surface including an inward race way thereon, and a plurality of rolling elements disposed in between said outward and inward race ways, said cap being secured to the opening at one end of said outer ring member to close said opening, said cap having a secured forward portion engaging the inner peripheral surface of the outer ring member adjacent said opening at said one end of said outer ring member and a projecting wall integrally formed with said secured forward portion, said projecting wall extending from said secured forward portion inwardly toward said inner ring member and having a peripheral edge in close proximity to said inner ring member to prevent grease present in the space accommodating said rolling elements from moving toward said opening.

5,011,234

ARRANGEMENT FOR MOUNTING A BRAKE POWER BOOSTER

Gilbert Bischoff, Hattersheim; Karl Breitwieser, Reinheim, and Eckhard Emmel, Hungen, all of Fed. Rep. of Germany, assignors to Alfred Teves GmbH, Frankfurt Am Main, Fed. Rep. of Germany



Filed Jun. 16, 1989, Ser. No. 367,409

Claims priority, application Fed. Rep. of Germany, Jul. 4, 1988, 3822554

Int. Cl.[5] B60T *13/52*

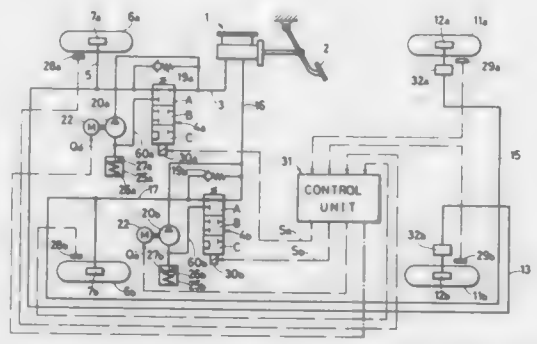
U.S. Cl. 303—4 **13 Claims**

1. An apparatus for mounting a brake power booster to a splash-board of a motor vehicle, which brake power booster is actuatable by means of an operating rod and is provided in a booster housing with at least an evacuatable first and a ventilatable second working chamber, said splash-board separating said motor vehicle's passenger compartment from a mounting compartment of the brake power booster, wherein the aeration of the second working chamber (9) is effected by way of an aeration compartment (10) communicating with the mounting compartment (4), said aeration compartment being confined by means of a protecting sleeve (3) at least partially surrounding one of the booster housing (2) and a control valve housing (21), said protecting sleeve being sealed both relative to the splash-board (6) and relative to the operating rod (5) wherein said protecting sleeve comprises a plastic material which engages said booster housing in snap-in relationship therewith and wherein said protecting sleeve and said operating rod are surrounded by a flexible bellows and wherein said protecting sleeve (3) is provided with a radial collar (11) clamped between

the booster housing and a cooperating member of the motor vehicle and including a sealing ring abutting the collar (11).

5,011,235

ANTI-SKID CONTROL APPARATUS FOR A VEHICLE BRAKING SYSTEM



Tetsuro Arikawa, Kanagawa, Japan, assignor to Nippon A B S, Ltd., Tokyo, Japan

Division of Ser. No. 212,517, Jun. 28, 1988, Pat. No. 4,979,784. This application Jul. 18, 1990, Ser. No. 555,172

Claims priority, application Japan, Jun. 30, 1987, 62-164376; Sep. 8, 1987, 62-225094

Int. Cl.[5] B60T *8/62*

U.S. Cl. 303—96 **7 Claims**

1. In an anti-skid control apparatus for a vehicle braking system including:

(A) a pair of front wheels and a pair of rear wheels which are diagonally connected with each other;

(B) wheel speed sensors associated with mid wheels, respectively;

(C) a first fluid pressure control valve device for controlling the brake fluid pressure of the wheel cylinder of one of said front wheels, arranged between a first fluid pressure generating chamber of a tandem master cylinder and said wheel cylinder of the one front wheel;

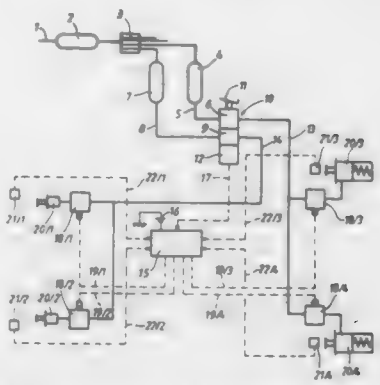
(D) a second fluid pressure control valve device for controlling the brake fluid pressure of the wheel cylinder of another of said front wheels, arranged between a second fluid pressure generating chamber of said tandem master cylinder and said wheel cylinder of the other front wheel; and

(E) a control unit receiving outputs of said wheel speed sensors for measuring the skid conditions of said front and rear wheels and for generating instructions for controlling said first and second fluid pressure control valve devices;

the improvement in which said control unit judges the skid condition of the one rear wheel on the larger one of the braking frictional coefficients of the sides of the road on which said wheels are running, on the basis of the acceleration condition and slip condition of said one rear wheel, while it judges the skid condition of the other rear wheel on the smaller one of the braking frictional coefficients of the sides of the road on which said wheels are running, only on the basis of the acceleration condition of said other rear wheel, and the braking pressures of said front and rear wheels of the respective conduit systems are controlled in a select-low manner.

5,011,236

PROCESS FOR CARRYING OUT A LOAD-DEPENDENT BRAKE REGULATION OF BRAKES ON A VEHICLE HAVING AN ANTI-LOCK SYSTEM



Bernhard Toepfer, Stuttgart, and Michael Reiner, Fellbach, both of Fed. Rep. of Germany, assignors to Daimler-Benz AG, Fed. Rep. of Germany

Filed Sep. 5, 1989, Ser. No. 402,538

Claims priority, application Fed. Rep. of Germany, Sep. 3, 1988, 3829951

Int. Cl.[5] B60T *8/60*

U.S. Cl. 303—100 **22 Claims**

1. Process for carrying out a load-dependent brake regulation of brakes on a commercial vehicle equipped with an electrically acting anti-lock system having an electronic central control and ABS brake valves adjacent the axle of the vehicle and possessing rotational-speed transmitters assigned to each brakeable wheel for providing instantaneous whee speed for an ABS control;

providing a load dependent regulation that is effective at a wheel brake pressure near a locking limit of the brakes; and

automatically regulating mid-axle brake-pressure distribution solely according to wheel-speed signals supplied by the rotational-speed transmitters, in a slip range below a range in which the ABS function takes effect;

wherein the automatic regulation of the brake-pressure distribution only occurs upon exceeding of a first predeterminable brake value in response to a correctable difference between mid-axle wheel speeds during braking.

5,011,237

ANTI-LOCK BRAKING SYSTEM

Michael F. Matouka, Utica, Mich.; Yudh V. Rajput, Xenia, Ohio; Paul D. Wilkey, Vandalia, Ohio, and James A. Bright, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich.

Filed May 17, 1989, Ser. No. 353,320

Int. Cl.[5] B60T *8/42*

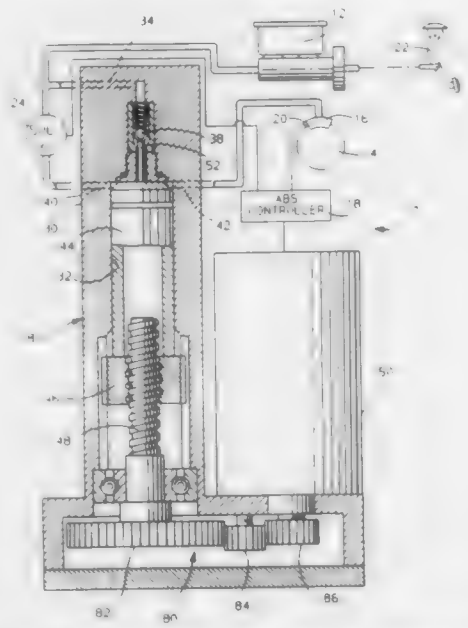
U.S. Cl. 303—115 **19 Claims**

1. A vehicle wheel anti-lock braking system (ABS) comprising:

master cylinder means for supplying pressurized fluid;

a wheel brake means receiving pressurized fluid from said master cylinder means and for restraining rotational movement of said wheel;

an ABS controller cognizant of the rotational condition of said wheel and providing a signal when the rotational condition of said wheel is within present parameters;



isolation means responsive to an activation signal given by said controller to prevent fluid communication between said master cylinder means and said wheel brake means;

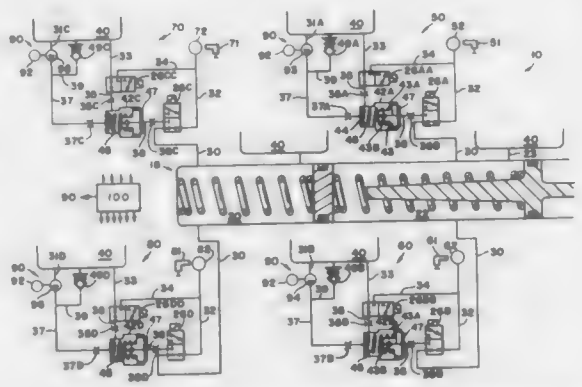
reversible motor means for powering said power screw, said motor means being responsive to signals given by said controller;

a non-rotative sleeve located between said power screw and said motor means in a fixed position, said sleeve having an inner diameter of a first value;

a coil spring having a free outer diameter of a second value generally equal to or greater than said first value, said coil spring being captured within said non-rotative sleeve, and said coil spring having a tang on each end;

a driver member with a torsion transfer portion projecting into said non-rotative sleeve, said driver member having a rotational axis, said driver member having an angular

position in correspondence with the angular position of said motor means, said driver member having first and second contact surfaces for engagement with said spring tangs to cause said tangs to release and to allow said spring to have sliding movement within said non-rotative sleeve in both directions;



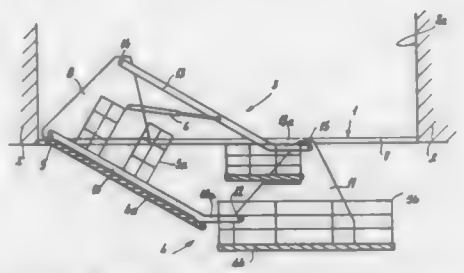
a driven member with an angular position in correspondence with the angular position of said power screw, said driven member having a rotational axis generally coterminous with said rotational axis of said river member and said driven member having projecting into said sleeve a torsion transfer portion for making contact with said driver member torsion transfer portion for transferring torque from said driver member to said power screw, said driven member having at least one contact surface for making contact on said spring tang on the opposite side of said spring tang said driver contact surface makes contact on to cause said spring to radially expand and lock within said sleeve to prevent torque from said power screw being transferred to said motor means when said piston is moving away from a position more adjacent to said means of fluid communication of said actuator frame bore with said wheel brake means by fluid pressure within bore.

5,011,238

MASTER CYLINDER WITH INTEGRATED ADAPTIVE BRAKING AND TRACTION CONTROL SYSTEM

Arthur K. Brown, Jr., South Bend, Ind., assignor to Allied-Signal Inc., Morristown, N.J.

Filed Mar. 19, 1990, Ser. No. 497,954
Int. Cl.[5] B60T *8/32*
U.S. Cl. 303—116 **22 Claims**



1. An integrated adaptive braking and traction control system assembly, comprising an elongated body having a mounting end and an axial bore extending from said mounting end, a master cylinder assembly operatively disposed in said bore, reservoir means communicating with said master cylinder assembly, pump means disposed adjacent the mounting end to communicate pressure toward wheel brakes of an associated vehicle, the elongated body including a plurality of valve devices of the adaptive braking and traction control system assembly, a plurality of displacement chambers with displacement pistons disposed therein, and a plurality of passages connecting together the valve devices, the master cylinder assembly with the wheel brakes via certain ones of the valve devices, the pump means with the displacement chambers, and the reservoir means with the master cylinder assembly, to provide the integrated adaptive braking and traction control system assembly for mounting on a vehicle.

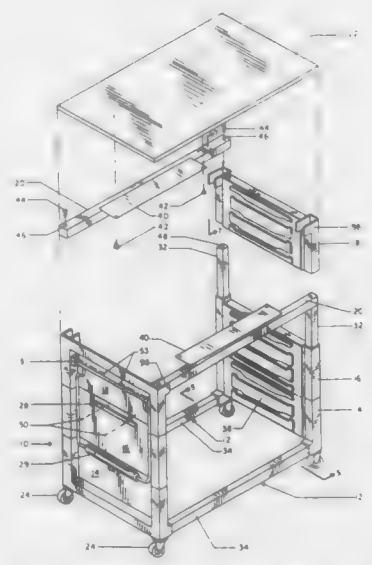
5,011,239

DEVICE FOR SUSPENDED STORAGE

Georges Guërin, Laplume, France, assignor to Sogal Industrie Franchise Industrielle Societe Anonyme S.I.F.I.S.A., Laplume, France

Filed Jan. 9, 1990, Ser. No. 462,703
Claims priority, application France, Jan. 12, 1989, 89 00837
Int. Cl.[5] A47B *67/02*
U.S. Cl. 312—248 **10 Claims**

1. A storage device comprising:



a horizontal supporting structure delimiting an opening; and at least one storage unit accommodated in the opening, said at least one storage unit articulated on the supporting structure capable of pivoting between two positions, a closed position in which the storage unit is integrated into a storage space and covers the opening and an open position in which the inside of the storage unit is accessible to the user, each said storage unit further comprising a quadrilateral four-bar linkage suspension system formed by a first and a second elongated parallel suspension link attached on each of opposite sides of the supporting structure, said first and second suspension links on each side of the supporting structure are pivotally attached at one end, said first suspension link above said second suspension link, to be offset and articulated about a horizontal axis, each said first and second suspension link articulated on an opposite end about a horizontal axis where pivotally attached on the storage unit, wherein the storage unit further comprises a closure panel consisting of at least two parts which abut in the closed position to horizontally cover over the opening in the supporting structure and permit storage on an inner side of said parts of said closure panel as defined when in the closed position, a first part of said closure panel associated with said second suspension link of the quadrilateral four-bar linkage pivotally attached on each side of said supporting structure and a second part of said closure panel associated with an element to which the opposite ends of said first and second suspension links are pivotally attached to complete the quadrilateral four-bar linkage, a side of the two parts of the closure panel facing into the opening in the closed position being accessible to the user in the open position, and return means for the closure panel that cooperates with the quadrilateral four-bar linkage to return the closure panel to its closed position and to brake its downward opening.

SEGMENTED SIDE WALL CART

James O. Kelley, Spring Lake, and Steven F. Goodman, Wyoming, both of Mich., assignors to Milcare, Inc., Zeeland, Mich.

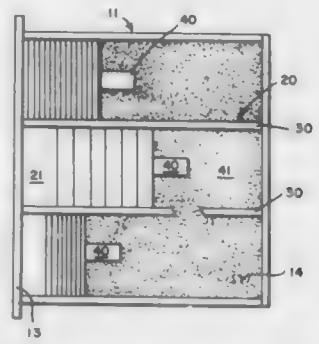
Filed Nov. 28, 1989, Ser. No. 442,188
Int. Cl.[5] A47B *91/00*
U.S. Cl. 312—250 **18 Claims**

1. A utility cart having a front, back, side, top, bottom and comprising a housing having a pair of U-shaped frames spanning the front and back portions of said cart, each of said U-shaped frames having a pair of upright legs joined by a bottom bight portion;

at least two side wall segments forming opposite sides of said cart, each of said side wall segments having frame receiving means at side edges thereof and shaped to receive the -legs-.of the U-shaped frame member;

said at least two side wall segments being spaced apart by said U-shaped frames with said legs of said U-shaped frames being retained by said receiving means;

means connecting the upper portions of said upright legs of each of said U-shaped-frame members together; and



a plurality of drawers or trays slidably mounted to said side wall segments.

5,011,241

ADJUSTABLE STORAGE SYSTEM FOR AUDIO AND/OR VIDEO MEDIA

James M. Horton, 287 S. Clarkson Str., Denver, Colo. 80209, and Eric L. Bunge, 300 E. 17th Ave., Number 1422, Denver, Colo. 80203

Filed Jan. 17, 1989, Ser. No. 298,110
Int. Cl.[5] A47B *88/00*
U.S. Cl. 312—330.1 **3 Claims**

1. An adjustable storage system for storing audio and/or video media for use with a cabinet which has at least one drawer with a bottom wall a front wall and a back wall wherein audio and/or video media of different heights, different widths and different thicknesses are arranged in a plurality of rows on the bottom wall of the drawer each of the rows extending from the front wall to the back wall, said adjustable storage system for storing audio and/or video media comprising:

a. a plurality of stops, each of which has a bottom surface and a front surface which is at an angle of slightly more than ninety degrees to said bottom surface and the top edge of which contacts the rear wall of the last of the audio and/or video media in each row;

b. stop coupling means for detachably coupling one of said plurality of stops to the bottom wall of the drawer whereby said adjustable storage system for storing audio-/or visual media may be adjusted to store additional audio and/or video media in each row by moving one of said plurality of stops;

c. a plurality of dividers, each of which has a bottom surface, each of said plurality of dividers being disposed between two rows of the audio and/or video media; and

d. divider coupling means for detachably coupling each of said plurality of dividers to the bottom wall of each drawer whereby said adjustable storage system for storing audio and/or visual media may be adjusted to store wider audio and/or video media in each row by moving one of said plurality of dividers.

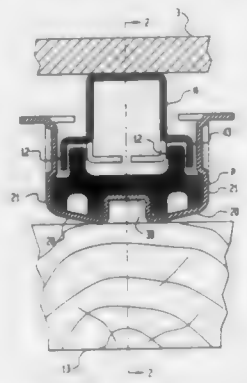
DRAWER GUIDE ASSEMBLY

Peter A. Cosme, R.R. 7-Box 319, Lockport, Ill. 60441

Filed Feb. 3, 1987, Ser. No. 10,545
Int. Cl.[5] A47B *88/00*
U.S. Cl. 312—344.1 **16 Claims**



1. A prefabricated metal drawer-slide assembly for mounting in a cavity of a furniture unit, comprising:

(a) a female channel-shaped guide member terminating in ends on a common level, said member adapted to be mounted in said cavity and to extend between front and

back sides of the furniture unit, for guiding a complementary male component affixed to a bottom side of a slideable drawer adapted for reciprocally movement in said cavity,

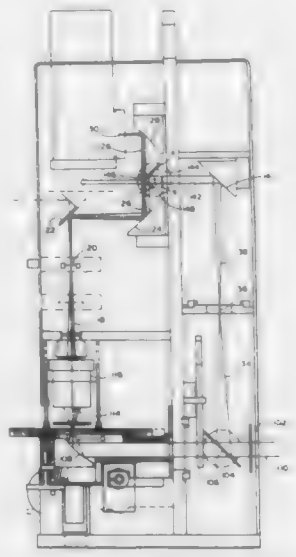
(b) an elevated reinforcing rib extending along the major length of a bottom side of said female guide member between said ends,

(c) downwardly sloping terminal portions extending from opposite ends of said elevated rib for mergence with said

opposite ends, each of said terminal portions being inclined slightly to the horizontal and provided with a screw opening adapted to accommodate an attachment screw for affixing said female guide member to frame elements of said furniture unit on a common level, said screws adapted to extend at a slight angle to the vertical and sufficient to clear a driving tool of the screw from the frame elements of the furniture unit irrespective of any vertical spacing between the frame elements.

5,011,243

REFLECTANCE INFRARED MICROSCOPE HAVING HIGH RADIATION THROUGHPUT



Walter M. Doyle, Laguna Beach, and Norman S. Hughes, San Clemente, both of Calif., assignors to Laser Precision Corporation, Irvine, Calif.

Filed Sep. 16, 1986, Ser. No. [illegible]7,995

The portion of the term of this patent subsequent to Aug. 1, 2006, has been disclaimed.

Int. Cl.[5] G02B *21/06, 21/18*; G01N *21/00*

U.S. Cl. 350—1.2 **11 Claims**

1. In an optical instrument having a sample supported in the instrument, a fully-reflecting objective, means for observing visible radiation at the sample location, a detector of infrared radiation, and means for causing a post-interferometer infrared radiation beam to enter the instrument, an infrared optical system combining transmission mode and reflectance mode functions, comprising:

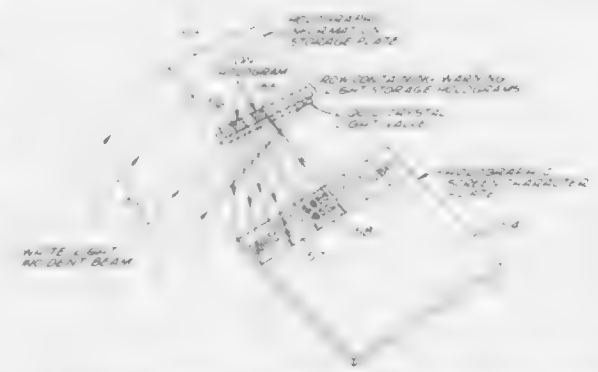
transmission mode means for directing the post-interferometer radiation beam into and completely through the objective from one direction for transmission illumination of the sample;

reflectance mode means for directing the post-interferometer infrared radiation beam into and completely through the objective from the opposite direction for reflectance illumination of the sample;

the reflectance mode means including a beamsplitter which (a) incorporates a fully reflecting mirror, (b) is located at a distance from the objective, and (c) causes approximately half of the interferometer infrared radiation beam to pass through the objective to be reflected by the sample; and

means for directing substantially an entire sample-reflected radiation to the detector.

5,011,244



HOLOGRAPHIC FULL COLOR DATA RETRIEVAL AND PROJECTION SYSTEM

Ronald T. Smith, Redondo Beach, and Ronald G. Hegg, Inglewood, both of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Dec. 16, 1988, Ser. No. 285,898

Int. Cl.[5] G03H *1/26*

U.S. Cl. 350—3.75 **6 Claims**

1. A holographic data retrieval and projection system comprising: a low-power light source means for producing a collimated beam of white light; at least one reflective holographic information storage plate including a plurality of holographic elements wherein each of said elements diffracts incident light over a predetermined, desired spectral bandwidth; and a holographic screen character plate comprising a plurality of reflective screen character holograms in predetermined, desired shapes and sizes, each screen character hologram being adapted to diffract light lying within a wavelength band which includes the incident light thereon in a uniform well-defined bundle of diffuse light directed toward a viewer, each screen character hologram being tuned to diffract a predetermined, desired color of light, and to transmit all other light colors incident thereon, said information storage plate and said screen character storage plate being spaced from one another and oriented so that the various light colors diffracted from said information storage plate strike predetermined, desired screen character hologram locations on said screen character storage plate.

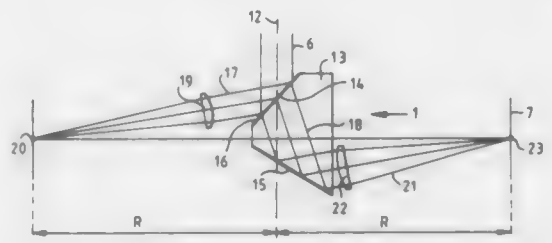
RADIATION SCANNING APPARATUS



Ronald Gibbs, Bedfordshire, United Kingdom, assignor to Crosfield Electronics Limited, London, England

Filed Jul. 21, 1989, Ser. No. 382,931

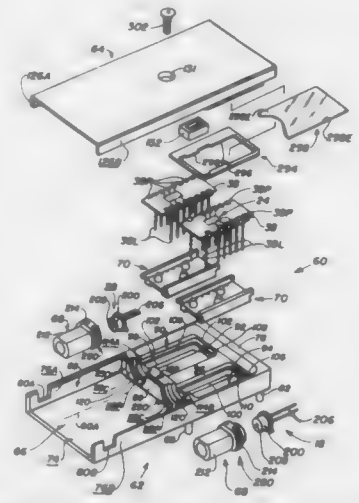
Claims priority, application United Kingdom, Aug. 5, 1988, 8818661

Int. Cl.[5] G02B *26/10*

U.S. Cl. 350—6.5 **5 Claims**

1. Radiation scanning apparatus comprising a record medium support; and a rotatably mounted scanning device on which a modulated radiation beam is incident, wherein device splits said incident beam into at least first and second subsidiary beams which scan in turn across a record medium on said support during relative rotation between said scanning device and said support, each said subsidiary beam exposing a respective scan line on said record medium in accordance with the beam modulation, and wherein the support and said device are relatively movable such that the scan lines are offset in the direction of relative movement.

5,011,246



HOUSING FOR AN OPTO-ELECTRONIC DEVICE

Anthony A. Corradetti, Brookhaven, Pa.; Edward P. Gargiulo, Wilmington, Del.; Leland L. Krauss, Glenmoor, Pa., and Robert W. Hooley, Ipswich, England, assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation of Ser. No. 354,530, May 19, 1989, abandoned. This application Jun. 29, 1990, Ser. No. 544,794

Int. Cl.[5] G02B *6/42*

U.S. Cl. 350—96.2 **38 Claims**

1. A housing for interconnecting an opto-electronic device with a ferrule having an optical fiber extending therethrough so that a point on the ferrule and a point on the device lie within a predetermined distance of each other along a common axis, the housing having an axis therethrough, the housing comprising:

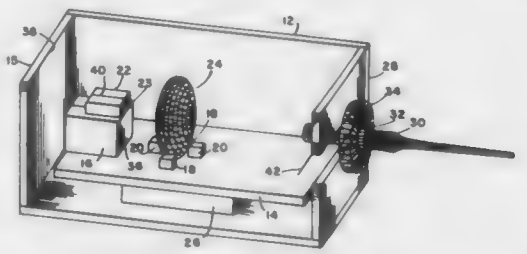
a base, a cover cooperable with the base to define a chamber,

a mounting member having a tip thereon and a bore therein, the bore having an axis therethrough, the mounting member extending into the chamber, the mounting member having a retainer for supporting an opto-electronic device in a predetermined position along the axis of the bore,

a pivot arrangement disposed on the mounting member and cooperating with at least one of the base or the cover for accommodating motion of the mounting member in response to a deflecting force imposed on the mounting member as a ferrule is introduced into the bore of the mounting member,

thereby to permit the axis of the mounting member to translate in two orthogonal directions in a plane perpendicular to the axis of the housing and to permit the mounting member to pivot to displace the tip of the mounting member in the two orthogonal directions in the plane perpendicular to the axis of the housing, so that the axis of the mounting member is alignable collinearly with the axis of the ferrule.

5,011,247



UPTAPERED SINGLE-MODE OPTICAL FIBER PACKAGE FOR OPTOLECTRONIC COMPONENTS

Robert A. Boudreau, Hampton, N.H., and William C. Rideout, Townsend, Mass., assignors to GTE Laboratories Incorporated, Waltham, Mass.

Filed Mar. 2, 1990, Ser. No. 487,497

Int. Cl.[5] G02B *6/42*

U.S. Cl. 350—96.2 **26 Claims**

1. A package for an optoelectronic semiconductor device having a photo-active element optically coupled to an uptapered single-mode optical fiber connecting said optoelectronic device to an external device, comprising:

a housing to enclose the necessary components to convert electrical signals to optical signals;

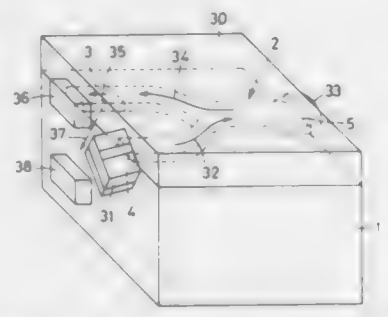
a substrate carrier having a solderable surface within said housing;

an optoelectronic device having an photo-active element secured to said substrate carrier;

a lens, having a numerical aperture sufficient to access optically said photo-active element secured to said carrier a fixed distance from said photo-active element to yield a desired magnification of a light beam emanating from said photo-active element by expanding the size of said beam;

an uptapered single-mode optical fiber extending from within said housing to the exterior of said housing through a port thereof, said optical fiber being positioned by active alignment;

means to secure said uptapered optical fiber to said housing such that the uptapered end of said optical fiber is optically coupled through said lens to said photo-active element and the opposite end of said optical fiber is outside said housing; and



a plurality of reference means on said housing and said carrier such that said optoelectronic device, said lens and said optical fiber are mechanically positioned with respect to one or more of said reference means; and such that uptapered said optical fiber is externally aligned and secured to said package.

5,011,248

THIN-FILM OPTICAL FUNCTION ELEMENT, AND OPTICAL HEAD USING THE SAME

Kazunari Taki, Nagoya, Japan, assignor to Brother Kogyo Kabushiki Kaisha, Japan

Division of Ser. No. 261,232, Oct. 24, 1988, Pat. No. 4,943,131.
This application May 16, 1990, Ser. No. 524,037
Claims priority, application Japan, Oct. 30, 1987, 62-277009
Int. Cl.[5] G02B *6/12*; G11B *5/127*
U.S. Cl. 350—96.11 **6 Claims**

1. An optical head for a magnetooptical disk, incorporating a thin-film optical function element comprising:

a substrate formed of a dielectric material;

a first optical waveguide consisting of a thin film of a dielectric material formed on said substrate, said first optical waveguide having a substantially same propagation constant with respect to two different modes which have field patterns whose vibrating directions are perpendicular to each other; and

a second optical waveguide consisting of another thin film of another dielectric material formed on said substrate, said second optical waveguide being optically coupled to said first optical waveguide, and guiding therethrough only one of said two different modes; and

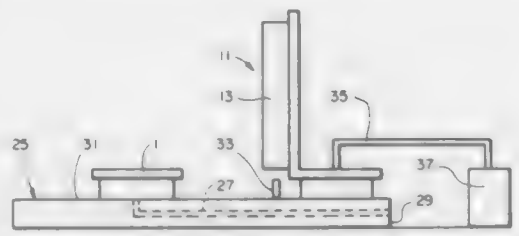
wherein said first optical waveguide comprises an Y-branching waveguide having a common path and two branch paths which merge with each other into said common path, and said second optical waveguide is coupled to one of said two branch paths of said Y-branching waveguide, said optical head comprising (a) a light emitting-element coupled to the other branch path of said Y-branching waveguide and operable to emit a linearly polarized light beam, (b) a converging lens coupled to said common path of said Y-branching waveguide, for converging said linearly polarized light beam which is guided through said first optical waveguide, and (c) at least one light-sensitive element each coupled to a corresponding one of said second optical waveguide and a portion of said substrate adjacent to said second optical waveguide.

5,011,249

CIRCUIT FOR THE TRANSMISSION OF OPTICAL SIGNALS

Stephen H. Diaz, Palo Alto, Calif., assignor to Raychem Corp., Menlo Park, Calif.

Filed Dec. 20, 1989, Ser. No. 454,099
Int. Cl.[5] G02B *6/12*
U.S. Cl. 350—96.11 **21 Claims**



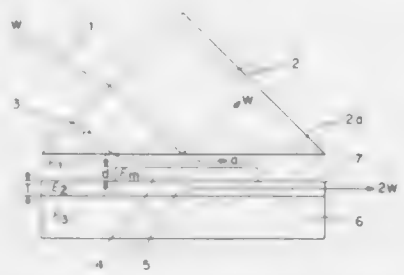
21. A circuit for the transmission of optical signals, comprising:

(a) a substrate;

(b) a waveguide through which an optical signal can pass when the circuit is in use;

(c) an optical component which includes an optically active device which is optically connected to the waveguide, the waveguide and the device being separated by a fluid which is transparent to the optical signal; and

(d) means by which the substrate and the component are mechanically interconnected, the interconnection means allowing the substrate and the device to move relative to one another, at least in the plane which extends perpendicular to the direction in which the signal passes between



the waveguide and the device, the interconnection means including at least one wire which extends between the substrate and the component.

OPTICAL HARMONIC GENERATOR

Yoshio Okada, Saitama, and Toshihiko Takano, Kashiwa, both of Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Filed Jun. 16, 1989, Ser. No. 367,128
Claims priority, application Japan, Jun. 16, 1988, 63-148529
Int. Cl.[5] G02F *1/37*
U.S. Cl. 350—96.12 **12 Claims**

5. A frequency conversion apparatus comprising a laser beam source;

an optical harmonic generator including an optical component for emitting light having a propagation constant greater than that of incident light;

a metal thin film in which a surface plasmon is excited by the light emitted from said optical component; and

a waveguide including a nonlinear optical thin film for emitting, from an end face thereof, light with a wavelength which is 1/N (N: integer equal to or larger than two) of the incident light, by the surface plasmon of said metal thin film;

wherein the thickness of said metal thin film and the depth of said waveguide are selected such that the propagation constant of said surface plasmon of said metal thin film is coincident with the propagation constant of the light having the 1/N wavelength with respect to the incident light wavelength and propagating through said waveguide.

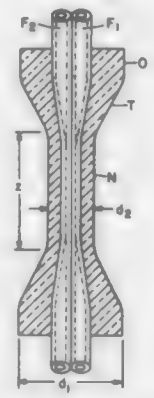
ACHROMATIC FIBER OPTIC COUPLER



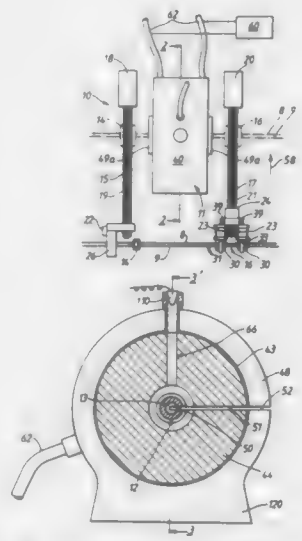
William J. Miller; Carlton M. Truesdale; David L. Weidman, and Donald R. Young, Jr., all of Corning, N.Y., assignors to Corning Incorporated, Corning, N.Y.

Filed Dec. 8, 1989, Ser. No. 447,808
Int. Cl.[5] G02B *6/26*
U.S. Cl. 350—96.15 **26 Claims**

1. An achromatic fiber optic coupler comprising

an elongated body of matrix glass having a refractive index n_3, said body having two opposed ends and a midregion,

a plurality of optical fibers extending longitudinally through said body, each of said fibers comprising a core of refractive index n_1 and a cladding of refractive index less than n_1 but greater than n_3, the refractive index n_2 of the cladding of a first of said fibers being different from the refractive index n_2' of the cladding of a second of said fibers by such an amount that the value of Δ_{clads} is greater than zero but less than 0.03%, wherein Δ_{clads} equals $(n_2^2-n_2'^2)/2n_2^2$,



said fibers being fused together along with the midregion of said matrix glass, the diameter of the central portion of said midregion and the diameters of said optical fibers in said central portion being smaller than the diameters thereof at the ends of said body, whereby a portion of an optical power propagating in one of said fibers couples to the other of said fibers.

FABRICATION OF FIBRE OPTIC COMPONENTS

David A. Thorncraft, Isabella Plains; David R. Kennedy, Kambah; Scott C. Rashleigh, Wanniassa, and Timothy P. Dabbs, Eastwood, all of Australia, assignors to The Commonwealth of Australia, Canberra, Australia

PCT No. PCT/AU87/00374, § 371 Date Sep. 12, 1988, § 102(e) Date Sep. 12, 1988, PCT Pub. No. WO88/03660, PCT Pub. Date May 19, 1988
PCT Filed Nov. 9, 1987, Ser. No. 258,697
Claims priority, application Australia, Nov. 14, 1986, PH8979/86
Int. Cl.[5] G02B *6/26*
U.S. Cl. 350—96.15 **24 Claims**

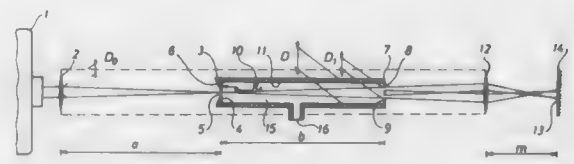
1. Apparatus for fabricating a fused biconical taper fibre optic coupler, comprising:

a hollow furnace having a longitudinal slot;

means to hold at least to suitably prepared optical fibres in intimate side-by-side contact;

means to relatively laterally move the fibres into and out of said furnace through said slot;

means to heat the furnace to in turn heat segments of the fibres therein while these segments are in intimate side-by-side contact to a temperature sufficient to cause the fibre segments to fuse together; and



means to longitudinally draw the heated fibres while in the hot furnace to cause each fused fibre to develop a biconical taper and so form a coupler.

OPTICAL SYSTEM FOR LASER MARKING

Flemming Olsen, 30, Nordskovvej, Stenlille DK-4295, Denmark

PCT No. PCT/DK88/00201, § 371 Date May 7, 1990, § 102(e) Date May 7, 1990, PCT Pub. No. WO89/05208, PCT Pub. Date Jun. 15, 1989
PCT Filed Dec. 2, 1988, Ser. No. 474,136
Claims priority, application Denmark, Dec. 8, 1987, 6447/87
Int. Cl.[5] G02B *6/32*
U.S. Cl. 350—96.18 **11 Claims**

1. An optical system for laser marking and comprising

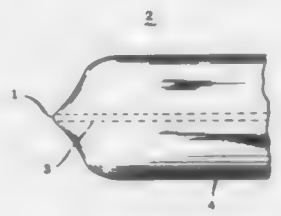
when seen in the direction of a light beam of a predetermined transverse measurement (D_0) and emitted by a laser (1)—a mask (7) including a mask pattern (8), and an image-producing means (12), such as a lens, and whereby the transverse measurement (D1) of the laser beam on the mask (7) is larger than the transverse measurement of the mask pattern (8), characterised in

that a focusing means (2), such as a lens, and a concave mirror (3) are situated between the laser (1) and the mask (7), the focusing means (2) being situated to focus the laser beam emitted by the laser (1) to have said transverse measurement (D1) on the mask (7) after focusing, the concave mirror (3) being situated with its vertex in the focal point of the focusing means (2) and with the reflecting surface (4) facing the mask (7), and where an inlet opening (5) is shaped about the vertex, the transverse measurement of said inlet opening being slightly larger than the transverse measurement of the focal point,

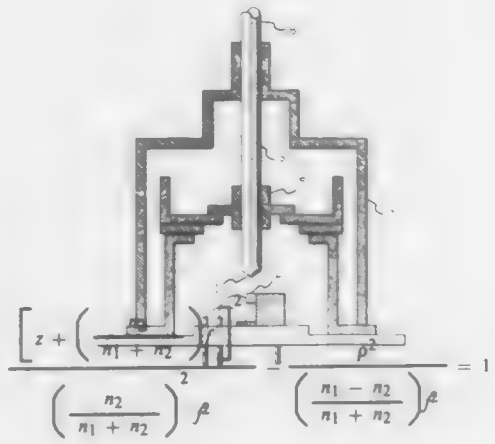
that the mask (7) is shaped as a mirror, preferably a plane mirror, with the reflecting surface (9) facing the concave mirror (3),

and that the radius of the curvature (R_4) of the concave mirror (3) is longer than twice the distance (b) between the mask (7) and the concave mirror (3).

5,011,254



COUPLING OF OPTICAL DEVICES TO OPTICAL FIBERS BY MEANS OF MICROLENSES



Christopher A. Edwards, Gilette, and Herman M. Presby, Highland Park, both of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Nov. 30, 1989, Ser. No. 444,578
Int. Cl.[5] G02B *6/42*
U.S. Cl. 350—96.18 **41 Claims**

1. An optical communication package comprising an optical device, an optical fiber and a microlens for improving coupling of optical power between the optical fiber and the optical device, in which said microlens lies within the boundaries of the fiber and has a contour shape selected so that light coupling losses arising from at least fiber truncation, mode mismatch and spherical aberration are substantially removed, the contour

shape of said microlens comprises substantially a hyperboloid of revolution which is described by the following expression:

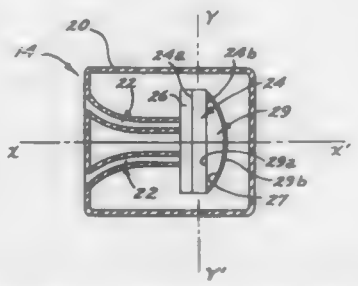
$$\left[z+\left(\frac{n_1}{n_1+n_2}\right)f\right]^2\Big/\left(\frac{n_2}{n_1+n_2}\right)^2 f^2 \;-\; \rho^2\Big/\left(\frac{n_1-n_2}{n_1+n_2}\right)^2 f^2 = 1$$

wherein z is a lens axial coordinate, n_1 and n_2 are each the index of refraction of the material of the lens and of the medium surrounding the lens, respectively, ρ is the axial coordinate and f is the focal distance of this lens defined by the following expression:

$$f=\frac{\pi\omega_0\omega_1{}^2}{\lambda\sqrt{\omega_1{}^2-\omega_0{}^2}}$$

wherein ω_0 is a mode radius of the optical device, ω_1 is a mode radius of the optical fiber and λ is a wavelength of the optical power being coupled.

5,011,255



HOLOGRAPHIC OPTICAL FIBER COUPLER

Terry P. Bowen, Etters, Pa., and John R. Rowlette, Clemmons, N.C., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Apr. 12, 1990, Ser. No. 508,884

Int. Cl.[5] G02B *6/34, 5/32*

U.S. Cl. 350—96.19 **52 Claims**

1. An optical fiber coupler for coupling first and second optical fibers, comprising:

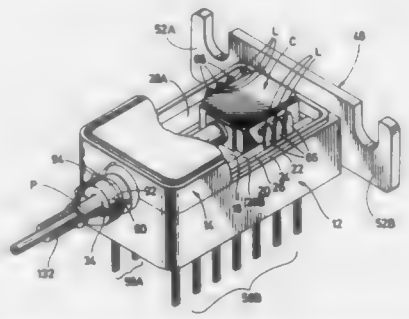
a housing; and

a holographic optical element (HOE) in said housing, said HOE having first and second faces and an optical axis;

said housing having first and second guide means therein, said first and second guide means being adapted to guide the ends of the first and second fibers, respectively, to contact said first face of said HOE, perpendicular thereto, and equidistant from said optical axis;

said HOE being adapted to couple optical energy from said first guide means to said second guide means and from said second guide means to said first guide means.

5,011,256



PACKAGE FOR AN OPTO-ELECTRONIC COMPONENT

Melvin H. Johnson, Chadds Ford; Leland L. Krauss, Aston, and Dirk Landman, Lancaster, all of Pa., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del.

Filed Oct. 28, 1988, Ser. No. 263,188

Int. Cl.[5] G02B *6/36*

U.S. Cl. 350—96.20 **34 Claims**

33. A package for an opto-electronic component comprising:

a base;

a sidewall on the base, the sidewall having an upper edge thereon, the edge being interrupted by a notch formed in the sidewall, an open cradle member mounted to the sidewall in proximity to and in communication with the notch therein;

a cover having a rim thereon, the rim of the cover being engageable with the upper edge of the sidewall, the rim of the cover being interrupted by an opening that registers with the notch in the edge of the sidewall, a cradle canopy mounted to the cover in proximity to and in communication with the opening therein;

a heat conducting member having a planar portion thereon, a portion of the base of the package being defined by the planar portion of the heat conducting member;

means for securing the cover to the base, the securing means comprising a bead mounted on each of the cover and the sidewall of the base, the beads being interengaged when the cover is received on the sidewall;

the cover, when received on the sidewall, cooperating with the sidewall and the base to define a generally enclosed component receiving chamber, the notch in the sidewall and the opening in the cover cooperating to define an access aperture, the chamber being accessible through the access aperture,

the cradle and the canopy cooperating with each other when the cover is mounted to the sidewall to define a tubular extension extending from the sidewall, the tubular extension being in communication with the chamber through the aperture defined by the registered opening and notch; and

an elastomeric boot connected to the tubular extension.

U.S. Cl. 350—96.21 **19 Claims**

1. In a method for the true alignment of two fiber ends, which includes illuminating the fiber ends to generate a picture of the fiber ends, and then scanning the picture with a sensor of a video camera, the improvements comprising the step of scanning includes scanning each of the fiber ends at least once transversely relative to the longitudinal axis to form a row, said step of illuminating being performed with the fiber ends acting as cylindrical lenses to create a maximum intensity for the center of the fibers, determining the intensity distribution separately for the imaging of each fiber end and determining the position of the respective longitudinal axis of the fiber and a mutual lateral offset between the fibers by using the intensity distribution and then adjusting the ends of the fiber based on the determined offset, said step of determining the intensity distribution including determining every row's discrete intensity values column-by-column and recording these values in a memory unit, said intensity distribution, wherein quantisized in columns and obtained for both fiber ends line-by-line, being made available for the evaluation for both fiber ends separately and in that from the difference in the columnwise position of the intensity distribution of the two fiber ends, the alignment error is determined and the post-adjustment of at least one fiber end for a true alignment is performed.

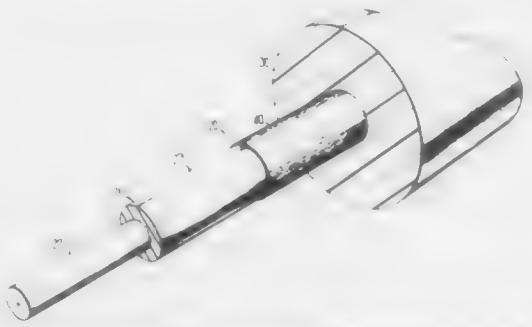
BUFFERED OPTICAL FIBER HAVING A STRIPPABLE BUFFER LAYER

M. Fred Marx, Dunwoody; Parry A. Moss, Stone Mountain; Mary J. Presnell, Atlanta; John W. Shea, Chamblee, all of Ga., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Jul. 26, 1989, Ser. No. 385,755

Int. Cl.[5] G02B *6/44;* B05B *5/00;* B05D *5/06;* B65H *69/02*



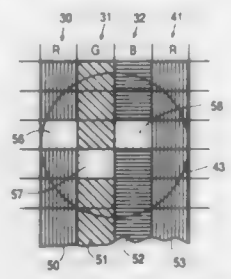
U.S. Cl. 350—96.23 **10 Claims**

1. A buffered optical fiber, which comprises:

an optical fiber which includes at least one layer of a coating material; and

a plastic buffering material which encloses said optical fiber, said buffering material having a controlled coupling to said at least one coating layer of said optical fiber such that said plastic buffering material has suitable adhesion to said

at least one coating layer during normal use but which is such as to allow removal of said plastic buffering material



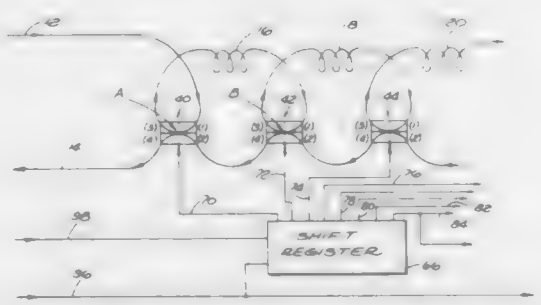
from said optical fiber upon the application of suitably low stripping forces.

5,011,261

COLOR PAGE SCANNER USING FIBER OPTIC BUNDLE AND A PHOTOSENSOR ARRAY

Eugene I. Gordon, Summit, N.J., assignor to Photon Imaging Corp., Edison, N.J.

Filed Apr. 17, 1989, Ser. No. 339,602
Int. Cl.[5] G02B *6/00, 6/06;* **H04N** *1/46*
U.S. Cl. 350—96.25 **18 Claims**



1. A color image scanner including a plurality of light pipes for transmitting an image from an entrance face to an exit face, an array of photosensors coupled to said exit face and including at least first, second, and third sensors for each fiber end in said exit face, a filter positioned between said exit face and said sensor array, said filter including a repetitive pattern of first, second, and third color areas corresponding to said first, second, and third sensors for each of said fiber ends.

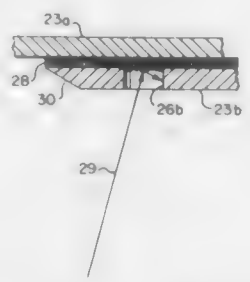
5,011,262

FIBER OPTIC SENSOR ARRAY

Michael R. Layton, Clayton, Calif., assignor to Litton Systems, Inc., Beverly Hills, Calif.

Filed Apr. 16, 1990, Ser. No. 509,236
Int. Cl.[5] G02B *6/02, 6/16*
U.S. Cl. 350—96.29 **7 Claims**

1. A fiber optic sensing array comprising, in combination:



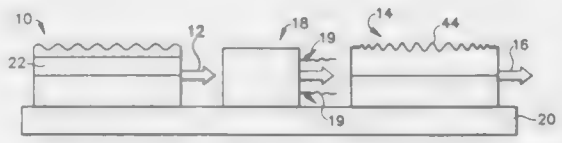
(a) a continuous optical fiber, said fiber being arranged into a sensor branch and a return bus;
(b) said sensor branch including a plurality of distinct fiber sensing coils;
(c) a plurality of switchable directional couplers, each of said couplers including a pair of input ports and a pair of output ports arranged so that communication is provided between said bus and said sensor branch;
(d) said sensor branch and said return bus being arranged so that a fiber segment of said sensor branch passes from an input port to an output port of each of said couplers and a fiber segment of said return bus passes from an input port to an output port of each of said couplers;
(e) means for selectively switching each of said couplers between an "on" state and an "off" state whereby, in said "off" state, light is not coupled between said sensor branch and said return bus segments of said optical fiber;
(f) means for applying a coherent optical pulse to said optical fiber;
(g) means for applying predetermined electrical signals to said couplers so that each coupler is switched to an "on" state prior to arrival of said pulse and switched to said "off" state after transit of said pulse therethrough; and
(h) means engaged to the termination of said optical fiber adjacent said return bus for receiving the optical output of said array.

5,011,263

PERFORATE PROJECTION SCREEN

Clayton L. Hopper, Canal Fulton, Ohio, assignor to Astro-Tec Manufacturing, Inc., Canal Fulton, Ohio

Filed May 11, 1990, Ser. No. 522,371
Int. Cl.[5] G03B *21/56*
U.S. Cl. 350—125 **12 Claims**



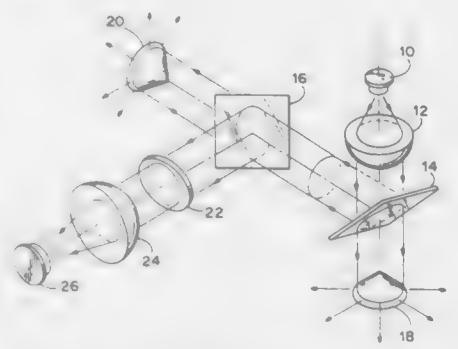
1. A perforate projection screen with substantially uniform reflectivity throughout its visible surface comprising:
(A) at least one perforate panel having:
(1) a light reflective surface on one side thereof, and
(2) a plurality of rows of holes therethrough located substantially throughout the entire reflective surface of each such panel,
(B) each such panel adapted to be mounted a spaced distance from a substantially non-reflective surface, thereby creating a substantially uniformly dark non-reflective chamber behind the panel; and
(C) a dark material covering the surfaces of any objects which are in sufficiently close proximity to the back of the panel to be visible through the holes in the panel without such covering, said dark material having a textured surface comprised of a plurality of dark fibers extending vertically from the surface thereof to reduce the surface reflectivity of all such objects so that they are not visible through the holes in the panel.

5,011,264

WIDE LINEAR DYNAMIC RANGE OPTICAL MODULATOR

Eric M. Bradley, San Diego, and Ronald F. Mathis, Ramona, both of Calif., assignors to General Dynamics Corp., Electronics Divn., San Diego, Calif.

Filed Dec. 28, 1989, Ser. No. 458,156
Int. Cl.[5] G02B *27/42;* **H01S** *3/10*
U.S. Cl. 350—162.24 **21 Claims**



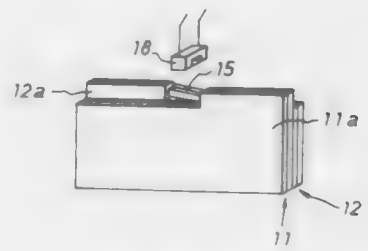
1. An apparatus for generating an amplitude modulated optical signal comprising:
signal generation means for generating an input optical signal at a wavelength;
tunable filter means, sharing a common optical axis with said signal generation means, for receiving said optical signal, said filter means responsive to an input control signal for varying the amplitude of said optical signal in a manner linear with said wavelength and for providing an output amplitude modulated optical signal; and
optical isolator means, located between and sharing said common optical axis with said signal generation means and said filter means, for preventing optical signals originating at said filter means traveling towards said signal generation means from impinging on said signal generation means.

5,011,265

OPTICAL ATTENUATOR

Hisashi Tamamura, and Shoji Sekiguchi, both of Tokyo, Japan, assignors to Sony/Tektronix Corporation, Tokyo, Japan

Filed Feb. 7, 1990, Ser. No. 476,833
Claims priority, application Japan, Oct. 6, 1989, 1-261763
Int. Cl.[5] B02B *27/14, 27/42*
U.S. Cl. 350—173 **6 Claims**



1. An optical attenuator comprising:
a first beam splitter for receiving an incident light beam from a light source at a predetermined angle of incidence to split the beam into a first reflected light beam and a first transmitted light beam;
a first deflecting means for deflecting the first transmitted light beam from said first beam splitter to cause the deflected light to be propagated in other than the incident direction of the first transmitted light beam;
a second beam splitter for receiving the first reflected light beam at said predetermined angle of incidence and in a plane of incidence perpendicular to the plane of incidence in which the first beam splitter receives the incident light, beam to split the first reflected light beam into a second reflected light beam and a second transmitted light beam; and
a second deflecting means for deflecting the second transmitted light beam from the second beam splitter to cause the deflected light to be propagated in other than the incident direction of the second transmitted light beam.

5,011,266

LIQUID CRYSTAL DISPLAY DEVICE

Takumi Suzuki, and Kiyohiro Uehara, both of Tokyo, Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

PCT No. PCT/JP88/00058, § 371 Date Sep. 22, 1988, § 102(e) Date Sep. 22, 1988
PCT Filed Jan. 26, 1988, Ser. No. 254,774
Claims priority, application Japan, Jan. 26, 1987, 62-9656; May 14, 1987, 62-72526; Jul. 28, 1987, 62-114663
Int. Cl.[5] G02F *1/133*
U.S. Cl. 350—335 **5 Claims**

1. A multi-layered liquid crystal display device, comprising:
liquid crystal display panels each including two sheets of polymer films kept apart from each other, and two transparent electrodes laminated respectively with inside surfaces of said respective polymer films, said inside surfaces facing each other;
two first electrode lead-out portions extending respectively together with said two transparent electrodes of one of said liquid crystal display panels in one identical direction outwardly from a display area of said one of said liquid crystal display panels;
two second electrode lead-out portions extending respectively together with said two transparent electrodes of the other of said liquid crystal display panels in one identical direction outwardly from a display area of said other of said liquid crystal panels;
an external circuit substrate inserted between said first electrode lead-out portions at one portion thereof and inserted between said second electrode lead-out portions at another portion thereof; and
a connector mounted on said external circuit substrate for connecting electrically said two transparent electrodes of the respective liquid crystal display panels with an external drive circuit through said external circuit substrate.

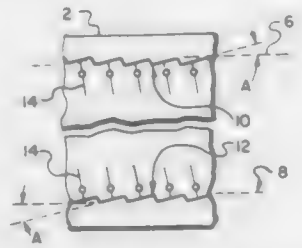
5,011,267

METHOD FOR TILTED ALIGNMENT OF LIQUID CRYSTALS WITH IMPROVED PHOTOSTABILITY

Leroy J. Miller, Canoga Park; Willis H. Smith, Jr., Newbury Park; Anna M. Lackner, Los Angeles, and J. David Margerum, Woodland Hills, all of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Oct. 14, 1986, Ser. No. 919,155
Int. Cl.[5] G02F *1/13*
U.S. Cl. 350—340 **11 Claims**

1. A method of preparing a liquid crystal cell having a pair of opposed surfaces and exhibiting an improved photostability and temperature insensitivity, comprising:
treating at least one surface of the opposed cell surfaces to provide generally aligned tilted surface microstructures



with free hydroxyl groups located thereon, said step of treating comprising:

a. depositing a first layer of SiO_x on said at least one surface at a medium grazing angle, wherein x ranges from 1 to 2;

b. rotating said at least one surface by 90° and

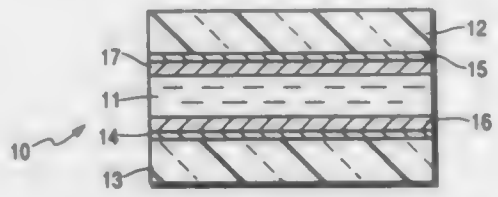
c. depositing a second layer of SiO_x on said first layer at a shallow grazing angle;

chemically reacting said microstructures with a long chain alcohol to bond long chain alkoxy groups to said microstructures at the location of the free hydroxyl groups, the

alcohol having the formula ROH, where R is a carbon chain having at least about 6 carbon atoms therein, the treatment of the opposed cell surfaces and the minimum length of the carbon chain being selected to yield a tilted-perpendicular alignment for the alkoxy groups substantially independent of the carbon chain length in the approximate tilt angle range of 0.5°-6°;

introducing liquid crystal material into said cell so that the liquid crystal has substantially the same alignment as the long chain alkoxy groups, the alignment being retained in the presence of photodecomposition.

5,011,268



INORGANIC ALIGNMENT LAYER FOR LIQUID CRYSTAL DEVICES AND METHOD OF FORMING

Grzegorz Kaganowicz, Belle Mead, N.J., assignor to General Electric Company, Princeton, N.J.

Filed Oct. 30, 1989, Ser. No. 428,698

Int. Cl.[5] G02F *1/133*

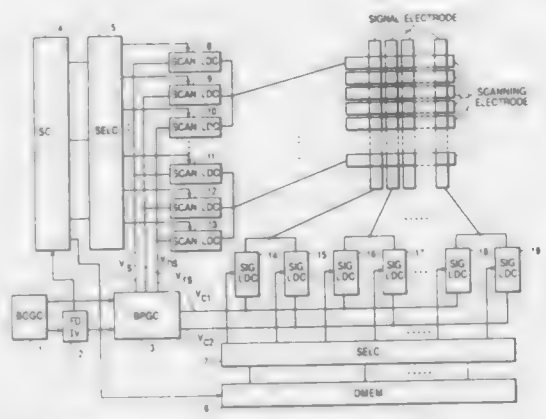
U.S. Cl. 350—341 **6 Claims**

1. In a liquid crystal device having a liquid crystal material disposed between first and second substrates and electrical electrodes arranged on the surfaces of said substrates adjacent to said liquid crystal material, an improved alignment layer comprising:

a glow discharge deposited layer of a porous inorganic, silicon based dielectric material on said electrodes.

5,011,269

METHOD OF DRIVING A FERROELECTRIC LIQUID CRYSTAL MATRIX PANEL



Naohide Wakita, Kobe; Tsuyoshi Uemura, Higashiosaka; Hiroyuki Ohnishi, Ikeda; Noriko Ohba, Nara, and Isao Ota, Osaka, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Sep. 5, 1986, Ser. No. 903,772

Claims priority, application Japan, Sep. 6, 1985, 60-198014; Sep. 6, 1985, 60-198015

Int. Cl.[5] G02F *1/13;* **G09G** *3/36*

U.S. Cl. 350—350 S **2 Claims**

1. A method of driving a liquid crystal matrix panel of the type in which ferroelectric liquid crystal is held between scanning electrodes and signal electrodes to form a matrix-arrayed pixels, characterized by: applying a first group of pulse voltages during a reset phase to an Nth scanning electrode connected to pixels in an Nth row when pixels in another row are selected, said first group of pulse voltages having enough peak value and pulse width to bring the pixels in the Nth row into a constant state of either bright or dark, thereby to reset said pixels in said Nth row; and applying, during a selected phase in which the pixels in said Nth row are to be selected, a second group of pulse voltages so that the pixels in said Nth row are either inverted or keep their state in accordance with signal voltages applied to the signal electrodes, wherein one grey-level is obtained by making a multiple number of field scannings while applying said first group of pulse voltages at different timing with each field scanning.

5,011,270

LIQUID CRYSTAL ELECTRO-OPTICAL DEVICE AND MANUFACTURING METHOD THEREFOR

Shunpei Yamazaki, Tokyo, and Masahiko Sato, Atsugi, both of Japan, assignors to Semiconductor Energy Laboratory Co., Ltd., Atsugi, Japan

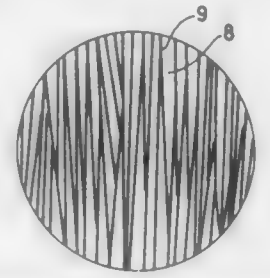
Division of Ser. No. 470,725, Jan. 26, 1990, which is a continuation of Ser. No. 250,411, Sep. 28, 1989, Pat. No. 4,906,074. This application Mar. 6, 1990, Ser. No. 489,348

Claims priority, application Japan, Sep. 29, 1987, 62-244808; Oct. 7, 1987, 62-253178; Oct. 7, 1987, 62-253179; Oct. 7, 1987, 62-253180

Int. Cl.[5] G02F *1/13*

U.S. Cl. 350—350 S **5 Claims**

1. A liquid crystal device comprising:



a pair of substrates;

a chiral smectic liquid crystal interposed between said substrates;

an electrode arrangement provided for defining a plurality of cell regions in said liquid crystal layer in array form and for applying an electric field to each region;

an orientation control surface formed at least one inside surface of said substrates;

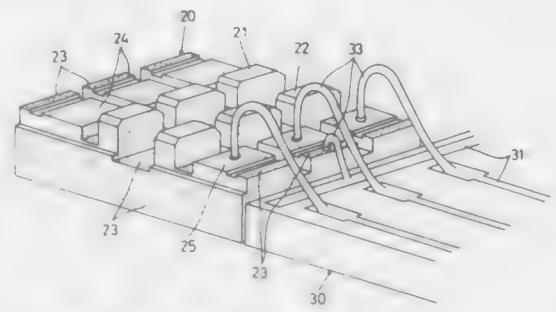
wherein said each region consists of a plurality of micro-domains each of which forms a lozenge having two diagonals, the length of one of said diagonals is not more than

450 microns and not less than 200 microns, and the length of another diagonal is not more than 25 microns and not less than 8 microns.

5,011,271

LIGHT SHUTTER ARRAYS FOR FORMING IMAGES

Itaru Saito; Ken Matsubara; Kouichi Shingaki; Tomohiko Masuda, and Hirohisa Kitano, all of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan



Filed Dec. 9, 1988, Ser. No. 282,304

Claims priority, application Japan, Dec. 11, 1987, 62-315007

The portion of the term of this patent subsequent to Aug. 8, 2006, has been disclaimed.

Int. Cl.[5] G02F *1/01, 1/03*

U.S. Cl. 350—356 **29 Claims**

1. A light shutter means comprising:

a plurality of shutter elements formed of a material having an electro-optical effect, said elements defined independently and three-dimensionally on an upper face of a substantially polyhedral chip and aligned in at least two arrays; each said element having a shutter window for selective light transmission therethrough; and

a common electrode, formed between said arrays, and extending at least from one end thereof to a first side face of the chip nearest said one end;

wherein the shutter elements of one array are disposed parallel with the shutter elements of the other array on said upper face of said chip.

5,011,272

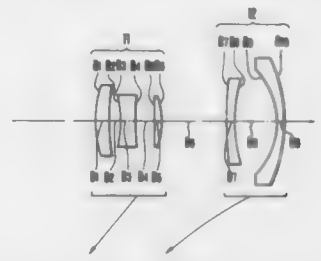
COMPACT ZOOM LENS

Hiroki Nakayama, Kanagawa; Nozomu Kitagishi, Tokyo; Jun Hattori, Kanagawa; Shigeyuki Suda, and Akihisa Horiuchi, both of Tokyo, Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 810,670, Dec. 18, 1985, abandoned. This application Mar. 27, 1989, Ser. No. 329,588

Claims priority, application Japan, Dec. 21, 1984, 59-271261; May 13, 1985, 60-102399; Jun. 25, 1985, 60-138195

Int. Cl.[5] G02B *15/00, 3/00, 9/00*



U.S. Cl. 350—427 **10 Claims**

1. A zoom lens comprising:

a positive lens unit having a plurality of lens components having a positive refractive power; and

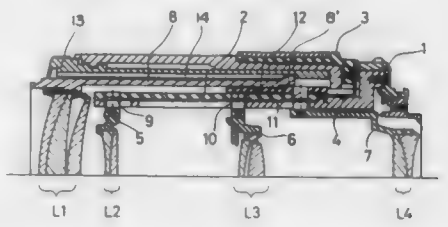
a negative lens unit having a plurality of lens components positioned nearer the image side than said positive lens unit;

wherein said positive and negative lens units are movable such that a zooming operation from wide angle to telephoto is performed by decreasing the distance between

said positive lens unit and said negative lens unit and by simultaneously moving said positive and negative lens units toward the object side, and wherein at least one lens unit compensates for image aberrations in cooperation with other lens components and includes at least one single distributive index type lens component having an optical axis in common with the other lens components, thereby to compensate for said image aberrations due to zooming throughout the entire zooming range.

5,011,273

LENS BARREL OF A ZOOM LENS



Masayuki Ueyama, and Minoru Kuwana, both of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Apr. 12, 1989, Ser. No. 336,847

Claims priority, application Japan, Apr. 13, 1988, 63-90543

Int. Cl.[5] G02B *15/00, 7/04*

U.S. Cl. 350—429 **9 Claims**

1. A lens barrel for a zoom lens having a first lens group and at least one second lens group the first and second lens groups moving as a linked unit during zooming, said lens barrel comprising:

a stationary cam ring capable of being fixedly mounted on a camera body;

a movable cam ring rotatably supported relative to said stationary cam ring;

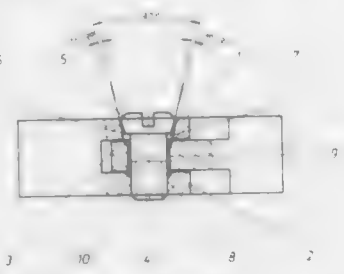
a first lens holder for holding said first lens group at a location outside said stationary cam ring and said movable cam ring;

a second lens holder for holding said second lens group at a location inside said stationary cam ring and said movable cam ring; and

a connecting means for connecting said first and second lens holders via said first and second cam rings.

5,011,274

EYEGLASS FRAME COMPRISING A SCREW JOINT WHICH IS PROTECTED FROM BECOMING LOOSE



Reiner Wagner, Ispringen, Fed. Rep. of Germany, assignor to OBE-Werk Ohnmacht & Baumgartner GmbH & Co. KG, Ispringen, Fed. Rep. of Germany

Filed Nov. 20, 1989, Ser. No. 439,289

Claims priority, application Fed. Rep. of Germany, Apr. 17, 1989, 8904802[U]

Int. Cl.[5] G02C *5/14, 5/22, 1/08*

U.S. Cl. 351—121 **7 Claims**

1. In an eyeglass frame comprising

at least two frame members, one of which is formed on opposite sides with a tapped bore and with a conical opening, which tapped bore and conical opening are axially aligned and open toward each other, and

a screw having a screw-threaded shank, which is screwed into said tapped bore, and a conical head portion, which tapers toward said shank and extends into said conical opening and engages said one frame member in said conical opening,

the improvement residing in that

said conical head portion tapers with an included angle of 20 to 40 degrees and defines with said one frame member in said conical opening a clearance angle of 1 to 3 degrees and a clearance space which surrounds said shank.

5,011,275

DIMETHYLACRYLAMIDE-COPOLYMER HYDROGELS WITH HIGH OXYGEN PERMEABILITY

Karl F. Mueller, New York, N.Y., assignor to Ciba Geigy Corporation, Ardsley, N.Y.

Division of Ser. No. 356,801, May 23, 1989, Pat. No. 4,954,587, which is a continuation-in-part of Ser. No. 215,101, Jul. 5, 1988, abandoned. This application Jul. 6, 1990, Ser. No. 549,528

Int. Cl.[5] G02C *7/04*

U.S. Cl. 351—160 H **14 Claims**

1. A hydrated composition in form of a contact lens which comprises a copolymer, having the characteristics of high clarity, high oxygen permeability and which is, in the water swollen hydrated state, soft and flexible, which copolymer comprises the polymerization product of, with weight percent based on the total weight of monomers (a), (b), (c) and (d), of

(a) 24.9 to 70 percent by weight of N,N-dimethylacrylamide,

(b) 65 to 19.9 percent by weight of a vinyl monomer selected from the group consisting of the acrylate or methacrylate esters of formula B1

$$CH_2=\underset{\displaystyle R_1}{\overset{|}{C}}-COO(CH_2)_n(CF_2)_mCF_2X \qquad (B1)$$

wherein

R_1 is hydrogen or methyl,

n is an integer from 1–4,

m is an integer from 0–11,

X is hydrogen or fluorine, with the proviso that, when m is 0, X is fluorine, and

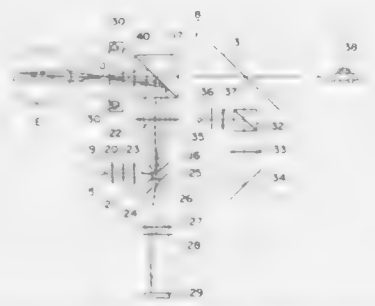
hexafluoroisopropyl methacrylate,

(c) 10 to 40 percent by weight of a C_2-C_4-hydroxyalkyl acrylate or methacrylate, a C_2-C_4-alkoxy-alkyl acrylate or methacrylate or an oligosiloxanyl-silylalkyl acrylate or methacrylate containing 2 to 10 silicon atoms, or mixture thereof, and

(d) 0.1 to 3 percent by weight of a crosslinking agent having at least two copolymerizable vinyl groups.

5,011,276

APPARATUS FOR MEASURING REFRACTIVE POWER OF EYE



Masakatsu Iwamoto, Kagawa, Japan, assignor to Ryusyo Industrial Co., Ltd., Osaka, Japan

Filed Jun. 26, 1989, Ser. No. 371,544

Claims priority, application Japan, Jun. 27, 1988, 63-158495; Dec. 29, 1988, 63-331999; Dec. 29, 1988, 63-332000; May 29, 1989, 1-136389; May 29, 1989, 1-136390

Int. Cl.[5] A61B *3/10*

U.S. Cl. 351—211 **16 Claims**

1. An apparatus for measuring the refractive power of an eye having an optical measuring device provided with a measuring optical system for measuring the refractive power of the eye and a main body for calculating the refractive power of the eye based on data transmitted thereto from said optical measuring device, wherein said optical measuring device is separated from said main body so as to be hand-movable with respect to said main body and includes:

a measuring light projecting optical system for projecting a measuring light so as to project an optical pattern on the retina of the eye;

a measuring light receiving optical system in which a light reflected from the pattern projected on the retina of the eye is received by a light receiving sensor;

a visual target optical system for allowing the eye to watch a visual target disposed at a far point with respect to the eye, and

an optical system including an illuminating optical system and an optical axes-aligned state detecting optical system which comprises an illuminating light source for illuminating the eye so that an illuminated pattern image reflected from the cornea of the eye is used as an optical axes-aligned state detecting light, the optical axes-aligned state detecting optical system allowing said light receiving sensor to receive a light reflected form the eye;

a monitor means being provided at least in one of said optical measuring device and said main body so as to display the eye based on an image signal transmitted thereto from said light receiving sensor and to display an optical axes-aligned state detecting reticle pattern on the screen thereof, said main body comprising:

an image processing device for detecting coordinates of the illuminated pattern image and the projected pattern image with respect to an optical axis of said measuring light receiving optical system and luminances of the illuminated and projected pattern images based on image signals transmitted thereto from said light receiving sensor;

optical axes-aligned state detecting means for detecting the axes-aligned state of said measuring optical system with respect to the eye based on the coordinate data of the illuminated pattern image transmitted thereto from said image processing device;

in-focus state detecting means for detecting the focused state of said measuring optical system with respect to the eye based on luminance data of the illuminated pattern image transmitted thereto from said image processing device;

measurement starting means for allowing said measuring light projecting optical system to project a measuring light based on focusing and axes-aligning information transmitted thereto from said optical axes-aligned state detecting means and said in-focus state detecting means, and

calculating means for calculating the refractive power of the eye based on the coordinate data of the illuminated pattern image transmitted thereto from said image processing device.

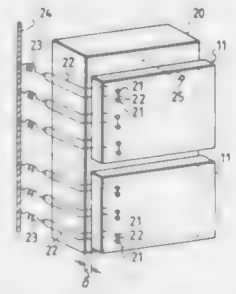
MULTI-SCREEN PROJECTOR



Masanori Ogino, Yokohama; Yoshiaki Iwahara, Yokosuka; Yuzo Tamura, Yokohama, and Shoji Kuroda, Odawara, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed May 9, 1990, Ser. No. 521,015

Claims priority, application Japan, May 10, 1989, 1-114906

Int. Cl.[5] G03B *21/60*

U.S. Cl. 353—94 **26 Claims**

1. A multi-screen projector comprising:

n×m unit projectors arranged horizontally in m columns and vertically in n rows like a matrix, where n and m are positive integers either of which is two or more;

transmisive screen means comprised of a plurality of sheets including at least n×m Fresnel sheets and m or n×m front sheets having lenticular stripes for diffusing the light horizontally, said transmissive screen means being formed by a plurality of unit screens each of which is composed of layers of sheets including at least a Fresnel sheet and a front sheet; and

spring means;

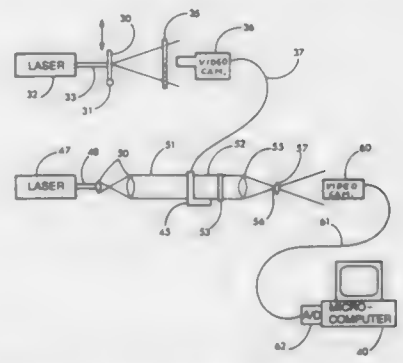
wherein one of two sheets included in said layers of sheets composing said each of unit screens is provided with the shape having a one-dimensional curvature for separating the peripheries of the two sheets in the unloaded state when the centers of the two sheets are in touch with each other, and

said spring means provides a force to pull the peripheries of said two sheets toward each other for said one of the two sheets.

5,011,278

OPTICAL CORRELATOR METHOD AND APPARATUS FOR PARTICLE IMAGE VELOCIMETRY PROCESSING

Patrick V. Farrell, Madison, Wis., assignor to Wisconsin Alumni Research Foundation, Madison, Wis.



Filed Apr. 25, 1989, Ser. No. 342,982

Int. Cl.[5] G01P *3/36;* **G01B** *9/02*

U.S. Cl. 356—28 **24 Claims**

1. A method of image processing for use in measuring the velocity of particles flowing in a fluid, wherein images of the particles have been recorded on optical medium in an optical double exposure showing the displacement of the particles over a time increment, comprising the steps of:

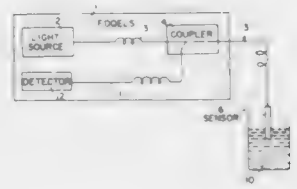
(a) projecting light through a portion of the medium onto a screen to form an image of Young's fringes:

(b) modulating a second beam of light in a two dimensional array in accordance with the image formed on the screen to produce a diffraction pattern in the light so modulated;

(c) forming an image of the diffraction pattern.

5,011,279

FIBER-OPTICAL SENSOR



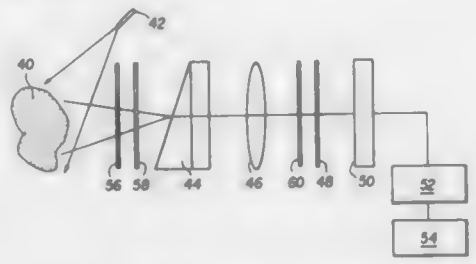
Helmut Auweter, Limburgerhof; Dieter Horn, Heidelberg; Dieter Lilge, and Juergen Wortmann, both of Limburgerhof, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Jun. 10, 1988, Ser. No. 205,353

Claims priority, application Fed. Rep. of Germany, Jun. 13, 1987, 3719806

Int. Cl.[5] G01N *21/00*

U.S. Cl. 356—28.5 **2 Claims**



1. A fiber-optical sensor for measuring the Doppler broadening of scattered laser light by the principle of quasi-elastic light scattering (QELS) , the scattered light originating from scattering of laser light by particles in movement in the sample (10) being measured, having a light guide (3) selected from the group consisting of a single-mode light guide and a multi-mode light guide used as an immersion probe into said sample and which transfers laser light from a source (2) to said sample and further which transfers light scattered from said sample to a detector (12) wherein the emergence surface (7) for the laser light at the end of said light guide is inclined at an angle $1° \leqq \phi \leqq 15°$, the angle of inclination being defined by the optical axis (8) of said light guide and the normal (9) of said emergence surface.

5,011,280

METHOD OF MEASURING DISPLACEMENT BETWEEN POINTS ON A TEST OBJECT

Yau Y. Hung, 3130 Quail Ridge Cir., Rochester Hills, Mich. 48309

Division of Ser. No. 129,709, Dec. 7, 1987, Pat. No. 4,887,899. This application Oct. 23, 1989, Ser. No. 425,250
Int. Cl.[5] G01B *9/02*
U.S. Cl. 356—35.5 **7 Claims**

1. A method of measuring displacement between two points on a test object, comprising the steps of:
(a) generating a first interference pattern representing the superposition of laterally-displaced images of the test object, while the object is in an undeformed state,
(b) generating a sequence of second interference patterns representing the superposition of laterally-displaced images of the test object, while the object is in a deformed state, and repeatedly producing third interference patterns determined by comparing each of said second interference patterns with the first interference pattern, the generating steps comprising the steps of storing the patterns in a computer, the comparing step being performed by electronically comparing the respective second patterns with the first pattern,
(c) selecting a point on one of the third interference patterns corresponding to the points on the test object,
(d) adjusting an optical element so as to adjust the phase of the second interference patterns currently being formed, by a measured amount, until the corresponding third interference pattern comprises a fringe pattern having an extremum at the selected point, and
(e) converting the measured amount of phase adjustment into a value of the displacement between the points on the object.

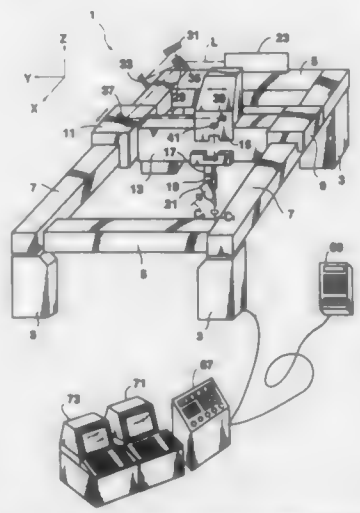
HUMIDIFICATION AND CLOUD CHAMBER BLOCK FOR PARTICLE CONCENTRATION DETECTION

Eric W. Harris, Moncks Corner, S.C., assignor to Research Equipment Corporation, North Charleston, S.C.

Continuation-in-part of Ser. No. 352,149, May 15, 1989, Pat. No. 4,967,187. This application Sep. 18, 1989, Ser. No. 408,880
Int. Cl.[5] G01N *1/00*
U.S. Cl. 356—37 **5 Claims**

1. A device for determing the density or changes in density of small particles, comprising:
a monolithic block of material that is impervious to light;
an elongated chamber formed in said block and defining a cloud chamber for receiving a source of light at one end and a photo detector at the opposite end, said chamber having input and output passageways;
a trough, formed in said block, and defining a humidification chamber;
a first passageway for connecting said humidification chamber to the input passageway of said cloud chamber within said block;
an air inlet passageway formed in said block;
an intermediate passageway formed within said block and coupled to said air inlet passageway, said intermediate passageway being coupled with said humidity chamber and the output passageway of said cloud chamber; and,
an exhaust opening formed in said block and communicative to said cloud chamber through the intermediate chamber for permitting a vacuum to be established in the intermediate passageway within said block, wherein said elongated



chamber, intermediate passageway and trough are contained within said block to minimize the length of the connecting passageways.

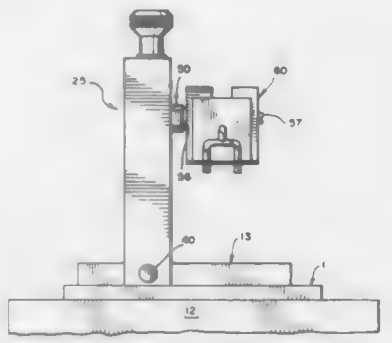
LASER BEAM PATH ALIGNMENT APPARATUS FOR LASER PROCESSING MACHINES

Stanley L. Ream, Charlottesville, Va.; C. S. Lee, Torrance, Calif.; G. C. Lim, Cerritos, Calif., and Kenneth Fukae, Westminster, Calif., assignors to Amada Company, Limited, Japan

Filed Nov. 16, 1989, Ser. No. 438,842
Int. Cl.[5] G01B *11/26*
U.S. Cl. 356—153 **6 Claims**



1. A laser beam path alignment apparatus for a laser processing machine that is provided with a laser generator, a laser processing head for performing laser processing, a means for moving the laser processing head in a predetermined axis direction, and a mirror for guiding a laser beam from the laser generator to the laser processing head, comprising:
means for detecting a laser beam position through which the laser beam passes, the laser beam position being defined in a plane perpendicular to the predetermined axis direction;
means for storing a first laser beam position which is detected by the laser beam position detecting means in the case where the moving means is positioned at a first position in the predetermined axis direction;
means for displaying the first laser beam position and a second beam position, the second laser beam position being detected by the laser beam position detecting means in the case where the moving means is positioned at a second position in the predetermined axis direction; and
means for rotating the mirror about an axis lying in the surface of the mirror, whereby the second laser beam position is changed to coincide with the first laser beam position.

5,011,283

FLOW CELL SUPPORT DEVICE

Tony R. Carrie, Evansville, and Robert A. Newton, Owensville, both of Ind., assignors to Bristol-Myers Squibb Co., New York, N.Y.

Filed Jan. 8, 1990, Ser. No. 461,879
Int. Cl.[5] G01N *21/01*
U.S. Cl. 356—246 **9 Claims**

1. A support for a spectrophotometric flow cell comprising:
(a) a base plate, said base plate including a front surface;
(b) a mounting bar including a back face, said mounting bar mounted on said front surface of said base plate along said back face of said mounting bar;
(c) a support arm slidably and releasably attached to said mounting bar, said support arm including an elongate cavity and two support legs forming a slot for receiving said mounting bar;
(d) an adjustment plug; and
(e) means for locating and adjusting the position of said adjustment plug within said elongate cavity.

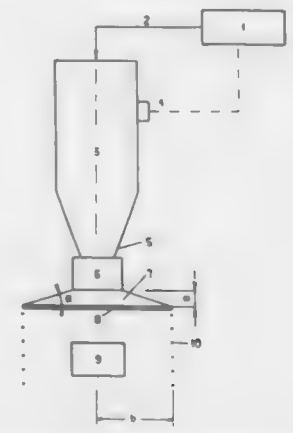
5,011,284

DETECTION SYSTEM FOR RAMAN SCATTERING EMPLOYING HOLOGRAPHIC DIFFRACTION

James M. Tedesco, Livonia; Harry Owen, Saline, and Byung J. Chang, Ann Arbor, all of Mich., assignors to Kaiser Optical Systems, Ann Arbor, Mich.

Filed Mar. 22, 1990, Ser. No. 497,238
Int. Cl.[5] G01N *21/65;* **G01J** *3/44*
U.S. Cl. 356—301 **16 Claims**

1. A Raman scattering detector comprising:
a source of collimated, substantially monochromatic light along a primary optical axis;
a first right angle prism having a first right angle face disposed perpendicular to said primary optical axis, a second right angle face disposed parallel to said primary optical axis, and an oblique face;
a holographic optical element disposed parallel to said oblique face of said first right angle prism, said holographic optical element having embedded therein regions of alternating indices of refraction for passing said monochromatic light substantially undiffracted while diffracting light at the wavelengths of expected Raman scattered light through an angle of approximately 90 degrees;
a second right angle prism having an oblique face disposed parallel to said holographic optical element, and a first right angle face disposed perpendicular to said primary optical axis;
a sample cell disposed on said primary optical axis beyond said first right angle face of said second right angle prism for holding a sample substance to be irradiated;
a concentrating lens disposed perpendicular to said primary optical axis between said first right angle face of said second right angle prism and said sample cell for concentrating said monochromatic light on the sample within said sample cell and for collimating Raman scattered light parallel to said primary optical axis;



a focussing lens disposed parallel to said second right angle face of said first right angle prism having a secondary optical axis perpendicular to said primary optical axis for focussing Raman scattered light diffracted by said holographic optical element at a focal plane; and
at least one photosensitive detector disposed on said focal plane of said focussing lens at a location off said secondary axis.

5,011,285

METHOD AND APARATUS FOR PERFORMING AUTOMATIC PARTICLE ANALYSIS

Terje Jorgensen, Skien; Oddbjorn E. Strand, Eidanger, and Odd A. Asbjornsen, Arnold, all of Norway, assignors to Norsk Hydro a.s., Oslo, Norway

PCT No. PCT/NO88/00095, § 371 Date Sep. 20, 1989, § 102(e) Date Sep. 20, 1989, PCT Pub. No. WO89/05971, PCT Pub. Date Jun. 29, 1989
PCT Filed Dec. 16, 1988, Ser. No. 399,479
Claims priority, application Norway, Dec. 18, 1987, 875304
Int. Cl.[5] G01N *15/02*
U.S. Cl. 356—335 **11 Claims**

1. A method of automatically analyzing a sample group of

particles to determine the size distribution of the particles and their deviation from a desired shape, comprising the steps of:

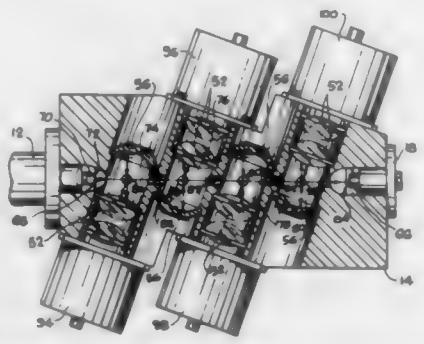
providing a container for particle samples, said container having an outlet for the particles, a vibrating plate having an outer edge positioned below said outlet a distance a, wherein the length between a center line of said outlet of said container and said outer edge of said vibrating plate is a distance b, said distances a and b being chosen such that the particles of the particle samples will flow from said outlet of said container onto said vibrating plate and over said outer edge in a monolayer when said plate vibrates, with an angle α of the surface of the particles on said vibrating plate relative to a horizontal plane at 50% to 90% of the sliding angle of the particles;

placing particle samples in said container such that the particle samples flow through said container and onto said vibrating plate via said outlet;

vibrating said vibrating plate with the particle samples thereon so as to form a monolayer of said particles flowing over said outer edge of said vibrating plate;

lighting said monolayer;

pictorially recording said monolayer while said monolayer is lit to obtain a pictorial record of said monolayer; and



analyzing said pictorial record of said monolayer to determine the size distribution of the particles therein.

5,011,286

MULTISENSOR PARTICLE COUNTER UTILIZING A SINGLE ENERGY SOURCE

Louis J. Petralli, Grants Pass, Oreg., assignor to Met One, Inc., Grants Pass, Oreg.

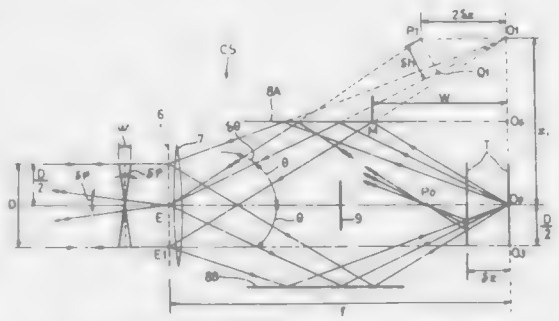
Filed Aug. 3, 1989, Ser. No. 389,061
Int. Cl.[5] G01N *21/00*
U.S. Cl. 356—343 **18 Claims**

1. An apparatus for the detection of individual particles in a fluid comprising:

a sensor body having a plurality of sample regions therein, adjacent sample regions being joined by an optical passageway,

a light source disposed with respect to said sensor body to project an incident beam along a light path through each of said sample regions via said optical passageway joining adjacent sample regions,

means for directing a plurality of generally identical sample flows of particle-bearing gas of substantially identical humidity into the sample regions such that each sample gas flow passes through said light path, none of said sample gas flows being reference flows with respect to the other sample gas flows, and



a plurality of detector means for sensing scattered light caused by impingement of individual particles along said light path and for providing a signal corresponding to the quantity of sensed light, thereby allowing counting of said particles, said detector means being disposed with respect to said sensor body such that each detector means is substantially limited to sensing of scattered light from an operationally separate sample region.

5,011,287

INTERFEROMETER OBJECT POSITION MEASURING SYSTEM AND DEVICE

Masayuki Mino, Toyokawa, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 129,730, Dec. 7, 1987, abandoned. This application Dec. 7, 1989, Ser. No. 450,504
Claims priority, application Japan, Dec. 8, 1986, 61-292110
Int. Cl.[5] G01B *9/02*
U.S. Cl. 356—356 **26 Claims**

1. An object position measuring method comprising the steps of:

generating parallel beams of light;

diffracting the light beams to produce a pair of positive and negative diffracted beams;

focusing the positive and negative beams onto a pair of symmetrically disposed mirrors so that the positive and negative beams will reflect off of opposite mirrors and be incident onto the object;

reflecting the positive and negative beams off of the object so that the positive beam is reflected towards the mirror which reflected the incident negative beam, and the negative beam is reflected towards the mirror that reflected the incident positive beams;

focusing the positive and negative beams that have been reflected back from the object and off of the symmetrically disposed mirrors;

re-diffracting each of the diffracted beams reflected by the object to interfere with each other thereby to provide interference fringes if the object is not positioned at a predetermined point when each of the diffracted beams is concentrated on the object; and

evaluating the interference fringes to determine the position of the object.

5,011,288

POSITION CONTROL SYSTEM FOR UNMANNED AUTOMATED VEHICLE

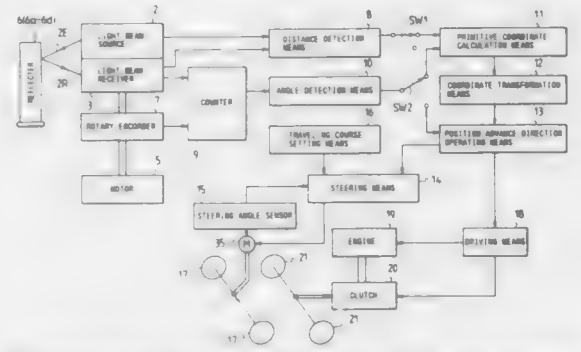
Akio Noji; Kenji Kamimura, and Sadachika Tsuzuki, all of Saitama, Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Apr. 28, 1989, Ser. No. 344,574
Claims priority, application Japan, May 13, 1988, 63-116689
Int. Cl.[5] G01B *11/14;* **B60T** *7/16;* **G08G** *1/123*
U.S. Cl. 356—375 **4 Claims**

1. A position control system for a moving vehicle comprising;

light-reflecting means disposed at at least three positions apart from the moving vehicle and reflecting light in the direction of incident light;

light beam source means mounted on the moving vehicle for emitting a light beam;



light beam scanning means mounted on the moving vehicle for scanning the light beam in all the different azimuthal directions around the moving vehicle;

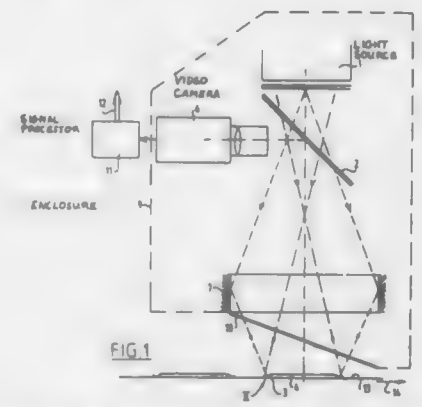
beam receiver means mounted on the moving vehicle for receiving beams of light reflected from the light-reflecting means;

distance detection means on said vehicle for detecting each distance between the moving vehicle and each of the light-reflecting means on the basis of the output of the beam receiver means;

angle detection means on said vehicle for detecting differential azimuths between two adjoining light-reflecting means on the basis of the output of the beam receiver means;

first calculating means on said vehicle for calculating the positions of the respective light-reflecting means on the basis of said detected distances and said detected differential azimuths, said calculation being on a primitive coordinate system wherein the position of the moving vehicle is fixed as the origin;

coordinate transformation means coupled to said first calculating means for transforming said primitive coordinate system to an execution coordinate system wherein the calculated position of one of the light-reflecting means is defined as the origin; and



second calculating means coupled to said coordinate transformation means and to said angle detection means for calculating the position of the moving vehicle on said execution coordinate system by use of triangular techniques employing detected differential azimuths provided by said angle detection means and the positions of said light reflecting means calculated by said first calculating means.

5,011,289

METHOD AND AN APPARATUS FOR CHECKING AN OBJECT FOR THE PRESENCE OF FILLING COMPOUND

Nicholaas C. Swart, Deventer, Netherlands, assignor to Heuft-Qualiplus B.V., Deventer, Netherlands

Filed Nov. 20, 1989, Ser. No. 439,543
Claims priority, application Netherlands, Nov. 21, 1988, 8802870
Int. Cl.[5] G01N *21/88*
U.S. Cl. 356—394 **9 Claims**

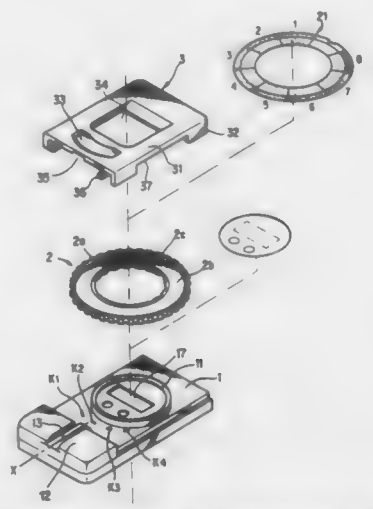
1. A method for inspecting the gutter of a container lid, comprising the steps of:

placing the container lid in a path of a light,

directing the light toward the gutter of the container lid, such that at least some light is reflected from the gutter, thereby forming an image of the gutter;

monitoring the image formed by the reflected light;

comparing the image of the gutter with a reference to determine if the gutter is flawed; and



generating a rejection signal if the gutter is flawed.

5,011,290

TEST SAMPLE COLOR COMPARISON DEVICE

Takao Terada, 1-2, Morikawachinishi, Higashiosaka-shi, Osaka; Hiroyuki Ota, 3-1, Demaru-cho, Takatsuki-shi, Osaka; Shigeru Makita, 748-1, Higashiimakojimachi, Shichihonmatsunishiiru, Imakojidori, Kamigyo-ku, Kyoto-shi, Kyoto, all of Japan; Bernd G. Herpichboehm, 6801 Gull Ct., Indianapolis, Ind. 46256; George H. Sierra, 8365 Cedar Key Dr., Indianapolis, Ind. 46256; Robert B. Summers, 6136 Drawbridge La., Indianapolis, Ind. 46256, and Thomas M. Watlington, 8040 Flatrock Ct., Indianapolis, Ind. 46256

Continuation of Ser. No. 268,561, Nov. 8, 1988, abandoned. This application Aug. 14, 1990, Ser. No. 567,699
Claims priority, application Japan, Nov. 8, 1987, 62-282780; Dec. 7, 1987, 62-310246
Int. Cl.[5] G01J *3/52*
U.S. Cl. 356—423 **4 Claims**

1. A test sample color comparison device comprising:

a casing unit having an insertion slot for receiving a color test sample, and a display section for viewably displaying a color test sample inserted in said slot along with a succession of reference color shades;

a manipulable member mounted so that it can be moved and having an upper portion;

a comparative color test sample section having said succession of reference shades positioned in a pattern, said color test sample section being located on said upper portion of said manipulable member, said succession of reference color shades being successively moved into a viewable position adjacent said color test sample in said display section upon movement of said manipulable member to thereby permit a visual comparison of said reference color shades with a color of said color test sample through said display section;

switch means for converting the position of said manipulable member into an electrical signal representing a position of said comparative color test sample section relative to said color test sample;

an uneven patterned code section movable with movement of said manipulable member for operating said switch means; and,

a display means for displaying a designated color shade

significance corresponding to the relative position of said comparative color test sample section to said color test sample in accordance with said electrical signal.

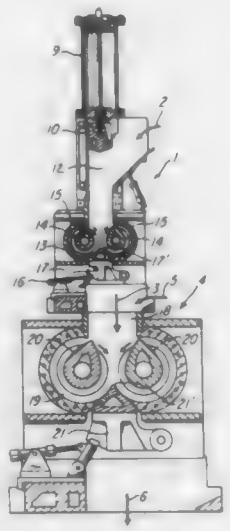
APPARATUS FOR PRODUCING RUBBER MIXTURES



Julius Peter, Tiergartenstr. 107, 3000 Hannover 71, Fed. Rep. of Germany

Division of Ser. No. 149,718, Jan. 29, 1988, Pat. No. 4,910,237. This application Nov. 22, 1989, Ser. No. 441,051

Claims priority, application Fed. Rep. of Germany, Jan. 30, 1987, 3702833

Int. Cl.[5] B19B 1/06

U.S. Cl. 366—91 10 Claims

1. An apparatus for producing rubber mixtures in two stages, namely a master-batching stage and a final mixing stage, in a discontinuous batch-type process that includes adding reactive ingredients, said apparatus comprising a master batcher with a first mixing chamber, a ram kneader and first cooling surface means for said master-batching stage, and a final mixer with a second mixing chamber, a ram-less kneader and second cooling surface means for said final mixing stage, in which:

a master batcher and a final mixer are combined to form a unit by disposing said master batcher above said final mixer, said master batcher and said final mixer communicating such that an outlet port of said master batcher opens directly into an inlet of said final mixer; with said second mixing chamber having a volume greater than a volume of said first mixing chamber; with said master batcher having a saddle at a bottom portion with which said outlet port that opens to said final mixer is closed; and, by opening said saddle, a material to be mixed is successively passed through, and transferred from, said master batcher to said final mixer, without intermediate storage thereof, by force of gravity.

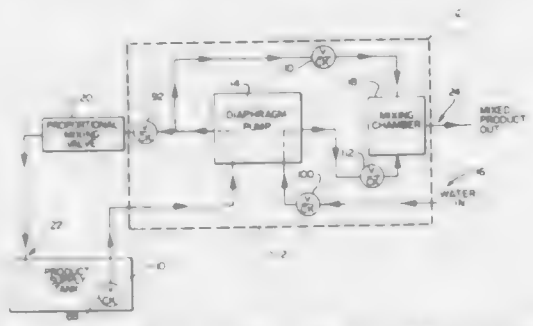
5,011,292

LIQUID PUMPING, MIXING AND DISPENSING APPARATUS

Timothy Trapasso, Phinney Rd., Gramby, N.Y. 13609, and John J. Howland, R.D. 3, Lockwood Rd., Auburn, N.Y. 13021

Filed Aug. 1, 1990, Ser. No. 561,177

Int. Cl.[5] B01F 15/04



U.S. Cl. 366—161 10 Claims

1. Apparatus for pumping a first liquid from a first remote location and mixing said first liquid in predetermined proportion with a second liquid, said apparatus including means to dispense the mixture of said first and second liquid to a second remote location, said apparatus comprising:

(a) a housing having an internal cavity adapted to receive and contain said second liquid;

(b) a first conduit having first and second ends, said first end communicating with said first liquid at said first remote location;

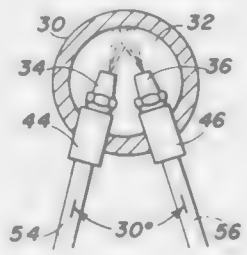
(c) a pump mounted in said housing internal cavity, said pump having first and second inlet ports and first and second outlet ports, said first conduit second end communicating with said first inlet port and said second liquid contained in said housing communicating with said second inlet port, said pump being operable to discharge said first and second liquids through said first and second outlet ports, respectively, at substantially equal rates;

(d) second and third conduits each having first and second ends, said second conduit first end communicating with said first outlet port and said third conduit first end communicating with said second outlet port;

(e) static mixing means having a third inlet port and a third outlet port, said second ends of both of said second and third conduits communicating with said third inlet port, whereby said first and second liquids are dispensed into said static mixing means and combined therein into said mixture; and

(f) a fourth conduit having first and second ends, said fourth conduit first end communicating with said third outlet port and said fourth conduit second end communicating with said second remote location.

5,011,293



EMULSIFIER MIXING CELL

Donald E. Roop, Worthington; David L. Bachman; Eugene J. Mezey, both of Columbus, all of Ohio, and Philip W. Bartram, Abingdon, Md., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Oct. 12, 1989, Ser. No. 420,810

Int. Cl.[5] B01F 5/02, 5/04; B01J 13/00

U.S. Cl. 366—173 5 Claims

1. An apparatus for producing an emulsion having a water containing component and an oil containing component, consisting essentially of:

a cylindrical cell having a circular interior wall;

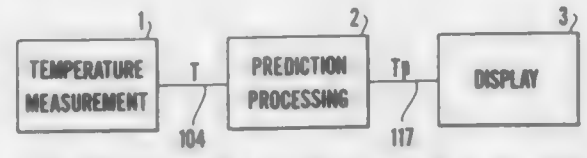
a first nozzle passing through said cell for spraying the water containing component against said interior wall;

a second nozzle passing through said cell in space relation to said first nozzle for spraying the oil containing component against said interior wall, said first and second nozzles being positioned so that the sprays of all said components intermingle with each other in space relationship to said interior wall prior to impingement on said interior circular wall

a plurality of means separably connected to the first and second nozzles for providing when needed said water containing component to the first nozzle and for providing said oil containing component to said second nozzle.

5,011,294

ELECTRONIC CLINICAL THERMOMETER



Keiji Yamaguchi, Shimizu, Japan, assignor to Terumo Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 363,892, May 18, 1989. This application Sep. 18, 1990, Ser. No. 584,344

Claims priority, application Japan, Nov. 19, 1986, 61-274088; Nov. 19, 1986, 61-274089

Int. Cl.[5] G06F 15/42; G01K 3/00

U.S. Cl. 374—107 4 Claims

1. An electronic clinical thermometer for predicting a sensed temperature that will prevail at a future time, comprising:

first memory means for storing a predetermined predictive functional formula in which values of predetermined coefficient parameters for superimposing said prediction function on a sensed temperature curve are undetermined;

temperature sensing means for sensing temperature and generating temperature data indicative of the temperature sensed;

time signal generating means for measuring elapsed time from start of temperature measurement and generating time data indicative of the measured elapsed time;

second memory means for storing the sensed temperature data in a manner correlated with the time data that prevailed when the temperature data were sensed;

data reading means for reading plural items of temperature data out of said second memory means by a predetermined method as measurement proceeds;

signal analyzing means for setting values of said coefficient parameters by solving simultaneous equations constituted by a plurality of said predictive functional formulae, in which the read temperature data serve as purposive variables and functions of the time data related to these temperature data serve as explicative variables; and

prediction processing means for calculating sensed temperature that will prevail at a future time in accordance with said predictive functional formula specified by the set values of the coefficient parameters.

METHOD AND APPARATUS TO SIMULTANEOUSLY MEASURE EMISSIVITIES AND THERMODYNAMIC TEMPERATURES OF REMOTE OBJECTS

Shankar Krishnan, Arlington Heights, Ill.; George P. Hansen, Austin, Tex.; Robert H. Hauge, Houston, Tex.; John L. Margrave, Houston, Tex., and Charles A. Rey, Riverwoods, Ill., assignors to Houston Advanced Research Center, The Woodlands, Tex.

Filed Oct. 17, 1989, Ser. No. 422,644

Int. Cl.[5] G01J 5/58, 5/10; G01K 7/00

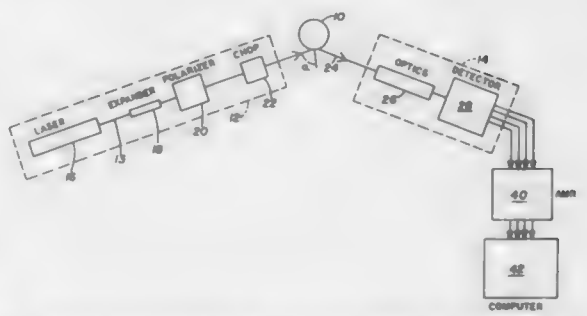
U.S. Cl. 374—126 17 Claims

11. Apparatus for measurement of the thermodynamic temperature of a radiating object comprising

a light source means of given wavelength for reflecting a beam of light off the object at a given angle,

means for interrupting said beam of light,

detector means for receiving radiation from said object comprising both



the self-emitted radiation from the object when the light is off in order to determine the brightness temperature of the object and

combined reflected and transmitted radiation from the object when the light source means is on, in order to determine the emissivity of the object.

said detector means comprising means for amplitude splitting of the received radiation into two component beams,

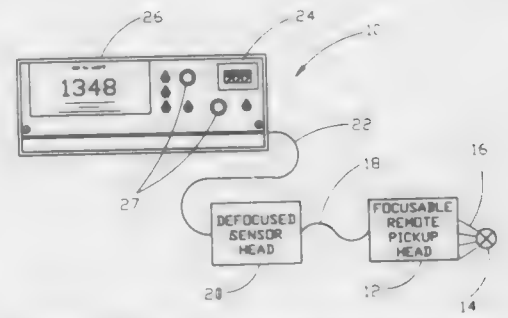
means for dividing each of the two component beams into two beams each of polar components, and

means for measuring the intensities of the four resulting components, said intensities being related to the four

Strokes vectors of the received radiation, and computing means for computing the brightness temperature and emissivity of the object and for combining said brightness temperature and said emissivity to determine the thermodynamic temperature of the object.

17. Method for non-contact determination of the thermodynamic temperature of a remote object, said method comprising the steps of directing a polarized light beam to the object causing said light to be reflected and transmitted from said object, measuring four polarization components of the light reflected and transmitted from the object to determine emissivity, interrupting said polarized light beam and simultaneously measuring the brightness temperature of the object from radiation self-emitted from the object, and combining the two measurements to determine the thermodynamic temperature.

5,011,296



METHOD OF USING INFRARED THERMOMETER WITH REMOTE FIBER OPTIC PICKUP

George Bartosiak, Naperville; Christopher Siskovic, Libertyville; Henry H. Tap, Algonquin; Sam Paris, Chicago, and Arthur E. Goldberg, Evanston, all of Ill., assignors to Square D Company, Palatine, Ill.

Division of Ser. No. 296,225, Jan. 12, 1989, Pat. No. 4,919,505. This application Jan. 25, 1990, Ser. No. 470,271

Int. Cl.[5] G01J 5/10, 5/08

U.S. Cl. 374—131 12 Claims

1. A method of using a remote infrared thermometer to determine the temperature of a target, comprising the steps of:

mounting an analyzer at a first located remote from the target to provide an indication of temperature based on electrical signals from a photosensor head electrically connected therewith;

mounting the photosensor head at a location remote from the target;

mounting a focusable lens assembly spaced from photosensor head and having

an objective lens at a fixed location with respect to the target, and

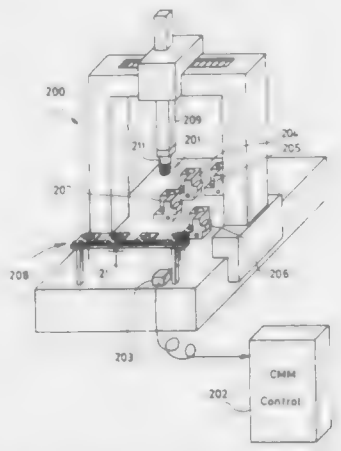
a fixed aperture at a variable location with respect to the target and within fucusable range of the target;

adjusting the focusable lens assembly while keeping said aperture fixed after said assembly is mounted at said fixed location to focus the lens assembly on a selected target; and

passing the light of the target from the lens assembly to a remote photosensor of the photosensor head via an elongate fiber optic cable for conversion thereby to corresponding electrical signals representative of the light from the target on which the lens assembly is focused.

5,011,297

APPARATUS FOR DETECTING THE TEMPERATURE OF AN OBJECT ON A COORDINATE MEASURING APPARATUS



Jakob Tittl, Sontheim/Brenz, Fed. Rep. of Germany, assignor to Carl-Zeiss-Stiftung, Heidenheim, Fed. Rep. of Germany

Division of Ser. No. 369,517, Jun. 21, 1989. This application Sep. 24, 1990, Ser. No. 587,032

Claims priority, application Fed. Rep. of Germany, Jul. 9, 1988, 3823373

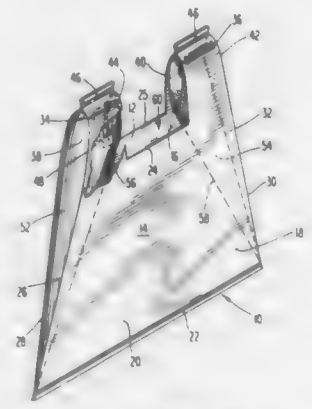
Int. Cl.[5] G01K *1/14, 13/00;* **G01D** *3/04*

U.S. Cl. 374—141 **7 Claims**

1. In a coordinate measuring apparatus having a movable measuring arm for moving and releasably engaging a plurality of coordinate measuring sensor components, each of the coordinate measuring sensor components having a holder which enables the coordinate measuring sensor components to be exchanged one for the other, a temperature sensor component for measuring the temperature of an object being measured by said coordinate measuring apparatus, the temperature sensor component comprising:

a temperature sensor holder having a form corresponding to the form of the holder of each of said coordinate measuring sensor components, whereby said temperature sensor component is exchanged with one of said coordinate measuring sensor components to measure the temperature of the object.

5,011,298



HALTER TOP BAG

Ajit K. Bose, Lawrenceville, N.J., and Kurt F. Strater, Barnesville, Ga., assignors to Union Camp Corporation, Wayne, N.J.

Continuation-in-part of Ser. No. 299,860, Jan. 19, 1989, abandoned. This application Jun. 7, 1990, Ser. No. 534,797

Int. Cl.[5] B65D *30/10, 30/20, 33/06*

U.S. Cl. 383—8 **1 Claim**

1. A halter top bag, which comprises:

a hollow tube of substantially uniform diameter formed from a flexible film of a thermoplastic resin, folded upon itself to form

(a) a rear panel having

(i) an inner bag surface;

(ii) an outer bag surface;

(iii) an imperforated film body defined by the inner and outer bag surfaces and having a substantially trapezoidal configuration including a base end, a peak end, a first side edge and a second side edge; and

(iv) a pair of handle members integrally joined to and extending outwardly from the peak end of the film body, said handle members having an inner side edge intersecting the peak end and an outer side edge integrally joined to the respective panel side edge.

(b) a front panel having

(i) an inner bag surface;

(ii) an outer bag surface;

(iii) an imperforate film body defined by the inner and outer bag surface (b) (i) and (ii) and having a substantially trapezoidal configuration including a base end, a peak end, a first side edge and a second side edge; and

(iv) a pair of handle members integrally joined to and extending outwardly from the peak end of the front panel film body, said handle members having an inner side edge intersecting the peak end and an outer side edge integrally joined to the respective panel side edge.

(c) a first gusset between and integrally joining together the first side edges of the film bodies of the front and rear panels, said gusset having a width at a point adjacent to the peak edges of the film bodies, which is twice the distance from a point of intersection of the peak end and the inner handle member edge and a point horizontally disposed from said point of intersection on the outer handle member edge; said gusset width decreasing linearly to a width of about zero to 0.5 inches at a point of intersection of the first side edges of the front and rear panels and the base end;

(d) a second gusset between and integrally joining together the second side edges of the film bodies of the front panel and rear panels, said second gusset having a width at a point adjacent to the peak edges of the film bodies which is twice the distance from a point of intersection of the peak end and the inner handle member edge and a point horizontally disposed from said point of intersection on the outer handle member edge; said gusset width decreasing linearly to a width of about zero to 0.5 inches at a point of intersection of the first side edges of the front and rear panels and the base end; and

(e) a bag mouth defined by the peak ends of the front and the rear panels taken together;

said front panel overlying the rear panel and conforming in size and configuration to the size and configuration of the rear panel;

said first gusset having a size and configuration conforming to the size and configuration of the second gusset;

the paired handle members of the rear panel being sealed to the paired handle members of the front panel to form a sealed top handle edge, which sealed edge forms a pair of handles at the bag mouth;

the base end of the front panel being sealed to the base end of the rear panel forming a base end of the halter top bag, the width of the sealed base ends being narrower than the bag mouth.

BAG CONSTRUCTION

Richard A. Black, Jr., Hatsalem, and Gilbert N. Yannuzzi, Jr., Richboro, both of Pa., assignors to American Packaging Corporation, Philadelphia, Pa.

Filed Feb. 20, 1990, Ser. No. 481,858

Int. Cl.[5] B65D *30/18*

U.S. Cl. 383—126 **5 Claims**

1. In a bag of the gusseted square-bottom type having a generally rectangular bottom formed by a diamond fold having at its ends a pair of bottom fold portions, said bottom fold portions being folded over along parallel spaced apart fold lines forming side edges of the bag bottom, the portion of the diamond fold between said fold lines being rectangular, said bottom fold portions being constructed to overlap one another in the folded condition thereof, the outer bottom fold portion being adhesively secured to the inner bottom fold portion between the opposed faces of the overlapping regions, the improvement comprising:

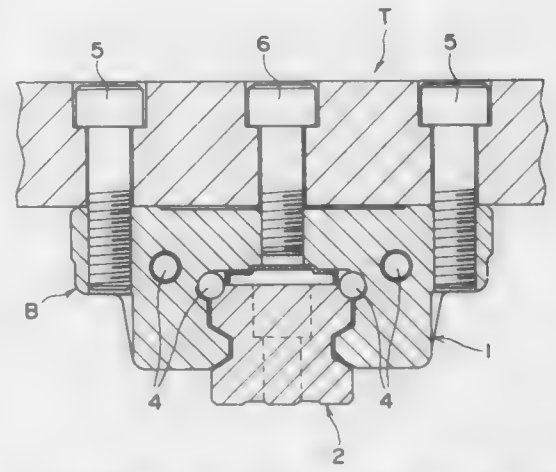
said inner bottom fold portion having a generally rectangular configuration and being sealed adjacent said fold line thereof, and

said outer fold portion having a generally triangular configuration and being sealed at its outer most ends to define an inner enclosed space which communicates with the interior of the bag, said adhesive securing said outer bag bottom fold portion to said inner bottom fold portion being responsive to the occurrence of an elevated temperature thereof to lose at least some of its adhesive properties whereby said outer bottom fold portion can move away from the bag bottom to break the attachment thereto in response to a force applied to said outer bottom fold portion as a result of gases flowing from the interior of the bag into said inner enclosed space within said outer bottom fold portion.

5,011,300

LINEAR SLIDING BEARING

Hiroshi Teramachi, Tokyo, Japan, assignor to THK Co., Ltd., Tokyo, Japan



PCT No. PCT/JP89/00829, § 371 Date Apr. 3, 1990, § 102(e) Date Apr. 3, 1990, PCT Pub. No. WO90/02271, PCT Pub. Date Mar. 8, 1990

PCT Filed Aug. 15, 1989, Ser. No. 469,465

Claims priority, application Japan, Aug. 16, 1988, 63-202668

Int. Cl.[5] F16C *21/00, 29/06*

U.S. Cl. 384—25 **2 Claims**

1. A linear sliding bearing comprising: a sliding bed having a section of generally inverted C-shape and including a horizontal portion and a pair of skirts depending downward from the two ends of the horizontal portion to form a recess at its lower side and formed in its inner sides with a pair of load races extending longitudinally thereof and with relief ball tracks corresponding to the load races; a track base having its upper portion fitted in the recess of said sliding bed, while maintaining a predetermined spacing inbetween, and formed with rolling races corresponding to said load races; a pair of covers attached to the front and rear end faces of said sliding bed and formed in their inner sides with guide grooves for providing the communicating connections between the end portions of the load races and the relief ball tracks of said sliding bed to form endless ball tracks; and a multiplicity of rolling members circulating in said endless ball tracks to bear the loads between the load races of said sliding bed and the rolling grooves of said track base,

wherein the improvement resides: in that the load races of said sliding bed are formed in the inner sides and at the roots of said skirts; in that the races of said track base corresponding to the load races of said sliding bed are formed at the shoulders of said track base; in that there is formed, between each of the leading ends of the inner sides of the skirts of said sliding bed and each of the two sides of the track base facing the former, a sliding bearing mechanism which include convex and concave portions having upward taper surfaces and downward taper surfaces shaped to be fitted in a wedged manner; and in that there is interposed, between said sliding bed and a table to be mounted on the upper surface of said sliding bed, gap adjusting means which includes a suspension or pressure mechanism for elastically deforming the horizontal portion of said sliding bed, whereby the pressure of contact between the upward and downward taper surfaces of said sliding bed and the downward and upward taper surfaces of said track base is adjusted by adjusting the gap between said sliding bed and said track base by said gap adjusting means.

AUXILIARY SEALING SYSTEM

Howard W. Martinie, Simpsonville, S.C., assignor to Reliance Electric Company, Greenville, S.C.

Continuation of Ser. No. 179,272, Apr. 8, 1988, Pat. No. 4,906,111, which is a division of Ser. No. 915,503, Oct. 6, 1986, Pat. No. 4,763,904. This application Dec. 15, 1989, Ser. No. 451,505

Int. Cl.[5] F16C *33/72*

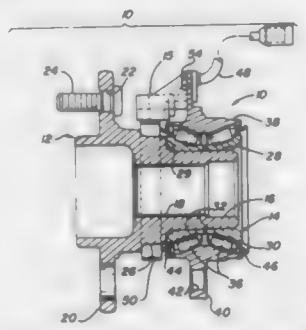
U.S. Cl. 384—140 **7 Claims**

1. Auxiliary sealing apparatus for a bearing assembly received about a rotatable shaft and including a circular member having securement means for securing said assembly to said shaft comprising:

a sealing ring element receivable about said circular member, said sealing ring element defining at least one radial opening therein; and

face sealing means of a predetermined configuration defined by said sealing ring element around the circumference of same and extending outwardly therefrom, said sealing means being mateable with a portion of said bearing assembly so that said sealing ring element opening may be moved into registry with said securement means for access thereto and moved out of registry therewith for sealing same while said face sealing means cooperates with said position of said bearing assembly to define a seal thereto.

5,011,302



MOTOR VEHICLE HUB AND BEARING WITH INTEGRATED ANTI-LOCK BRAKE SENSOR MOUNTING

David M. Mott, Roseville, and Frank C. Rosiek, Royal Oak, both of Mich., assignors to The Budd Company, Troy, Mich.

Filed Jun. 25, 1990, Ser. No. 543,327

Int. Cl.[5] F16C *19/08;* **G01P** *3/48*

U.S. Cl. 384—448 **6 Claims**

1. A hub and bearing assembly for a motor vehicle of the type having an anti-lock braking system comprising:

a hub having means for affixing a wheel thereto and defining a cylindrical surface,

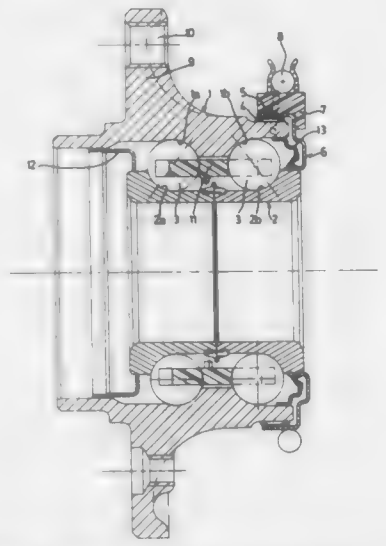
an exciter ring affixed to said hub and disposed on said cylindrical surface,

a sensor for said anti-lock braking system for providing an output related to the rotation of said wheel and said hub, and

a bearing pack for supporting said hub for rotation and including rolling bearing elements between at least one inner race coupled to said hub and at least one outer race coupled to a mounting flange, said mounting flange having means for mounting said bearing pack to a suspension structure and defining a pair of separated webs defining a notch therebetween with each of said webs defining an aperture for receiving mounting means for said sensor for directly engaging and mounting said sensor to provide a desired radial clearance between said exciter ring and said sensor.

5,011,303

INTEGRATED BEARING PROVIDED WITH A PULSER AND WITH A SENSOR FOR EQUIPPING A MOTOR VEHICLE WHEEL HUB



Fabrice Caron, Montigny-le-Bretonneux, France, assignor to SKF France, Clamart Cédex, France

Filed Jun. 22, 1990, Ser. No. 542,033

Claims priority, application France, Jul. 4, 1989, 89 08984

Int. Cl.[5] F16C *33/78*

U.S. Cl. 384—448 **10 Claims**

1. Integrated bearing intended for equipping a motor-vehicle wheel hub, comprising a rotary outer ring (1) and a stationary inner ring (2); at least one row of rolling elements (3) arranged between the outer and inner rings; an annular pulser (4) fixed to the rotary ring (1) in the vicinity of one of its ends; and a sensor (5) stationary relative to the stationary ring (2) and located opposite the pulser so as to be capable of measuring the rotational speed of the outer ring in relation to the inner ring of the bearing, characterized in that it comprises a substantially annular flange (6) delimited by an inner cylindrical rim (6*a*) fixed to the inner ring (2) and by an outer cylindrical rim (6*b*) which is coaxial relative to the inner rim and on the outside of which is mounted a sensor carrier (7) equipped with means (16) for fastening a connecting cable (8) connected to the sensor, the flange covering without contact the end of the outer ring (1) where the pulser is fastened and being equipped with an orifice (6*c*), through which the sensor is mounted opposite the pulser.

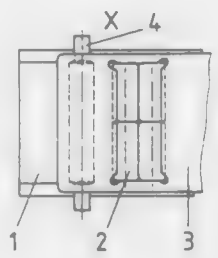
CAGE FOR A SECTORIAL ANTIFRICTION BEARING

Bernhard Breuer, Garstadt, and Johannes Schottdorf, Hammelburg, both of Fed. Rep. of Germany, assignors to FAG Kugelfischer Georg Schafer (KGaA), Fed. Rep. of Germany



PCT No. PCT/DE88/00474, § 371 Date Mar. 30, 1989, § 102(e) Date Mar. 30, 1989, PCT Pub. No. WO89/01095, PCT Pub. Date Feb. 9, 1989

PCT Filed Jul. 30, 1988, Ser. No. 335,786

Claims priority, application Fed. Rep. of Germany, Jul. 31, 1987, 8710514[U]

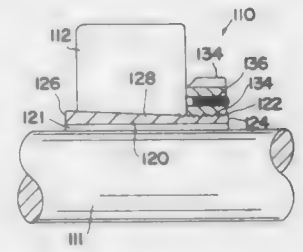
Int. Cl.[5] F16C *33/46;* **F01B** *3/00;* **F04B** *1/20*

U.S. Cl. 384—572 **8 Claims**

1. A cage for a sectorial antifriction bearing, the cage including a solid body in the shape of an arcuate sector having opposite circumferential ends, the cage also having opposite lateral sides, a plurality of parallel pockets extending in a direction across the solid cage body and toward the lateral sides, each pocket for receiving an antifriction bearing rolling element therein;

at least one support pin located toward at least each end of the cage body and extending parallel to the pockets and extending of a length to protrude beyond one lateral side of the cage for cooperating with a locating device for resetting the cage.

5,011,306



APPARATUS FOR MOUNTING A BEARING OR OTHER DEVICE AND TAPERED ADAPTER ONTO A SHAFT

Howard M. Martinie, Simpsonville, S.C., assignor to Reliance Electric Industrial Company, Greenville, S.C.

Filed Mar. 9, 1990, Ser. No. 491,300

Int. Cl.[5] F16C *27/04*

U.S. Cl. 384—585 **6 Claims**

1. An improved bearing assembly for securement to a shaft, comprising:

a tapered adapter of a size for receipt on said shaft, said adapter having a first end of lesser diameter and a second end of a diameter greater than said diameter of said first end and having a tapered outer surface therebetween, said first end of said adapter defining threads therearound for a portion of the length of same, and said adapter defining a radial opening therethrough and extending along the length thereof;

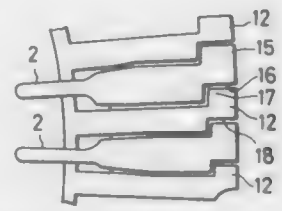
a bearing received about said adapter adjacent said first end of same;

a locknut received about said first end of said adapter in threaded engagement therewith, said locknut defining a plurality of threaded openings therethrough in a direction generally parallel to the length of said adapter; and

a plurality of elements received in said openings in threaded engagement therewith, said elements being capable collectively upon turning of generating a force adequate only to clamp said adapter to a shaft passing therethrough and seat the bearing on the adapter while being inadequate to move said bearing up the tapered surface of said adapter.

5,011,307

WIRE DOT PRINTER HEAD WITH ARMATURE GUIDES



Isao Ohwada, Tamayama, Japan, assignor to Alps Electric Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 133,549, Dec. 16, 1987, abandoned. This application Feb. 23, 1989, Ser. No. 315,205

Claims priority, application Japan, Apr. 20, 1987, 62-58635[U]

Int. Cl.[5] B41J *2/275*

U.S. Cl. 400—124 **3 Claims**

1. An improved head for a wire dot printer having a cylindrical housing in combination with a plurality of armatures located in a circumferential row and extending in radial directions within said housing, each of said armatures being supported at a radially outer end portion thereof for reciprocal rocking motion to actuate a print wire secured to a radially inner end portion thereof, and a guide member located between each pair of adjacent ones of said armatures for restraining movement of the adjacent armatures in directions other

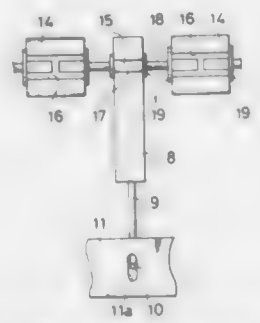
than directions of the reciprocal rocking motion, wherein the improvement comprises:

each of said armatures being longitudinally asymmetrically shaped and having an outer end portion defining a laterally extending tab on one side and a recess on the other side; and

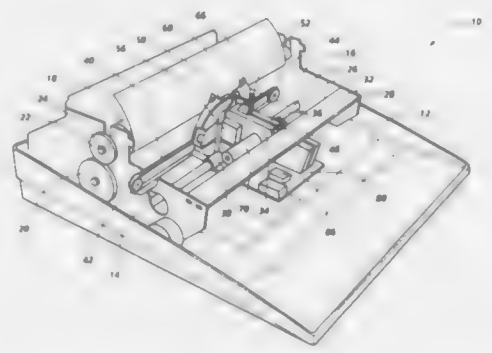
each of said guide members being longitudinally asymmetrically shaped and having an outer end portion defining a laterally extending tab on one side for fitting with the recess of an adjacent one of said armatures, and defining a recess on the other side for fitting with the laterally extending tab of an adjacent one of said armatures.

5,011,308

RELEASING TYPE DOT PRINTER HEAD



Masashi Shimosato, and Kuniaki Ochiai, both of Shizuoka, Japan, assignors to Tokyo Electric Co., Ltd., Tokyo, Japan



Filed May 10, 1989, Ser. No. 349,832

Claims priority, application Japan, May 10, 1988, 63-61484[U]; Jul. 5, 1988, 63-89359[U]

Int. Cl.[5] G41J *2/235*

U.S. Cl. 400—124 **8 Claims**

1. A releasing type dot print head comprising:

a plurality of cores which are fitted with electromagnetic coils;

a plurality of armatures having needles on one of their end parts, said needles comprising needle tips which define needle tip positions, said armatures being opposingly disposed with respect to said cores;

supporting parts disposed on both sides of the other end part of each of said armatures; and

elastic-member holding parts having openings for holding elastic members with limited play in the longitudinal direction of said armature when said elastic member is inserted into said openings said elastic-member holding parts being formed on said armatures and said supporting parts;

wherein at least one of said openings of said elastic-member holding parts formed on said armatures and said supporting parts is wider than the other openings of said elastic-member hodling parts for allowing additional play in the longitudinal direction of said armature, and wherein the play in the longitudinal direction of said armature allowed by said openings enable said needle tip positions to be disposed in fixed positions such that said needle tip positions act as standards when said elastic members are welded to said elastic-member holding parts.

INKED RIBBON CARTRIDGE WITH REMOVABLE CARRIER MEMBER

Edelbert Wiechert, Berlin, Fed. Rep. of Germany, assignor to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed Aug. 22, 1989, Ser. No. 396,924

Claims priority, application Fed. Rep. of Germany, Aug. 26, 1988, 3829445

Int. Cl.[5] B41J *35/28*

U.S. Cl. 400—207 **4 Claims**

1. An inked ribbon cartridge for an image recording apparatus, said cartridge comprising the following:

a cassette housing;

a printing roller in a roller bracket in said housing, said printing roller having a longitudinal axis;

a carrier replaceable member insertable and lockable into, and removable from, said housing including an inked ribbon stored on two winding reels, said winding reels having respective longitudinal axes;

means for mounting said winding reels and said printing roller in said housing with their longitudinal axes parallel; and

at least one lock mechanism having at least one actuation means, disposed on said carrier member, for both unlocking and gripping said carrier member for removing said carrier member from said cassette housing;

two lateral parts, each accepting an axle end of each winding reel;

a guard member connecting the lateral parts and provided with a longitudinal recess means for receiving the printing roller; and

wherein said actuation means includes a pair of actuation elements, one of said pair arranged at each of the lateral parts.

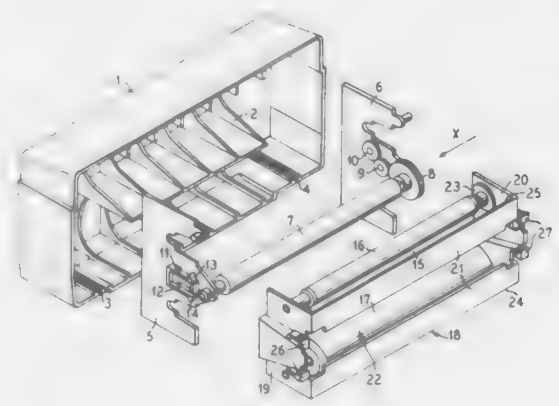
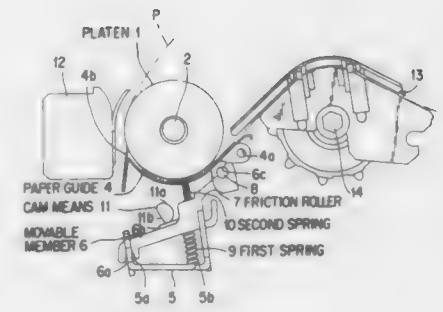
PAPER FEED MECHANISM FOR A PRINTER



Hiroyuki Sato, Sumida, Japan, assignor to Seikosha Co., Ltd., Tokyo, Japan



Filed Oct. 16, 1989, Ser. No. 421,869

Claims priority, application Japan, Oct. 20, 1988, 63-265046

Int. Cl.[5] B41J *11/50*

U.S. Cl. 400—605 **17 Claims**

1. A paper feed mechanism for feeding paper comprising:

a frame means;

a platen rotatably mounted on said frame means;

a friction feed means mounted on said frame means and having roller means movable between an operable position in which said roller means is in biasing engagement with said platen and a non-operable position in which said roller means is not biasingly urged toward said platen;

a tractor feed means juxtaposed to said platen;

drive means for driving said piaten and said tractor feed means;

actuating means having a first actuated position in which said drive means is operable to drive both said platen and said tractor feed means and a second actuated position in which said drive means is operable to drive said platen and does not drive said tractor feed means;

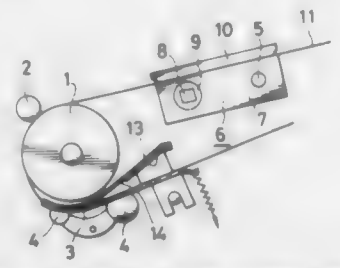
interconnecting means operably interconnected between said actuating means and said friction feed means such that when said actuating means is in said first actuated position, said friction feed means is disabled and said tractor feed means feeds said paper, and when said actuating means is in said second actuated position, said tractor feed means is disabled and said friction feed means feeds said paper;

said friction feed means comprising support means pivotably supporting roller means, said support means being movable between said operable and non-operable positions, cam means rotatable between a first cam position to effect positioning of said support means in said operable position and a second cam position to effect positioning of said support means in said non-operable position, said interconnecting means being operably connected between said

cam means and said lever such that pivotal movement of said lever rotates said cam means.

5,011,314

PAPER FEEDING DEVICE



Shinichiro Fujii, Shizuoka, Japan, assignor to Tokyo Electric Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 263,868, Oct. 28, 1988, abandoned. This application May 14, 1990, Ser. No. 522,086

Claims priority, application Japan, Oct. 30, 1987, 62-166447[U]

Int. Cl.[5] B41J *15/08*

U.S. Cl. 400—619 **2 Claims**

1. A paper feeding device for feeding paper, comprising:

a platen;

a paper pan extending along a lower portion of an outer periphery of said platen;

a tractor including a paper transport member having a circumferential speed set substantially equal to or a little lower than the circumferential speed of said platen;

a fulcrum shaft supporting said tractor thereon for pivotal motion between a pushing in position in which said tractor is directed toward the lower portion of the outer periphery of said platen and a pulling position in which said tractor is directed to an upper portion of the outer periphery of said platen;

a fixing means for alternatively fixing said tractor to the pushing in position or the pulling position; and

a thin piece extending along the lower portion of the outer periphery of said platen from an extension line of a paper feeding route of said tractor in the pushing in position between said platen and said tractor and resiliently contacting with an inner face of said paper pan, such that when said tractor is in said pushing in position, said thin piece is for guiding said paper to said lower portion of said outer periphery of the platen, and when said tractor is in said pulling position, said paper is supplied from between said thin piece and said paper pan, and said thin piece is for applying a force to said paper to displace said paper away from the platen such that said paper and said platen do not contact each other along at least said lower portion of said outer periphery of said platen under which said paper pan and said thin piece extend to thereby reduce a paper pulling force of said platen.

PRINTER

Toshiharu Kitagawa; Ryuji Nishiyama, both of Katano; Masaaki Takita, Ibaraki, and Yoshikazu Tsuru, Hirakata, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Continuation of Ser. No. 155,074, Feb. 11, 1988, abandoned. This application Jun. 30, 1989, Ser. No. 373,701

Claims priority, application Japan, Feb. 18, 1987, 62-35039; Feb. 18, 1987, 62-35040

Int. Cl.[5] B41J *13/03*

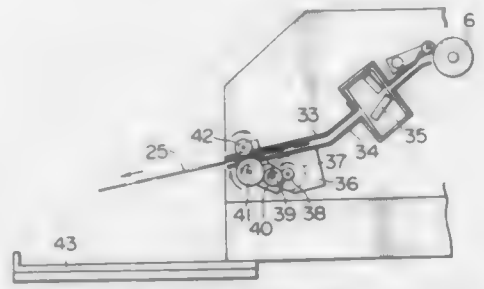
U.S. Cl. 400—624 **2 Claims**

1. A printer comprising:

a pair of upper and lower chutes for guiding printer paper;

an idle roller provided on said upper chute;

a paper discharging motor bracket provided on said lower chute;



a motor mounted on said paper discharging motor bracket and having a rotary shaft;

a paper discharging gear fitted on the rotary shaft of said motor inside of said paper discharging motor bracket;

a fulcrum shaft arranged inside of said paper discharging motor bracket in parallel with the rotary shaft of said motor;

a U-like paper discharging lever disposed rotatably about said fulcrum shaft and having a forward end;

an intermediate gear provided inside of said paper discharging lever so as to be coaxial with said fulcrum shaft and to be rotatable about said fulcrum shaft, said intermediate gear making contact with said paper discharging gear;

a spring urging said paper discharging lever in a thrust direction so as to press the latter against said intermediate gear;

a pulley shaft arranged inside of said paper discharging lever at the forward end thereof in parallel with said fulcrum shaft;

a pulley gear meshed with said intermediate gear so as to be rotated about said pulley shaft while having one side surface; and

a paper discharging pulley fixed on said one side surface of said pulley gear so as to be rotatable about said pulley shaft and having a diameter greater than that of said pulley gear;

wherein said paper discharging lever is rotated by a driving force of said motor provided on said bracket to cause contact to occur between said idle roller and said paper discharging pulley, thereby discharging the paper.

U.S. Cl. 401—6 **20 Claims**

1. A hand-held soap-holder for attachment to a bar of soap; and comprising in combination:

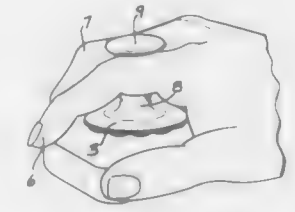
finger-gripping means;

support-base means;

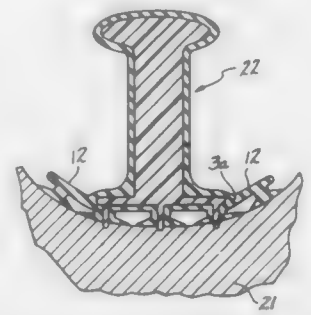
suction means;

implanting means; and

support-flap means;



said finger-gripping means extending generally upwardly from said



support-base means for use in securing said soap-holder in a user's hand;

said support-base means being of substantially rigid construction and being integrally positioned as to substantially underlie said finger-gripping means, substantially overlie said implanting means, and substantially overlie some portion of said suction means;

said suction means including an array of flexible suction cups disposed outwardly from beneath said soap-holder for attachment to a bar of soap;

said implanting means disposed downwardly from said support-base means for preventing transverse movement of the soap-holder on the surface of a bar of soap;

said support-flap means including at least one flexible portion, extending generally outwardly from said base-support means and substantially overlying some portion of said suction cups, whereby said flexible portion of said support-flap means is free to flex and bend, and whereby said flexible portion can conform and attach to the underlying surface of a bar of soap.

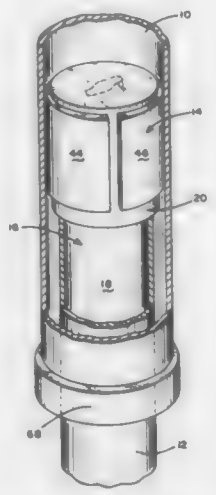
LOCKING MECHANISM FOR TELESCOPING TUBULAR POLES

Avraham Y. Levi, St. Paul, and Craig D. Quarberg, Brooklyn Park, both of Minn., assignors to A.C. Innovations, Inc., Bloomington, Minn.

Filed Jan. 2, 1990, Ser. No. 459,641

Int. Cl.[5] F16B *7/10*



U.S. Cl. 403—109 **16 Claims**

1. Apparatus for releasibly locking inner and outer cylindrical telescoping tube segments against longitudinal movement relative to one another, comprising:

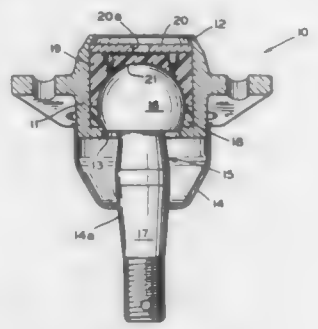
(a) a double lobed cam element attached to one end of said inner tube segment for rotation therewith; and

(b) first and second cam followers each being of substantially semi-circular cross-section and of a predetermined length dimension, each including an arcuate recess extending inward from a chordal edge and subtending an angle of about 90 degrees between a pair of stop surfaces located at opposed ends of said arcuate recess, said arcuate recesses in said first and second cam followers each receiving one

of said double lobes of said cam, said first and second cam followers and said cam being insertable into the bore of said outer tube segment, rotation of said cam in a first direction against one of said pair of stop surfaces spreading said cam followers apart from one another against the

inner wall of said outer tube segment and rotation of said cam in a direction opposite said first direction to the other of said pair of stop surfaces drawing said first and second cam followers together and out of contact with said inner wall of said outer tube segment.

5,011,320



BEARING FOR A BALL AND SOCKET JOINT

Mickey L. Love, and Douglas V. Massey, both of Oklahoma City, Okla., assignors to Dana Corporation, Toledo, Ohio

Filed Dec. 20, 1989, Ser. No. 453,601

Int. Cl.[5] F16C *11/06*

U.S. Cl. 403—132 **17 Claims**

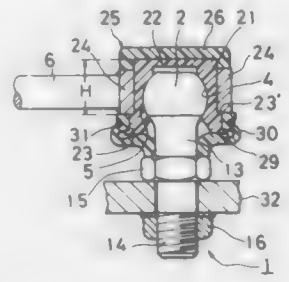
1. A ball and socket joint comprising:

a generally hollow socket member;

a ball member disposed within said socket member; and

a bearing disposed within said socket member including a body portion having a first and second ends, a bearing surface formed in said first end engaging and supporting said ball member, reservoir means formed in a surface of said second end including a central recess and a groove extending outwardly from said central recess along said surface of said second end, said reservoir means adapted to store a quantity of lubricant therein, and a passageway extending through said body portion from said bearing surface to said reservoir means groove, whereby lubricant is permitted to pass from said reservoir means to said bearing surface and said ball member.

5,011,321



BALL JOINT FOR STABILIZER

Susumu Kidokoro, Fuji, Japan, assignor to Gotoh Seisakusho Co., Ltd., Fuji, Japan

Filed Sep. 13, 1990, Ser. No. 583,822

Int. Cl.[5] F16C *11/00*

U.S. Cl. 403—140 **5 Claims**

1. A ball joint for a stabilizer comprising a stud ball made of metal and having a spherical head and a pillow ball seat for swingably supporting said metal stud ball,

said pillow ball seat including:

a cylindrical ball seat member made of synthetic resin, permitting said spherical head of said stud ball to be pressure-fitted therein and having an annular spherical concave surface formed in the inner periphery thereof for swingably supporting said spherical head thereon;

a top wall portion provided integrally at the top of said ball seat member;

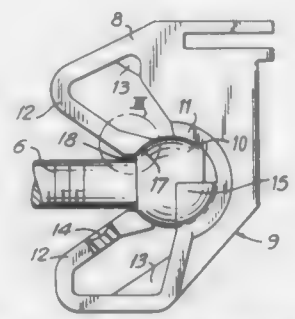
a cylindrical piece member made of metal and fitted on said ball seat member;

a disklike cap member made of synthetic resin fitted on said top wall portion of said ball seat member; and

means for securing said cap member to said top wall portion.

5,011,322

BALL JOINT



Friedrich Schauwecker, Pfullingen, Fed. Rep. of Germany, assignor to Robert Bosch GmbH, Stuttgart, Fed. Rep. of Germany

Filed Jul. 13, 1989, Ser. No. 379,805

Claims priority, application Fed. Rep. of Germany, Sep. 1, 1988, 8811059[U]

Int. Cl.[5] F16C *11/06*

U.S. Cl. 403—141 **6 Claims**

1. A ball joint comprising a ball stud including a shank and a ball formed at one end of said shank and having an outer surface; a ball socket for receiving said ball and including resilient arm means having an outer surface corresponding to said outer surface of said ball and engaging the same, said resilient arm means having on said outer surface thereof ridges and said ball stud having a substantially flat annular shoulder defining a transistion surface extending between said shank and said ball, said ridges engaging said annular shoulder upon a predetermined angular displacement of said ball to prevent displacement of said ball stud out of the socket.

ANGLE COUPLING STRUCTURE FOR KNOCKDOWN CABINETS

Chih C. Liuo, 2Fl., No. 4, Lane 767, Ming Sheng E. Rd., Taipei, Taiwan

Filed Oct. 16, 1989, Ser. No. 421,766

Int. Cl.[5] F16D *1/00*

U.S. Cl. 403—172 **3 Claims**

1. An angle coupling structure for knockdown cabinets comprising:

an angle coupling (1);

a plurality of elongated connecting rods (11) fixed to said angle coupling and extending from said angle coupling, each connecting rod extending at a different angle to each other connecting rod, each connecting rod having a plurality of threaded screw holes (111) therein spaced along the length of each respective connecting rod;

a plurality of separate and unconnected elongated securing rods (3) equal in number to said plurality of elongated connecting rods, each securing rod having a plurality of unthreaded round holes (31) therein spaced along the length of each respective securing rod and spaced by an equal amount to the spacing of the screw holes in each respective connecting rod;

a plurality of elongated connectable sections (2), each connectable section having an elongated connecting rod retaining channel (21) therein having a cross sectional shape substantially corresponding to the cross sectional shape of one of said connecting rods for receiving one of said connecting rods therein, each connectable section having an elongated securing rod retaining channel (22) therein extending parallel to said connecting rod retaining channel, said securing rod retaining channel having a cross sectional shape substantially corresponding to the cross sectional shape of one of said securing rods for receiving one of said securing rods, each connectable section having a wall separating said connecting rod retaining channel from said securing rod retaining channel with a longitudinal slot (23) in said wall for providing continuous communication between the holes of a securing rod in said securing rod retaining channel and the holes of a connecting rod in said connecting rod retaining channel; and

a plurality of screws for extending through the holes of said securing rods and the longitudinal slots and for being threaded into the holes in said connecting rods whereby said securing rods are freely slidable along said securing rod retaining channels for lining up the holes of said securing rods and said connecting rods to closely connect said angle coupling to said connectable sections.

5,011,324

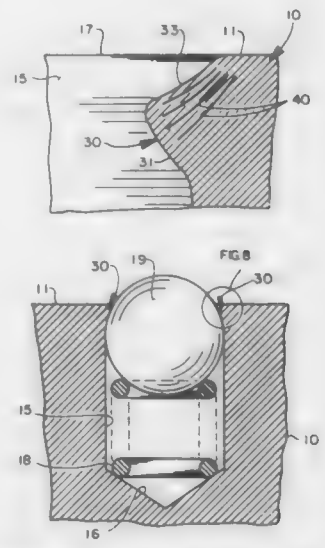
DETENT STRUCTURE HAVING A RETAINING LIP WITH A SMOOTH CONTINUOUS OUTER SURFACE FREE FROM STRESS-CONCENTRATING CORNERS

Gordon A. Putney, Lake Geneva, Wis., assignor to Snap-on Tools Corporation, Kenosha, Wis.

Filed May 14, 1990, Ser. No. 522,902

Int. Cl.[5] B25G *3/18*; F16B *21/07*

U.S. Cl. 403—328 **8 Claims**



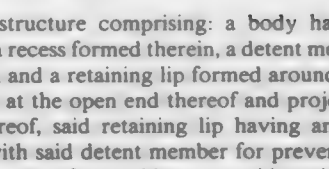


FIG. 8

1. Detent structure comprising: a body having an outer surface with a recess formed therein, a detent member disposed in said recess, and a retaining lip formed around the perimeter of said recess at the open end thereof and projecting laterally inwardly thereof, said retaining lip having an inner surface engageable with said detent member for preventing escape of said detent member from said recess, said retaining lip having a smooth continuous outer surface free of corners and extending from said outer surface of said body substantially to the lateral inner end of said retaining lip, said outer surface of said retaining lip being depressed axially inwardly of said recess with respect to said outer surface of said body.

5,011,325

MODULAR ELEMENT FOR DEFINING AREAS AND ROUTES ON CARRIAGE ROADS AND THE LIKE

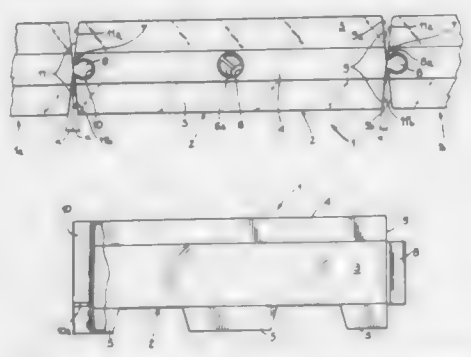
Giuseppe Antonioli, Bellinzona, Switzerland, assignor to Wirtgen AG, Switzerland

Filed Sep. 7, 1989, Ser. No. 404,339

Claims priority, application Switzerland, Mar. 31, 1989, 01183/89

Int. Cl.[5] E01F *13/00, 15/00*

U.S. Cl. 404—6 **3 Claims**



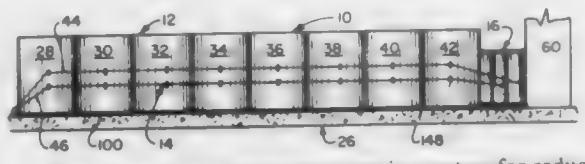
1. A modular element for defining areas and routes on roads and the like, comprising:

a plastic body having two opposite side walls joined by two ends, said side walls having a top portion, a base portion and a transverse section symmetrically diverging from said top portion towards a base portion;

joining means operating at opposite ends of said body to allow the modular element to be joined with a contiguous modular element;

said joining means having at one end a substantially cylindrical coupling lug integral with the plastic body, said cylindrical lug extending from and vertically along said one end surface of said body and having an undercut portion connecting the cylindrical portion with said one end surface, and at the other end a substantially cylindrical engagement seat formed in the other end, said seat extending vertically along said other end and being sized substan-

tially complementary to said coupling lug wherein said coupling lug of said modular element is positively engageable in a pivotable relationship with the engagement seat of a contiguous modular element;



each end surface of the body being divided symmetrically into two half parts which diverge from each other to the side walls and form an angle with said side walls whereby a plurality of modular elements can be connected together to form barriers having a curvilinear shape.

5,011,326

NARROW STATIONARY IMPACT ATTENUATION SYSTEM

John F. Carney, III, Nashville, Tenn., assignor to State of Connecticut, Hartford, Conn.

Filed Apr. 30, 1990, Ser. No. 516,276
Int. Cl.[5] E01F *13/00, 15/00*
U.S. Cl. 404—6 **11 Claims**

1. A narrow stationary impact attenuation system for reducing the severity of vehicular collisions occasioned by an errant vehicle striking an immovable object at narrow hazard sites comprising:

a. crash cushion means operative for cushioning the shock of an errant vehicle striking the narrow stationary impact attenuation system;

b. lateral stability means extending the length of said crash cushion means on either side thereof and operative for providing lateral stability to said crash cushion means;

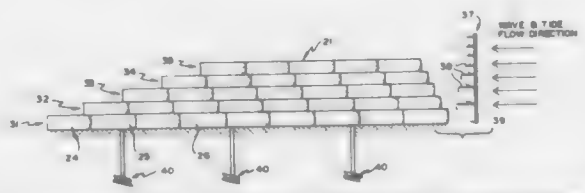
c. backup means positioned in juxtaposed relation to said crash cushion means at the rear thereof and operative to provide support for said crash cushion means at the rear thereof;

d. support means positioned in juxtaposed relation to said crash cushion means at the front thereof to anchor said lateral stability means at the front of said crash cushion means;

e. lateral deflection means mounted in supported relation at selected positions relative to said crash cushion and operative to limit the amount of lateral deflection that said crash cushion means is permitted to undergo when the narrow stationary impact attenuation system is struck by an errant vehicle under side impact conditions;

f. vehicle anti-vaulting means mounted in supported relation at selected positions relative to said crash cushion means and operative for preventing an errant vehicle that strikes the narrow stationary impact attenuation system from vaulting over or submarining under the narrow stationary impact attenuation system;

g. redirection means mounted in supported relation at selected positions relative to said crash cushion means and operative to effect in combination with said lateral stability means and said lateral deflection means the redirection into the traffic flow direction of an errant vehicle striking the narrow stationary impact attenuation system under side impact conditions; and



h. base means operative as the surface on which the narrow stationary impact attenuation system is emplaced.

5,011,327

EROSION BARRIER

E. Brandt Thiac, 10920 Airline Hwy., Apt 141, Baton Rouge, La. 70816

Filed Jun. 15, 1990, Ser. No. 538,616
Int. Cl.[5] E02B *3/06*
U.S. Cl. 405—28 **7 Claims**

1. For use with the shoreline of tidal water, an erosion barrier comprising a first barrier of a plurality of vertically stacked tiers of pneumatic tires cut in half and joined at their severed ends by bolt and nut connections, each tier of tires being staggered with each other tier above and below it, the tires being laid on their sides and joined to adjacent half tires at their abutting ends to form a tire line, said tire lines being vertically stacked tier upon tier in staggered overlying relationship, each half tire having arcuate spreader-connectors located one at at least each end and one intermediate the two ends, the spreaders of one line being joined to the spreaders of an adjacent line of a tier of tires by a bolt and nut connection, bracket connectors join the vertically adjacent line of interconnected tires of two lines of tires of a tier of tires through a bolted connection, strap connections joining the lines of interconnected tires between tiers of vertically stacked staggered lines of tires to form the tire barrier revetment, and a second barrier of the louvered type placed about 20–25 feet from the tire revetment, in the direction of tidal origin with the louvers being pivotally mounted vertically on the louvered barrier to unseat in the direction of inward or flood flow of tidal water and to seat against the barrier and with the ebb of tidal water to cause the louvers to remain closed to allow solids carried by the ebb water to build up and form with the tire barrier revetment an anti-erosion levee

---

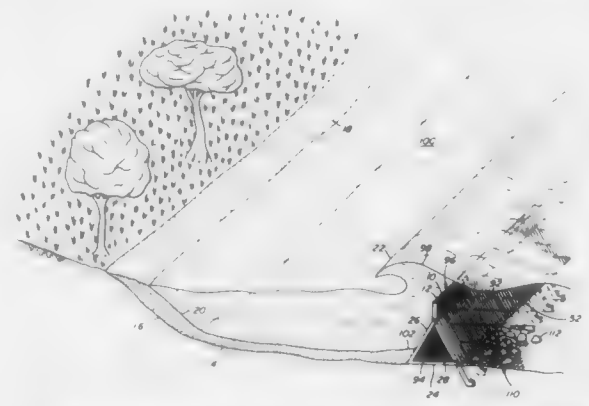
PERMEABLE BREAKWATER

Francis S. Atkinson, 6550 Orleans Ave., New Orleans, La. 70124, and William G. McDougal, P.O. Box 1418, Philomath, Oreg. 97370

Filed Jan. 23, 1989, Ser. No. 299,493
Int. Cl.[5] E02B *3/06*
U.S. Cl. 405—30 **23 Claims**

1. A permeable breakwater adapted for underwater installation offshore comprising:



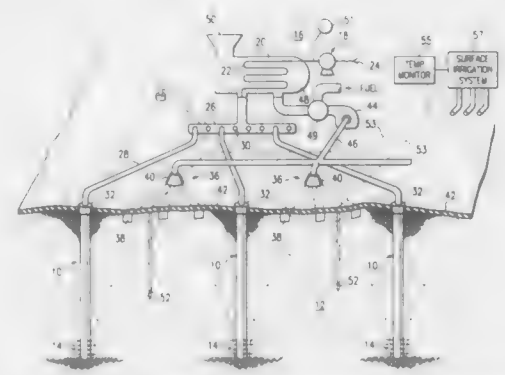
a base;

a seaward permeable wall projecting upward from the seaward side of said base;

a landward permeable wall having one end connected to said base and projecting upward from the landward side of said base and having another end attached to said seaward permeable wall, said landward and seaward permeable walls having apertures for the flow of water therethrough; and

a permeable wave wall projecting upwardly at an angle to said seaward permeable wall to reflect waves and dissipate wave energy;

said seaward permeable wall includes spaced anchor sections projecting from said seaward permeable wall, and



said anchor sections include a foot projecting at an angular deviation to said seaward permeable wall.

5,011,329

IN SITU SOIL DECONTAMINATION METHOD AND APPARATUS

Joseph M. Nelson, Wilmington, Del., and Garland R. Rau, Lewisville, Tex., assignors to Hrubetz Exploration Company, Dallas, Tex.

Filed Feb. 5, 1990, Ser. No. 458,084
Int. Cl.[5] E02D *3/11*
U.S. Cl. 405—128 **53 Claims**

1. A method for in situ decontamination of an earth site, comprising the steps of:

forming one or more wells in the contaminated site;

heating a gas;

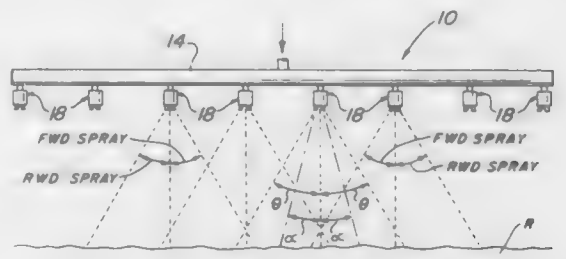
pumping the heated gas down said well so that said gas permeates earth materials at the site and vaporizes earth moisture and contaminants therefrom;

controlling the gas temperature and injection rate to control recondensation of liquid ahead of a heat front; and

recovering vaporized contaminants at the surface of the site.

5,011,330

FOAM DISTRIBUTION APPARATUS



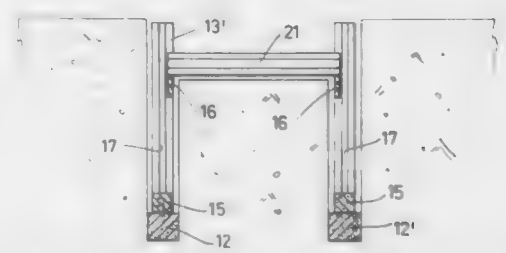
Paul A. Kittle, and David Manlowe, both of West Chester, Pa., assignors to Rusmar Incorporated, West Chester, Pa.

Filed Aug. 8, 1990, Ser. No. 564,367
Int. Cl.[5] B09B *1/00*
U.S. Cl. 405—129 **10 Claims**

1. In a system for laying a blanket of foam on a waste disposal landfill, the system including a vehicle for traversing the landfill and a foam generator carried by the vehicle, a foam distribution apparatus comprising:

an elongate manifold for mounting on the rear end of the vehicle transverse to the direction of movement of the vehicle having an inlet for receiving the foam from the generator;

a plurality of nozzle assemblies fixed to said manifold at spaced intervals along the length thereof, each assembly including a holder having a first bore communicating with said manifold for receiving the foam therefrom, second and third bores communicating with said first bore, and



first and second spray nozzles communicating respectively with said second and third bores for producing a foam spray in first and second downward directions with respect to the direction of movement of the vehicle, the first direction being to one side and, forward, and the second direction being to the opposite side and rearward; whereby all sides of any projecting or recessed objects in the landfill are reached by the foam.

5,011,331

METHOD AND STRUCTURAL ELEMENTS FOR CONSTRUCTION UNDERGROUND GARAGES

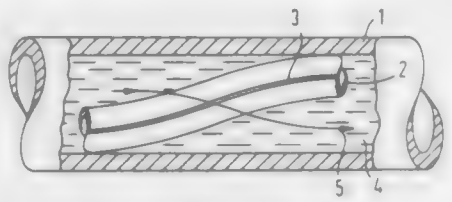
Amedeo Clavarino, Viale Brianza, 12, 20127 Milano, Italy, assignor to Armedio Clavarino; Ferruccio Clavarino; Lucca Clavarino, all of Milan; Massino Medri and Umberto Capelli, both of Turin, all of, Italy

Filed Nov. 20, 1989, Ser. No. 439,294
Claims priority, application Italy, Nov. 25, 1988, 22734 A/88
Int. Cl.[5] E21D *10/00*
U.S. Cl. 405—149 **11 Claims**

1. A method for constructing underground garage parking units, comprising forming two parallel walls by sinking two rows of spaced pillars into the ground, and inserting a plurality of sheet piles between adjacent pillars in each row thereof, whereby each row of pillars and the sheet piles therebetween form one of said two walls, the lower sheet piles of each said plurality thereof being subsequently removable, thereafter digging a tunnel between said two walls, removing said lower sheet piles to uncover vertical portions of the earth at opposite sides of said tunnel, inserting a plurality of tubular elements from said tunnel into the vertical portions of earth thus uncovered, and removing the earth soil from inside the tubular elements to form garage parking units therein.

5,011,332

APPARATUS AND METHOD FOR INTRODUCING A CABLE-LIKE ELEMENT INTO A PIPE AND ELEMENTS SUITABLE THEREFOR



Dieter Kunze, Neuried, and Wolfgang Giebel, Planegg, both of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed Nov. 3, 1989, Ser. No. 431,198

Claims priority, application Fed. Rep. of Germany, Nov. 14, 1988, 3842122

Int. Cl.[5] F16L *1/12*

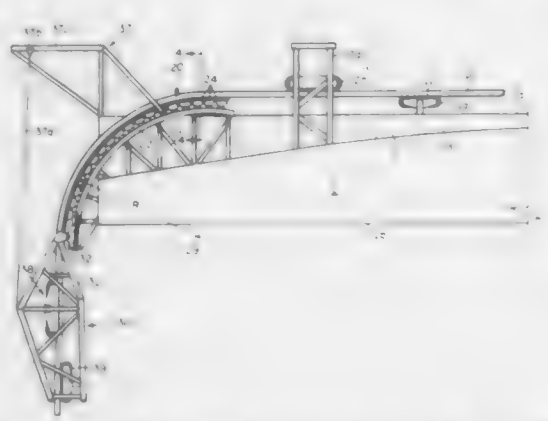
U.S. Cl. 405—158 **30 Claims**

28. A cable-like element comprising:

an outer jacket having an exterior surface; and

a plurality of solid, radially extending projection means integrally formed on said exterior surface of said outer jacket for creating turbulence and thereby promoting oscillatory movement of said cable-like element in a selected direction in a pipe together with a flow of flowing agent moving in said pipe in said selected direction.

5,011,333



UNDERWATER PIPE LAYING APPARATUS

Glenn A. Lanan, Houston, Tex., assignor to Intec Engineering, Inc., Houston, Tex.

Filed Jul. 3, 1990, Ser. No. 547,294

Int. Cl.[5] F16L *1/14;* **B63B** *35/03*

U.S. Cl. 405—166 **20 Claims**

1. Apparatus for laying a continuous metal pipe along the bottom of a body of water from a surface vessel comprising:

means on said vessel for producing a continuous metal pipe in a substantially linear stress free condition and extending longitudinally toward one end of said vessel;

means defining a pipe overbending track structure adjacent said one end of said vessel, said overbending structure having an arcuate periphery in a vertical plane extending from a position overlying said vessel and aligned with said continuous metal pipe to said one end of said vessel;

pipe conveyor means mounted along said arcuate periphery of said overbending structure;

means on said overbending structure defining an arcuate track parallel to said arcuate periphery of said overbending structure;

carriage means movable along said arcuate track to any selected one of a plurality of positions;

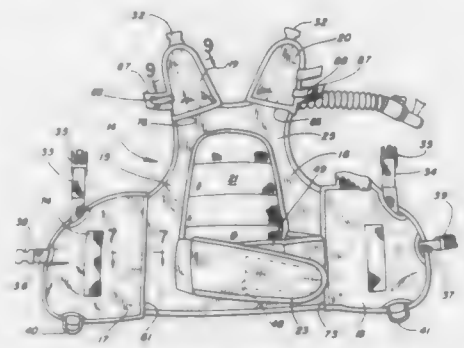
a stinger frame straddling said overbending structure and having its forward end horizontally pivotally secured to said carriage means;

a first roller means carried by said stinger frame and engagable with the upper surface of said continuous pipe to bend said pipe into engagement with a selected portion of said pipe conveyor means determined by the selected position of said carriage means in said arcuate track;

a second roller means carried by said stinger frame in longitudinally spaced relationship to said first roller means and engagable with the bottom surface of said continuous pipe to reversely bend said pipe into a substantially linear configuration for discharge into the water; and

means for selectively positioning said carriage means along said arcuate track, thereby determining the entry angle of the continuous pipe into the water.

5,011,334



BUOYANCY COMPENSATOR WITH INTERCHANGEABLE ACCESSORIES

Marjorie Vorhauer, Spring Valley, Calif., assignor to Soniform, Inc., El Cajon, Calif.

Filed Jun. 22, 1989, Ser. No. 370,271

Int. Cl.[5] B63C *9/24*

U.S. Cl. 405—186 **14 Claims**

1. A buoyancy compensator comprising a vest having a back portion, right and left side flaps, and right and left shoulder flaps, a pocket removably inserted over one of the flaps, said one of said flaps extending into but not through said pocket, and means for removably attaching the pocket to said one flap.

5,011,335

METHOD FOR MAKING FOUNDATION FOR A JACKABLE PLATFORM, AND MEANS FOR CARRYING OUT THE METHOD

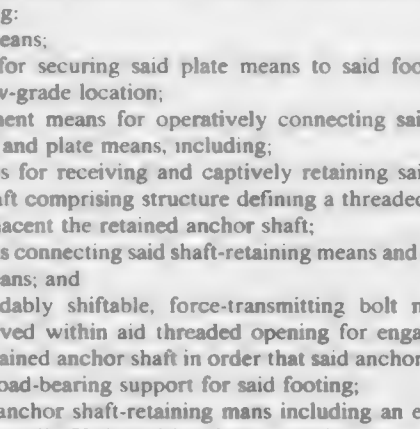
Svein Fjeld, Oslo, Norway, assignor to Norwegian Contractos A/S, Stabekk, Norway

PCT No. PCT/NO88/00042, § 371 Date Feb. 14, 1989, § 102(e) Date Feb. 14, 1989, PCT Pub. No. WO88/08902, PCT Pub. Date Nov. 17, 1988

PCT Filed May 13, 1988, Ser. No. 299,991

Claims priority, application Norway, May 14, 1988, 872007

Int. Cl.[5] E02B *17/00*



U.S. Cl. 405—204 **15 Claims**

1. A method for positioning, in a sea, a platform having a buoyant deck and having a plurality of legs extending downwardly from said platform, said plurality of legs being movable vertically relative to said platform and being spaced apart from one another in a predetermined manner, comprising the steps of:

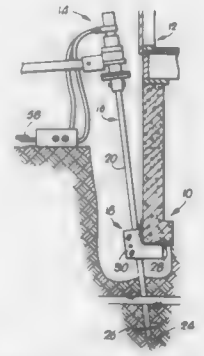
arranging at least one vertically oriented tubular element on the sea bottom at a position corresponding to a position at which at least one of said plurality of legs is desired to be located;

at least partially filling said at least one tubular element with a filling material;

lowering said at least one of said plurality of legs relative to said platform until a bottom end of said at least one of said plurality of legs presses against said filling material which was previously filled into said at least one tubular element; and

raising said platform relative to said at least one of said plurality of legs so as to cause said platform to be elevated above the level of the sea.

5,011,336



UNDERPINNING ANCHOR SYSTEM

Daniel Hamilton; Robert M. Hoyt, both of Centralia; Patricia J. Halferty, Columbia, and J. Thomas Odom, Centralia, all of Mo., assignors to A. B. Chance Company, Centralia, Mo.

Filed Jan. 16, 1990, Ser. No. 464,937

Int. Cl.[5] E02D *5/00*

U.S. Cl. 405—230 **11 Claims**

1. An underpinning bracket assembly adapted for interconnecting a foundation, footing or the like with an embedded earth anchor presenting an upstanding anchor shaft whereby the anchor will support the footing, said bracket assembly comprising:

plate means;

means for securing said plate means to said footing at a below-grade location;

attachment means for operatively connecting said anchor shaft and plate means, including;

means for receiving and captively retaining said anchor shaft comprising structure defining a threaded opening adjacent the retained anchor shaft;

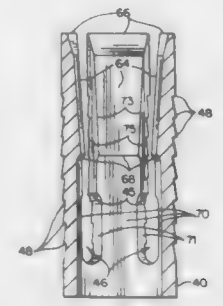
means connecting said shaft-retaining means and said plate means; and

threadably shiftable, force-transmitting bolt means received within aid threaded opening for engaging said retained anchor shaft in order that said anchor becomes a load-bearing support for said footing;

said anchor shaft-retaining mans including an elongated, generally U-shaped bracket presenting an open lateral face with a top cross plate secured to the upper end thereof, said threaded opening being located through said top cross plate, and a retainer piece received within the open lateral face of said bracket.

5,011,337

MINE ROOF EXPANSION ANCHOR SHELL AND LEAF



Carl A. Clark, and Raymond L. Wright, both of New York, N.Y., assignors to The Eastern Company, Naugatuck, Conn.

Division of Ser. No. 264,050, Oct. 28, 1988, Pat. No. 4,913,593. This application Apr. 7, 1989, Ser. No. 334,723

The portion of the term of this patent subsequent to Apr. 3, 2007, has been disclaimed.

Int. Cl.[5] E21D *20/02*

U.S. Cl. 405—261 **35 Claims**

15. A mine roof expansion anchor leaf of malleable iron having a lower end integrally attached to a ring-like base portion of an expansion anchor, and extending along an axis from said lower end to an upper end, said leaf comprising:

(a) an inner, an outer and two side surfaces, said side surfaces each having an inner edge at which said side surfaces meet said inner surface, and an outer edge at which said side surfaces meet said outer surface;

(b) said inner surface including a first portion extending from said upper end for a first axial distance, and a second portion extending from a juncture with said first portion to said lower end;

(c) said outer surface including a plurality of serrations formed as a substantially evenly spaced succession of steps lying in substantially evenly spaced, parallel planes extending laterally for the full width of said outer surface and joined by surface portions sloping outwardly toward said lower end, said serrations extending from said lower end for at least ⅓ of the distance to said upper end; and

(d) a first succession of said steps beginning at said lower end having a radial depth greater than the radial depth of a second succession of steps extending from said first succession toward said upper end of said leaf.

5,011,338

CANAL TRIMMING MACHINE

D. William Giroux, 694 Umpqua Place, LaConner, Wash. 98257; James N. Ferry, 21575 Bonanza Blvd., Elkhorn, Nebr. 68022; Kendall J. Kelly, 708 Normal, Woodbine, Iowa 51579; Thomas G. Bell, 608 S. Main St., Ida Grove, Iowa 51455; Conway P. Narby, 15 Calle Christina, Rancho Santa Margarita, Calif. 92588, and Gary L. Patburg, 3701 Mujica Pl., Brea, Calif. 92621

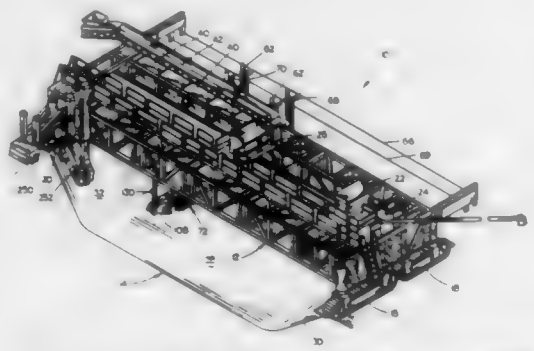
Filed Apr. 10, 1990, Ser. No. 507,615

Int. Cl.[5] E02B *5/02*

U.S. Cl. 405—268 **28 Claims**

1. An apparatus for trimming the bottom and sides of an earthen irrigation canal having water therein, comprising,

an elongated frame means extending transversely across the canal and having opposite ends, a forward end and a rearward end,



propulsion means on the ends of said elongated frame means for propelling said frame means at least forwardly along the length of the canal,

means for raising and lowering said frame means relative to said propulsion means,

a first trimmer means selectively longitudinally movably mounted on said frame means and having an elongated rotary trimmer mounted thereon, the longitudinal axis of said rotary trimmer being disposed parallel to the length of the canal for trimming at least a portion of the bottom and at least a portion of one of the sides of the canal as the first trimmer means is moved longitudinally on said frame means,

means for vertically moving said rotary trimmer,

said first trimmer means including a dredge pump means for

pumping the material trimmed by said rotary trimmer to a location outside of the canal,

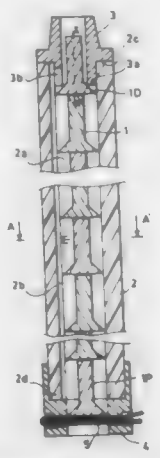
an elongated spreader means mounted on said frame means rearwardly of said first trimmer means which is normally positioned in the water of the canal closely adjacent at least a portion of the trimmed canal to fill low spots in the trimmed canal with rock material,

hopper means on said frame means above said spreader means for storing rock material thereon,

means for supplying said rock material to said hopper means, and means connecting said hopper means with said spreader means for supplying said rock material to said spreader means.

5,011,339

PROCESS FOR DISTRIBUTION OF PIECES SUCH AS RIVETS, AND APPARATUS FOR CARRYING OUT THE PROCESS



Jean-Marc Aurtoi, and Philippe Bornes, both of Flourens, France, assignors to Ste. Ateliers de la Haute-Garonne-ets Auriol et Cie, Balma, France

Filed Dec. 7, 1989, Ser. No. 447,501

Claims priority, application France, Dec. 8, 1988, 88 16292

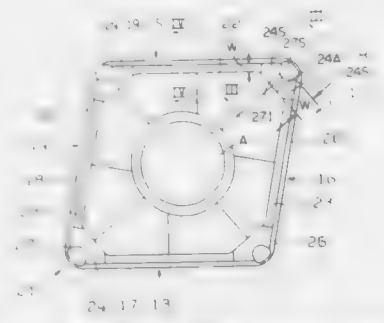
Int. Cl.[5] B65G *53/016, 51/018*

U.S. Cl. 406—191 **6 Claims**

1. A process for dispensing identical pieces having a symmetry of revolution about an axis, comprising: providing a tube (2) having a hollow center (*2a*) and a shape corresponding to the transverse section of the greatest diameter of the pieces for assuring a peripheral guiding of said pieces at the level of this section, arranging the pieces one after another in the interior of the tube (2) with their axes of revolution extending along the longitudinal axis of said tube and feeding one end of said tube with a compressed fluid for assuring the transfer of the pieces toward an open dispensing end (*2d*) of said tube, admitting the compressed fluid into the one end of the tube behind the piece closest to said one end of the tube and distributing the fluid along the length of the tube through at least one longitudinal passageway (*2b*) on the internal surface of said tube and opening into the hollow center (*2a*) thereof for exerting the pressure of the fluid along the hollow center in the spaces (E) between the pieces, to the piece (1P) closest to the dispensing end on which said pressure acts for assuring the transfer toward the dispensing end (*2d*).

5,011,340

DOUBLE-SIDED CUTTING INSERT



Lars T. Pettersson, Glen Rock, N.J., and Jörgen V. Wiman, Sandviken, Sweden, assignors to Sandvik AB, Sandviken, Sweden

Filed Sep. 26, 1989, Ser. No. 413,005

Claims priority, application Sweden, Sep. 26, 1988, 8803389

Int. Cl.[5] B23C *5/02*

U.S. Cl. 407—114 **10 Claims**

1. A double-sided cutting insert for chipforming machining comprising a generally polygonal body defining uppermost and lowermost planes, said body having upper and lower rake faces, clearance face means intersecting said upper and lower rake faces to define on each of said rake faces cutting edge means extending between adjacent corners of the body, each rake face including a plurality of corner chip faces located at respective corners of said insert and lying in an associated one of said uppermost and lowermost planes to define a chip deformer when in a cutting position and to define an insert support when facing a holder, and recessed surface means extending inwardly from said corner chip faces toward a center of the insert and being recessed relative to respective ones of said uppermost and lowermost planes, each rake face further including main chip faces disposed along respective ones of said cutting edges and being recessed relative to said corner chip faces.

5,011,341

TWO SPEED GEAR SYSTEM FOR POWER TOOL

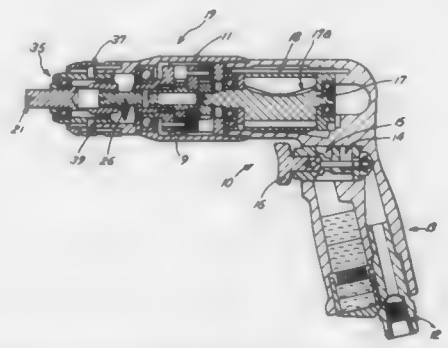
Morton S. DeGroff, Stryker, Ohio, assignor to The Aro Corporation, Bryan, Ohio

Filed Nov. 9, 1989, Ser. No. 434,925

Int. Cl.[5] B23B *47/04*

U.S. Cl. 408—124 **5 Claims**

1. In a power tool having a rotary driven output spindle defining an axis, a motor having an output motor shaft axially aligned with the spindle, transmission means connecting the output motor shaft with the spindle, and control means for operating the motor, the power tool further comprising, in combination:



a two speed gear system incorporated in the transmission means to provide a first drive having a higher speed, lower torque output, and a second gear reduced drive having a higher torque output and lower speed output relative to the first drive, said two speed gear system also including means for selectively engaging the first or the second drive;

said system comprising:

an orbital gear member concentric with the axis and motor shaft;

a sun gear driven by the motor;

a planetary gear mounted on a plate concentric with the axis,

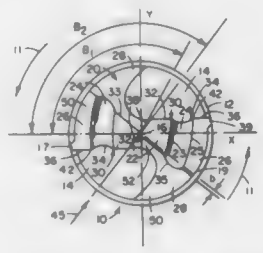
said sun gear continuously cooperative with the orbital gear member by means of the planetary gear to provide the second drive output from said plate, said sun gear also including axial gear means for cooperative direct driving engagement with the spindle in response to the means for selectively engaging the first drive;

said spindle also having a first axial gear means cooperative with the axial gear means of the sun gear;

said spindle further including second means for drivingly engaging the plate in the second drive position;

said means for selectively engaging including means for axially translating the spindle between the first drive position of engagement of the spindle and sun gear axial drive means and the second drive position of engagement of the spindle and plate.

5,011,342



TWIST DRILL

George Hsu, Martinez, Ga., assignor to 501 Greenfield Industries, Inc., Evans, Ga.

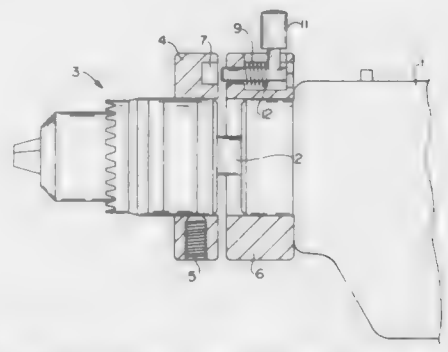
Filed Mar. 14, 1988, Ser. No. 168,074

Int. Cl.[5] B23B *51/02*

U.S. Cl. 408—224 **34 Claims**

1. A twist drill comprising a fluted barrel portion having a point end and point surfaces formed on said point end, said point surfaces including an inner flank surface extending from the center of said point end to the inner extent of a groove surface, an outer flank surface extending from the outer diameter of said point end to the outer extent of said spiral groove surface and a split surface, said groove being formed along a generally circular path about the center axis of said drill.

5,011,343



DRILLS

Oded Saban, and Yaron Berger, both of 5 Kashani Street, Ramat Aviv G, Israel

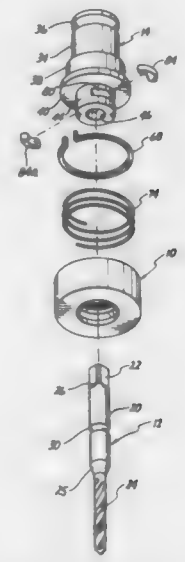
Filed Nov. 15, 1989, Ser. No. 436,639

Int. Cl.[5] B23B *31/06*

U.S. Cl. 408—240 **3 Claims**

1. In drilling apparatus which include at least one chuck having a drilling axis, an attachment comprising first and second collars the first of which is firmly connected with the exterior part of the chuck and has at its side which is directed away from the drill holding jaws a bow-shaped recess and elastic buffers in the recess at respective ends of the recess while the second collar is fitted on the body of the respective drilling apparatus, a driver body parallel to said axis extending from the second collar towards the said recess and means for engaging the driver body in said recess in the first collar.

5,011,344



POSITIVE DRIVE ADAPTER

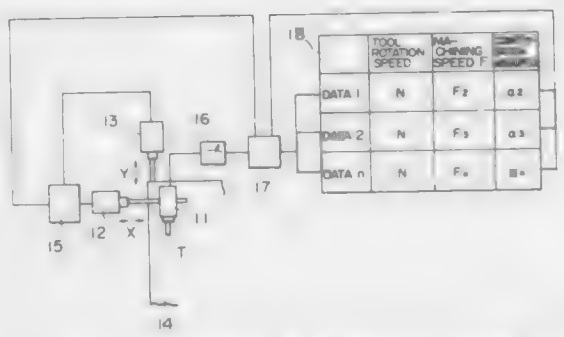
Allan S. Johnson, Newport Beach, Calif., assignor to Tapmatic Corporation, Irvine, Calif.

Continuation of Ser. No. 278,371, Dec. 1, 1988, abandoned. This application Aug. 27, 1990, Ser. No. 572,349

Int. Cl.[5] B23B *31/12*

U.S. Cl. 408—240 **4 Claims**

1. In a quick change holder having a longitudinal axis adapted for holding a tool which has an end part and which has a holding formation in the form of a groove in it spaced at a



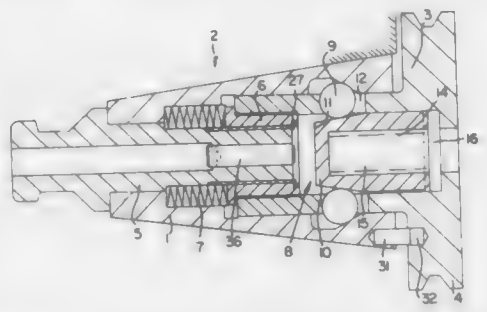
predetermined distance from the end of the tool, and comprising a body configured to receive the tool, including a portion to receive said end part of the tool, an axially moveable collar moveably mounted upon said body having at least one position for holding the tool and at least one position for releasing the tool from the holder and including a radially inner section, and at least one element contained in at least one slot defined in the body for engaging said groove in said tool in holding engagement when said collar is in said at least one position for holding the tool and for disengaging from the groove in the aforesaid tool to permit the aforesaid tool to be released from holding engagement when said collar is in said at least one release position, the improvement comprising said at least one element having an arcuate truncated toroidal configuration having a convex radially inner surface configured to engage a complementary section of the said holding formation in the form of a groove in the tool, the radially outer surface of said at least one element being convex, the collar having a radially inner surface including a substantially flat portion and a portion having a recess defined therein for receiving the convex radially outer surface of said at least one element in said at least one release position of the collar, whereby in said at least one release position said at least one element is movable radially outwardly into said recess in said inner surface of said collar by virtue of removal of said tool from engagement with said at least one element, and whereby in said at least one holding position said substantially flat portion of said collar engages with said radially outer surface of said at least one element to hold the radially inner surface of said at least one element in holding engagement with said complementary section of said holding formation in the form of a groove in said tool.

5,011,345

CONTOUR MACHINING METHOD AND APPARATUS FOR PRINTED CIRCUIT BOARD

Masao Nishigai, Ayase; Tamio Otani, Hadano; Yasuhiko Kanaya, Machida, and Tetsuo Murakami, Atsugi, all of Japan, assignors to Hitachi Seiko Co., Ltd., Tokyo, Japan

Filed Dec. 6, 1989, Ser. No. 446,588
Claims priority, application Japan, Dec. 12, 1988, 63-312018
Int. Cl.[5] B23C *1/00*
U.S. Cl. 409—132 **4 Claims**



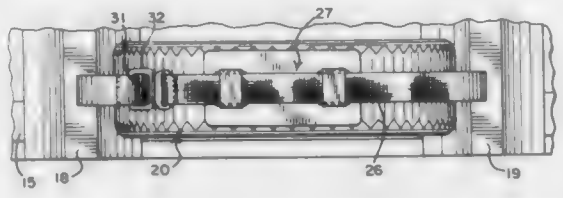
1. A method of machining the contour of a printed circuit board by effecting a relative feed movement between a rotating tool and the outer periphery of the printed circuit board, said method comprising: detecting the electrical current value of a drive motor for driving a spindle to which said tool is attached; and changing, when the detected electrical current value of said spindle drive motor has reached a predetermined current value immediately before tool breakage, the machining condition in such a manner as to reduce the electrical current value of said spindle drive motor and, at the same time, changing the tool diameter compensation amount to a value corresponding to the machining condition after the change.

5,011,346

MOUNTING DEVICE WITH CONICAL SHANK

Emile Pfalzgraf, Bouxwiller, France, assignor to E.P.B. Emile Pfalzgraf, Societe Anonyme, Bouxwiller, France

Filed Feb. 20, 1990, Ser. No. 486,876
Claims priority, application France, Jan. 23, 1990, 90 00901
Int. Cl.[5] B23C *9/00;* **B23B** *31/10*
U.S. Cl. 409—234 **13 Claims**



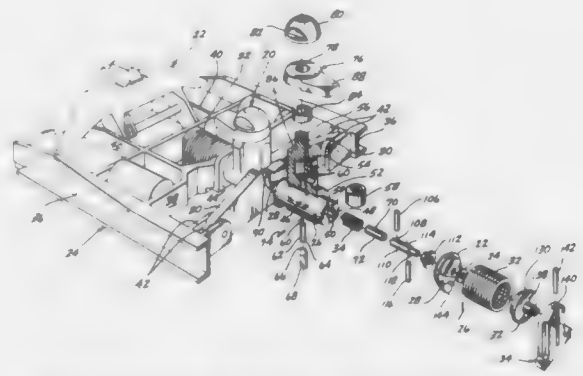
1. Mounting device with conical shank, particularly a 7/24ths cone, for cone-to-surface application for attachments, toolholders and tools, essentially constituted by a cone (1) for mounting in spindle (2), by a front part (3) having a portion thereof centered in the cone (1) and provided with a flange (4) for application via its rear face against the front face of the spindle (2), and by a knob (5) connecting for assembly the cone (1) and the front part (3) by means of an intermediate threaded element (6), on which bears an elastic unit (7) formed of Belleville washers intended to apply the cone (1) into the spindle (2) in locking position and mounted in compression between the said cone (1) and the front part (3), characterized in that between the cone and said portion is provided a device (8) for locking the mutual position of the cone (1) and the front part (3), in mounting position in the spindle (2) with application of the flange (4) against the face of the said spindle (2), by gripping at least two balls (9) between the said cone (1) and front part (3).

5,011,347

UNIVERSAL WHEEL RESTRAINING CLEAT AND STRAP ASSEMBLY FOR WHEEL CHOCKS

Robert L. Bullock, Antioch, Ill., assignor to Standard Car Truck Company, Park Ridge, Ill.

Filed Nov. 29, 1989, Ser. No. 443,244
Int. Cl.[5] B60P *3/077, 3/075*
U.S. Cl. 410—9 **11 Claims**



1. A wheel harness for use in a vehicle hold down apparatus in a railway car to secure a vehicle wheel having a pneumatic tire to the floor of the car, wherein a chock is secured to the floor at each side of the tire tread, and the harness is connected to the chocks, said harness including strap means of flexible, substantially non-stretchable material substantially circumferentially overlying the tire tread and connected to the chocks, and a substantially plate-like cleat carried on the strap and disposed on and substantially at the top of the tire tread, said cleat being molded of plastic having high strength and resilient characteristics, said resilient characteristics allowing the cleat to conform to the contour of the tire tread, said cleat having openings through which the strap is threaded, and projections on the tire contacting surface which produce a slip-free engagement with the tire tread when the strap is tightened.

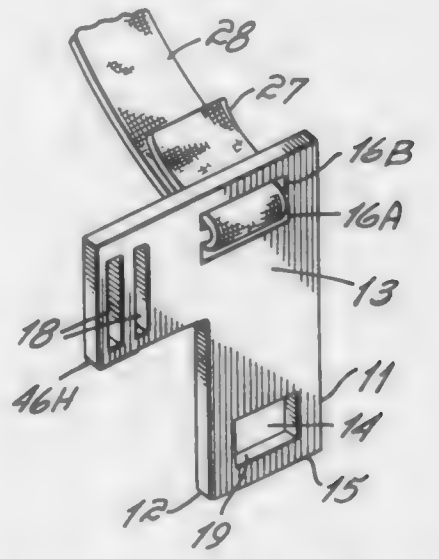
5,011,348

AUTOMATICALLY RETRACTABLE CENTERLINE RESTRAINT

Tom M. Jensen, Kirkland, and Herbert E. Hamilton, Edmonds, both of Wash., assignors to The Boeing Company, Seattle, Wash.

Filed Dec. 15, 1989, Ser. No. 451,434
Int. Cl.[5] B60P *7/08*
U.S. Cl. 410—79 **14 Claims**

1. An automatically retractable restraint assembly for vertically restraining a body by engagement with a side of the body, the restraint assembly comprising:
a frame;
a shaft having a horizontal axis mounted in said frame for rotation about said horizontal axis;
a first head on said shaft that rotates with said shaft, said first head normally extending above said frame in an upright position and having a toggle extending outwardly therefrom to engage the side of and thereby vertically restrain the body;
a locking means on said shaft that rotates with said shaft, said locking means having a pair of contacting surfaces disposed on opposite sides of said horizontal axis of said shaft and a pair of projections disposed on opposite sides of said horizontal axis of said shaft;
a pair of release wings pivotally mounted to said frame on opposite sides of said horizontal axis of said shaft, each release wing having an extension in cooperative engagement with one of said contacting surfaces of said locking means to maintain said first head in its normally upright position, and whereby rotation of one of said release wings upon engagement by the body disengages said extension from said one of said contacting surfaces of said locking means to allow said first head to rotate downwardly into said frame upon engagement by the body, and whereby one of said projections engages the extension of the other of said release wings to lock said first head in a down position upon rotation of said first head into said frame below the bottom of the body;
a first biasing means for urging said first head back to its normally upright position after passage of the body; and
a second biasing means for urging said first head toward the body should the body attempt to move out of engagement with said toggle.



5,011,349

TAILGATE MOUNTED CARGO RETAINING DEVICE

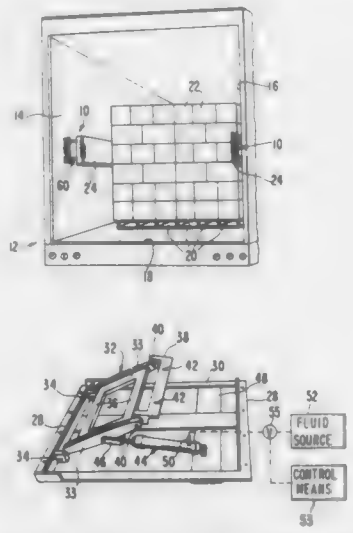
Glenn McAndrews, 402 E. Warren St., Lebanon, Ohio 45036

Filed Mar. 21, 1990, Ser. No. 496,650
Int. Cl.[5] A44B *11/06;* **B60P** *7/04*
U.S. Cl. 410—102 **18 Claims**

1. A device for securably retaining cargo in a vehicle having a tailgate with latches on opposing sides of said tailgate, each of said latches including a latch tongue and a backplate fixture, in circumstances where the tailgate of the vehicle is lowered into a horizontal postion, said device comprising:
a plurality of straps; and
two end connector members for fastening said straps and engaging a respective latch, each end connector member including an upper portion with strap attaching means,, a lower portion being integral with said upper portion, and a latch tongue receiving aperture located in said lower portion, said latch receiving aperture having sufficient

penetrable area to releaseably engage a tailgate latch tongue; and
whereby each end connector member is releaseably engagable into said respective latch, during said engagement each said tongue extendably penetrates said respective aperture and coacts with said respective backplate fixture, and whereby said cargo is retained by said straps when said straps are attached to said end connector members and said end connector members are engaged with said respective latches to fixedly attach the end connector members to said tailgate.

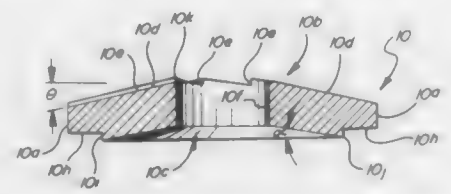
5,011,350



LOAD STABILIZING UNIT

Warren Brock, 5064-A N. Wishon, Fresno, Calif. 93704

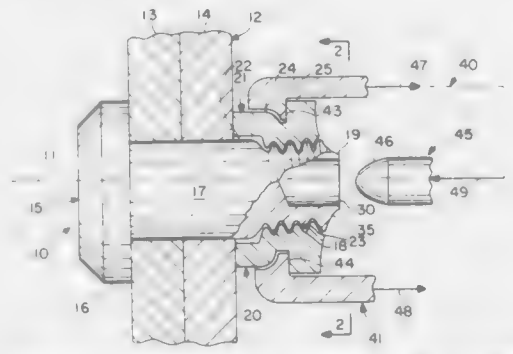
Filed Jul. 12, 1989, Ser. No. 379,505
Int. Cl.[5] B61D *45/00*
U.S. Cl. 410—128 **6 Claims**



1. A stabilizing unit for a load carried on a vehicle having a side wall with an inner surface comprising:
a main frame adapted to be secured to the inner surface of the vehicle side wall, said main frame having a pair of side members;
a drive hinge having a pair of sides and pivotally mounted at one of said sides on one side member of the main frame;
a load stabilizing panel;
means pivotally coupling the panel to the other side of the drive hinge for movement from a retracted position in which the panel is adjacent to the inner surface of the side wall to an operative position spaced inwardly from the inner surface of the side wall against a load adjacent thereto; and

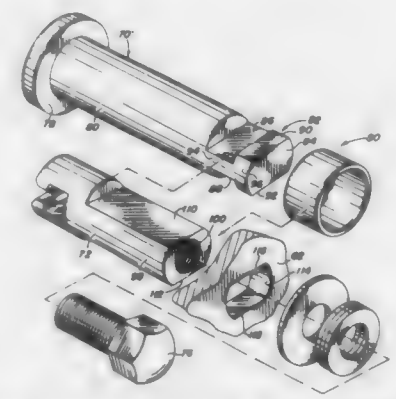
extensible means coupled with the drive hinge near the other side thereof and to the main frame near the other side

member of the main frame for releasably holding the panel in its operative position.



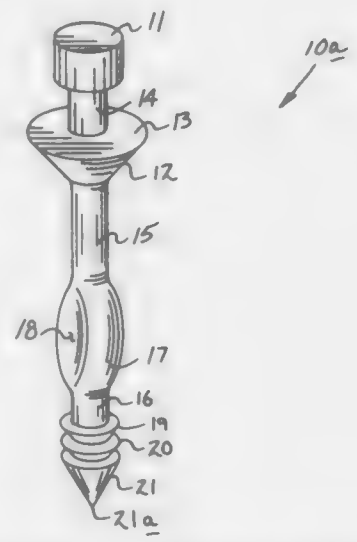
5,011,351
WEDGE LOCK DIE WASHER
Sydney L. Terry, 47 Pine Ct., Grosse Point Farms, Mich. 48236
Filed Mar. 19, 1990, Ser. No. 495,618
Int. Cl.[5] F16B *39/24, 39/282*
U.S. Cl. 411—144 **21 Claims**

1. A locking fastener comprising an annular washer member having flat wrenching sides at an outer periphery thereof, having a convexly conical upper annular face within said outer periphery, having a plurality of circumferentially spaced teeth means on its upper conical surface, and defining a circular seating surface on its lower annular surface.



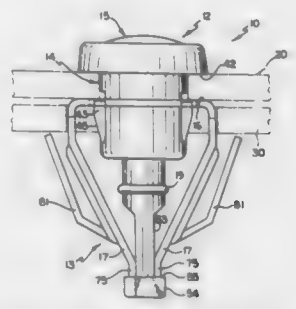
5,011,352
DEFLECTION TYPE THREAD LOCK FOR A THREADED FASTENER
Edwin E. Hatter, Torrance, Calif., assignor to Hi-Shear Corporation, Torrance, Calif.
Filed Sep. 8, 1989, Ser. No. 404,697
Int. Cl.[5] F16B *39/02*
U.S. Cl. 411—271 **8 Claims**

1. A fastener having a central axis comprising:
a pin having a shank, a free end, an external thread adjacent to its free end, and a reduced cross-section near its free end;
a collar having a body, an axial passage through said body, an internal thread in said passage so proportioned and arranged as to engage the external thread on said pin, said internal and external threads being so shaped, proportioned and arranged that the collar can freely be run onto the pin and tightened down without impediment between said threads, and when said collar is assembled to said pin to leave at least some of said reduced cross-section exposed beyond said collar;
said body having a shoulder so disposed and arranged as to be engageable by pulling means, whereby with the collar tightened onto the pin, said pulling means may be engaged to said shoulder and deflector means may be forced in



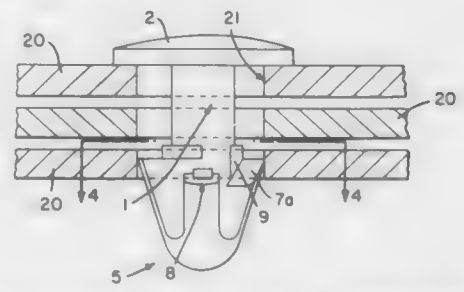
axial opposition to axial forces exerted by pulling means to deflect an end portion of the pin or of the collar into the axial path of the other to provide a thread lock to resist removal of the collar from the pin.

5,011,353
HIGH TEMPERATURE TURBINE ENGINE STRUCTURE
Gary L. Boyd, Tempe, Ariz., assignor to Allied-Signal Inc., Morris Township, Morris County, N.J.
Filed Dec. 6, 1988, Ser. No. 280,760
Int. Cl.[5] F16B *35/02*
U.S. Cl. 411—383 **12 Claims**



1. A high temperature hybrid ceramic/metallic fastener comprising:
an elongate ceramic portion having at one end thereof a head part of comparatively larger diameter, an integral elongate shank part of comparatively smaller diameter extending axially from said head part to an end termination portion thereof;
a metallic end fitting defining an axially extending thread defining feature, and reacting means for cooperating with a housing receiving said fastener for reacting torque applied to said end fitting via said thread defining feature;
said end fitting and said shank portion defining cooperating means for coaxially intersecuring one to the other to sustain an axially directed tensile force, whereby said ceramic portion is subjected only to said tensile force and is isolated by said torque reacting means from torque applied to said thread defining feature.

5,011,354
CONCRETE FASTENER APPARATUS
Ritch J. Brownlee, 4129 328th Pl. SE, Fall City, Wash. 98024
Filed Feb. 28, 1990, Ser. No. 486,294
Int. Cl.[5] F16B *15/00*
U.S. Cl. 411—439 **1 Claim**



1. A concrete fastener for assembling a support member to a concrete substrate, wherein the fastener comprises,
an upper cylindrical first head member defined by a first head diameter, and
a first cylindrical shank defined by a shank diameter integrally and coaxially mounted to a bottom surface of the first head member, and
an inverted and truncated conical second head member integrally mounted to a lower terminal end of the first cylindrical shank, and
a second cylindrical shank integrally and coaxially mounted to a lower terminal end of the second head member, wherein the second cylindrical shank is defined by a shank diameter, and
an anchor means integrally and coaxially mounted to a lower terminal end of the second cylindrical shank for securement to the concrete substrate, and
a third cylindrical shank coaxially aligned with and mounted to a lower terminal end of the anchor member, wherein the third cylindrical shank is defined by a shank diameter, and wherein the anchor means extends beyond the second and third cylindrical shanks, and
wherein the conical second head member includes an upper annular surface spaced from and underlying the bottom surface of the first head member, and
wherein the anchor means is defined by an elliptical projection extending beyond the second and third cylindrical shanks, and
wherein the elliptical projection includes a concave elliptical recess formed on opposing sides of the elliptical projection to maintain geometrical integrity to the elliptical projection during enacting of the fastener through the support member, and
wherein a lower terminal end of the third cylindrical shank terminates in a plurality of inverted truncated conical anchors, and including a further terminal conical anchor terminating in a lower pointed end, wherein the anchors are defined by anchor diameters extending beyond and greater than the shank diameter of the third cylindrical shank.

5,011,355
PUSH BUTTON TYPE FASTENER RELEASABLE BY ROTATION
Inaba Motoshige, Kanagawa, Japan, assignor to VSI Corporation, Torrance, Calif.
PCT No. PCT/US89/00618, § 371 Date Oct. 6, 1989, § 102(e) Date Oct. 6, 1989, PCT Pub. No. WO89/07719, PCT Pub. Date Aug. 24, 1989
PCT Filed Feb. 15, 1989, Ser. No. 460,857
Claims priority, application Japan, Feb. 19, 1988, 63-35414
Int. Cl.[5] F16B *21/00*
U.S. Cl. 411—552 **5 Claims**

1. A push button type fastener comprising:
a stud assembly attachable to a moving side panel, said stud assembly including a stud with a cam at its tip, a wall portion at the rear position thereof and an engaging surface therebetween, and a spring; and
said cam having two planar surfaces spaced apart a distance;
a socket attachable to a fixed side panel, said socket including a base portion and a pair of resilient arms projecting angularly from said base portion and converging toward each other such that said base and said pair of arms substantially form a triangle, said resilient arms further having stopping surfaces at their tips;
wherein said stud can be pushed between said pair of resilient arms, against the yielding bias of the spring, and then released so that said engaging surface is stopped at said stopping surfaces and said panels are fastened together;
wherein said panels can be unfastened by rotating said stud;
and wherein said cam and said wall portion of said stud assembly are directly connected together in a twisted relation without any intervening structure and the portion of said cam that is immediately adjacent said wall portion forms said engaging surface, said engaging surface having a thickness substantially equal to the distance between the two planar surfaces of said cam.

5,011,356
PANEL FASTENER
Miguel C. Fernandez, Sao Paulo, Brazil, assignor to ITW-Mapri Industria e Comercio LTDA, Sao Paulo, Brazil
Filed Jan. 25, 1990, Ser. No. 469,905
Int. Cl.[5] F16B *21/00*
U.S. Cl. 411—553 **16 Claims**

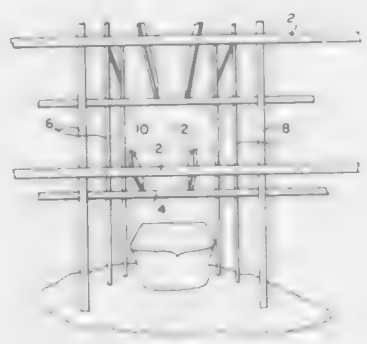
1. A fastener for fastening together a plurality of overlap-

ping panels, having holes defined therein and through which said fastener is to be inserted for fastening said panels together, comprising:

a body portion having a longitudinal axis;

a head provided upon a first end of said body portion for engaging a first outer surface of a first one of said plurality of nanels when said fastener is inserted through said holes of said panels;

a pair of diametrically opposed resiliently flexible fingers provided upon a second end of said body portion for engaging a second outer surface of a second one of said plurality of panels when said fastener is inserted through said holes of said panels so as to fasten said panels together, between said head of said fastener and said flexible fingers, in such a state that said panels are disposed in a non-compressed overlapping state with respect to each other; and



a pair of diametrically opposed inclined cam portions, provided upon said body portion at a position which is axially between said first and second ends of said body portion and within a plane substantially perpendicular to a plane within which said flexible fingers are disposed, for engaging said second outer surface of said second one of said plurality of panels when said fastener has been inserted through said holes of said panels so as to compress said overlapping panels together from said non-compressed state to a compressed, overlapped state when said fastener is rotated about said longitudinal axis thereof through means of an angular displacement of 90° from the position at which said flexible fingers engage said second outer surface of said second one of said panels.

5,011,357

BOAT/AUTO PARKING SYSTEM FOR MARINA

Richard Studler, 22 Cooper St., #1, Lake George, N.Y. 12845

Filed Jun. 9, 1989, Ser. No. 363,984
Int. Cl.[5] E04H *6/00*
U.S. Cl. 414—253 **16 Claims**

1. A method for parking boats and automobiles at marinas comprising the steps of:

providing a pallet having means thereon for receiving and supporting selectively either an automobile or a boat,

providing a storage area having a support structure,

placing a boat upon the pallet,

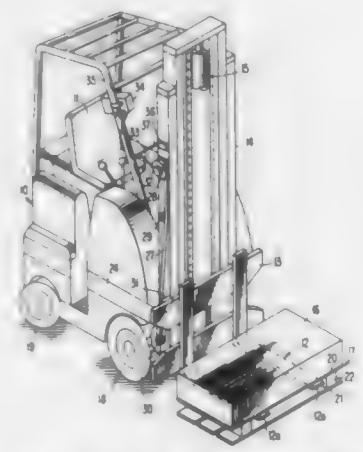
placing the pallet upon said support structure,

removing the pallet and the boat thereon from the storage area,

placing the boat and the pallet in the water,

removing the boat from the pallet,

placing an automobile upon the pallet, and,



placing the pallet in the storage area.

5,011,358

HEIGHT INDICATOR FOR A FORK LIFT TRUCK

Eric T. Andersen, and Edward A. Andersen, both of Rte. 1, Box 138A, Barboursville, Va. 22923

Filed Oct. 25, 1988, Ser. No. 262,311
Int. Cl.[5] B65G *1/04*
U.S. Cl. 414—273 **18 Claims**

1. A height indicator for use on a fork lift truck of the type having a vertically positionable fork operatively associated therewith, said height indicator for indicating to an operator of the fork lift truck the position of the fork with respect to a particular shelf of a shelving system within a warehouse independently of a control system of the fork lift truck, said height indicator comprising:

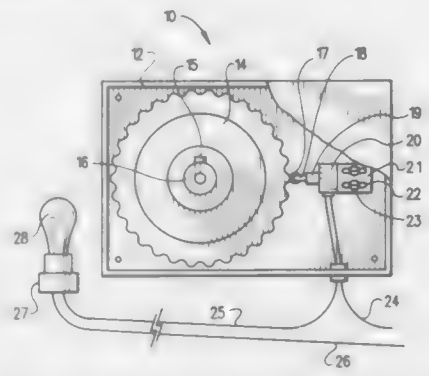
programmable memory means for storing information regarding the vertical location of a plurality of shelves of a shelving system, said information including a storage height and a retrieve height for each of the plurality of shelves,

a first sensing means for tracking the vertical position of a fork of a fork lift truck and sending signals representative of the sensed vertical position,

comparing means that receives the signals from said sensing means for comparing the sensed vertical position of the fork to the stored information of the vertical location of the plurality of shelves stored in said programmable memory means, and

a first display means that receives signals from said comparing means for indicating to the operator as the fork is controlled by the operator when the fork is positioned within a preselected vertical range of a selected shelf of the plurality of shelves, said preselected vertical range encompassing both the storage height and the retrieve height for the selected shelf, whereby the operator can load or unload between the fork and the shelves based on the indication of the display means within the predetermined range.

5,011,359



SILO ROTARY UNLOADER MONITOR

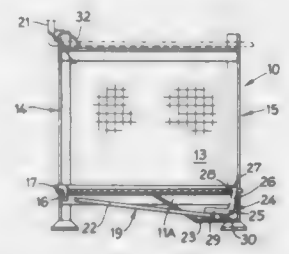
Edward McDonald, 270 S. Washington St., Lyndon Station, Wis. 53944

Filed Apr. 4, 1990, Ser. No. 503,950
Int. Cl.[5] B65G *65/38*
U.S. Cl. 414—289 **2 Claims**

1. In combination with a silo rotary unloader having a discharge chute, a stationary collector ring secured to said discharge chute, a suspension harness secured to said stationary collector ring, a rotary collector ring rotationally secured to said stationary collector ring, a frame secured to said rotary collector ring, a screw auger on said frame, drive means for rotating said screw auger and for rotating said rotary collector ring with respect to said stationary collector ring, a rotary monitor, comprising:

a wheel mounted for rotation with said rotary collector ring, said wheel having a cylindrical side wall provided with a sinusoidal wave pattern;

a limit switch mounted on said stationary collector ring, said limit switch having an actuating sensor biased into engagement with said sinusoidal wheel side wall; and



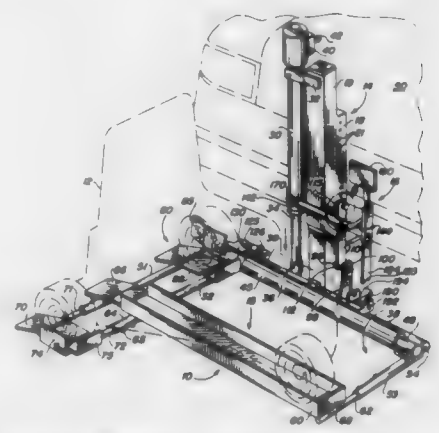
indicating means operably connected to said limit switch to indicate rotary speed of said wheel with respect to said stationary collector ring.

5,011,360

SELF-EMPTYING CONTAINER

David A. S. Abram, Troon, and Bruce W. Wishart, East Kilbride, both of Scotland, assignors to Empteezy Limited, West Lothian, Scotland

Filed Oct. 18, 1988, Ser. No. 259,264
Int. Cl.[5] B65G *65/00*
U.S. Cl. 414—424 **22 Claims**



1. A self-emptying free standing container having a base and being adapted to be lifted by a mechanical lift apparatus, the container including relatively movable parts movable to allow emptying, a latch mechanism to normally hold said parts together to prevent emptying, said latch mechanism having a latch member and an actuator member which extends underneath and below the base and is pressure actuated to release the latch member, there being further provided at a lower portion of the container, support means to space the actuator from the ground during storage or loading and to prevent actuation thereof, wherein the support means includes a plurality of spaced support members which are fixed to the container and depend below a level of the actuator, said support members providing open peripheral spaces therebetween which enable the support members to straddle in use a raised surface and allow the actuator member to engage the raised surface to actuate release of the latch by pressure of the raised surface on the actuator member.

5,011,361

VEHICLE MOUNTABLE CARRIER FOR THREE-WHEELED SCOOTER AND THE LIKE

Edward A. Peterson, 3240 Delaware St., Chandler, Ariz. 85225

Filed Oct. 27, 1988, Ser. No. 263,243
Int. Cl.[5] B60P *9/00*
U.S. Cl. 414—462 **11 Claims**

1. A vehicle-attachable carrier for transporting an object comprising:

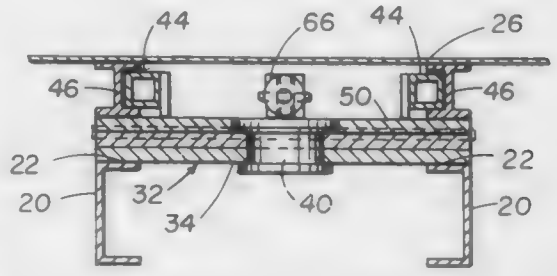
(a) a mast having a vertical lift apparatus associated therewith which life is selectively movable in an upward and downward direction said mast having an engagement member;

(b) means for detachably securing said mast to a vehicle;

(c) a platform operatively connected to said lift apparatus for supporting the object, said platform including a frame and pivotal from a horizontal position to a generally vertical position about a pivot axis; and

(d) a fold control means for controlling folding of said platform including:

(i) fold-up means for selectively engaging said engagement member, said fold-up means having a first position in engagement with said engagement member whereby said platform will pivot to said vertical position upon upward movement of said lift and a second position out of engagement with said engagement member; and



(ii) load responsive means responsive to the presence of an object supported on the platform for moving said fold-up means to said second position to maintain said platform in said horizontal position.

5,011,362

VEHICLE WITH MULTI-POSITIONABLE FLAT BED

Joseph A. Pijanowski, 14351 Irving St., Brooksville, Fla. 34609

Filed Sep. 29, 1989, Ser. No. 414,519
Int. Cl.[5] B60P *1/04*
U.S. Cl. 414—480 **7 Claims**

1. A roll-back flat-bed truck comprising a cab at the front end and a frame at the rear end and a flat bed secured thereto by securement means, the securement means including:

a hinge having a lower hinge half coupled to the frame

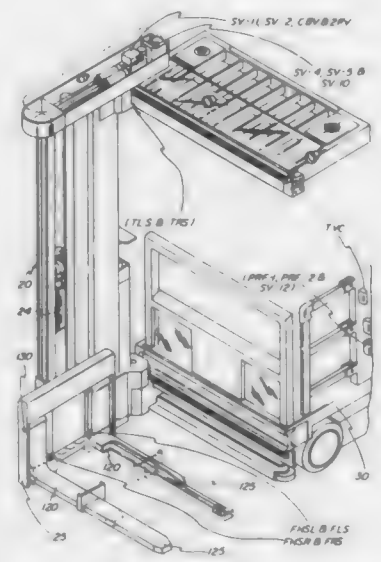
adjacent to the rear end of the frame and an upper hinge half coupled to the bed and a hinge pin coupling the hinge halves to allow tilting the upper hinge half and bed with respect to the lower hinge half and frame about a horizontal axis;

a swivel plate attached to the frame adjacent to the rear end of the frame and a swivel pin positioned in an aperture extending through the swivel plate and lower hinge half to allow swiveling of the bed with respect to the frame about a vertical axis;

an intermediate support attached to the upper surface of the upper hinge half with means to slidably couple the bed thereto to allow for rolling the bed longitudinally with respect to the intermediate support, hinge and frame;

first drive means to slide the bed longitudinally with respect to the intermediate support, hinge and frame;

second drive means to tilt the bed, intermediate support and upper hinge half with respect to the lower hinge half, swivel plate and frame; and



third drive means having a component adjacent to the front end of the intermediate support to swivel the bed, intermediate support and hinge with respect to the frame.

5,011,363

EXTEND AND RETRACT CONTROL FOR FORK LIFTS

Walter Conley, III, St. Marys; Ned E. Dammeyer, New Bremen, and Kim A. Klopfleisch, St. Marys, all of Ohio, assignors to Crown Equipment Corporation, New Bremen, Ohio

Filed Dec. 5, 1989, Ser. No. 446,222
Int. Cl.[5] B66F *9/06*
U.S. Cl. 414—666 **3 Claims**

1. In a materials handling vehicle including a power unit for moving the vehicle, a platform assembly supported on and being vertically movable relative to the power unit including an operator's station and controls for operating various functions of said vehicle, a load handler assembly mounted for traverse movement across the platform assembly from a home position to a limit position, a traverse motor for moving said load handler assembly across the platform assembly, fork carriage assembly mounted on and vertically moveable relative to the load handler assembly, extendable forks carried by said fork carriage assembly and movable by fork extension cylinders, and a control handle for controlling the traverse movement of the load handler assembly, the improvement comprising

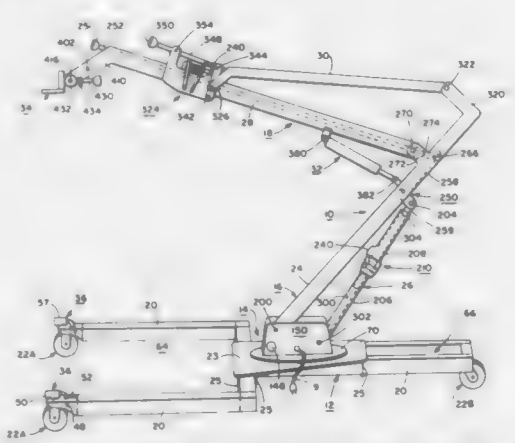
means responsive to movement of the control handle for controlling a supply of hydraulic fluid to power the traverse motor and to extend and retract the forks,

means for sensing the direction of movement of the control handle,

means for indicating the direction the load handler assembly is facing,

limit switch means for sensing when the fork carriage assembly has moved to its limit position on either side of the platform assembly,

transfer valve means for transferring hydraulic fluid between the traverse motor and the fork extension cylinders,



circuit means responsive to said control handle sensing means, said limit switch means and said direction indicating means for controlling said transfer valve whereby the movement of the load handler assembly and the extendable forks will be automatic in response to movement of the control handle.

5,011,364

PORTABLE ARTICLE HANDLING/SUPPORTING APPARATUS

John E. Anderson, 395 Blossom St., Fitchburg, Mass. 01420

Filed Nov. 30, 1989, Ser. No. 443,157
Int. Cl.[5] B66C *1/10*
U.S. Cl. 414—694 **17 Claims**

1. An article handling/supporting apparatus, comprising:

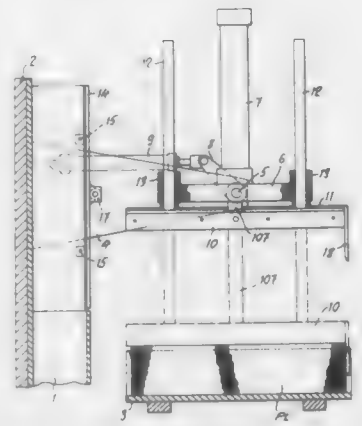
a. a base;

b. a turnable assembly rotatably mounted upon said base said turntable assembly including means for securing said turntable assembly in a preselected rotational position with respect to said base, and means for slightly varying and preselected rotational position of said turntable assembly after said securing means has secured said turntable in said preselected rotational position;

c. a boom, said boom being pivotally mounted adjacent one end thereof to said turntable assembly, means for securing said boom in a preselected position with respect to said turntable assembly, and means for slightly varying said preselected position of said boom after said securing means has secured said boom in said preselected position;

d. an arm, said arm being pivotally mounted adjacent one end thereof to said boom, means for securing said arm in a preselected position with respect to said boom, and means for slightly varying said preselected position of said arm after said securing means has secured said arm in said preselected position;

e. means adjacent an end of said arm for attaching an article thereto; and



f. means for simultaneously releasing said securing means associated with said turntable assembly, said boom and said arm.

APPARATUS FOR FEEDING BUNDLES OF LAMINATIONS

Umberto Sassi, Varazze, Italy, assignor to SASSI S.r.l., Varazze, Italy

Filed May 24, 1989, Ser. No. 356,100
Claims priority, application Italy, May 25, 1988, 12486 A/88
Int. Cl.[5] B66C *1/00*
U.S. Cl. 414—737 **10 Claims**

1. An apparatus for feeding bundles of laminations (PL) to a machine that processes or uses bundles of laminations, said apparatus comprising a vertical feeding duct (**1**) into which vertically oriented bundles of laminations (PL) are introduced in sequence, said apparatus further comprising a movable grasping and transferring device (**10, 11**) for cyclically taking bundles of laminations (PL) from a magazine (**3**) located in a withdrawal station, and conveying said bundle of laminations (PL) over an opening of said feeding duct (**1**) in alignment with said feeding duct, and positioning said bundle into said duct, and wherein said grasping and transferring device consists of at least one permanent magnet (**10**), for grasping each bundle of laminations (PL) from a respective magazine (**3**) at said withdrawal station by simply contacting same with said at least one permanent magnet, movable abutment members (**14**) and means for shifting said abutment members between an inactive position in which said bundle of laminations (PL) are freely positioned over said opening of said feeding duct (**1**), and an active position in which said abutment members are positioned to engage and hold back said bundle of laminations (PL) positioned over said opening of said feeding duct, thus causing separation of said bundle of laminations (PL) from said at least one permanent magnet (**10**) upon retraction of said grasping and transferring device.

ULTRACLEAN ROBOTIC MATERIAL TRANSFER METHOD

Richard F. Miller, 10905 Eureka St., Boca Raton, Fla. 33428

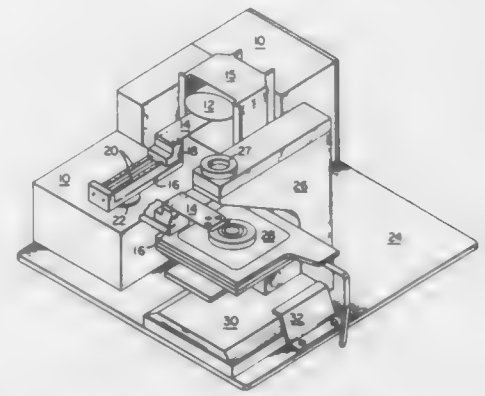
Filed Jul. 31, 1989, Ser. No. 386,971
Int. Cl.[5] B65G *1/10*
U.S. Cl. 414—786 **4 Claims**

1. A method using a first and a second vacuum operated gas cylinder, connected cable drives, connected slide arm and connected rotating base to transfer material in an ultraclean environment comprising:

applying a first vacuum to a first side of the first gas cylinder;

applying a second vacuum that is of greater magnitude than the first vacuum to a second side of the first gas cylinder;

allowing a rod of the first gas cylinder to move a connected cable drive a distance defined by a stroke of the slide arm on smooth rod supports; and



activating a vacuum force to a tongue supported by the side arm to pick up a wafer from a cassette;

causing the second vacuum of the first gas cylinder to decrease in magnitude below that of the first vacuum of the first gas cylinder;

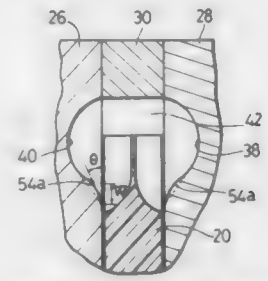
allowing a rod of the first gas cylinder to move the connected cable drive a distance defined by a reverse stroke of the side arm on smooth rod supports;

applying a first vacuum to a first side of the second gas cylinder;

applying a second vacuum that is of greater magnitude than the first vacuum to a second side of the second gas cylinder;

allowing a rod of the second gas cylinder to move the connected cable drive a distance defined by a rotational arc of a pulley connected to the rotating base of the slide arm on smooth rod supports, thus rotating the slide arm and the tongue from the cassette to an inspection station:

releasing the vacuum force to the tongue to place the wafer on the inspection station; and



retracting the slide arm and tongue from the inspection station.

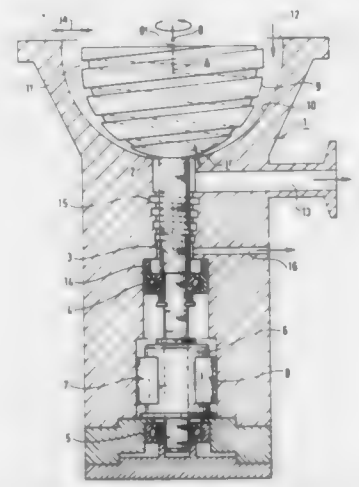
FUEL PUMP

Shigeru Yoshida, and Yoshimasa Ito, both of Obu, Japan, assignors to Aisan Kogyo Kabushiki Kaisha, Obu, Japan

Filed Jan. 19, 1990, Ser. No. 467,566
Claims priority, application Japan, Jan. 31, 1989, 1-10395[U]
Int. Cl.[5] F04D *5/00*
U.S. Cl. 415—55.1 **13 Claims**



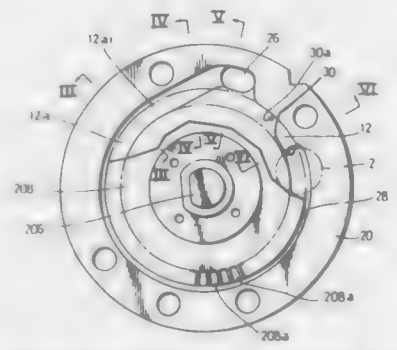
1. A fuel pump comprising impeller means having a plurality of vanes at an outer circumference thereof and a wall member surrounding said vanes and formed with fuel groove means to define a pump chamber, said fuel groove means comprises an outer circumference, an inner circumference, an intake portion and a discharge portion, wherein a portion of an edge of said inner circumference of said fuel groove intersecting said vanes at said discharge portion is chamfered in order to reduce shearing noise generated when the impeller vanes move across said intersecting groove edge portion.

5,011,368

VACUUM PUMP OF THE TYPE HAVING A GAEDE CHANNEL

Sébastien Frindel, Annecy le Vieux, and Luc Mathieu, Annecy, both of France, assignors to Alcatel Cit, Paris, France

Filed Jan. 8, 1990, Ser. No. 461,895
Claims priority, application France, Jan. 9, 1989, 89 00152
Int. Cl.[5] F01D *1/36*
U.S. Cl. 415—90 **4 Claims**



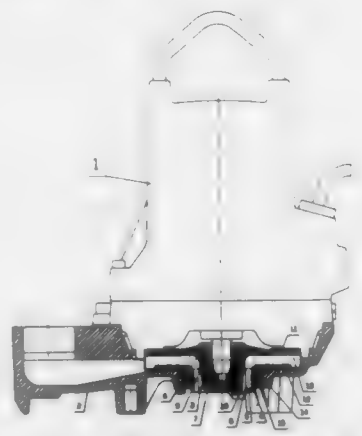
1. A vacuum pump of the type having a Gaede channel, the pump comprising a stator and a rotor driven to rotate inside the stator, the stator including a suction inlet and a delivery outlet, wherein the active portion of the rotor situated between the suction inlet and the delivery outlet is hemispherical in shape and is disposed inside a cavity of the stator which is likewise hemispherical in shape, the axis of rotation δ of said rotor coinciding with the axis of the hemispherical cavity of the stator, suction taking place at the large circle end of the hemispherical rotor via radial clearance j_a between the rotor and the stator, and delivery taking place at the pole end of the hemispherical rotor, an adjustment distance piece for axially positioning the rotor relative to the stator being provided so that the radial delivery clearance j_r is smaller than the radial suction clearance j_a.

5,011,369

REGENERATIVE PUMP

Koichi Mine, and Sigeru Suzuki, both of Obu, Japan, assignors to Aisan Kogyo Kabushiki Kaisha, Obu, Japan

Filed Dec. 21, 1988, Ser. No. 287,324
Claims priority, application Japan, Dec. 28, 1987, 62-335238; Dec. 28, 1987, 62-335239; Dec. 28, 1987, 62-335240
Int. Cl.[5] F04D *17/06*
U.S. Cl. 415—55.1 **16 Claims**



1. In a cascade pump mechanism including a plurality of impellers each having outer circumferential vane channels, a wall member having a wall portion surrounding each impeller from its axial and radial directions and defining a plurality of pump chambers in series, inlet and outlet holes formed through said wall member, a communication hole formed through each wall portion in the axial direction of said wall member, so as to communicate said pump chambers with each other, and circumferential grooves formed on the wall member in the axial direction to form a series of flow passages leading from said inlet hole to said outlet hole through said communication hole; the improvement wherein said flow passage in each pump chamber is provided at the side close to said communication hole to the next-stage pump chamber or close to said outlet hole with a passage portion so designed as to have a radial size such that a portion overlapping said vane channels is gradually narrowed; and said passage portion is so formed as to go gradually outward in the radial direction, so as to gradually increase a flow area toward the downstream side.

5,011,370

CENTRIFUGAL PUMP

Bengt Sodergard, Vasby, Sweden, assignor to ITT Corporation, New York, N.Y.

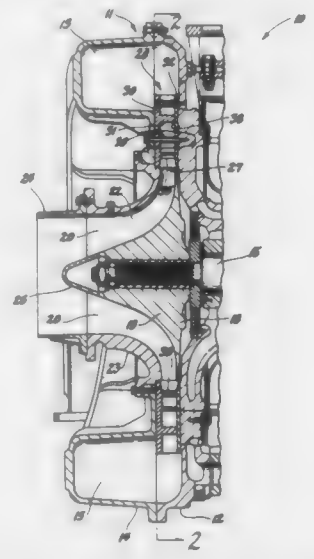
Filed Feb. 5, 1990, Ser. No. 475,461
Claims priority, application Sweden, Apr. 27, 1989, 8901534
Int. Cl.[5] F03B *11/08*
U.S. Cl. 415—121.1 **3 Claims**

1. A centrifugal pump for pumping liquids containing solid bodies and pollutions such as rags and other elongated objects and comprising:

a pump housing (2) having a central inlet (3);

a rotating impeller (6) being mounted in said housing and having cutting means (8), (9), and an insert part (4) within the pump inlet (3), said insert part (4) having grooves (5) whereby a cutting takes place between the cutting means (8), (9) and the edges of the grooves (5); said impeller (6) is a closed impeller with upper and lower cover discs (11) and (12) respectively, and intermediate vanes (13); said lower cover disc (12) having a collar (14) which surrounds the end of the insert part (4) heading the impeller (6), to provide a radial seal; and said lower cover disc (12) having a collar extension (15) which extends a distance inwards over the insert part (4), thus creating an axial seal.

5,011,371



CENTRIFUGAL COMPRESSOR/PUMP WITH FLUID DYNAMICALLY VARIABLE GEOMETRY DIFFUSER

Paul Gottemoller, Lockport, Ill., assignor to General Motors Corporation, Detroit, Mich.

Continuation of Ser. No. 44,008, Apr. 29, 1987, Pat. No. 4,815,935. This application Mar. 13, 1989, Ser. No. 322,751
The portion of the term of this patent subsequent to Mar. 28, 2006, has been disclaimed.
Int. Cl.[5] F04D *1/00*
U.S. Cl. 415—211.1 **8 Claims**

1. A centrifugal fluid machine having a vaned impeller with a peripheral annular outlet and a vaned diffuser having an annular inlet generally aligned with and surrounding the impeller outlet to receive therefrom fluid flow having velocity and direction varying in part as a function of impeller speed and differential pressure, the diffuser vanes having suction sides trailing in the direction of impeller rotation and being angled so as to be in general alignment with the overall direction of fluid flow during the fluid machine operating range from choke to surge/instability conditions, and the improvement wherein

the orientation of the suction sides of the vanes is more radial

than the fluid flow direction in the portion of the operating range near the surge/instability condition by an incidence angle sufficient to create stall bubbles along the vanes, suction sides in and adjacent to the throat at the diffuser inlet to forestall surge/instability by effectively fluid dynamically reducing the flow area of the diffuser throat near the surge/instability condition and thereby extending the operating fluid flow range of the fluid machine between the choke and surge/instability conditions, said incidence angle near the surge/instability condition having a value in excess of 3.5 degrees.

5,011,372

AERATION APPARATUS FOR POND

Nicholas B. Nigrelli, Cleveland, and David Wasmer, Newton, both of Wis., assignors to Nigrelli Systems, Inc., Kiel, Wis.

Filed Dec. 14, 1989, Ser. No. 450,426
The portion of the term of this patent subsequent to May 22, 2007, has been disclaimed.
Int. Cl.[5] F01D *9/02*
U.S. Cl. 415—211.2 **22 Claims**

1. A device for aerating water comprising:

a. an electric motor having an output shaft for rotating about a generally vertical axis;

b. a propeller tube having a lower end and an upper end and a central axis;

c. bracket means for joining the propeller tube to the motor;

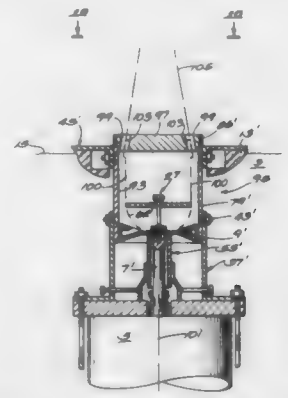
d. float means connected to the propeller tube for suspending the device in a body of water;

e. a propeller mounted to the motor shaft and surrounded by the lower end of the propeller tube, the propeller creating an output stream of water within the propeller tube when the motor shaft rotates;

f. a diffuser plate;

g. extension means attached to the motor shaft for retaining the diffuser plate in the propeller tube and in the path of the water output stream; and

h. cap means mounted to the propeller tube upper end for directing the output stream of water from the propeller into a generally vertical column.



22. A method of aerating water comprising the steps of:

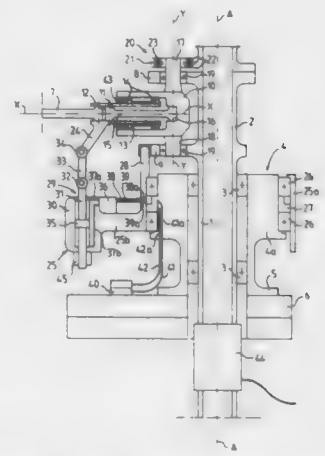
a. submerging a propeller and a propeller tube that surrounds the propeller into the water;

b. locating a diffuser plate in the propeller tube;

c. rotating the propeller about a generally vertical axis to create a generally hollow water output stream;

d. supporting the periphery of the diffuser plate with the interior surface of the hollow output stream at an equilibrium location whereat the force of the water output stream on the diffuser plate equals the weight of the diffuser plate, the water output stream flowing past the periphery of the diffuser plate and out of the propeller tube;

e. mounting a perforated cap in the propeller tube downstream of the propeller and the diffuser plate; and



f. directing the water output stream through the perforated cap and into a generally vertical column having a predetermined pattern.

5,011,373

INDIVIDUAL PITCH CONTROL DEVICE FOR BLADES OF ROTORS OF ROTOR CRAFT BY MEANS OF ROTATING LINEAR JACKS

Jacques A. Aubry, Cabries, and Jean J. Mondet, Pelisanne, both of France, assignors to aerospatiale Societe Nationale Industrielle, Paris Cedex, France

Filed Sep. 11, 1989, Ser. No. 405,264
Claims priority, application France, Sep. 16, 1988, 88 12142
Int. Cl.[5] B63H *3/00;* **B64C** *11/00*
U.S. Cl. 416—108 **25 Claims**

1. An individual pitch control device for the blades (7) of a rotor of a rotor craft, said rotor having a plurality of independently controlled blades, comprising, for each blade (7) of the

rotor, a respective dual-action, electrohydraulic linear jack (29) with at least one body, controlling the collective, monocyclic and, if appropriate, multicyclic pitch in a rotating reference system of said blade, said jack (29) being driven in rotation with the rotor about an axis (A) thereof and disposed substantially longitudinally with respect to a rotor mast (1), and outside said rotor mast, wherein each jack (29) is implanted, via one of two elements formed by a respective cylinder (30) and rod (31), on a rotating support (25) surrounding the rotor mast (1) and driven in rotation with the rotor about the axis (A) thereof, whilst the other of said two elements of the jack (29) is connected to a pitch control lever (24) of the corresponding blade.

5,011,374

METHOD AND APPARATUS FOR BALANCING TURBINE ROTORS

Michael L. Miller, Westchester, Ohio, assignor to General Electric Company, Cincinnati, Ohio

Continuation of Ser. No. 121,710, Nov. 17, 1987, abandoned. This application Nov. 17, 1989, Ser. No. 437,318

Int. Cl.[5] F04D *29/66*

U.S. Cl. 416—144 **30 Claims**

1. A system for balancing a rotor in the low pressure stage of a turbine, the rotor having a shroud formed with a forward rail, an aft rail, an inner face and an outer face, comprising:

a balance clip, including:

(i) a clip body having a forward end and an aft end, said clip body being adapted to engage the inner face of the shroud;

(ii) a forward hook formed on said forward end of said clip body, said forward hook being adapted to fit onto the forward rail of the shroud;

(iii) an aft tab formed on said aft end of said clip body, said aft tab being adapted to engage the aft rail of the shroud;

crimping means engageable with said forward hook and said aft tab of said balance clip for bending said aft tab between a first position wherein said aft tab is oriented at an acute angle relative to said clip body and a second, crimped position wherein said aft tab is oriented substantially parallel to said clip body, said aft tab in said second, crimped position being effective to clamp the shroud between said clip body and said aft tab.

5,011,375

GAS-DYNAMIC PRESSURE-WAVE MACHINE WITH REDUCED NOISE AMPLITUDE

Andreas Mayer, Niederrohrdorf, Switzerland, assignor to Asea Brown Boveri Ltd., Baden, Switzerland

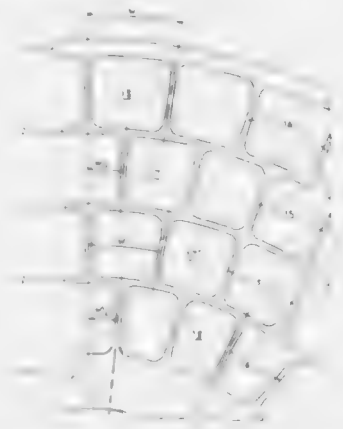
Filed Feb. 7, 1990, Ser. No. 476,564

Claims priority, application Fed. Rep. of Germany, Mar. 2, 1989, 3906551

Int. Cl.[5] F04F *11/02*

U.S. Cl. 417—64 **5 Claims**

1. A multiflow gas-dynamic pressure-wave machine, comprising:



a rotor housing;

a rotor mounted in said housing for rotation about a rotational axis; and

air and gas housings respectively connected to opposite axial ends of said rotor housing, each of said air and gas housings having both intake ducts and discharge ducts for respectively supplying and discharging a gas flow of a gaseous working substance to and from said rotor,

wherein said rotor comprises:

(a) three substantially concentric pipes having axes extending parallel to said axis of rotation and dividing the gas flow through said rotor into four radially spaced concentric flows, and

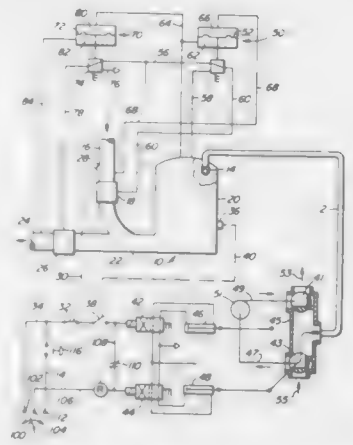
(b) a plurality of substantially radially extending cell walls extending between adjacent ones of said concentric pipes to form a plurality of cells dividing each of said concentric flows into a plurality of circumferentially spaced flows,

wherein two radially outer ones of said concentric flows are divided to form a first equal number of said cells, and wherein two radially inner ones of said concentric flows are divided to form a second equal number of said cells, said second equal number of cells being smaller than said first equal number of cells.

5,011,376

VALVE CONTROL SYSTEM FOR AN AIR DISPLACEMENT TYPE PUMP

Kurt K. G. Henriksson, 328 - 8500 Ackroyd Rd., Richmond, British Columbia, Canada V6K 3H8 , and Raymond A. Breckner, 4695 Britania Dr., Richmond, British Columbia, Canada V6G 1K9



Filed Apr. 5, 1990, Ser. No. 504,838

Int. Cl.[5] F04F *1/02*

U.S. Cl. 417—145 **8 Claims**

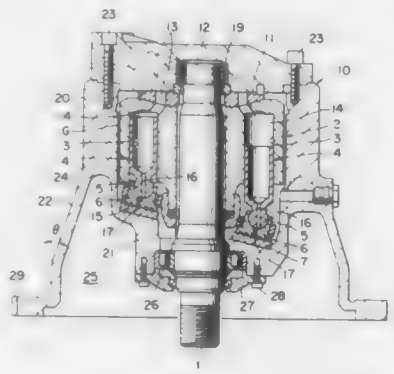
1. A control system for an air displacement type pump, said pump comprising a tank, inlet line to said tank and an outlet line from said tank, an inlet valve in said inlet line and an outlet valve in said outlet line means for selectively applying positive or negative air pressure to said tank, means to actuate said outlet valve including means to compare pressure in said tank with pressure in said outlet line on the side of said outlet valve remote from said tank, said means to compare controlling said

means to actuate said outlet valve to maintain said outlet valve closed when said pressure in said outlet exceeds the pressure in

said tank and to open said outlet valve when the pressure in said tank exceeds the pressure in said outlet line.

5,011,377

SWASH-PLATE TYPE PISTON PUMP MOTOR



Toyoaki Sagawa; Makoto Sonoda, and Tokihiko Umeda, all of Kobe, Japan, assignors to Kawasaki Jukogyo Kabushiki Kaisha, Hyogo, Japan

Filed Aug. 10, 1990, Ser. No. 566,531

Claims priority, application Japan, Sep. 12, 1988, 63-227682

Int. Cl.[5] F04B *1/10, 1/12, 1/20*

U.S. Cl. 417—269 **5 Claims**

1. A swash-plate type piston pump motor comprising:

an output shaft having first and second ends;

a cylinder rotor concentrically encompassing and coupled to said output shaft thereby to rotate unitarily therewith and having a plural number of cylinder bores formed therein around the output shaft with axial orientations parallel to the axis of the output shaft;

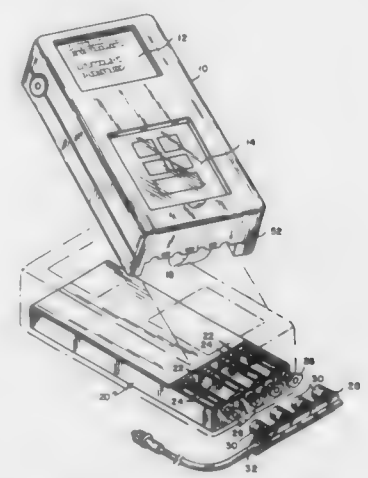
a number of pistons slidably fitted in respective cylinder bores, each piston at one end thereof and a head end of the respective cylinder bore forming therebetween a hydraulic pressure chamber;

a number of shoes coupled to the other ends of respective pistons in a manner to function as universal joints;

a swash plate of annular shape encompassing the output shaft and fixedly supported with an inclined orientation relative to the output shaft, said shoes being in pressing sliding contact with an inclined swash surface of said swash plate; and

a housing assembly enclosing the above named parts and comprising: a cylinder side peripheral wall means encompassing the cylindrical periphery of said cylinder rotor; an inner peripheral wall joined contiguously to said cylinder side peripheral wall and extending away therefrom toward said second end of the output shaft, said inner peripheral wall enclosing and fixedly supporting said swash plate and rotatably supporting the output shaft at a part thereof near said second end; an outer peripheral wall joined contiguously to said cylinder side peripheral wall on the outer side of and apart from said inner peripheral wall and flaring radially outwardly from the output shaft and in the direction of said second end, an annular space being formed between said inner and outer peripheral walls, said outer peripheral wall having at an extremity a motor mounting flange; and an end plate fixed to the end of said cylinder side peripheral wall remote from said motor mounting flange and rotatably supporting said first end of the output shaft, said end plate further supporting rotatably said cylinder rotor against thrust loads in the direction of said first end.

5,011,378



PUMP TUBE MOUNT AND CARTRIDGE FOR INFUSION PUMP

Eric W. Brown, Newport Beach, and Charles M. Kienholz, San Dimas, both of Calif., assignors to I-Flow Corporation, Irvine, Calif.

Continuation-in-part of Ser. No. 216,512, Jul. 8, 1988, Pat. No. 4,950,245. This application Jan. 24, 1989, Ser. No. 301,611

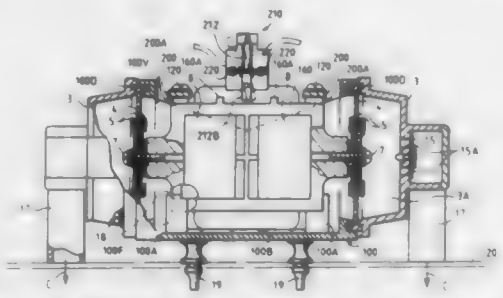
Int. Cl.[5] F04B *43/12*

U.S. Cl. 417—360 **17 Claims**

1. A pump tube mount comprising:

a front wall having a hollow outlet extending therefrom;

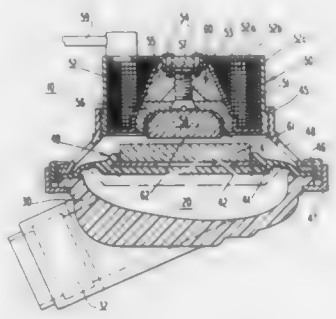
a rear wall having a hollow inlet;



means for connecting said front wall to said rear wall at a fixed distance from one another;

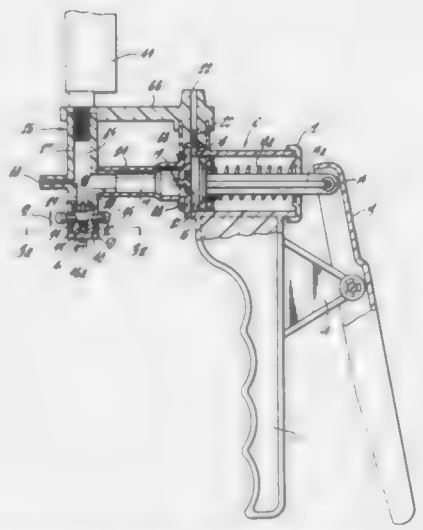
a tube mounted between said front wall and said rear wall to provide fluid communication between the hollow outlet and the hollow inlet;

a rigid base portion supported by said connecting means beneath said tube and spaced apart from said front wall; and



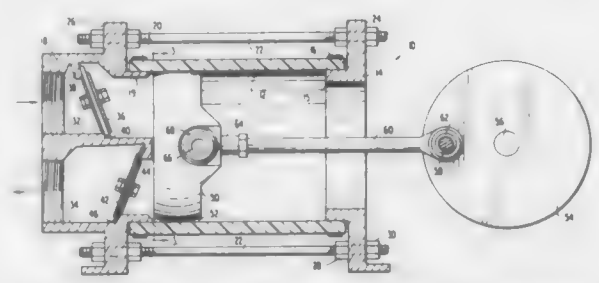
said rear wall extending downwards below the level of said rigid base portion and having tabs extending from the rear wall beneath said rigid base portion projecting forwards from the rear wall.

5,011,379
ELECTROMAGNETIC DIAPHRAGM PUMP
Atsuki Hashimoto, Tokyo, Japan, assignor to Nitto Kohki Co., Ltd., Tokyo, Japan
Filed Nov. 27, 1989, Ser. No. 441,277
Claims priority, application Japan, Dec. 15, 1988, 63-161890[U]
Int. Cl.[5] F04B *45/04, 39/14*
U.S. Cl. 417—360 **5 Claims**



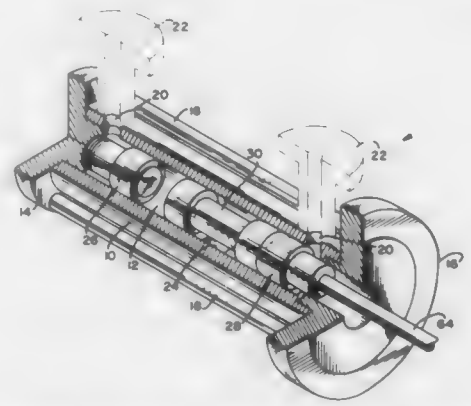
1. An electromagnetic diaphragm pump comprising a pair of diaphragms placed apart so as to be opposed to each other, a pair of closed diaphragm chambers having an intake valve and a discharge valve, each of which is partially comprised of said diaphragms, a vibrator shaped in a flat board having at least one magnet attached thereto, said vibrator being connected to said each diaphragm at opposite ends thereof and positioned at the middle of said pair of diaphragms, a pair of field core halves, each having a coil wound therearound, said field core halves being placed apart on both sides of the flat boardshaped vibrator so that the respective magnetic poles of the field core halves are opposed to said at least one magnet, a base member housing comprising a bottom plate and substantially parallel side walls which are formed in one piece, said housing having an open top, the bottom plate having protruding mounts thereon for positioning and mounting the pair of field core halves, which mounts are formed in one piece with the bottom plate, and the side walls being provided with fitting portions into which the pair of diaphragms are fitted, respectively, the pair of the closed diaphragm chambers being supported by the side walls outside thereof, the pair of the field core halves being fixed to the bottom plate individually in such a position that main side surfaces of the core halves are substantially parallel to the bottom plate.

5,011,380
MAGNETICALLY ACTUATED POSITIVE DISPLACEMENT PUMP
Steven G. Kovacs, Oldsmar, Fla., assignor to University of South Florida, Tampa, Fla.
Filed Jan. 23, 1989, Ser. No. 300,361
Int. Cl.[5] F04B *43/14*
U.S. Cl. 417—413 **17 Claims**



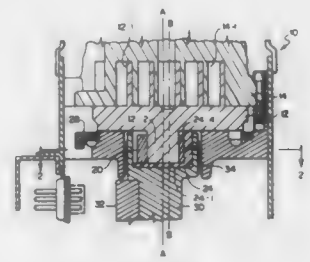
1. An apparatus for the pulsatile pumping of liquids comprising:
a pumping chamber having inlet and outlet valves, wherein one wall of said chamber comprises a flexible diaphragm, said diaphragm having a permanent magnet centrally disposed therein in coaxial alignment therewith;
electromagnetic means for repulsing said permanent diaphragm magnet from a starting position when current is supplied to said electromagnetic means; and
magnetic means for returning said diaphragm to its starting position when said current is interrupted.

5,011,381
HAND-HELD VACUUM PUMP VACUUM RELEASE
Theodore C. Neward, 9251 Archibald, Cucamonga, Calif. 91730
Filed Sep. 22, 1989, Ser. No. 411,332
The portion of the term of this patent subsequent to Feb. 21, 2006, has been disclaimed.
Int. Cl.[5] F04B *41/00, 39/10*
U.S. Cl. 417—440 **4 Claims**

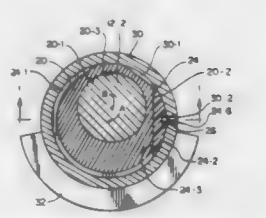


1. A hand-held vacuum pump, comprising
a cylinder for isolating a volume from the atmosphere and having an inlet port and an outlet port,
biased piston means for drawing a vacuum through the inlet port of the cylinder and including a piston which can be moved in the cylinder,
a handle assembly coupled with the cylinder and the piston means for moving the piston with respect to the cylinder, and
a vacuum release valve communicating with the inlet port of the cylinder and including a housing having an opening therein forming a cam surface, and further including a closure member with a cam arm which engages said cam surface and which closure member is rotatable within the housing to cause the closure member to move toward a valve seat in the housing for closing the vacuum release valve and which is moveable away from the valve seat as the arm moves along the cam surface to open the vacuum release valve, and torsion spring means connected between said arm and said housing of the vacuum release valve for biasing said arm and closure member in a rotational direction to axially cause the closure member manually to engage the valve seat and thereby close the vacuum release.

5,011,382
RECIPROCATING PISTON PUMP
George A. Thompson, 114 Demotte Ave., Daytona Beach, Fla. 32019
Filed Jan. 26, 1989, Ser. No. 301,551
Int. Cl.[5] F04B *39/14*
U.S. Cl. 417—571 **4 Claims**



1. A reciprocating piston pump comprising first and second end caps having cylindrical hubs, a flexible resilient cylinder having opposite ends fitted over and secured to said hubs, respectively, inlet and outlet means disposed in said second end cap, adjustable interconnecting means connected between said first and second end caps for adjustable increasing the tension on said cylinder to compensate for wear on the internal surface of the cylinder and piston means having a partial spherical surface disposed in sliding engagement with said cylinder and having a diameter at least equal to an internal diameter of said cylinder.



5,011,383
VALVE ASSEMBLY, FOR USE IN COMBINATION WITH A STRAIGHT-CYLINDER, GAS-COMPRESSION CHAMBER, AND IN COMBINATION THEREWITH
Robert A. Bennitt, Painted Post, N.Y., assignor to Dresser-Rand Company, Corning, N.Y.
Filed Jan. 2, 1990, Ser. No. 459,482
Int. Cl.[5] F04B *21/02*
U.S. Cl. 417—534 **12 Claims**

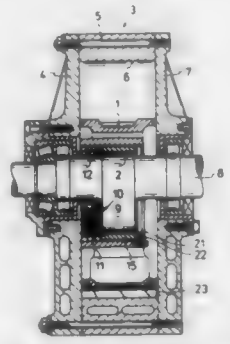
1. In combination with a straight-cylinder, gas compression chamber having end closures, a gas-control valve, comprising:
a ported valve seat;
a ported valve guard;
a ported valve plate interposed between said seat and guard; and
a bolt, for mounting of said seat, guard and plate thereon, having (a) external threads formed thereon, and (b) an annular shoulder formed thereabout; wherein
said seat, guard, and plate are centrally apertured;
said guard is set about said bolt; and against said shoulder;
said seat is internally threaded, (b) threadedly engaged with said bolt threads, and (c) has replaceable sealing means engaged with the periphery thereof;
said valve is reciprocably confined within, and sealingly engaged with the inner surface of, said gas-compression chamber;
said seat and guard are circular; and including
a dampening plate interposed between said valve plate and said valve guard; and wherein
said valve guard and said dampening plate have mutually confronting, peripheral surfaces;
said peripheral surface of said guard is circular; and
said peripheral surface of said dampening plate is trochoidal.

5,011,384
SLIDER BLOCK RADIAL COMPLIANCE MECHANISM FOR A SCROLL COMPRESSOR
Stefan H. Grunwald, Liverpool, and Howard H. Fraser, Jr., Lafayette, both of N.Y., assignors to Carrier Corporation, Syracuse, N.Y.
Filed Dec. 1, 1989, Ser. No. 444,238
Int. Cl.[5] F04C *18/04, 29/02*
U.S. Cl. 418—55.5 **12 Claims**

1. In a scroll compressor means having an orbiting scroll means including an axis, a fixed scroll means, crankshaft means having a first and a second end and adapted to rotate about an axis of said crankshaft means, a slider block radial compliance mechanism comprising:
a circular recess means formed in said first end of said crankshaft means;
bearing seat means fixedly located in said recess means and having a flat circular portion and an axially extending portion;
slider block means located in said recess means;
said recess means and said bearing seat means coacting with said slider block means to limit movement of said slider block means to substantially only relative reciprocating movement of said slider block means with respect to said bearing seat means; and
said slider block means and said orbiting scroll means coacting to permit relative rotary motion of said axis of said orbiting scroll means about said axis of said crankshaft means and said orbiting scroll means is moved with said slider block means when said slider block means moves in relative reciprocating movement in said recess means.

5,011,385

BEARING-AND DRIVE ARRANGEMENT OF A ROTARY PISTON INTERNAL COMBUSTION ENGINE



Dankwart Eiermann, Weissensberg, Fed. Rep. of Germany, assignor to Wankel GmbH, Berlin, Fed. Rep. of Germany

Filed May 17, 1990, Ser. No. 525,142

Claims priority, application Fed. Rep. of Germany, Sep. 7, 1989, 3929813; Feb. 19, 1990, 4005023

Int. Cl.[5] F01C *21/08;* **F02B** *55/02*

U.S. Cl. 418—61.2 **7 Claims**

1. A bearing- and transmission drive arrangement of a rotary piston internal combustion engine having a housing consisting of two side parts and a casing mantle part with a dual-arc trochoidal-shaped casing mantle inner raceway surfacing as well as having an eccentric shaft that passes axially through the housing and that is journalled by the two side parts as well as including an eccentric upon the eccentric shaft upon which a triangular piston controlled by a synchronous transmission drive means has corners of the triangular piston sliding with continuous engagement along the casing mantle raceway inner surfacing and with which the synchronous drive transmission means consists of a hollow gear fixed stationary on the piston and a pinion fixed stationary in a side part and located concentrically around the eccentric shaft, the improvement comprising:

a tooth means of the hollow gear worked out of a bearing bore; a further bore means provided concentrically in the bearing bore extending from a side of the piston remote from the synchronous drive transmission means as far as to a hollow gear; said tooth means having a diameter located between tooth tips and tooth bases so that tooth butt ends remain; and a bearing sleeve 15 inserted upon the tooth butt ends so that passages result between the bearing sleeve, the tooth butt ends and the tooth bases.

ROTARY POSITIVE DISPLACEMENT MACHINE FOR INCOMPRESSIBLE MEDIA

Kurt Güttinger, Murten, Switzerland, assignor to Gutag Innovations AG, Murten, Switzerland

Filed Sep. 19, 1989, Ser. No. 409,324

Claims priority, application Switzerland, Sep. 20, 1988, 03493/88

Int. Cl.[5] F04C *2/04*

U.S. Cl. 418—59 **13 Claims**

1. A positive displacement machine for incompressible media, comprising:

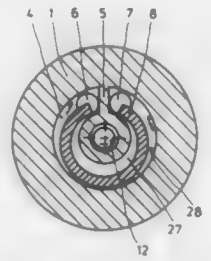
a stationary housing;

a working chamber having inner and outer circumferential walls separated by a bottom surface, an inlet and an outlet, said working chamber being located in the stationary housing and having the configuration of a circular slot;

a land extending from said housing into the working chamber;

said inlet being separated from said outlet by said land;

a disk shaped rotor located within said housing and driven eccentrically relative to the housing;



a circular displacer body located in said working chamber and being held on said disk shaped rotor so as to be driven eccentrically relative to the housing in a manner such that in operation the circular displacer carries out a circular motion limited by the circumferential walls of the working chamber;

the curvature of said displacer is dimensioned relative to the curvature of the working chamber so that the displacer contacts the inner and outer circumferential walls of the working chamber at a sealing line continuously progressing in operation, thereby dividing the working chamber into inner and outer work spaces, by which work spaces the medium is conveyed from the inlet to the outlet;

said displacer body being interrupted in the area of said land;

a coupling is provided for interconnecting the displacer body relative to the housing;

a wobble rod connected to said displacer body and a driving

crank connected to said wobble rod wherein said wobble rod as driven by said driving crank provides for the circular motion of the displacer body;

in the area of the land, the inner and outer work spaces communicate with each other at the inlet and the outlet;

the displacer body and the working chamber have an at least approximately circular configuration over the overwhelming part of their configuration;

the displacer body being arranged so as to seal over at least 360°;

wherein an end of said displacer body on an inlet side of the displacer body and the working chamber and an end of the displacer body on an outlet side of the displacer body and the working chamber, in an angular zone α of maximum 30°, each have significantly smaller radii of curvature than that of the overwhelming circumference.

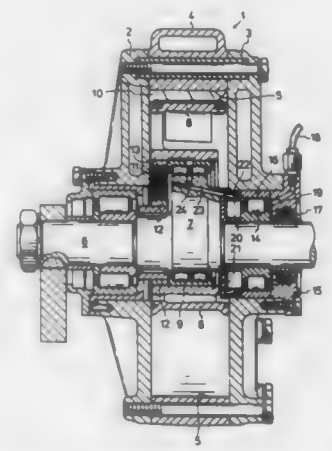
ROTARY PISTON INTERNAL COMBUSTION ENGINE

Josef Speiser, Wasserburg, Fed. Rep. of Germany, assignor to Wankel GmbH, Berlin, Fed. Rep. of Germany

Filed Oct. 11, 1989, Ser. No. 420,053

Claims priority, application Fed. Rep. of Germany, Oct. 11, 1988, 8812757[U]

Int. Cl.[5] F01C *21/04*



U.S. Cl. 418—94 **7 Claims**

1. A rotary piston internal combustion engine of trochoidal type of construction of which a housing consists of side parts and at least one mantle part with respectively dual-arc mantle runway inner surface, said housing having a shaft extending therein with at least one eccentric means per mantle runway inner surface in the housing with the shaft passing through the eccentric means, as well as including eccentric bearing means with roller bearings and including a triangular piston means journalled upon roller bearings of the eccentric bearing means and having piston corners thereof in sliding engagement along the pertaining mantle runway inner surface, and including a gear transmission means that controls and regulates rotation of the piston means and that is arranged between a side wall of one side part and the eccentric means, the improvement therewith comprising:

an oil-collector groove means as an oil-collector through arranged concentrically around the shaft on a side of the eccentric means remote from the gear transmission means;

a bore means provided at the location of the eccentricity maximum of the eccentric means extending at an incline radially outwardly into that oil-collector groove means;

a radial bore means terminating in the middle of the roller bearing of the eccentric bearing means and into which the inclined bore means opens; and

means provided stationary on the housing of the rotary piston internal combustion engine for conveying all of dosed lubricating oil to the eccentric bearing means and via the oil-collector trough extending in a full circle around the shaft.

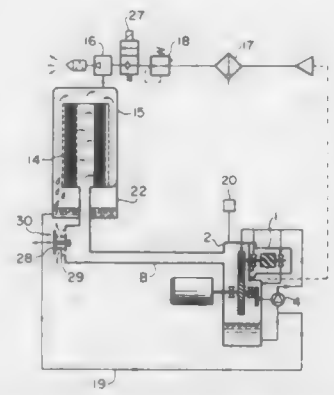
OIL-FREE SCREW COMPRESSOR APPARATUS



Masakazu Aoki, and Akira Suzuki, both of Shimizu, Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Apr. 25, 1989, Ser. No. 343,496

Claims priority, application Japan, Apr. 28, 1988, 63-107313

Int. Cl.[5] F04C *18/16, 29/02*

U.S. Cl. 418—95 **18 Claims**

1. An oil-free screw compressor apparatus comprising:

a gear case integrally mounted on the oil-free screw compressor and containing gears for driving a rotor shaft of said compressor, oil stored in a lower portion of said gear case being supplied therefrom to bearings and gears of said compressor, and oil, subsequent to lubrication of said bearings and gears, and gas leaking through an inner shaft seal mechanism of said compressor being discharged into said gear case;

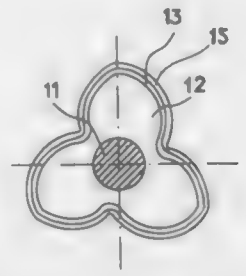
a gear case exhaust pipe for preventing inner pressure of said gear case from increasing due to said gas leaking from said compressor, said gear case exhaust pipe being connected to said gear case;

a closed filter container containing a filter element for separating oil mist, said closed filter container being connected to said gear case exhaust pipe at a first side of said filter element; and

a vacuum ejector for making pressure at a second side of the filter element contained in said closed filter container negative pressure, said vacuum ejector having a suction port connected to said closed filter container at the second side of the filter element.

5,011,389

ROTOR FOR A ROTARY SCREW MACHINE



Karlis Timuska, Spånga, Sweden, assignor to Svenska Rotor Maskiner AB, Stockholm, Sweden

Continuation-in-part of Ser. No. 314,119, Feb. 1, 1989, abandoned. This application Mar. 8, 1989, Ser. No. 320,773

Claims priority, application Sweden, Sep. 5, 1986, 8603720; PCT Int'l Appl., Sep. 4, 1987, PCT/SE87/00397

Int. Cl.[5] F04C *29/00, 18/16*

U.S. Cl. 418—152 **23 Claims**

1. In a rotor for a rotary screw machine having helical lobes and intermediate grooves forming the working surface of the rotor, the rotor being axially limited by two radial end surfaces and having a core with a coating on at least said working surface, said coating comprising at least one layer of substantially uniform thickness and being made of plastic,

the improvement wherein:

said core includes a shaft of a first material and a rotor body of a second material mounted on said shaft, and the coefficient of thermal expansion of said plastic is 1 to 3 times as great as that of said second material, and the coefficient of thermal expansion of said second material is 1 to 6 times as great as that of said first material.

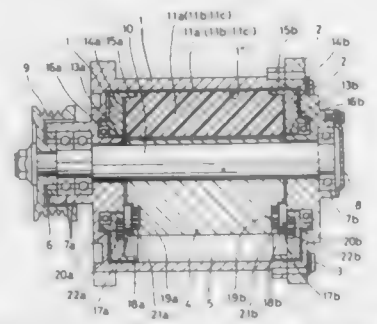
5,011,390

ROTARY VANE MACHINE HAVING STOPPER ENGAGING RECESS IN VANE MEANS

Hiroshi Sakamaki; Yukio Horikoshi; Takeshi Jinnouchi, and Kenji Tanzawa, all of Sakado, Japan, assignors to Eagle Industry Co., Ltd., Tokyo, Japan

Division of Ser. No. 197,548, May 23, 1988, Pat. No. 4,958,995, Continuation-in-part of Ser. No. 75,006, Jul. 17, 1987, abandoned, Continuation-in-part of Ser. No. 110,919, Oct. 21, 1987, abandoned, Continuation-in-part of Ser. No. 113,568, Oct. 26, 1987, abandoned, Continuation-in-part of Ser. No. 115,677, Oct. 31, 1987, abandoned. This application Aug. 16, 1989, Ser. No. 394,777

Claims priority, application Japan, Jul. 22, 1986, 61-111490[U]; Jul. 22, 1986, 61-170903; Oct 23, 1986, 61-161609[U]; Oct. 23, 1986, 61-161610[U]; Nov. 4, 1986, 61-168145[U]; Nov. 4, 1986, 61-168147[U]; Nov. 14, 1986, 61-269960[U]; Nov. 14, 1986, 61-269961; Nov. 17, 1986, 61-271934; Nov. 21, 1986, 61-178287[U]; Nov. 21, 1986, 61-178288[U]; Nov. 21, 1986, 61-276689; Nov. 21, 1986, 61-276690; Dec. 3, 1986, 61-185571[U]



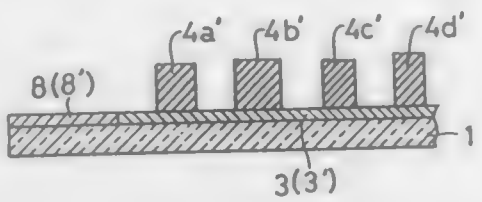
The portion of the term of this patent subsequent to Apr. 17, 2007, has been disclaimed.

Int. Cl.[5] F01C *1/344;* **F16C** *32/06*

U.S. Cl. 418—256 **21 Claims**

1. A rotary machine for handling a fluid comprising a housing means having a rotor chamber, said rotor chamber having

an inner peripheral surface, a rotor means rotatably mounted in said rotor chamber, said rotor means having an axis of rotation, said inner peripheral surface having an axis which is eccentric relative to said axis of rotation of said rotor means, said rotor means having a plurality of generally radially disposed vane slots, a plurality of vanes slidably mounted in said vane slots and operable to define variable volume chambers as said rotor means rotates and said vanes move generally radially in and out of said vane slots, said vanes having longitudinal ends and outer radial ends, recesses in said vanes opening up onto said longitudinal ends and opening up onto said outer radial ends, said recesses having recess walls having a thickness corresponding to the thickness of said vanes, one of said recess walls



being an inner recess wall which extends generally parallel to said axis of rotation of said rotor means, retainer plate means disposed between said housing means and said longitudinal ends of said vanes, rotatable support means rotatably supporting said retainer plate means from said housing means, said retainer plate means having stopper means extending axially into said recesses in said vanes, said stopper means having an annular engageable surface, said annular engageable surface being engaged by said inner recess wall to limit the extent of outward radial movement of said vanes to preclude sliding contact between said vanes and said inner peripheral surface of said rotor chamber, said annular engageable surface having a center coincident with said central axis of said inner peripheral surface of said rotor chamber.

METHOD OF MANUFACTURING GAS DISCHARGE DISPLAY DEVICE

Sadanobu Kawasaki; Jun Koishikawa, both of Kanagawa, Japan, and Donald W. Kuty, Niagara Falls, N.Y., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

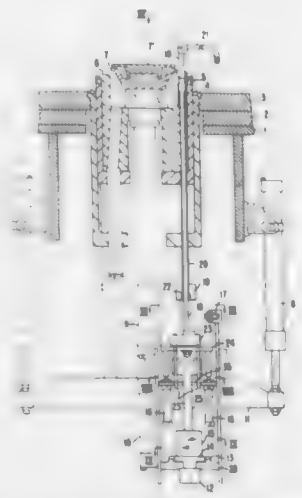
Filed Mar. 2, 1989, Ser. No. 317,717
Claims priority, application Japan, Mar. 2, 1988, 63-49438
Int. Cl.[5] H01J *9/24*
U.S. Cl. 445—24 **7 Claims**

1. A method of manufacturing a gas discharge display device comprising a pair of panel substrates arranged to oppose each other at a predetermined gap, at least one of said pair of panel substrates having on a surface thereof a plurality of electrodes which form discharge light-emitting display sections and an insulating barrier for defining the discharge light-emitting display sectioon, said pair of panel substrates being encapsulated by an encapsulating member, characterized in that the method of forming the insulating barrier comprises the sequential steps of:

(1) forming a slip, which contains, as the major component, finely divided electrically insulating solids which form a major constituent of the insulating barrier and an organic binder, into a green sheet;

(2) processing said green sheet by forming holes in the green sheet in an array corresponding to discharge areas such that the green sheet remaining between the holes defines the insulating barrier;

(3) laminating said processed green sheet to a predetermined position on at least one of said panel substrates; and



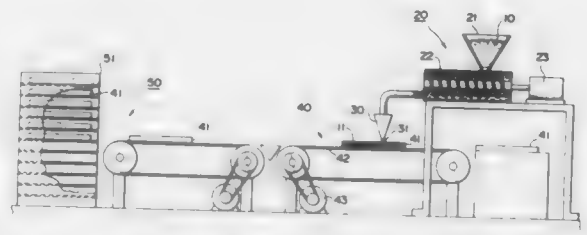
(4) firing said processed and laminated green sheet.

5,011,392

DRAIN EJECTOR IN A TIRE VULCANIZING MACHINE

Hideaki Katayama; Toshifumi Murakami, both of Nagasaki; Koji Soeda, Kobe; Yoshiya Kubota; Shoji Okamoto, both of Toyota; Akinori Kubota, Kobe; Michihito Kobayashi, Toyota, and Masaaki Ijiri, Aichi, all of Japan, assignors to Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo and Sumitomo Rubber Industries Ltd., Hyogo, both of, Japan

Filed Mar. 2, 1990, Ser. No. 487,250
Claims priority, application Japan, Mar. 2, 1989, 1-48558
Int. Cl.[5] B29C *33/02, 35/02*
U.S. Cl. 425—35 **4 Claims**



1. In a tire vulcanizing machine having a bladder, and a lower ring and a guide ring between which a lower edge portion of the bladder is clamped, an ejector for ejecting condensate of vulcanizing steam which has accumulated within the bladder to the outside of a tire supported in the machine, said ejector comprising: a drain extraction pipe elevatably and rotatably supported in the machine and extending through the lower ring and the guide ring clamping the lower edge portion of the bladder, a drain suction pipe extending horizontally from the top end portion of said drain extraction pipe and having a tip end portion bent downwards, elevation drive means and rotary drive means operatively connected to said drain extraction pipe for raising nd lowering and rotating said drain extraction pipe in the machine, and a rotary limit adjusting device provided in said rotary drive means for limiting the extend to which said drain extraction pipe is rotatable by said rotary drive means.

5,011,393

APPARATUS FOR MANUFACTURING SILICONE GEL SHEET

Motoyasu Nakanishi, Fujishi, Japan, assignor to Kabushiki Kaisha Cubic Engineering, Shimizushi, Japan

Division of Ser. No. 73,067, Jul. 13, 1987, Pat. No. 4,950,148.
This application Oct. 26, 1988, Ser. No. 262,878
Claims priority, application Japan, Jan. 31, 1987, 62-21254
Int. Cl.[5] B28B *7/36*
U.S. Cl. 425—89 **7 Claims**

1. An apparatus for manufacturing a silicone gel material, comprising:

a material supply means having:

a pair of tanks for separately storing and kneading first and second liquids which are used to prepare silicone gel material,

a feeder connected to said pair of tanks for feeding two kinds of liquids supplied from said tanks while kneading the liquids,

a debubbling unit connected to said feeder which has at least one debubbling tank for storing silicone gel material supplied from said feeder, means for removing air bubbles contained in silicone gel material in said tank by temporarily sealing said tank at a debubbling position and reducing the pressure within the tank, and means for causing silicone gel material in the tank to flow out of the tank by turning the tank upside down, and

a hopper provided at a position beneath the tank of said debubbling unit where said tank is turned upside down;

a nozzle connected to said hopper for receiving silicone gel material from said hopper and having a narrow and long discharge port which is horizontally elongated for discharging silicone gel material in a predetermined thickness;

a transfer unit having:

a lower film supplying means for supplying a lower film to move in a direction and below said discharge port of said nozzle to receive a film of silicone gel material thereon,

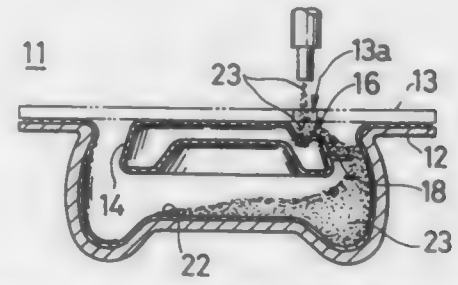
an upper film supplying means for supplying an upper film onto said film of silicone gel material at a point spaced from said discharge port of said nozzle in the direction of movement of said lower film,

upper and lower rollers spaced from said point in the direction of movement of said lower film and engaging the upper and lower films respectively for rolling the said upper and lower films and said film of silicone gel material into a laminated strip, and

a belt conveyor spaced from said rollers in the direction of movement of said lower film for receiving said laminated strip at a specified speed; and

a heating section having:

a heating tunnel through which said belt conveyor extends from an entrance to an exit and including heating means for gelling the silicone gel material of the laminated strip, and



strip taking up means provided at the exit of said heating tunnel.

5,011,394

MOLD FOR SKIN COVERED FOAMED PLASTIC MOLDING

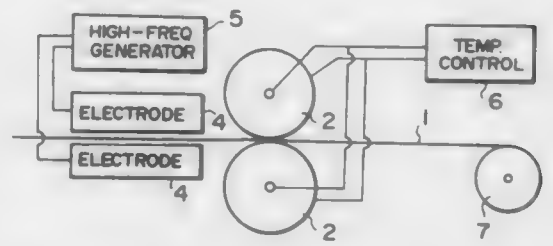
Hiroyuki Katagiri; Hisayoshi Mizuno, and Masami Mori, all of Ayase, Japan, assignors to Ikeda Bussan Co., Ltd., Kanagawa, Japan

Filed Mar. 28, 1989, Ser. No. 329,578
Claims priority, application Japan, Nov. 29, 1988, 63-301812
Int. Cl.[5] B29C *39/10, 45/14*
U.S. Cl. 425—117 **6 Claims**

1. A mold for skin covered foamed plastic molding, comprising:

a lower mold having a molding surface onto which a skin cover is to be placed, so that a liquid foam resin can be poured onto the skin cover;

an upper mold to be closed over the lower mold; and



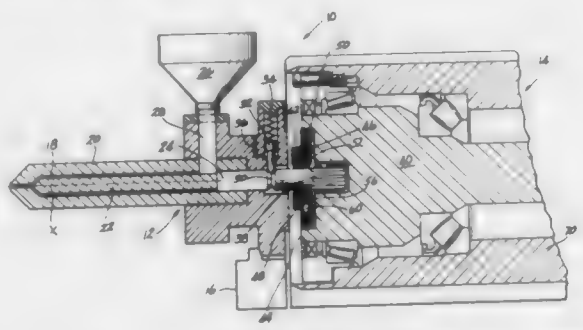
a middle mold to be placed between the upper mold and the lower mold, and having means for reducing pressure exterted by the liquid foam resin on the skin cover.

5,011,395

SURFACE SMOOTHING APPARATUS FOR MAGNETIC RECORDING MEDIUM

Toshio Kawamata, Odawara, Japan, assignor to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Jul. 19, 1983, Ser. No. 515,154
Claims priority, application Japan, Aug. 12, 1982, 57-140168
Int. Cl.[5] B29C *59/04;* **B30B** *3/04*
U.S. Cl. 425—143 **3 Claims**



1. An apparatus for smoothing the surface of a flexible magnetic recording medium, said apparatus comprising at least one set of two rolls one of said two rolls being a metal roll, said metal roll being highly planished, and the other of said two rolls being a resilient roll; a high-frequency dielectric heater provided prior to said two rolls; and a temperature regulator for controlling the surface temperature of said rolls, whereby the magnetic recording medium is first passed through said high-frequency dielectric heater and then passed through and pressed between said rolls.

5,011,396

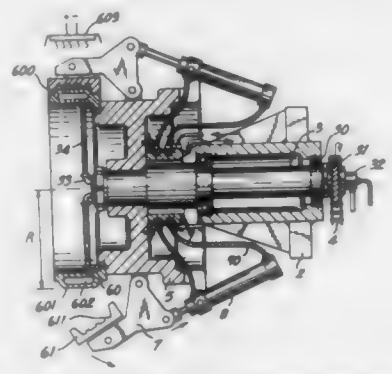
QUICK COUPLING DEVICE FOR EXCHANGING PLASTICIZING UNIT OF AN INJECTION MOLDING MACHINE

John Cosman, Bolton, and Victor Silaghi, Willowdale, both of Canada, assignors to Husky Injection Molding Systems, Ltd., Bolten, Canada

Filed Apr. 2, 1990, Ser. No. 502,748
Int. Cl.[5] B29C 45/46, 45/70
U.S. Cl. 425—190 9 Claims

1. In an injection molding machine, a removable plasticizing unit, said plasticizing unit including a barrel and a screw mounted in said barrel along an axis of injection, said screw having a shank portion; a drive unit including driving means mounted along said axis of injection for rotating an axially moving said screw within said barrel, said driving means having an end face; and coupling means for selectively securing said shank portion of said screw to said end face of said driving means, said coupling means including a first recess of depth X having a female spline located in said end face of said driving means about said axis of injection, a second recess of depth Y located in said end face about said first recess wherein X is greater than Y, a male spline located on the shank portion of said screw wherein said male spline and female spline are matching splines and collar means mounted in said second recess and rotatably movable between a first position and a second position, said collar means including an internal bore having a female spline substantially identical to said female spline in said end face of said driving means such that when said collar means is in said first position said female splines are aligned thereby allowing said male spline on said shank portion of said screw through said female spline on said collar means and into and out of said first recess so as to facilitate removal of said plasticizing unit from said molding machine and when said collar means is in said second position said female splines are non-aligned thereby locking said male screw spline in engagement with said female spline of said first recess.

5,011,397



APPARATUS FOR PRODUCING PREVULCANIZED TREADS

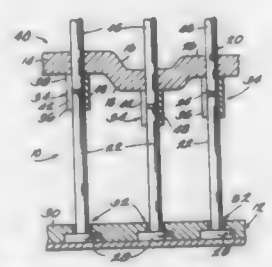
Michel Remond, Ceyrat, France, assignor to Compagnie Generale des Etablissements Michelin, Clermont-Ferrand Cedex, France

Division of Ser. No. 84,482, Aug. 12, 1987, which is a continuation of Ser. No. 782,365, Oct. 1, 1985, abandoned. This application Jul. 29, 1988, Ser. No. 226,069
Claims priority, application France, Oct. 4, 1984, 84 15362
Int. Cl.[5] B29D 30/52
U.S. Cl. 425—328 8 Claims

1. In an apparatus for manufacturing prevulcanized treads comprising first molding means for the sole of the tread, second molding means for the tread pattern and heating means for vulcanizing the tread, the first molding means defining in closed position at least in part a first quasi-cylindrical surface and the second molding means defining in said closed position at least in part a second coaxial quasi-cylindrical surface located radially outward of the first surface, the improvement comprising

(a) means for moving the second molding means from a spaced apart open position to said closed position, the first and second molding means in said closed position are

immovable with respect to each other and are imparted a movement of rotation around the axis of said surface, and



(b) the first and second molding means define during the molding and vulcanizing of the tread a continuous molding space arranged as a circular arc of less than 360°.

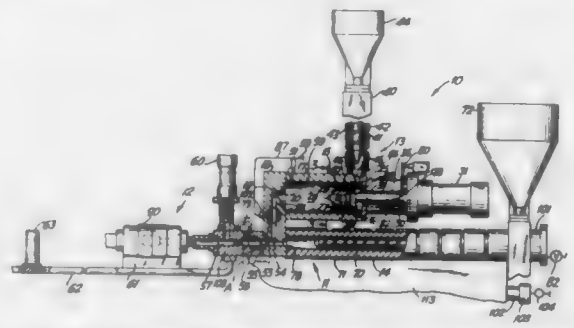
5,011,398

APPARATUS FOR LOST FOAM MOLDING AND METHOD OF ASSEMBLING SAME

Russell J. VanRens, Milwaukee, Wis., assignor to Outboard Marine Corporation, Waukegan, Ill.

Continuation of Ser. No. 337,754, Apr. 13, 1989, abandoned.
This application Jul. 26, 1990, Ser. No. 561,290
Int. Cl.[5] B29C 33/30, 33/44
U.S. Cl. 425—444 15 Claims

1. A mold assembly comprising a mold apparatus including a mold member having a first side which is contoured to impart a shape to a component, a second side opposite said first side, an aperture extending between said first and second sides, an ejector pin positioned proximate said second side of said mold member and having a first end movable into sliding engagement within said aperture to become a portion of a surface including said first side, said ejector pin also being movable to effect movement of the component away from said mold member after the component is imparted with the shape, and means engaging said second side of said mold member adjacent said aperture and projecting outwardly from said second side for reducing destructive contact of said first end of said ejector pin with said second side of said mold member when said first end moves into said aperture.



14. A method of assembling a mold apparatus including a mold member having a first side which is contoured to impart a shape to a component, a second side opposite said first side, a plurality of apertures extending between the first and second sides, a like plurality of ejector pins generally positioned adjacent the second side and having respective ends positioned to respectively move into the apertures and to become a portion of a surface including the first side, and also positioned to effect movement of the component away from the mold member, said method comprising the steps of providing a like plurality of assembly pins having respective ends positioned to respectively pass through the apertures, and providing a like plurality of sleeves respectively positioned to slide partially onto the ends of the ejector pins and to effect self support thereof on the respective ends of the ejector pins and with respective portions of the sleeves exposed to receive therein the respective ends of the assembly pins in axial alignment with the respective ejector pins in the sleeves, partially and respectively sliding the sleeves onto the ends of the ejector pins, positioning the second side of the mold member proximate to the sleeves, respectively inserting the assembly pin ends through the apertures from the first side of the mold member and into the exposed portions of the sleeves, and moving the mold member relative to the ejector pins so that the ejector pins move into the apertures.

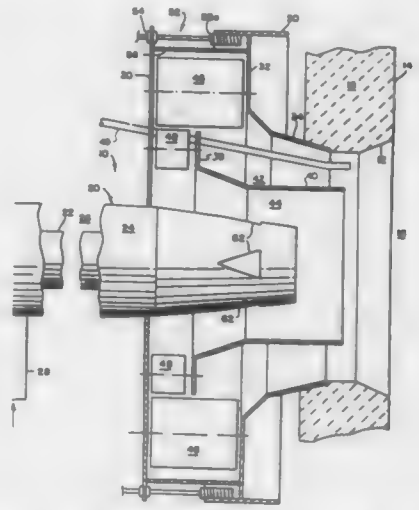
5,011,399

HIGH CAPACITY INJECTION MOLDING APPARATUS

John J. Farrell, Greenbrook, N.J., assignor to BM Corp., Somerville, N.J.

Filed Nov. 2, 1989, Ser. No. 430,870
Int. Cl.[5] B29C 45/06
U.S. Cl. 425—557 18 Claims

1. An injection molding machine comprising; a piston and a cylinder, said piston being slidably disposed in said cylinder, and means for reciprocal movement of said piston in said cylinder, said cylinder having front and back parts and being formed with an orifice at the front part of the cylinder, said piston being formed with a bore, and piston valve means disposed in said bore so that there is selective communication between the back part of the cylinder and the front part of the cylinder, and means for providing molten thermoplastic material to the back part of the cylinder to accumulate the molten thermoplastic material in the back part, whereby the piston is moved towards said orifice to inject the thermoplastic material from the front part of the cylinder through the orifice to a mold assembly with the accumulation of the molten thermoplastic in the back part of the cylinder.



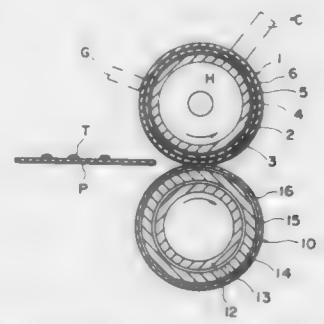
5,011,400

CONTROLLED FLOW SPLIT STEAM BURNER ASSEMBLY WITH SORBENT INJECTION

Joel Vatsky, Millburn, N.J., assignor to Foster Wheeler Energy Corporation, Clinton, N.J.

Continuation of Ser. No. 828,074, Feb. 3, 1986, abandoned, which is a continuation of Ser. No. 604,706, Apr. 27, 1984, abandoned. This application Dec. 29, 1986, Ser. No. 948,471
Int. Cl.[5] F23J 7/00
U.S. Cl. 431—4 21 Claims

1. A burner assembly for introducing fuel and air into an inlet passage formed through a furnace wall, said assembly comprising nozzle means having an outlet for discharging a mixture of air and fuel into said inlet passage, means for discharging air into said inlet passage in an inner and outer radially spaced path, each of which are radially spaced from said nozzle, and means for discharging sorbent into said inlet passage downstream of said nozzle outlet and downstream of the discharge area of said air from said radially outer path, said



sorbent mixing with said air during their passage through said inlet passage before they enter the interior of said furnace.

5,011,401

ELASTIC ROTATABLE MEMBER AND FIXING APPARATUS

Masaaki Sakurai, Yokohama; Iichiro Yamamoto, Niiza; Masahiro Goto, Kawasaki; Tsukasa Kuge, and Michio Shigenobu, both of Tokyo, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

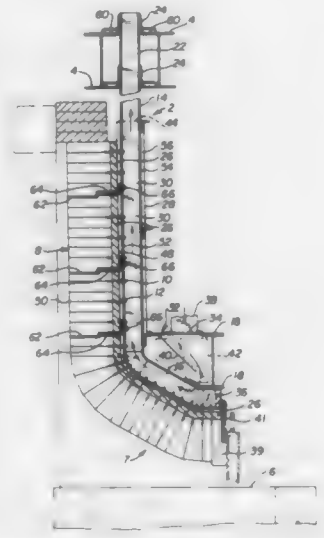
Continuation of Ser. No. 432,403, Nov. 6, 1989, abandoned, which is a continuation of Ser. No. 358,463, May 30, 1989, abandoned, which is a continuation of Ser. No. 94,418, Sep. 9, 1987, abandoned. This application May 14, 1990, Ser. No. 522,460
Claims priority, application Japan, Sep. 13, 1986, 61-216928
Int. Cl.[5] F27B 9/28
U.S. Cl. 432—60 34 Claims

1. An elastic rotatable member, comprising:

a base member;

an elastic material layer outside said base member;

a first primer layer between said base member and said elastic material layer;



a resin layer outside said elastic material layer; and

a second primer layer between said elastic material layer and said resin layer;

wherein said first primer layer has a thermal conductivity which is larger than that of said second primer layer; and

wherein said elastic material layer is composed of an elastic material, and the elastic material layer has a thermal conductivity which is higher than that of the first primer layer.

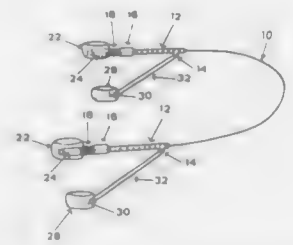
SUSPENDED FURNACE WALL
John A. Hammond, Washington, Pa., assignor to Frazier Simplex, Inc., Washington, Pa.
Filed Sep. 20, 1989, Ser. No. 410,090
Int. Cl.[5] F27D *1/12*; F23M *5/00*, *5/08*
U.S. Cl. 432—238 18 Claims

1. A suspended wall structure for use in a high temperature furnace comprising:
a plurality of spaced-apart, vertically extending columns;
means attached to lower portions and upper portions of the columns for supporting the columns within the furnace, wherein the upper portions of the columns are free to move in a lateral direction to accommodate thermal expansion and contraction;
a plurality of refractory members forming a refractory face along a first side of the columns;
thermal insulation means positioned between said refractory members and the first side of the columns;
hanger means for attaching said refractory members to the columns;
closure means for enclosing a second side of said columns, extending between adjacent columns and spaced from said thermal insulation means, forming a substantially continuous air chamber therealong; and
duct means communicating with said air chamber and with a source of mechanically drafter air to cause an air flow through said air chamber to cool said hanger means and columns.



5,011,403
ORTHODONTIC BRACKET MADE FROM ZIRCONIUM OXIDE
Michael Sadoun, 3 avenue Séverine, 92400 Courbevoie, and Alain Decker, 113, avenue Gabriel Péri, 91700 Ste Genevieve des Bois, both of France
Filed Feb. 17, 1989, Ser. No. 311,913
Claims priority, application France, Feb. 19, 1988, 8802017

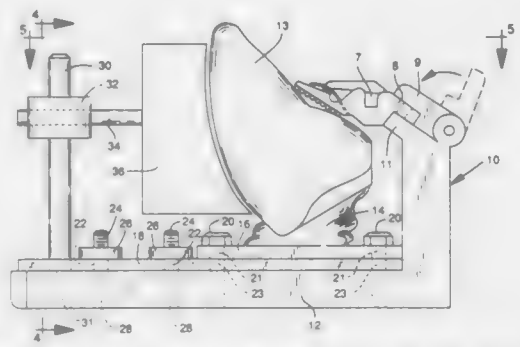
1. A nonporous ceramic bracket for bonding to the external face of a tooth consisting essentially of sintered small zirconium oxide particles partially stabilized by a transition metal

oxide, said bracket having a color and translucency substantially corresponding to those of said tooth.

5,011,404
APPLIANCE FOR CORRECTING DENTAL MALPOSITIONS
Enrico Losi, Milan, Italy, assignor to Franca Losi, Cinisello Balsamo, Italy, a part interest
Filed May 26, 1989, Ser. No. 357,937
Claims priority, application Japan, May 26, 1988, 63-20751
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—19 16 Claims



1. An appliance for correcting dental malpositions, comprising:
a metal wire arch for application to incisor and canine teeth;
at least one metal tube provided, in an intermediate part of said tube with a projection which is engaged by one of the two ends of a coil-spring wound around the tube while the other end engages a sleeve for fastening to a malpositioned tooth, said sleeve receiving a portion of the tube, said tube being provided with at least one hook projection; at said end, said metal wire arch is partially housed and freely movable within the tube, and said hook projection is connected by means of at least one rubber band to a hook projection provided on metal bands for fitting onto one or more teeth.

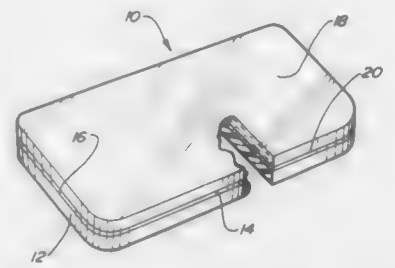
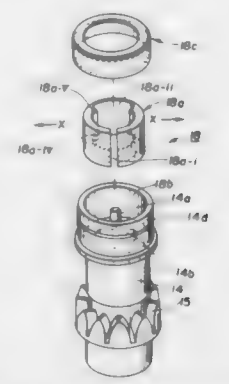
METHOD FOR DETERMINING ORTHODONTIC BRACKET PLACEMENT
Marc S. Lemchen, New York, N.Y., assignor to Dolphin Imaging Systems, Valencia, Calif.
Filed Jan. 24, 1989, Ser. No. 301,606
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—24 19 Claims

1. A method for determining orthodontic bracket placement on a malocclused tooth in a patient's jaw to correct the malocclusion comprising the steps of:
generating digital information defining the shape and location of the malocclused tooth with respect to the patient's jaw;
generating a mathematical model of the malocclused tooth as positioned in the jaw from the digitized information;
calculating the finish position in the jaw to which the malocclused tooth is to be moved from the digitized information; and



calculating the placement position of an orthodontic bracket on the malocclused tooth required in order to move the malocclused tooth to its finish position by a preselected orthodontic treatment.

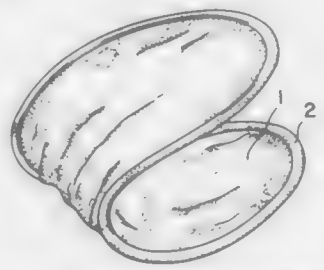
5,011,406
ORTHODONTIC SETUP AND ARCHWIRE FIXING METHOD
Alexander J. Wildman, 2440 Willamette St., Eugene, Oreg. 97405
Continuation-in-part of Ser. No. 249,453, Sep. 26, 1988, Pat. No. 4,909,735. This application Jan. 29, 1990, Ser. No. 472,362
Int. Cl.[5] A61C *3/00*
U.S. Cl. 433—24 21 Claims



16. Apparatus for forming archwires to fit into archwire slots of orthodontic brackets arranged in a predetermined archform, the apparatus comprising:
a plurality of separate setup plate structures for mounting model teeth thereon;
an alignment fixture for positioning the setup plate structures thereon with the model teeth in a curved arrangement defining an archform; and
a plurality of archwire forming fixtures, each forming fixture being mountable on the alignment fixture in a predetermined relationship to one of the setup plate structures;
each archwire forming fixture including an archwire forming slot in a predetermined position so that the archwire forming slot has a predetermined relationship to the setup plate structure.

5,011,407
CUSTOM DENTAL IMPRESSION TRAY
Joseph Pelerin, 3051 E. Pontiac Rd., Auburn Hills, Mich. 48057
Filed May 22, 1989, Ser. No. 354,712
Int. Cl.[5] A61C *9/00*
U.S. Cl. 433—48 1 Claim

1. A custom impression dental tray assembly consisting of:
a sheet of thermosetting material becoming pliable at a temperature in the range of 115°–150° F. and rigid at the temperature of the mouth, said thermosetting material composed of polycapractone,
a separation layer having one side directly contacting, overlying, covering and attached to one side of said sheet of thermosetting material, said separation layer composed of a sheet of gauze,
a pliable wax covering on the other side of said separation layer, directly contacting said layer, said wax covering being moldable with said sheet of thermosetting material and having a substantially uniform thickness,
said sheet, said separation layer and said wax covering forming an integral structure,
wherein, after said tray assembly is heated and molded into the desired shape, said separation layer enables said separation layer and said wax covering to be removed from said sheet of thermosetting material which forms a custom impression tray.



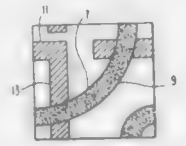
5,011,408
CHUCK DEVICE FOR DENTAL HANDPIECE
Takasuke Nakanishi, c/o Nakanishi Dental Mfg. Co., Ltd., 340 Kamihinata, Kanuma-shi, Tochigi-ken, Japan
Filed Dec. 22, 1988, Ser. No. 288,680
Claims priority, application Japan, Dec. 28, 1987, 62-329981
Int. Cl.[5] A61C *1/14*
U.S. Cl. 433—127 6 Claims

1. A chuck device for a dental handpiece comprising:
a dental tool for applying dental treatment,
a sleeve for fitting and securing said dental tool,
a push button having a cam surface adapted for detaching said dental tool, and
connecting-removal means for positively holding and securing said dental tool within said sleeve and for detaching said dental tool at the time of exchanging said dental tool,
said connecting-removal means including an elastic engagement member engaging with an engaging projection of said dental tool for positively holding and securing said dental tool within said sleeve, and attachment means for attaching said elastic engagement member to said sleeve, said elastic engagement member having a slit so that said elastic engagement member is extended apart about a portion thereof as fulcrum, said elastic engagement member being in the form of a cylinder, the inner surface of which is formed with shoulder sections for engaging and positively holding said engaging projection of said dental tool within the inside of said cylinder, said elastic engagement member being adapted to be extended apart substantially radially within an opening of said sleeve, said engaging projection abutting on and engaging with said shoulder sections for substantially the whole extend of said engaging portion, said engaging projection of said dental tool and said elastic engagement member normally engaging with each other in the non-extended state of said elastic engagement member for positively holding and securing said dental tool within said sleeve, said push button being thrust at the time of exchanging said dental tool for bringing said cam surface into abutment with said elastic engagement member to extend said elastic engagement member apart to release the engagement between said engagement projection of said dental tool and said

elastic engagement member to detach said dental tool from said sleeve.

5,011,409
POLYURETHANE INTRAORAL DAM
Norman Gray, Cary, N.C., assignor to Aukland (USA), Inc., Cary, N.C.
Filed Jan. 11, 1990, Ser. No. 463,541
Int. Cl.[5] A61C *5/14*
U.S. Cl. 433—136 **5 Claims**

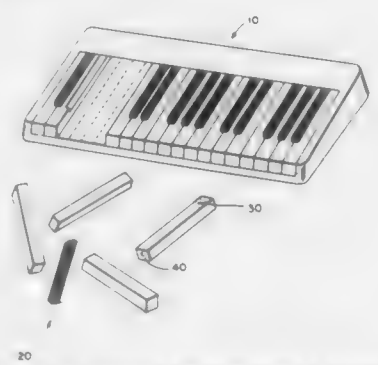
1. In a unitary preassembled disposable intraoral dam having a flexible elastic membrane held taut about its periphery by a complimentary annular spring-like frame member, the improvement comprising an extrudable thermoplastic polyurethane composition, said composition being the reaction product of an aliphatic diisocyanate, a high molecular weight aliphatic polyether diol, said aliphatic polyether diol having a molecular weight in the range of about 600 to about 5,000, and a low molecular weight aliphatic diol containing about 2 to about 6 carbon atoms, wherein the molar ratio of said polyether diol to said aliphatic diol is in the range of about 0.3 to about 0.7.



5,011,410
SILANE-TREATED METAL DENTAL ARTICLES
Scott R. Culler, Burnsville; Jon W. Fundingsland, Maplewood, both of Minn., and Dwight W. Jacobs, River Falls, Wis., assignors to Minnesota Mining and Manufacturing Co., St. Paul, Minn.
Filed Sep. 14, 1989, Ser. No. 407,365
Int. Cl.[5] A61C *13/08*
U.S. Cl. 433—208 **21 Claims**

1. A method for applying a layer of exogenous inorganic oxide to the surface of a metal dental article, which method comprises the steps of:
(a) coating at least a portion of the surface of the article with a coupling agent; and
(b) heating the coated surface at a temperature and for a time sufficient to convert the coating to a layer of exogenous inorganic oxide.

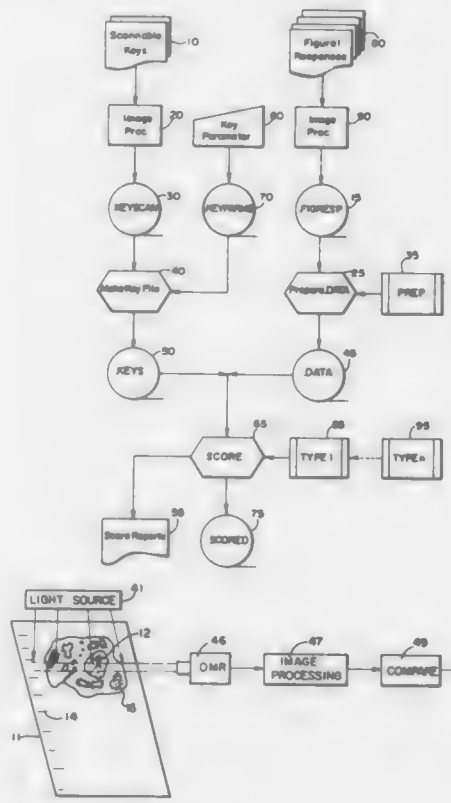
5,011,411
METHOD OF MAKING A NON-REPETITIVE MODULAR DESIGN
Andreas F. Loewy, 620 Coolidge St., Lafayette, La. 70503
Continuation-in-part of Ser. No. 195,032, May 17, 1988, abandoned. This application Oct. 31, 1989, Ser. No. 429,633
Int. Cl.[5] G09B *1/32*
U.S. Cl. 434—96 **50 Claims**



1. A method of making a non-repetitive modular design, comprising the steps of:
(a) providing a polygon, having a shape which is capable of being nested with other polygons of substantially identical shape and size and arranged to cover a surface, the polygon having vertices,
(b) selecting a plurality of points along one side of the polygon, the points being arranged in a symmetrical pattern around the midpoint of the side of the polygon, all of said points being distinct from said midpoint and distinct from said vertices,
(c) duplicating the pattern of points on the remaining sides of the polygon,
(d) drawing lines connecting pairs of said points, such that

each point is connected to one line, wherein the lines are drawn such that the resulting pattern does not have rotational symmetry,
(e) making a plurality of copies of the polygon prepared according to steps (a) through (d), and
(f) arranging said copies to cover said surface.

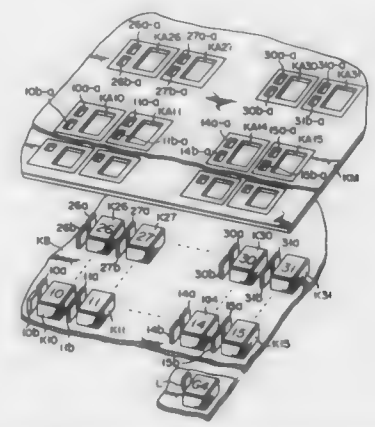
5,011,412
EDUCATIONAL KEYBOARD WITH REMOVABLE KEYS
Toni J. Rosenberg, 379 Harvard St., Cambridge, Mass. 02138
Filed Jul. 20, 1990, Ser. No. 556,025
Int. Cl.[5] G09B *15/04, 15/08, 15/00*
U.S. Cl. 434—227 **16 Claims**



1. An educational musical keyboard and a corresponding set of musical keys substantially in the shape of standard musical keys including means borne on the keyboard and the keys cooperating to make musical tone generation of a given note possible only when the key corresponding to said note is inserted in its correct corresponding key slot on said keyboard.

5,011,413
MACHINE-INTERPRETABLE FIGURAL RESPONSE TESTING
John J. Ferris, Titusville; William Kraft, Cranbury; Winton H. Manning, Princeton, and Michael Martinez, Hopewell, all of N.J., assignors to Educational Testing Service, Princeton, N.J.
Filed Jul. 19, 1989, Ser. No. 382,716
Int. Cl.[5] G09B *7/00*
U.S. Cl. 434—358 **12 Claims**

1. An automatic testing system for determining a figural response to a test inquiry, comprising:
(a) a test sheet of predetermined dimensions and having a grid thereon, said grid defining a plurality of marking areas arranged in predetermined positions on said test sheet;

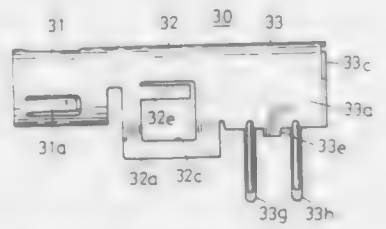


(b) a two-dimensional figural arrangement on said test sheet, said figural arrangement having a first optical reflectivity, said figural arrangement further being arranged within said grid and corresponding to at least one of said marking areas;
(c) response indicia of a second optical reflectivity created by a test taker in making a two dimensional figural response by overmarking selected response marking areas on said test sheet in relation to said figural arrangement;
(d) optical scanning means having different optical sensitivities to said first and second optical reflectivities for scanning said sheet to determine the positions of said response marking areas in at least two dimensions on said test sheet;
(e) memory means for storing key position data representative of at least one predetermined key marking area on said test sheet; and
(f) processing means for comparing said response marking areas with said key position data and generating an indication of the comparison.

8. A method of testing for figural responses to a test inquiry, comprising:

(a) presenting a test sheet of predetermined dimensions and having a grid thereon, said grid comprising a plurality of marking areas arranged in predetermined positions, said grid further comprising a two-dimensional figural arrangement thereon with a first optical reflectivity, said figural arrangement comprising part of said test inquiry;
(b) storing the position of at least one predetermined key marking area on said test sheet corresponding to a specified figural response to said test inquiry;
(c) instructing a test taker to make a figural response to said test inquiry, wherein said test taker provides at least one mark positioned on said sheet in relation to said figural arrangement, said mark having indicia of a second optical reflectivity;
(d) optically scanning said test sheet to determine the position of said mark made by the test taker in at least two dimensions and generating data representative of a position of said mark; and
(e) comparing said determined position and said stored position and generating a numerical indication of said comparison.

5,011,414
KEY-INPUT APPARATUS OR CAI SYSTEM
Yasuo Yoshizawa, Yonezawa; Hiroichi Kawaguchi, Chiba, and Kazunari Seto, Yokosuka, all of Japan, assignors to Yoshiki Industrial Co., Ltd, Yonezawa and Uchida Yoko Co., Ltd., Tokyo, both of, Japan
Continuation-in-part of Ser. No. 2,396, Dec. 15, 1986, abandoned. This application Jun. 30, 1989, Ser. No. 373,598
Claims priority, application Japan, Apr. 18, 1985, 60-83219
Int. Cl.[5] G09B *5/00, 7/07;* **G06F** *15/20*
U.S. Cl. 434—431 **5 Claims**

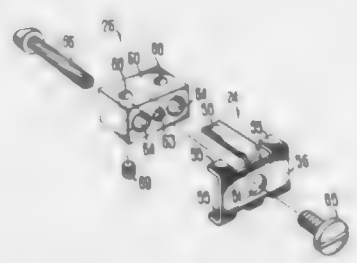


1. A key-input apparatus for a computer-aided instruction system, comprising:
a keyboard having a plurality of keys arranged in a matrix and in which a plurality of learning terminals are selectively assigned to said plurality of keys in correspondence with the arrangement of said learning terminals in a classroom, the number of said keys being more than that of said learning terminals in the classroom in both row and column directions;
first indication means for indicating a key of said keys on said keyboard corresponding to a calling terminal of said learning terminals;
second indication means for indicating an operated key of said keys on said keyboard corresponding to a called terminal of said learning terminals called by a teacher;
a table memory for storing the relationship between said keys of said keyboard and said learning terminals assigned thereto;
means for specifying the learning terminal corresponding to the operated key on said keyboard through said table memory; and
a plurality of key masks each of which is selectively put on said keyboard to identify on the keyboard only selected keys corresponding to the learning terminals arranged in the classroom so that the keys identified by each of said key masks coincide visually with the arrangement of the learning terminals in the classroom.

5,011,415
RIGHT ANGLE COAXIAL RECEPTACLE
Takao Suzuki, Oume; Mamoru Suzuki, Akishima, and Yasufumi Hayashi, Tachikawa, all of Japan, assignors to Japan Aviation Electronics Industry Limited, Tokyo, Japan
Filed Mar. 8, 1990, Ser. No. 490,315
Claims priority, application Japan, Mar. 31, 1989, 1-38917
Int. Cl.[5] H05K *1/00*
U.S. Cl. 439—63 **8 Claims**

1. A right angle coaxial receptacle comprising:
an external conductor including a forward portion having a plurality of resilient contact pieces formed at substantially

equiangular intervals about the center axis of said external conductor and a rear portion formed as a unitary structure with said forward portion and forming a housing portion that is semicyclindrical above said center axis on the side opposite from a printed circuit board on which said receptacle is to be mounted, said external conductor being formed as one piece by stamping it out of a resilient metallic plate through press work, at least one external conductor terminal extending down at right angles to said center axis from said rear portion of said external conductor at a position below said center axis;

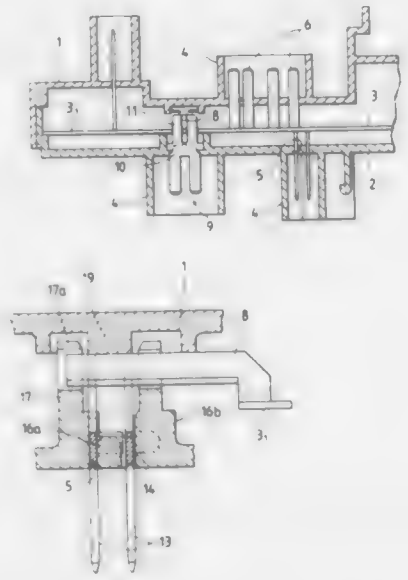


an insulator having a through hole coaxial with said center axis and received in said housing portion of said external conductor, said insulator having formed integrally with its rear end portion a substantially square pedestal portion protruding therefrom toward said printed circuit board at right angles to said center axis, said pedestal portion having a slot extending in the direction of said center axis

from the rear end face of said pedestal portion and communicating with said through hole; and

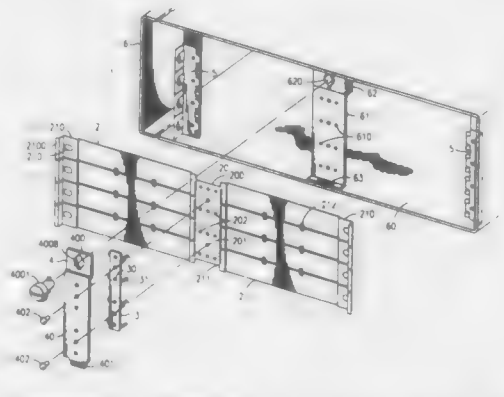
a center conductor composed of an engaging contact portion extending forwardly on said axis in said forward portion of said external conductor, a rod-like middle portion extending from the rear end of said engaging contact portion and inserted in said through hole of said insulator, and a center conductor terminal extending from the rear end of said middle portion, bent in an L-shape and projecting out through said slot at right angles to said center axis, said housing portion of said external conductor being substantially cylindrical and having a keep plate portion extending from the rear end edge of said housing portion at the top thereof to form its rear end face receiving the rear end of said insulator, and U-shaped resilient locking means extending from the lower end of said keep plate portion and surrounding said pedestal portion of said insulator from behind.

5,011,416
CABLE CONNECTING DEVICE
Robert H. Gladden, Jr., Norcross, and Phillip M. Thomas, Lake City, both of Ga., assignors to AT&T Bell Laboratories, Murray Hill, N.J.
Division of Ser. No. 358,991, May 26, 1989, abandoned. This application Apr. 2, 1990, Ser. No. 503,360
Int. Cl.[5] H01R *13/648*
U.S. Cl. 439—98 **5 Claims**



1. A device which is connectable to a cable and which is adapted to terminate strength member wires of said cable, said device including:

cable engagement clamping means for being secured to a cable jacket, said clamping means including a portion adapted to become engaged with and clamped to an outer surface of the plastic jacket of the cable and further including an upstanding portion which is substantially perpendicular to a longitudinal axis of the cable; and



bonding block means adapted to be secured in engagement with said upstanding portion of said clamping means and spaced from said portion of said clamping means which engages the cable jacket along a radial line extending from the cable for securing strength members of the cable which are disposed between said upstanding portion and said bonding block means, said bonding block means also including at least one passageway for receiving an end portion of a ground wire.

5,011,417
STRUCTURE OF CONNECTION BETWEEN BUS BAR AND PRESS-CONNECTING BRANCH TERMINAL IN ELECTRIC CONNECTION BOX
Etsuji Matsumoto; Mamoru Araki, and Keiichi Ozaki, all of Shizuoka, Japan, assignors to Yazaki Corporation, Tokyo, Japan
Filed Jun. 7, 1990, Ser. No. 534,564
Claims priority, application Japan, Jun. 9, 1989, 1-145302
Int. Cl.[5] H01R *9/09*
U.S. Cl. 439—76 **5 Claims**

1. A structure of connection between a bus bar and a press-connecting branch terminal in an electric connection box wherein a plurality of bus bars constituting a circuit are accommodated within a casing having an upper case and a lower case; a housing having at least one tab insertion hole at its bottom is formed on at least one of said upper and lower cases; a branch tab formed on one side portion of a press-connecting branch terminal is extended through said tab insertion hole into said housing to thereby constitute a connector insertion portion, and a desired one of said bus bars is press-fitted in and connected to a U-shaped slot formed in a press-connecting portion formed on the other side portion of said press-connecting terminal; said press-connecting branch terminal including a base plate portion, opposed press-connecting portions projecting from one side of said base plate portion and each having a U-shaped slot, and at least one branch tab projecting from the other side of said base plate portion; said structure comprising a first retaining means for retaining said press-connecting branch terminal in place when said upper and lower cases are coupled together, said first retaining means including a seat formed on a bottom of said housing for receiving said base plate portion and a press portion formed on an inner surface of said case disposed in opposed relation to said seat, and a second retaining means for retaining said press-connecting branch terminal in place when said base plate portion is press-fit in said seat, whereby said press-connecting branch terminal and the bus bar which are press-connected together are fixedly held between said seat and said press portion.

5,011,418
COMPUTER TERMINAL COVER ASSEMBLY
Thomas R. Perzentka, Jr., Lisle, Ill., assignor to AT&T Bell Laboratories, Murray Hill, N.J.
Filed Aug. 2, 1990, Ser. No. 562,508
Int. Cl.[5] H05K *5/00*
U.S. Cl. 439—135 **11 Claims**

1. A backplane assembly for use with a computer terminal card cage having slots for receiving feature cards comprising means for shielding the card cage slots and having a plurality of filler members all with a common end releasably secured to the card cage and with each of said filler members corresponding with one of the card cage slots and having an opposite end extended across the one card cage slot for covering and shielding the one card cage slot, and means affixed to the card cage opposite said filler members common end and having spring members each corresponding with one of said filler members with each spring member formed for engaging said one filler member opposite end and wherein said engaging means have a plurality of protuberances each formed to maintain said one filler member opposite end in engagement with said corresponding spring member and wherein said protubernace is releasable with respect to said one filler member for enabling said corresponding spring member to exert a force for disengaging said one filler member opposite end to extend outward and free from the card cage.

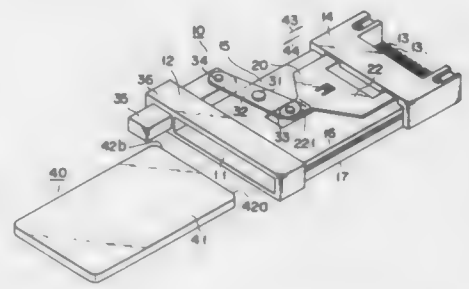
SAFETY SOCKET
Jack Maan, 4 Fl., No. 7-1, Chung Yang Erh St., Hsin Tien City, Taipei Hsien, Taiwan
Filed Dec. 21, 1989, Ser. No. 454,173
Int. Cl.[5] H01R *13/44*
U.S. Cl. 439—145 **3 Claims**

1. A safety socket comprising:

a cover plate having a rectangular opening thereon;



a base plate having a first recessed portion for receiving said cover plate, a second recessed portion being formed on said first recessed portion, said second recessed portion having a first pair of hot slots therein; and

a sliding means comprising a stepped plate and a combination of a spring and a guide-rod, said stepped plate having a raised plate extending from a top surface at a substantially intermediate position thereof and a second pair of hot slots thereon, said combination of spring and guide-rod being received in a channel provided on said base plate, said raised plate being confined to be displaceable within said opening of said cover plate, said stepped plate being slidable within said second recessed portion from a

safety position where said first pair of hot slots are blocked by said second pair of hot slots to a work position where said first pair of hot slots are aligned with said second pair of hot slots.

5,011,420
CONNECTOR APPARATUS HAVING AN EJECTING MECHANISM
Haruo Sakamoto, Yokohama, Japan, assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.
Filed Feb. 26, 1990, Ser. No. 484,972
Claims priority, application Japan, Mar. 1, 1989, 1-21982[U]
Int. Cl.[5] H01R *13/00*
U.S. Cl. 439—152 **3 Claims**

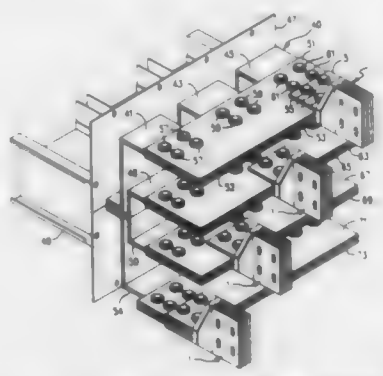
1. A connector apparatus to be connected to an IC pack comprising:

housing means for receiving and holding the IC pack inserted thereto,

connector means for contacting electrically to said inserted IC pack,

ejecting means for ejecting said inserted IC pack from said connector means having at least two ejecting arms having a U-shaped cross section, two opposing sections of said ejecting arm sandwiching said housing means, and the other section perpendicular to said opposing sections being arranged to contact with the front end of said IC pack, and

means for activating said ejecting means so as to eject said IC pack from said connector means.



5,011,421
PLANE CHANGE CONNECTOR ASSEMBLY
Jonathan W. Duke, Lancaster, and Barry R. Richards, Greenwood, both of S.C., assignors to Westinghouse Electric Corp., Pittsburgh, Pa.
Filed Mar. 5, 1990, Ser. No. 489,132
Int. Cl.[5] H01R *4/60, 25/00*
U.S. Cl. 439—213 **17 Claims**

7. A busbar connecting assembly for connecting a first three-

phase busway having multiple co-planar outwardly extending busbars for each phase, with the busbars for each phase spaced apart from one another and stacked in separate, parallel planes to a second, three-phase busway also having multiple co-planar outwardly extending busbars for each phase with the busbars for each phase spaced apart from one another and stacked in separate, parallel planes at a predetermined angle to the planes of said parallel planes of the first busway, the connecting assembly comprising:

a plane change member associated with each phase, each plane change member having a plurality of spaced-apart first coupling flanges parallel to a first plane, a planar joining member having two opposing sides, said joining member being in a plane perpendicular to said first coupling flanges and having said first coupling flanges cantilevered from one side of said joining member, a plurality of spaced-apart second coupling flanges parallel to a second plane which is at the predetermined angle to said first plane, and said second coupling flanges being cantilevered from the opposing side of said joining member;

connecting means associated with each phase, said associated connecting means for the first phase connecting the co-planar bars of the first phase of said first electrical components to said first coupling flanges of the associated plane change member for the first phase, and connecting the co-planar bars of the first phase of said second electrical component to said second coupling flanges of the associated plane change member for the first phase;

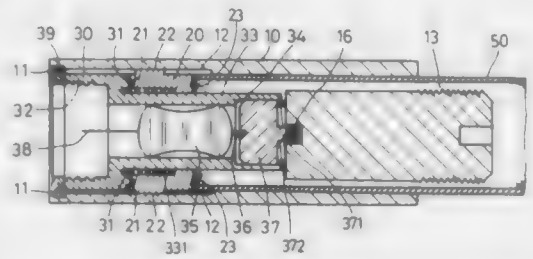
the associated connecting means for the second phase connecting the co-planar bars of the second phase of said first electrical component to said first coupling flanges of the associated plane change member for the second phase, and connecting the co-planar bars of the second phase of said second electrical component to said second coupling flange of the associated plane change member for the second phase;

the associated connecting means for the third phase connecting the co-planar bars of the third phase of said first electrical component to said first coupling flanges of the associated plane change member for the third phase, and connecting the co-planar bars of the third phase of said second electrical component to said second coupling flanges of the associated plane change member for the third phase;

a first ganging plate means associated with each phase, said first ganging plate means connecting the multiple co-planar bars of each phase of said first electrical component to the first coupling flanges of said associated plane change member for that phase;

a second ganging plate means associated with each phase, said second ganging plate means connecting the multiple co-planar bars associated with each phase of said second electrical component to the second coupling flanges of said associated plane change member for that phase;

first fastening means for securing said ganging plates to said coupling flanges; and



second fastening means for securing said co-planar bars to said ganging plate.

5,011,422

COAXIAL CABLE OUTPUT TERMINAL SAFETY PLUG DEVICE

Ming-Hwa Yeh, No. 2, Lane 8, Hsin An Rd., Shih Lin District, Taipei, Taiwan

Filed Aug. 13, 1990, Ser. No. 567,126
Int. Cl.[5] H01R *13/629, 13/66*
U.S. Cl. 439—307 **3 Claims**

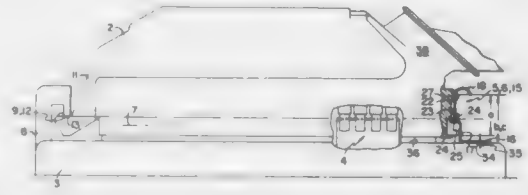
1. A coaxial cable output terminal safety plug device comprising:

a plug comprising a round tube having an inner flange at the front end, two opposite, longitudinal grooves on the inner wall, and a cylindrical projection at the rear end, said cylindrical projection being designed in an outer diameter slightly smaller than said round tube and having three stop strips equidistantly connected between said round tube and said cylindrical projection, a driving tube and a threaded tube concentrically received therein, said driving tube having toothed portion at its front end and two opposite, raised strips on its outer wall surface respectively releasably engaged in said two longitudinal grooves, said threaded tube having a toothed portion at its rear end and releasably engaged with the threaded portion of said driving tube and an inner thread at its front end, a resistor mounting tube extending from the rear end of said threaded tube inserted in said driving tube for holding a resistor therein, a compression spring sleeved on said resistor mounting tube and set between said threaded tube and said driving tube, said resistor mounting tube having a stepped portion in larger inner diameter, said resistor having a rear end conductor fixedly connected to an element, said element having a projecting end sleeved with a spring and stopped between said element and the front end of said cylindrical projection; and

a driving tool comprising a handle having a front tube extending therefrom, said front tube having three longitudinal channels made at the front and three openings radially made on its periphery around a circle near the front end thereof.

5,011,423

PLUGGING DEVICE FOR THE ELECTRIC INITIATION OF AN AIRBAG PROVIDED WITH LOCKING MEANS TO PERMIT THE OPENING THEREOF WITHOUT TRIGGERING THE FUNCTIONING OF THE AIRBAG



Werner Reuter, Erkrath, Fed. Rep. of Germany, assignor to Grote & Hartmann GmbH & Co. KG, Wuppertal, Fed. Rep. of Germany

Filed Oct. 30, 1989, Ser. No. 427,874
Claims priority, application Fed. Rep. of Germany, Nov. 4, 1988, 8813830[U]
Int. Cl.[5] H01R *13/703*
U.S. Cl. 439—341 **15 Claims**

1. In a plugging device for connecting at least one line of an electric switching arrangement for electrical initiation of an airbag, including first and second plugging device parts having contact elements for the line, and an auxiliary switching arrangement having first and second auxiliary contacts to prevent the initiation of the airbag when the plugging device is opened, the auxiliary switching arrangement including a short circuit bridge arrangement associated with the first and second auxiliary contacts so that when the first and second auxiliary contacts are closed in engagement with each other during opening movement of the plugging device, the short circuit bridge arrangement is also closed to bring about a short circuit to prevent the initiation of the airbag, the first auxiliary contact being movably held in the first plugging device part and the second auxiliary contact being immovably held in the second plugging device part, the first and second auxiliary contacts being closed at a predetermined first position during the opening movement of the plugging device, the contact elements being opened out of engagement with each other at a predetermined second position during the opening movement of the plugging device, the predetermined first position for closing the first and second auxiliary contacts being reached first during the opening movement of the plugging device before the predetermined second position for opening the contact elements so that the short circuit occurs to prevent the initiation of the airbag, an improvement comprising:

said plugging device including first and second casing parts with the first plugging device part being disposed in said first casing part, and the second plugging device part being disposed in said second casing part;

hinge means for connecting one end of said first casing part to one end of said second casing part so that said first casing part can pivot away from said second casing part during the opening movement of said plugging device;

delay opening means for retarding the pivoting of said first casing part during the opening movement of said plugging device at a predetermined third position disposed between said predetermined first and second position to allow a longer time to bring about the short circuit;

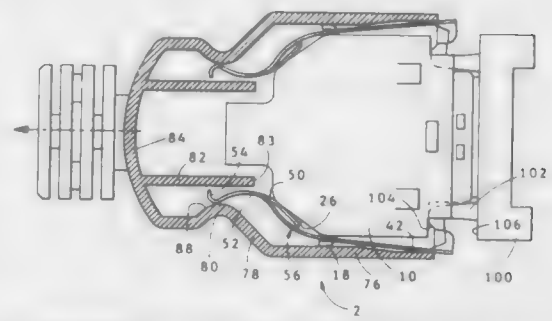
said delay opening means including a locking mechanism arranged at a distance from said hinge means on opposite ends of said first and second casing parts;

said locking mechanism including a grip part secured on the opposite end of said second casing part so that said grip part can be bent elastically away from the opposite end of said first casing part for first and second movement stages during the opening movement of said plugging device;

said grip part including locking means for engaging the opposite end of said first casing part to lock said first and second casing parts together in a closed position;

said grip part including stop means for engaging the opposite end of said first casing part to maintain said first casing part at said predetermined third position at an end of said first movement stage during the opening movement of said plugging device; and

said first casing part including holding means for engaging said grip part during said first movement stage so that said stop means is prevented from being pulled away from said first casing part when said grip part is bent elastically away from the opposite end of said first casing part to a first releasing position to open said plugging device;



whereby at the end of said first movement stage, said grip part is again bent elastically away from the opposite end of said first casing part to a second releasing position to release said stop means to start said second movement stage so that said plugging device can be fully opened.

5,011,424

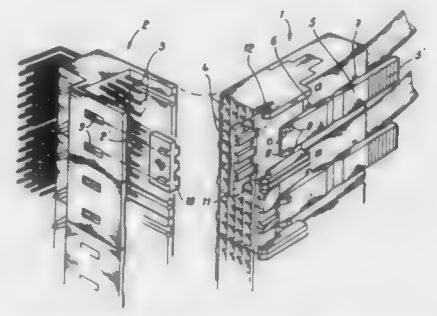
LATCH MECHANISM FOR ELECTRICAL CONNECTOR

Randy G. Simmons, Clemmons, N.C., assignor to AMP Incorporated, Harrisburg, Pa.

Filed Nov. 1, 1989, Ser. No. 431,049
Int. Cl.[5] H01R *13/627*
U.S. Cl. 439—352 **5 Claims**

1. An electrical connector having an inner body section and an outer housing section, the inner body section having two latch arms operatively hinged to hinges provided on side walls thereof, and having forward of the hinges, latch arms having latching surfaces at forward ends which latch the connector to a complementary connector, the connector having rearward of the hinges, rotatable actuation arms; the connector being characterized in that:

the latch arms are stamped from a material having resilient characteristics, hinge receiving openings extend through the latch arms, the hinge receiving openings being dimensioned to received respective hinges therein, the rotatable actuation arms are provided on the latch arms and extend from the hinge receiving openings in a direction opposed to the latching surfaces,



the rotatable actuation arms including on ends thereof, actuator sections having forwardly directed surfaces, while the housing include rearwardly facing camming surfaces disposed proximate to the forwardly facing surfaces, and in that the housing is axially movable relative to the inner body causing the camming surfaces to rotate the latch arms about the hinges, thereby unlatching the connector from the complementary connector.

CONNECTOR ASSEMBLY WITH LATCHING MEANS

Albertus Van Zanten, Dp's-Hertogenbosch, and Johannes Maria B. Van Woensel, Eg Rosmalen, both of Netherlands, assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Jun. 6, 1990, Ser. No. 533,825
Claims priority, application Netherlands, Jun. 6, 1989, 8901438
Int. Cl.[5] H01R *13/62*
U.S. Cl. 439—353 **11 Claims**

1. A connector assembly comprising a plug-in connector and a socket connector adapted to mate with and detach from one another, the plug-in connector having at least one contact

member of a first type and the socket connector having at least one contact member of a second type, said contact members being adapted to cooperate when the connectors mate, wherein:

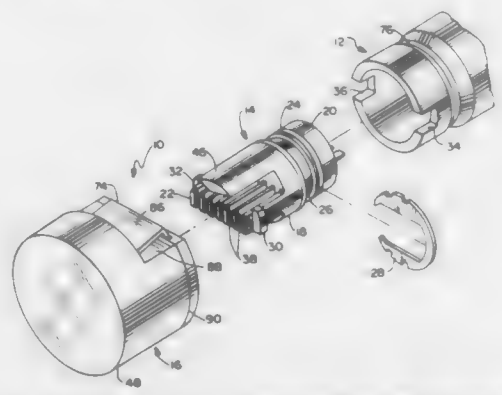
the plug-in connector having a housing of electrically insulating material, at least one lever-type locking element extending along an external side of said housing and having a first and second pivot point, spaced a part along the length of the connector, at least one projecting latching element provided at a first free end of said lever-type locking element near a mating side of the plug-in connector, said latching element projecting outward away from the housing, a second free end of said lever-type locking element being adapted for gripping and application of a force inward toward the housing; and

the socket connector also having a housing of electrically insulating material, at least one slotted opening in a side of said socket housing which can receive the projecting latching element from within the socket housing;

when the plug-in connector is inserted into the whereby when the plug-in connector is inserted into the socket connector, the first free end of the lever-type locking element extends within said socket connector housing along the side containing the slotted opening and the outwardly projecting latching element snaps into the slotted opening from within the socket housing to latch the two connectors together, and

whereby when the connectors are to be disconnected, a force directed inward toward the plug-in connector housing is exerted at the second free end of the lever-type locking element, said force causing the second free end to pivot about the second pivot point and the first free end to pivot about the first pivot point, so that the latching element moves away from the side of the socket connector housing in the same direction as the second free end of the lever-type locking element and disengages from the slotted opening.

5,011,426



ELECTRICAL CONNECTOR ASSEMBLY FOR VEHICULAR SUSPENSION SYSTEM COMPONENT

Stephen A. Colleran; Edward J. Plocek, both of Lisle; Timothy R. Ponn, Aurora, and William D. Gruhn, Wheaton, all of Ill., assignors to Molex Incorporated, Lisle, Ill.

Filed Feb. 2, 1990, Ser. No. 474,571

Int. Cl.[5] H01R *13/73*

U.S. Cl. 439—357 17 Claims

1. An electrical connector assembly for a vehicular suspension system component employed in a high vibration environment, said suspension system component including an open ended tip, electrical control means associated with said component for controlling selected operations of the suspension system component, the electrical connector assembly having a first connector with first terminals disposed in a first housing mounted adjacent the tip of the suspension system component and being operatively connected to the electrical control means and a second connector with second terminals disposed in a second housing mated with the first connector, wherein the improvement comprises:

portions of each said first terminal being insert molded into said first housing, such that said first housing defines a unitary matrix of nonconductive material surrounding, engaging and supporting portions of each said first terminal, said first housing includes an outer peripheral surface having n inwardly directed annular groove therein, a deflectable washer being seated in the groove of said first housing and securely engaging the suspension system component in the open ended tip for retaining the first housing therein, each said first terminal including a mounting end extending from the portion thereof insert molded in the first housing and into the suspension system component for electrical connection with the electrical control means therein and a mating end extending from the portion thereof insert molded in the first housing bent over a supporting portion of said first housing and generally toward the open ended tip of the suspension system component;

portions of each said second terminal being insert molded into said second housing such that second housing defines a unitary matrix of nonconductive material surrounding, supporting and engaging said portions of each said second terminal, said second housing being lockingly but releasably engageable over the exterior of the tip of said suspension system component, with a mating end of each said second terminal extending toward the open ended tip of said suspension system component for releasably electrically contacting a corresponding one of the first terminals of said first connector, whereby the insert molding of the first and second terminals in the respective first and second connectors achieves environmental sealing and accurate positioning of the terminals in the high vibration environment of said suspension system component.

CORD PROTECTOR

Eugene Z. Martin, 1821 NW. 39th, Oklahoma City, Okla. 73118

Filed Mar. 13, 1990, Ser. No. 492,912

Int. Cl.[5] H01R *13/62*

U.S. Cl. 439—373 9 Claims

1. In an electrical outlet having a plurality of receptacles, said receptacles each providing for the removable installation of an electrical plug having two or more terminals, the combination comprising;

an apparatus to prevent the inadvertent removal of one or more of said plugs from one or more of said receptacles, including;

an outlet mounted bracket attachable in overlying relationship to said outlet by means of an outlet cover plate retaining screw,

said outlet mounted bracket having a first element and a second element,

said outlet mounted bracket first and second elements extending substantially perpendicularly from opposite ends of said outlet mounted bracket,

said outlet mounted bracket first and second elements including essentially planar and parallel facing surfaces and opposed surfaces,

said outlet mounted bracket containing a plurality of apertures each providing for the insertion of one said electrical plug therethrough and into said electrical receptacle,

a slidable member including a first element and a second element in substantially parallel relationship and perpendicularly extending from a central element positioned therebetween, said slidable member first element and second elements having facing and opposing surfaces,

said slidable member central element containing elongated indentations permitting the reception of an electrical cord but not allowing the passage of one said plug,

the major axes of said indentations substantially parallel to said slidable member first and second elements, and

slidably engageable mating connection means on said first and second elements of said bracket and slidable member.

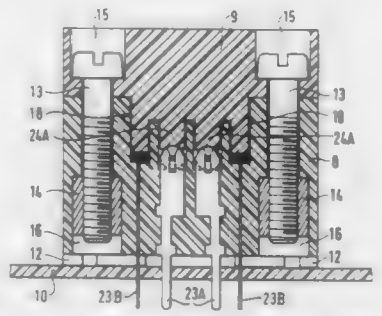
TAPPING CONNECTOR FOR A SCREENED ELECTRIC CABLE



Jean-Paul Heng; Henri Guernet, both of Lyons, and André Marmonier, Bron, all of France, assignors to Entrulec S. A., Cedex, France

Filed Apr. 12, 1990, Ser. No. 507,808

Claims priority, application France, Apr. 14, 1989, 89 04970

Int. Cl.[5] H01R *4/24*

U.S. Cl. 439—394 3 Claims

1. A tapping connector for a screened multiwire electric cable comprising an outer covering around both a plurality of conductor wires which are electrically insulated from one another and electromagnetic screening forming a sheath around said conductor wires, and optionally around a drain conductor providing electrical continuity for the screening, an annular portion of the outer covering and at least a portion of the sheath forming the screen being removed from a selected position along the cable for receiving the connector, wherein the connector comprises at least two complementary portions which are separable to allow a cable to be put into a position passing between them and to enable the cable to be held stationary relative thereto when they are reassembled, the connector including a plurality of laterally spaced, parallel grooves on one face of one of said portions, which grooves are open at both ends and to the side facing a zone where the two portions meet, at least one of said grooves containing an insulation-piercing connection piece for making electrical connection with a corresponding one of the insulated conductor wires or with a drain conductor, and at least one other of said grooves containing a conducting connection piece constituting a tab for making contact with a drain conductor or a conducting link providing screening continuity, the other portion of the connector having laterally spaced male pushers penetrating into respective ones of the grooves for causing a drain conductor or a conducting link or a conductor wire to be held stationary in each groove and for causing electrical connection to be made therewith when the connector portions are pressed against each other.

CONNECTION TERMINAL PLATE

Hai-Yung Ku, 8th Fl., No. 614, Lin Sen N. Road, Taipei, Taiwan

Filed Mar. 30, 1990, Ser. No. 501,702

Int. Cl.[5] H01R *4/24*

U.S. Cl. 439—409 3 Claims

1. A wire connection terminal block comprising a metal conducting terminal structure and insulator housing, wherein said terminal structure is positioned within the insulator, said terminal structure comprising:

a housing having two opposite sides with aligned wire holes each of said wire holes having a top rim with an oblique surface forming a wedge;

a movable block having a wire hole with a perimeter on two opposite, faces of the movable block, said perimeter of said wire hole on each said opposite face having a bottom rim with an oblique surface forming a concavity in said face of said moveable block; and

a compressing spring,

said compressing spring and movable block being accommodated within said housing, said housing having upper and lower openings, said upper opening being covered by a folding portion, said lower opening being covered by a plug, said wire hole of said movable block being normally displaced from said wire holes of said housing by said compressing spring, said wire holes of said housing and said moveable block being alignable when said compressing spring is compressed so that a wire can be inserted through said wire holes in said housing and said moveable block, an inserted wire being bent along said concavities on opposite faces of said moveable block, and a cover of the wire being pierced by said wedges at the top rims of the wire holes of said housing on sa d opposite faces of said moveable block when said compressing spring is released.

ELECTRICAL CONNECTOR HAVING CABLE STRAIN RELIEF

Louis Haitmanek, Florham Park, N.J., assignor to Thomas & Betts Corporation, Bridgewater, N.J.

Filed May 8, 1990, Ser. No. 520,697

Int. Cl.[5] H01R *13/58*

U.S. Cl. 439—456 5 Claims

1. An electrical connector assembly for terminating a transverse termination extent of an elongate multiconductor ribbon cable, said assembly comprising:

an elongate connector base having opposed upper and lower surfaces;

a plurality of contacts fixedly positioned in said base in a pre-determined pattern, said contacts having insulation-piercing extents extending above said upper surface of said base and connection extents adjacent said lower surface of said base;

an elongate cover movably supported over said base having a pair of longitudinal side walls, transverse end walls, and a lower cable engagement wall extending therebetween for affecting movement of said transverse termination extent of said cable into insulation-piercing connection with said contacts; and

an elongate leaf spring clip supported by and separate from said cover along a side wall of said pair and extending longitudinally therealong for supporting a further transverse extent of said cable longitudinally spaced from said transverse termination extent, said clip being spring-biased toward said side wall to secure said further transverse extent of said cable thereagainst in strain-relief fashion.

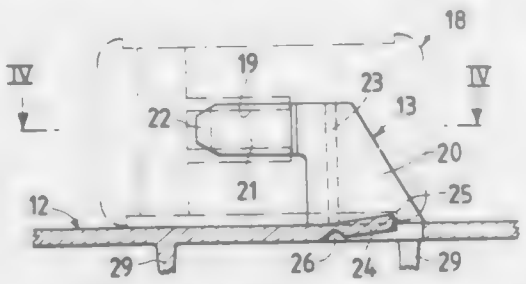
BASEPLATE FOR SUPPORTING A PLURALITY OF ELECTRIC CONNECTORS ON A MOTOR CAR



Renato Pasquali, Garbagnate, and Raffaele Drago, Milan, both of Italy, assignors to Alfa Lancia S.p.A., Arese, Italy

Filed Jan. 8, 1990, Ser. No. 462,050

Claims priority, application Italy, Jan. 10, 1989, 20422[U]

Int. Cl.[5] H01R *13/627*

U.S. Cl. 439—540 **11 Claims**

1. A supporting baseplate for electric conductors for use on a motor car, each of the conductors having first latching means for securing the conductors to said baseplate, said baseplate comprising a plate-like base casing which can be secured to a component part of the car, said plate-like base casing having at least one connector-supporting member projecting generally perpendicular from said base casing, said at least one connector-supporting member having second latching means for cooperating with said first latching means of a respective connector to retain the respective connector, said base casing further having a third latching means in correspondence with said at least one connector-supporting member for disconnectably securing the respective connector to said base casing.

5,011,432

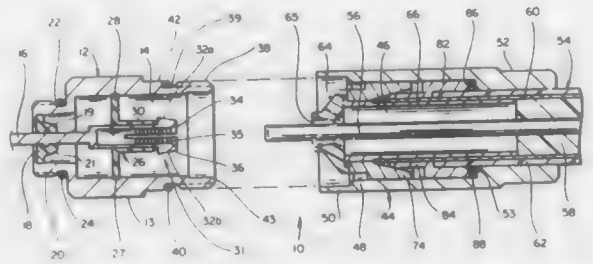
COAXIAL CABLE CONNECTOR

Gayle A. Sucht, Mountain View, and John S. Mattis, Sunnyvale, both of Calif., assignors to Raychem Corporation, Menlo Park, Calif.

Continuation of Ser. No. 485,798, Feb. 22, 1990, Pat. No. 4,952,174, which is a continuation of Ser. No. 351,738, May 15, 1989, abandoned. This application Aug. 28, 1990, Ser. No. 574,413

Int. Cl.[5] H01R *13/00*

U.S. Cl. 439—584 **21 Claims**



3. A threadably tightenable coaxial cable nut connector for installation on a prepared end of a coaxial cable including a center conductor, dielectric core disposed axially about the center conductor, an outer metal conductor jacket concentric with the center conductor and spaced therefrom by the dielectric core, and an outer protective plastic sheathing surrounding the outer metal jacket, the prepared end having the outer jacket and protective sheathing trimmed to expose a length of the center conductor, the connector comprising:

a threadably tightenable nut,

the nut defining an interior space including a mandrel assembly freely rotatable within the interior space until the nut is tightened upon installation; and

the mandrel assembly including:

mandrel means slideably mounted under said outer metal conductor jacket and plastic sheathing

ferrule means slideably mounted over said outer conductor jacket and plastic sheathing means and including collet fingers disposed over a portion of said mandrel means,

said mandrel means including ferrule collet closure means for closing the collet fingers of said ferrule means to cause them to compress said outer metal conductor jacket between said portion of said mandrel means and the collet fingers as said nut is tightened during installation of said connector to said prepared cable end.

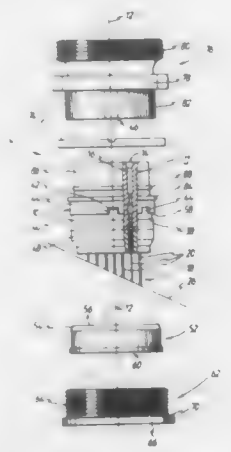
MULTIPOLE CONNECTOR FOR CONTROL DEVICES IN UNDERGROUND WORKING



Otmar Pfeiffer; Guy Geuns, and Josef Welzel, all of Wuppertal, Fed. Rep. of Germany, assignors to Hermann Hemscheidt Maschinenfabrik GmbH & Co., Wuppertal, Fed. Rep. of Germany

Filed Oct. 17, 1989, Ser. No. 422,537

Claims priority, application Fed. Rep. of Germany, Oct. 20, 1988, 3835756

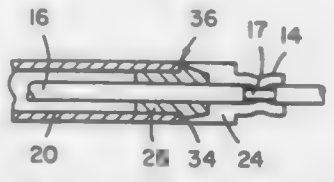
Int. Cl.[5] H01R *13/44, 13/52*

U.S. Cl. 439—589 **12 Claims**

1. A multipole connector adapted to be led in a sealed manner through an opening in a wall of a casing of a control device used for underground working, comprising a contact holder made of a resilient material, securing parts on the contact holder for securing the contact holder in a sealed manner in the opening in the wall, a plurality of contact chambers extending through the contact holder parallel to one another in the direction of the longitudinal axis of the connector, a plurality of contact elements in the contact chambers with each contact element having at least one constriction engaging an annular web formed in the respective contact chamber, connecting pieces in the form of parallel soldering tabs on the contact elements arranged to project outwards from one side of the contact holder for the purpose of making connections, a slotted clamping ring disposed in an annular groove in the contact holder and surrounding the contact holder in the region of the constructions in the contact elements and the annular webs of the contact chambers, a positioning cam on the slotted clamping ring being disposed on the one hand in a recess in the contact holder and on the other hand in an axial slot in one of the securing parts.

5,011,434

FILTERED ELECTRICAL CONNECTOR



Christopher W. Blunt, Faversham, United Kingdom, assignor to Amphenol Corporation, Wallingford, Conn.

Filed Nov. 20, 1989, Ser. No. 438,868

Claims priority, application United Kingdom, Nov. 23, 1988, 8827349

Int. Cl.[5] H01R *13/66*

U.S. Cl. 439—620 **21 Claims**

1. A contact for use in a filtered electrical connector, said contact comprising:

a longitudinally extending electrically conductive body;

a pair of flanges projecting outwardly from said conductive body and spaced from one another along the length of said conductive body;

a capacitive casing which surrounds a portion of said electrically conductive body between said pair of spaced flanges; and

resilient conductive spacers held in compression between each end of said capacitive casing and an adjacent one of said spaced flanges to support said capacitive casing relative to said conductive body; wherein said contact further comprises:

a hollow shell extending from each of said pair of spaced flanges towards the adjacent end of said capacitive casing, each of said hollow shells overlying at least a part of the outer surface of said resilient conductive spacer between said flange from which said hollow shell extends and the adjacent end of said capacitive casing.

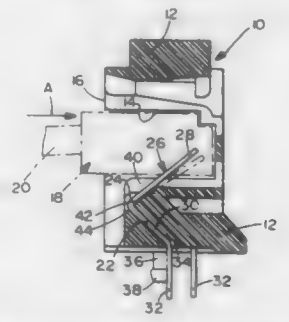
5,011,435

MODULAR JACK

Teresa A. Y. C. Seong, and Yap Y. Teck, both of Singapore, Singapore, assignors to Molex Incorporated, Lisle, Ill.

Filed Apr. 5, 1990, Ser. No. 504,768

Int. Cl.[5] H01R *13/00*



U.S. Cl. 439—676 **18 Claims**

1. A modular jack, comprising:

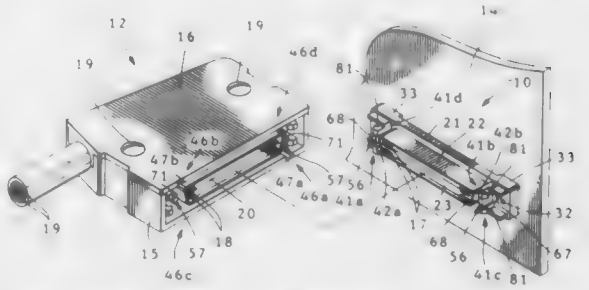
an insulating body having a plug insertion hole formed in a front end thereof for receiving therein a complementary plug having appropriate contact means, contact insertion holes in the body communicating with the plug insertion hole, and contact insertion slots int he body inside the plug insertion hole at entrances tot he contact insertion holes;

jack contacts inserted into the contact insertion holes with free end portions of the contacts exposed inside the plug insertion hole in the body for contacting the plug contact means; and

wherein a portion of each jack contact engages its respective contact insertion slot, the contact insertion slots being sized relative to the size of the jack contacts so that there

is provided an interference fit therebetween to prevent the jack contacts from backing out of the contact insertion holes.

5,011,436



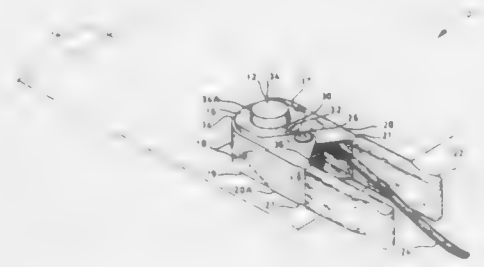
HERMAPHRODITIC KEYS

Mark H. Waters, Harrisburg, Pa., assignor to AMP Incorporated, Harrisburg, Pa.

Continuation of Ser. No. 270,489, Nov. 4, 1988, abandoned, which is a continuation of Ser. No. 90,293, Aug. 31, 1987, abandoned. This application Apr. 14, 1989, Ser. No. 338,533

Int. Cl.[5] H01R *13/64*

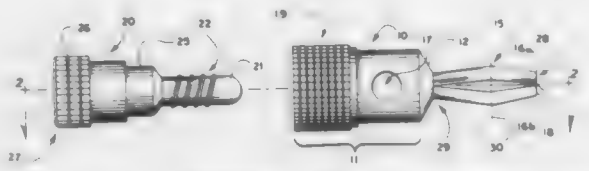
U.S. Cl. 439—681 **12 Claims**



1. An electrical connector comprising:

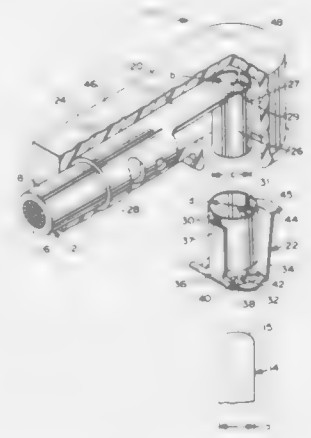
a housing having contacts secured therein, said housing having at least a pair of members integral with and extending upwardly from a surface thereof;

a first keying system including at least one key supported by said housing and extending outwardly from said surface, said at least one key being adapted to cooperate with at least one opposing key on a complementary connector during mating of said connector and said complementary connector, and being adapted to be oriented in any selected one of a plurality of possible keying orientations to provide a given number of keying combinations between said connector and said complementary connector; and



a second keying system including a pair of spaced projections integral with and extending upwardly from said surface along said pair of members for preventing said connector from mating with a complementary connector with which it is not intended to mate, said pair of spaced projections being symmetrically disposed about said surface and extending outwardly toward the periphery of said surface, said projections being adapted to be received within an aligned pair of spaced openings in a complementary connector with which said connector is intended to mate.

5,011,437
BATTERY TERMINAL CONNECTOR
Darvin C. Gibbons, 1528 Lakeview Cir., Morristown, Tenn. 37814
Filed Oct. 27, 1989, Ser. No. 427,709
Int. Cl.[5] H01R *11/24*
U.S. Cl. 439—759 **16 Claims**

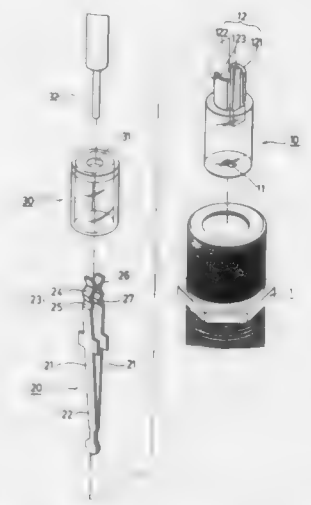


1. An improved connector for connecting an electrically conductive cable to the terminal post of a wet-cell storage battery to facilitate quick connection and disconnection therebetween, comprising:
attaching means for accomplishing physical and electrical connections to said electrically conductive cable;
opposably disposed operable jaw pieces containing inner lining walls of conductive material specially shaped and sized for circumscribing and contacting said terminal post of said storage battery;
positive electrical contact means for ensuring positive electrical connection between the two sides of said inner lining should said inner lining separate into two pieces physically;
biasing means for holding said inner lining clamped against said terminal post of said storage battery under constant tension; and
releasing means for opposably operating said jaw pieces against said biasing means to release said connector from contact with said terminal post of said storage battery.

5,011,438
METHOD FOR MANUFACTURING IMPROVED ELECTRICAL CONNECTOR
Jerry R. Awbrey, Winder, Ga., assignor to Esoteric Audio USA, Inc., Winder, Ga.
Filed Nov. 28, 1989, Ser. No. 442,052
Int. Cl.[5] H01R *13/00*
U.S. Cl. 439—825 **11 Claims**

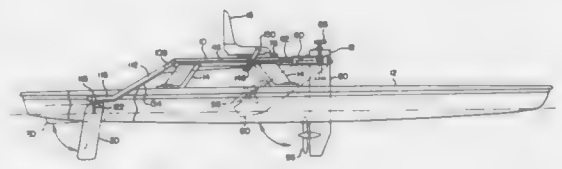
1. A method of constructing an electrical connector comprising the steps of:
providing a slug;
shaping said slug into a cylinder having a characteristic longitudinal axis;
removing metal from a first end of said cylinder to form an elongated tip and a body portion adjoining said elongated tip;
boring into said elongated tip along said longitudinal axis to provide a hollow bore;
forming a multiplicity of tangs around said hollow bore in said elongated tip by making a plurality of cuts through said elongated tip along said longitudinal axis;
providing an insertion tool comprising a generally bell-shaped member and a shaft member attached to the concave surface of bell-shaped member at a first end and having a tapered tip at a second end of said chart member;
inserting said tapered tip of said insertion tool into said hollow bore in said elongated tip such that, as said tool is inserted, said tapered tip forces said multiplicity of tangs apart and said bell-shaped member subsequently forces said tangs back together; and
withdrawing said insertion tool.

5,011,439
SPRING CLIP ELECTRICAL CONNECTOR
Jeffrey J. Pawlicki, Downers Grove, Ill., assignor to Molex Incorporated, Lisle, Ill.
Filed Jan. 18, 1990, Ser. No. 466,810
Int. Cl.[5] H01R *13/187*
U.S. Cl. 439—847 **13 Claims**



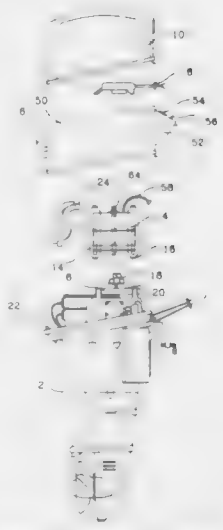
1. An electrical connector for mounting to a pin terminal in a high vibration environment, said connector including a connector terminal having a wire engaging end mounted to a wire and a mating end for engaging the pin terminal, wherein the improvement comprises:
the mating end of the connector terminal defines a split sleeve dimensioned to resiliently engage the pin terminal;
a spring clip comprising a split sleeve for sliding telescoping engagement over the split sleeve of the terminal, a pin engaging portion hingedly connected to the split sleeve of the spring slip and resiliently deflectable relative thereto, such that in an unbiased condition said pin engaging portion grippingly engages a pin disposed in the split sleeve of the terminal, and such that said pin engaging portion can be biased into a position to permit slidable movement of the split sleeve of the terminal over the pin the spring clip further including an actuator extending from the pin engaging portion for deflecting the pin engaging portion relative to the split sleeve of the spring clip.

5,011,440
WIRE CONNECTOR
Chun-Te Lee, No. 98-1, Chiu-She Lane, Chiu-She Li, Pei-Tun Dist., Taichung, Taiwan
Filed Sep. 10, 1990, Ser. No. 579,573
Int. Cl.[5] H01R *11/22*
U.S. Cl. 439—857 **2 Claims**



1. A wire connector including:
a first tubular member having a lower wall with a bottom through-hole and an upper wall with a top opening;
a second tubular member having a top wall with a top through-hole and a bottom wall with a bottom opening;

a pair of tongs joined at a bottom to form a V in profile and a top section with two bend portions, one on each tong, said two bend portions being abutting with each other, and said bottom joined section being adapted to be received in said first tubular member, said top section being adapted to be received in said second tubular member;
wherein the improvements are characterized by said first tubular member having a pair of opposed braces extending upward from said top wall, adjacent to said top opening,

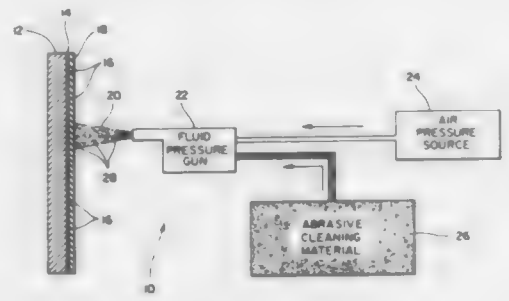


said pair of opposed braces preventing radial movement of said pair of tongs when said bottom joined section of said pair of tongs is seated in said first tubular member, and each of said bend portions of said pair of tongs being substantially W-shaped with a first upper bend and a second lower bend, said second lower bends being spaced apart and correspondingly curved towards each other, said first upper bends abutting each other, adjacent to said second lower bends and opposite said bottom joined section of said pair of tongs.

5,011,441
PEDAL OPERATED WATER CYCLE
John J. Foley, Lake Oswego; Ralph M. Eide, West Linn, and Ranald I. Macdonell, Tualatin, all of Oreg., assignors to Recreation Industries Company, Oak Grove, Oreg.
Continuation of Ser. No. 334,908, Apr. 7, 1989, abandoned. This application Sep. 11, 1990, Ser. No. 582,135
Int. Cl.[5] B63H *16/20*
U.S. Cl. 440—30 **11 Claims**

10. A water cycle comprising:
a pair of elongated parallel pontoons having forward and rearward ends,
a tubular main body member extending parallel with said pontoons and having an openn front end,
said body member having top, bottom and side wall surfaces with longitudinal guide portions formed in at least some of said wall surfaces,
at least one transverse support frame supporting said main body member centrally between said pontoons and thereabove,
forwardly facing seat means,
means mounting said seat means on said main body member for longitudinal adjustment for selectively locating a person on said cycle and providing a desired trim of the cycle on the water,
clamp means engageable with said guide portions for mounting said seat in its said selected adjusted position longitudinally of said body member,
a front removable longitudinal extension projecting in telescoping relation from the open end of said main body member and being adjustable longitudinally and removable relative to said main body member in non-rotatable engagement with said guide portions,
and an upright pedal drive propeller assembly on said extension adjustable with said extension to a selected pedaling distance from said seat.

5,011,442
AUXILIARY POWER GENERATION MEANS FOR OUTBOARD MOTORS
Laszlo Polcz, 878 Cabot Trail, Milton, Ontario, Canada L9T 3W3 , and Salvatore Sgro, 85 Clement Road, Etobicoke, Ontario, Canada M9R 1Z1
Filed Nov. 13, 1989, Ser. No. 435,054
Int. Cl.[5] B63H *21/26*
U.S. Cl. 440—900 **1 Claim**



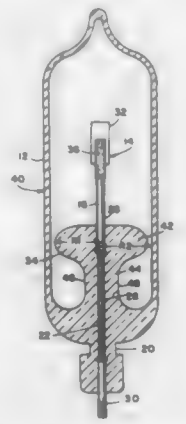
1. For use in outboard motors having a flywheel with a recoil starter mounted coaxially with facing sides adjacent to each other, an auxiliary power generation device comprising:
an alternator adapted for installation between said flywheel and said recoil starter, said alternator having a rotor shaft projecting from both ends of the alternator, for mounting coaxially with said flywheel and said recoil starter;
means mounted on the facing side of said flywheel for engaging means mounted on the near end of the rotor shaft of said alternator, whereby rotation of said flywheel produces rotation of said alternator rotor shaft, and vice versa;
means connecting said recoil starter with the other end of said rotor shaft.

5,011,443
CLEANING OF FLAT GLASS CRT FACEPLATE WITH INTERNAL ANTI-GLARE SURFACE
Yong S. Park, South Barrington, Ill., assignor to Zenith Electronics Corporation, Glenview, Ill.
Filed Jan. 2, 1990, Ser. No. 460,043
Int. Cl.[5] H01J *9/50*
U.S. Cl. 445—2 **10 Claims**

1. For use in re-using a flat glass faceplate in a color cathode ray tube (CRT) rejected during assembly, wherein the flat

glass faceplate includes a textured anti-glare finish as well as a plurality of layered video image producing and enhancing materials disposed on an inner surface thereof, a method for removing said layered materials and cleaning the inner surface of the flat glass faceplate comprising the steps of:

combining a gas under pressure with a solution containing small insoluble particles in forming a slurry; and



directing the slurry under pressure onto the inner surface of the flat glass faceplate for removing the layered materials therefrom without changing the texture of the anti-glare finish.

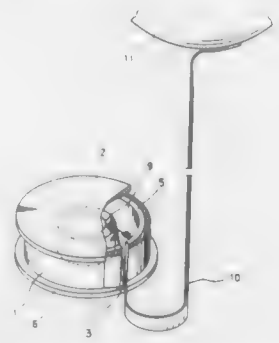
TRANSPARENT TOY HOUSE

Alec Feinberg, 4 Whiffletree Cir., Andover, Mass. 01810

Filed Nov. 6, 1989, Ser. No. 432,361
Int. Cl.[5] A63H *3/52, 33/00*
U.S. Cl. 446—85 **10 Claims**

1. A model of a structure having internal and external features comprising, a first plurality of fixedly attached transparent walls and a second plurality of fixedly attached transparent walls, said first and second plurality of walls removably engaged with each other, each of said walls having an inner side and an outer side, said walls shaped and sized to stimulate the walls of said structure, means bearing images of said features, and means for supporting said means bearing images of said features, said supporting means attached to said inner sides of the said walls, said means bearing images of said features



adapted to be removably supported on said supporting means with said images visible through said transparent walls.

BALLOON HOLDER

Hajime Watanabe, Saitama, Japan, assignor to Superloon K.K., Tokyo, Japan

Filed Jun. 21, 1990, Ser. No. 541,677
Claims priority, application Japan, Jun. 28, 1989, 1-76116[U]
Int. Cl.[5] A63H *3/06*
U.S. Cl. 446—220 **4 Claims**

1. A holder for attachment to a balloon comprising:

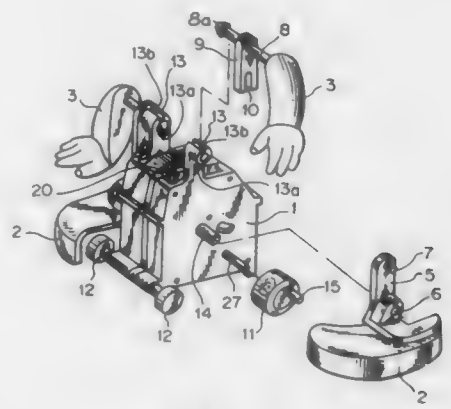
a shallow cylindrical external cap;

a cylindrical internal cap fitted into said external cap; each of said caps including a cylindrical sleeve having a disc shaped end flange extending beyond said sleeve;

a core having string wound thereon and stored under a free state having a movable axis of rotation inside of said external and internal caps;

each of said external and internal caps being equipped with a slit which communicates with each other when said external and internal caps are rotated, making it possible to pull out said string;

said internal cap having an outer wall and said external cap having an inner wall with said outer wall and said inner wall rotatable in close proximity to each other and spaced to clamp said string between said walls;



said external and internal caps and said core having a total weight thereof greater than the buoyancy of the balloon to be fitted.

SPIRAL-SPRING-DRIVEN DOLL TOY

Kiyoji Asano, No. 2-14, Mibu-cho, Omochanomachi, 2-chome, Shimotsuga-gun, Tochigi-ken, Japan

Filed Dec. 4, 1989, Ser. No. 445,749
Claims priority, application Japan, Dec. 9, 1988, 63-159408[U]; Jul. 28, 1989, 1-88032[U]
Int. Cl.[5] A63H *11/10*
U.S. Cl. 446—293 **3 Claims**

1. A spiral spring-driven doll toy, comprising:

a housing having an upper portion and a plurality of bearings in said upper portion,

a gear mechanism provided within the housing,

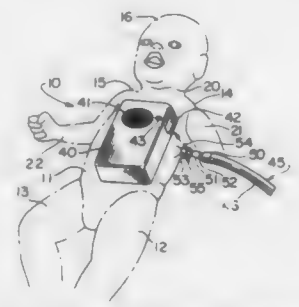
a spiral spring connected with the gear mechanism for driving the gear mechanism,

a wheel shaft connected to the gear mechanism to be rotated by the gear mechanism,

two wheels fixed to said wheel shaft, said gear mechanism being structured so that said spiral spring is wound up by rotating said wheels backward and said wheels are rotated forward by said spiral spring when said wheels are released,

a wheel pin attached to each of said wheels eccentrically relative to said wheel shaft and extended in an axial direction from each of said wheels,

a plurality of leg portions rotatably mounted on said housing, each of said leg portions having a laterally extended leg pin and each of said leg portions having a groove therein for engagement with one of said wheel pins structured so that said leg portions are rotated to and fro when said wheels rotate, and



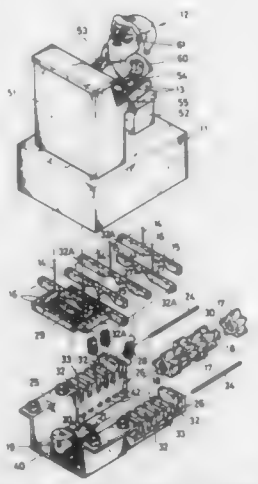
a plurality of arm portions, each of said arm portions having an individual arm shaft insertable in one of said bearings for rotatably mounting said arm portions on said housing, each of said arm portions also having an engaging piece with a recess and one of said leg pins engaging in said recess of one of said engaging pieces so when said leg portions are rotated to and fro said arm portions rotate oppositely to said leg portions.

5,011,449

APPENDAGE MOTION RESPONSIVE DOLL

John N. Handy, Long Beach, and Sterling S. Spector, Woodland Hills, both of Calif., assignors to Mattel, Inc., El Segundo, Calif.

Filed Mar. 26, 1990, Ser. No. 498,680
Int. Cl.[5] A63H *3/28*
U.S. Cl. 446—297 **8 Claims**



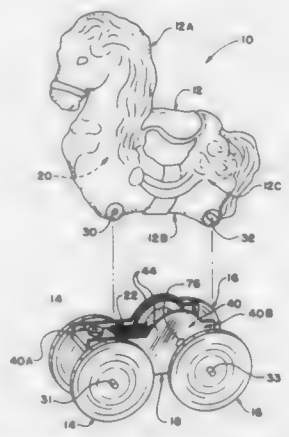
1. An appendage motion responsive doll comprising:
a torso portion;
a first appendage movably joined to said torso portion;
a first bend sensor coupled to said appendage and responsive to motion thereof; and
vocalizing means capable of producing a plurality of sound patterns coupled to said bend sensor for producing a selected one of said sound patterns corresponding to the degree of bending of said first bend sensor.

5,011,450

SOUND PRODUCING TOY WITH DRIVE MECHANISM FOR MOVABLE FIGURE

Francis Chen, P.O. Box 96-405, Taipei 10098, Taiwan

Filed Apr. 2, 1990, Ser. No. 502,794
Int. Cl.[5] A63H *5/00, 13/04*
U.S. Cl. 446—303 **4 Claims**



1. A toy combination comprising a base, a doll disposed upon said base, said doll including a plurality of movable parts, and a transmission device provided for manipulating a movement of said doll; said transmission device comprising:
a U-shaped frame being fixed on said base, a flat board being formed on a bottom of said U-shaped frame, a plurality of channels being formed on both side walls of said U-shaped frame;
a music bell being fixed on said flat board of said U-shaped frame, said music bell having a music code roller;
a cam shaft being coupled to said music code roller and being rotated in concert with said music code roller;
a plurality of cam wheels being disposed on said cam shaft;
a cam lever being provided upon each of said cam wheels, one end of each of said cam levers being received within a respective channel formed on said side walls of said U-shaped frame and being pivotally coupled therein, a plurality of holes being formed in an upper surface of each of said cam levers, a lower surface of each of said cam levers contacting with a respective cam wheel;
a plurality of rigid pull wires, one end of each of said rigid pull wires being connected with one of said movable parts of said doll, and the other end being connected with one of said holes formed on said upper surface of a respective cam lever; and
a plurality of springs, one end of each of said springs being connected with one of said cam levers, and the other end being coupled to a respective side wall of said Ushaped frame so that said cam levers are biased downward and so that said lower surfaces of said cam levers are biased to contact with said cam wheels; and
when said music code roller rotates, said cam shaft and said cam wheels being caused to rotate so that said cam levers are caused to move up and down by an engagement between said cam levers and said cam wheels, and so that said movable parts of said doll are caused to move up and down by said rigid pull wires.

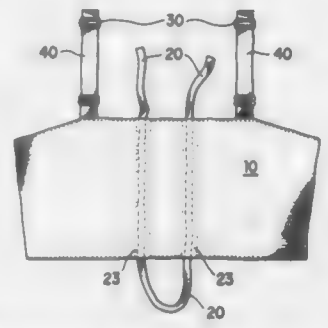
5,011,451

MUSIC BOX SUBASSEMBLY AND A VEHICLE STRUCTURE INCLUDING THE SAME

Eugene S. Holtier, Olmsted Twp., Lorain County, Ohio, assignor to Those Characters From Cleveland, Inc., Cleveland, Ohio

Filed Feb. 28, 1990, Ser. No. 486,136
Int. Cl.[5] A63H *5/00, 17/34, 29/24;* **G10F** *1/06*
U.S. Cl. 446—409 **18 Claims**

1. A vehicle structure comprising a body with an internal cavity, a plurality of wheels connected with said body and adapted to enable said body portion to roll in forward and reverse directions along a surface, and a music generating device disposed in said internal cavity of said body;
said body having a fanciful external configuration;
said music generating device including a relatively rigid cylindrical member which is rotatable about a central axis thereof to enable said music generating device to generate music, and a first drive device which is rotatable about said central axis, said first drive device adapted to be engaged with said rigid cylindrical member to rotate said rigid cylindrical member therewith about said central axis;
a second drive device which is connected with at least one of said wheels, said second drive device being adapted selectively to engage said first drive device and to rotate said first drive device and said cylindrical member in one direction about said central axis when said one of said wheels rolls in at least one of said forward and reverse directions along the surface;



said first and second drive devices being relatively moveable between first and second orientations relative to each other, biasing means for biasing said first and second drive devices to said first orientation, said first and second drive devices being moveable to said second orientation against the force of said biasing means;
said second drive device being adapted to engage said first drive device and to rotate said first drive device and said cylindrical member in said one direction about said central axis when said first and second drive devices are in said second orientation and said one of said wheels rolls along the surface.

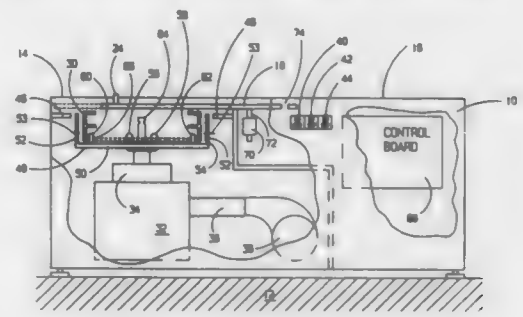
5,011,452

BREATHABLE BRASSIERE WITH ADJUSTABLE DRAWSTRING

Toby Kelly, 702 Pepperridge Rd., Bloomington, Ind. 47401

Filed Mar. 30, 1990, Ser. No. 502,418
Int. Cl.[5] A41C *3/00, 3/02*
U.S. Cl. 450—69 **20 Claims**

1. A brassiere comprising:
a substantially rectangular front panel constructed of non-stretch material, the front panel having opposed side ends;
a substantially rectangular continuous back panel constructed of stretch material, the back panel having opposed side ends, each said side end being connected to a side end of the front panel;
at least one drawstring provided in the front panel such that two drawstring ends extend out of the front panel at one edge thereof;
whereby when the drawstring ends are pulled away from the front panel, the front panel tightens; and
wherein the drawstring ends and the at least one drawstring are located in an area of the front panel which is substantially equidistant from the opposed side ends.



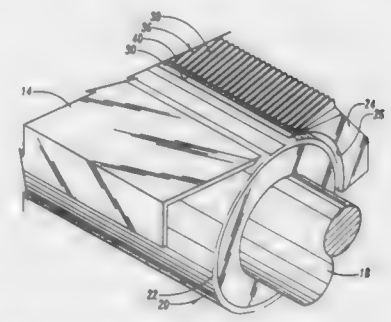
5,011,453

CENTRIFUGAL CRAB MEAT EXTRACTION APPARATUS

James M. Lapeyre, and George C. Lapeyre, both of New Orleans, La., assignors to The Laitram Corporation, New Orleans, La.

Continuation of Ser. No. 776,448, Sep. 16, 1985, abandoned. This application Jan. 28, 1987, Ser. No. 9,020
Int. Cl.[5] A22C *29/00*
U.S. Cl. 452—10 **17 Claims**

1. Apparatus for centrifugally extracting meat from crab bodies comprising:
a support structure;
rotary drive means supported by said support structure;
crab body holding means rotatably supported and releasably attached about a spin axis, said crab body holding means being driven by said drive means and being open at the top such that a plurality of crab bodies may be dropped or placed in said holding means, said crab body holding means further restraining a crab body in a selected orientation adjacent a meat passageway of said holding means, said selected orientation such that when said holding means spins around said spin axis, centrifugal forces on said crab bodies extracts crab meat through openings in the shell structure of said restrained crab body and propels said extracted meat from said holding means through said meat passageway;
meat receiving means operating in combination with said crab body holding means and located outward and peripherally of said holding means for collecting said extracted meat as it is propelled through said passageway, said meat receiving means having a spin axis coaxial and common with said crab body holding means and rotatably supported in an operating position and driven by said rotary drive means, and readily separable from said crab body holding means such that said meat receiving means may remain in said operating position when said crab body holding means is removed from said rotary drive means;
means for controlling said crab body holding means such that said crab body holding means may be accelerated from a non-spinning condition to a selected rotating speed at a first selected acceleration rate; and
means for decelerating said rotating crab body holding means.



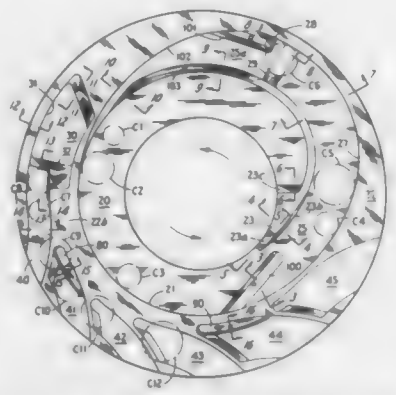
5,011,454

BLADE ATTACHMENT FOR MEAT SKINNING MACHINES

Ray T. Townsend, Des Moines, Iowa, assignor to Townsend Engineering Company, Des Moines, Iowa

Filed Oct. 19, 1989, Ser. No. 423,849
Int. Cl.[5] A22B *5/16;* **A22C** *17/12*
U.S. Cl. 452—125 **1 Claim**

1. A meat skinning machine, comprising,
a frame,
a rotatably powered gripping roll having a cylindrical peripheral surface on said frame,
a plurality of meat gripping teeth on the peripheral surface of said gripping roll,
an elongated blade holding means on said frame extending parallel to said gripping roll and being positioned closely adjacent thereto,
an elongated blade secured to said blade holding means,
said blade having a forward edge portion protruding from said blade holding means and terminating in a sharp cutting edge which is closely adjacent the teeth on said gripping roll,



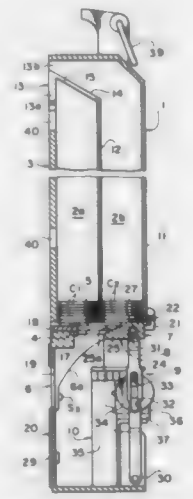
an elongated shoulder on said blade holding means,
said shoulder being comprised of a plurality of forwardly extending spaced teeth, said shoulder being a plate of solid continuous construction,
said plate having a base portion of solid construction with said spaced teeth being formed on the upper surface of said base portion,
said base portion having an inner edge, with said spaced teeth having outer spaced tips extending beyond said inner edge, with the forwardmost portions of said tips collectively comprising the forward edge of said plate,
said shoulder extending along said blade and being closely spaced rearwardly from said cutting edge of said blade to hold meat passing rearwardly thereover up and away from the teeth of said gripping roll as any membrane on said meat is severed from said meat by said cutting edge.

5,011,455

COIN SORTER WITH AUTOMATIC BAG-SWITCHING

James M. Rasmussen, Chicago, Ill., assignor to Cummins-Allison Corporation, Mt. Prospect, Ill.

Filed Feb. 12, 1990, Ser. No. 478,341
Int. Cl.[5] G07D *3/16*
U.S. Cl. 453—010 **8 Claims**



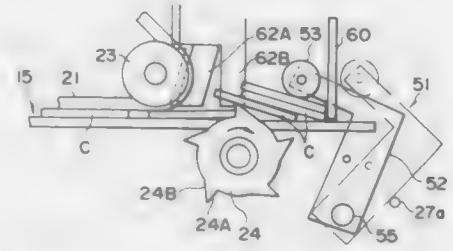
1. A coin sorting apparatus for receiving and sorting mixed coins by denomination, said apparatus comprising
a rotatable disc having a resilient surface for receiving said mixed denomination coins and imparting rotational movement to said mixed denomination coins,
means for rotating said disc,
a stationary guide plate having a contoured surface spaced slightly away from and generally parallel to said resilient surface of said rotatable disc, said guide plate including means for queuing the coins on said disc into a single file of coins, and a guiding edge which engages selected edges of the coins in said single file and guides said coins along a prescribed path where the positions of the engaged edges of the coins are determined by the diameters of the respective coins,
sorting means for discriminating among coins of different denominations and selecting coins of different denominations for discharge from said rotating disc at different locations around the periphery of said stationary guide plate,
said sorting means including at least two different selecting means for a prescribed coin denomination for discharging coins of that prescribed denomination at two different locations around the periphery of said guide plate, and
controllably actuatable shunting means associated with the first of said two different selecting means for shunting coins of said prescribed denomination past the first of said two different selecting means to the second of said two different selecting means so that said coins are discharged at the second of said two different locations.

5,011,456

COIN RECEIVING AND DISCHARGING APPARATUS

Osamu Kobayashi, Saitama; Mitsugu Mikami, Kawagoe; Kenji Nishiumi, Sakado, and Kenji Nakajima, Saitama, all of Japan, assignors to Kabushiki Kaisha Nippon Conlux, Japan

Filed Jun. 22, 1989, Ser. No. 370,245
Claims priority, application Japan, Jun. 22, 1988, 63-81680[U]; Jul. 9, 1988, 63-170035; Oct. 19, 1988, 63-135531[U]
Int. Cl.[5] G07D *1/00*
U.S. Cl. 453—32 **23 Claims**



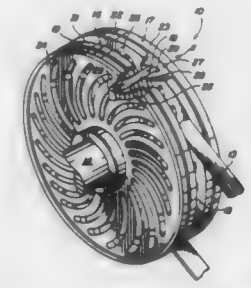
1. A coin receiving and discharging apparatus comprising a coin receiving unit and a coin discharging unit, said coin receiving unit and said coin discharging unit being removably coupled with each other:
wherein said coin receiving unit includes:
a housing vertically extending in the form of a hollow square pillar and having a front side, a rear side and left and sides, said housing being longer in depth than in width;
front and rear coin cases formed by dividing the interior of said housing with a partition plate extending in parallel with said front and rear sides of said housing for receiving coins in a horizontally piled state, said front and rear coin cases having respectively open lower ends positioned in one and the same horizontal plane;
a pair of coin inserting slits formed in an upper portion of said front side of said housing, and including a vertically elongated slit for inserting a coin therethrough into said front coin case and a horizontally elongated slit for inserting another coin therethrough into said rear coin case, said vertical and horizontal slits being combined with each other to form a T-shaped coin inlet;
coin introducing means provided in said housing for selectively introducing coins from said respective coin inserting slits into said front coin case and said rear coin case, and including a guide plate arranged to connect a lower edge of said horizontal slit and an upper end of said partition plate so as to incline downward toward said upper end, whereby a coin inserted through said horizontal slit is slid down on said guide plate and dropped into said rear coin case, and an elongated slit formed in said guide plate between said vertical slit and said upper end so as to enable another coin to vertically wholly enter from said vertical slit into said front coin case;
coin guiding means provided under said front and rear coin cases for selectively accepting one of two coins lying in the respective lowest layers in said front and rear coin cases and successively dropping said one coin into said coin discharging unit, said coin guiding means having a plate-like guide member horizontally secured to said respective open lower ends of said front and rear coin cases and having a coin passing hole the diameter of which is not less than a coin diameter and the central axis of which is positioned just under a lower end of said partition plate, and a sliding plate mounted on an upper surface of said guide member so as to be reciprocal forward/rearward between said open lower ends and said guide member and having a coin accepting hole which has a diameter not less than the coin diameter and an edge thickness substantially equal to a coin thickness and traverses right over said coin passing hole of said guide member when said sliding plate is reciprocated, said sliding plate having a socket formed in a lower surface thereof to open downward; and
wherein said coin discharging unit includes:
a coin discharging section detachably disposed under said coin guiding means of said coin receiving unit for discharging a coin dropped by said coin guiding means to the exterior of said coin discharging unit;
driving means detachably engaged with said socket of said sliding plate of said coin guiding means for horizontally reciprocating said sliding plate forward and rearward; and
controlling means for selectively controlling said driving means so that said sliding plate of said coin guiding means is moved to accept one of the coins in said front and rear coin cases into said coin accepting hole of said sliding plate and successively to drop the coin into said coin discharging section at each reciprocation of said sliding plate.

5,011,457

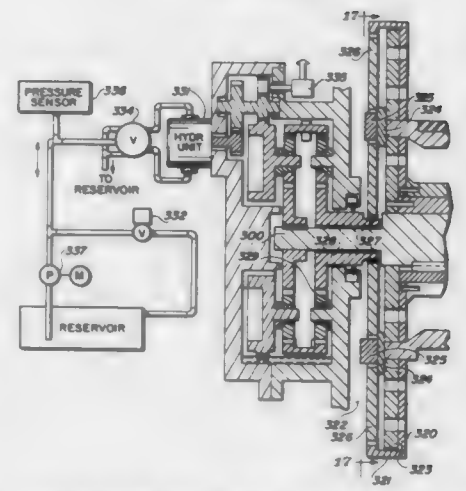
COIN STACKING APPARATUS

Ichiro Takatani, Hyogo; Nobuyuki Nakatani, Himeji, and Shigeru Minami, Hyogo, all of Japan, assignors to Glory Kogyo Kabushiki Kaisha, Hyogo, Japan

Continuation-in-part of Ser. No. 138,889, Dec. 28, 1987, Pat. No. 4,869,029. This application Sep. 5, 1989, Ser. No. 403,474
Claims priority, application Japan, Dec. 26, 1986, 61-308244
Int. Cl.[5] G07D *9/06;* **B65G** *57/30*
U.S. Cl. 453—61 **9 Claims**



5. A coin stacking apparatus comprising:
conveyor means (**21**) for transporting coins (c) in a horizontal row along a coin guideway (**15**) leading to a coin stacking position adjacent to a vertically extending coin stacking space; and
means for stacking the coins at said coin stacking position into the coin stacking space, said means for stacking the coins comprising a stacking ratchet (**24**) rotatable about a horizontal axis perpendicular to the direction of said row, said ratchet having a series of teeth formed circumferentially thereon, each of said teeth having a non-sloping side (**24A**) and a sloping side (**24B**);
said stacking ratchet (**24**) being disposed at such a position immediately below the coin stacking space that a downstream part of the ratchet with respect to the direction of transporting coins is within a horizontal range of the coin stacking space and that the remaining upstream part of the ratchet is upstream of said horizontal range;
said ratchet being so disposed that each of the teeth has the non-sloping side (**24A**) thereof facing the coins being transported toward the coin stacking position and takes a position above said guideway (**15**) so as to be abutted against by the coins on the guideway, when each of the teeth is at a topmost position of the ratchet;
the arrangement of the teeth of the ratchet and the guideway being such that when a coin being transported abuts against the non-sloping side of each tooth at the topmost position, the ratchet is turned about its horizontal axis so as to cause the tooth at the topmost position to move obliquely downward into the horizontal range of the coin stacking space while causing the following tooth to move obliquely upward to the topmost position and then beyond the topmost position, for lifting a trailing part of the coin above the guideway by means of the sloping side of the following tooth with a leading part of the coin supported on the guideway and for feeding the coin into the coin stacking space with an attitude in which the trailing part is higher than the leading part.



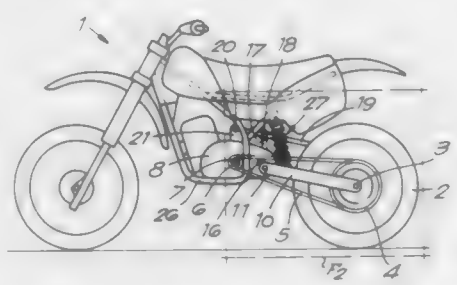
5,011,458

CONTINUOUSLY VARIABLE TRANSMISSION USING PLANETARY GEARING WITH REGENERATIVE TORQUE TRANSFER AND EMPLOYING BELT SLIP TO MEASURE AND CONTROL PULLEY TORQUE

Emerson L. Kumm, Tempe, Ariz., assignor to Kumm Industries, Inc., Phoenix, Ariz.

Continuation-in-part of Ser. No. 269,471, Nov. 9, 1988, abandoned. This application Sep. 12, 1989, Ser. No. 406,975
Int. Cl.[5] F16H *9/10, 59/46*
U.S. Cl. 474—49 **24 Claims**

1. A continuously variable, regenerative transmission mechanically disposed intermediate a prime mover source of variable rotational power and variable unidirectional rotational speed output and a geared output shaft having a variable rotational rate and variable rotational direction, said regenerative transmission comprising:
(A) a continuously variable transmission assembly
(1) a first variable diameter pulley;
(2) a first actuator for establishing the diameter of said first variable diameter pulley;
(3) a second variable diameter pulley;
(4) a second actuator for establishing the diameter of said second variable diameter pulley; and
(5) a belt coupling said first and second variable diameter pulleys;



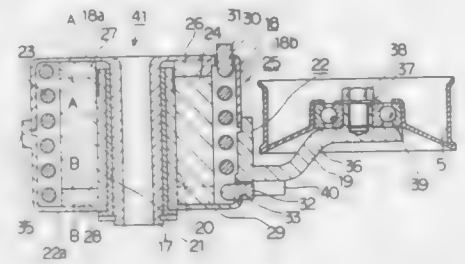
(B) an input shaft coupled to said first variable diameter pulley and to a prime mover;
(C) a sun gear shaft coupled to said second variable diameter pulley, said sun gear shaft carrying a high gear rotating therewith;
(D) a planetary gear assembly coupled to said sun gear shaft, said planetary gear assembly including:
(1) a sun gear rotating with said sun gear shaft;
(2) a planet carrier rotatably about said sun gear shaft axis;
(3) a plurality of planet gears carried by said planet carrier and meshing with said sun gear;
(4) a ring gear meshing with said planet gears; and
(5) a low gear rotating with said ring gear;
(E) transfer means coupling rotation of said input shaft to said planet carrier;
(F) an output shaft, said output shaft having an output gear rotating therewith;
(G) a high output gear rotatably carried by said output shaft, said high output gear being coupled to said high gear;
(H) a low output gear rotatably carried by said output shaft, said low output gear being coupled to said low gear;
(I) a high clutch adapted to selectively couple said high output gear to said output shaft;
(J) a low clutch adapted to selectively couple said low output gear to said output shaft; and
(K) control means including:
(1) means to sense the rate of rotation of said output gear, on said output shaft;
(2) means to give a desired rotational direction of said output gear, on said output shaft;
(3) means to sense the rotation-al direction of said output gear, on said output shaft;
(4) means to sense the rate of rotation of a prime mover;
(5) means to adjust the rate of rotation of a prime mover;
(6) means to actuate at least one of said high and low clutches; and
(7) means to adjust said first and second actuators to obtain a belt slip that corresponds to a pulley torque versus belt tension which results in rotation of said output gear in the desired direction at a rate according to a predetermined ratio of the rate of rotation of the prime mover with respect to the rate of rotation of said output gear.

5,011,459

WHEEL SUSPENSION FOR A WHEEL DRIVEN BY AN ENDLESS TRANSMISSION

Alfons Van De Vel, Kretenborg 39, B - 2580 Sint-Katelijne-Waver, Belgium

PCT No. PCT/BE89/00002, § 371 Date Sep. 6, 1989, § 102(e) Date Sep. 6, 1989, PCT Pub. No. WO89/06203, PCT Pub. Date Jul. 13, 1989
PCT Filed Jan. 6, 1989, Ser. No. 415,264
Claims priority, application Fed. Rep. of Germany, Jan. 7, 1988, 8800009
Int. Cl.[5] F16H *7/08;* **B62K** *25/02*
U.S. Cl. 474—101 **12 Claims**



1. A wheel suspension for suspending a wheel relative to a vehicle part and driven by an endless transmission, comprising:
an endless element and two rotating elements supporting the endless element, a first of the rotating elements being rotatable with respect to the vehicle part around a first axis, a second of the rotating elements being rotatable around a second axis;
the suspension comprising two rocking arms each having first and second ends;
the wheel and the second rotating element of the transmission being rotatably supported between the first ends;
the suspension further comprising two levers rotatably connected to each other, a first of the levers being rotatably connected to the second ends around a rocking axis;
a second of the levers being rotatably connected to the vehicle part, the levers assuring that during rocking of the rocking arms, the rocking axis of the second ends is always located on a theoretical line drawn through the of the first rotating element and the second rotating element of the transmission, the distance between said rotating axes remaining at least approximately constant.

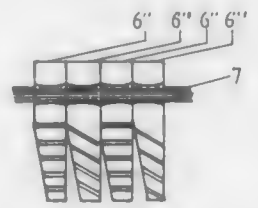
5,011,460

BELT TENSIONER WITH ELASTIC DAMPING FEATURE

Hideo Ouchi, Sagamihara, and Kouichi Sakai, Zama, both of Japan, assignors to Nippon Seiko Kabushiki Kaisha, Tokyo, Japan

Filed Mar. 9, 1990, Ser. No. 491,218
Claims priority, application Japan, Mar. 16, 1989, 1-62164; Apr. 14, 1989, 1-93052
Int. Cl.[5] F16H *7/12*
U.S. Cl. 474—133 **12 Claims**

1. A belt tensioner comprising a fixed shaft of a fixed member, a pivotal member adapted to be rotated about said fixed shaft as the center of rotation, a tension pulley provided at the end of an arm member extended radially from said pivotal member and pivotally mounted on said pivotal member by a pivot extending parallel to said fixed shaft, a spring having one end retained by said pivotal member and adapted for applying to said pivotal member a spring force pressing said tension pulley to a belt, and a solid damping device provided between said pivot member and said fixed member and having one axial end secured to said pivotal member and the other axial end secured to said fixed member, wherein a relative movement between said fixed member and said pivotal member causes said solid damping device to be twisted, and the deformation of said spring and the deformation of said solid damping device during usage are adapted to be set independently of each other.



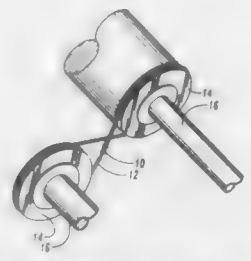
5,011,461

TRANSMISSION PROVIDED WITH A DRIVING BELT AND V-SHAPED PULLEYS

Theodorus M. J. Brouwers, De Kaatsheuvel, Netherlands, assignor to Van Doorne's Transmissie B.V., Netherlands

Filed Jan. 9, 1990, Ser. No. 462,266
Claims priority, application Netherlands, Feb. 3, 1989, 8900266
Int. Cl.[5] F16H *55/38;* **F16G** *5/20*
U.S. Cl. 474—188 **23 Claims**

1. Transmission provided with at least one driving belt and V-shaped pulleys in a wet environment, whereby said driving belt comprises a plurality of side by side transverse elements each provided with converging side faces for intermating with contact surfaces of said V-shaped pulleys, whereby said side faces of said transverse elements have a non-continuous surface provided with grooves located between ridges, whereby each



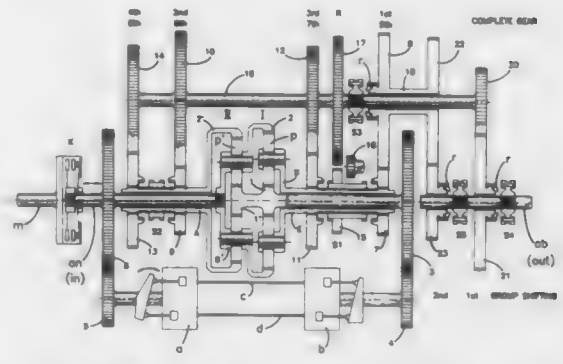
of said grooves has a width which is at least as large as one and a half-times the width of the ridges on either side thereof.

5,011,462

CONNECTOR FOR CONNECTIBLE BELT AND METHOD FOR USING SAME

Thomas R. Smith, Newton, Iowa, assignor to Pyramid, Inc., Newton, Iowa

Filed May 29, 1990, Ser. No. 529,946
Int. Cl.[5] F16G *15/00*
U.S. Cl. 474—255 **7 Claims**



1. A belt connector for connecting first and second ends of an elongated belt, said first and second ends each comprising a loop formed from an elongated elastomeric loop member, said loop member having a hook engaging portion of predetermined cross sectional size; said connector comprising:
an elongated connected body having a fist J-shaped hook at one of its ends and a second J-shaped hook at the other of its ends; and
said first and second J-shaped hooks each forming an elongated hook slot having an inner end, said hook slot having a longitudinal axis and having a width smaller than said predetermined cross sectional size of said hook engaging portions of said elastomeric loop members of said first and second loops whereby hooking each of said first and second hook members over side hook engaging portions of said first and second loop members respectively, causes said hook engaging portion of said loop member to be compressed by each of said first and second J-shaped hooks into a compressed portion, the cross sectional shape of said compressed portion being elongated and having a longitudinal axis extending in the same direction as said longitudinal axis of said hook slot.

INFINITELY VARIABLE HYDROSTATIC MECHANICAL POWER SHIFT GEAR WITH GROUP SHIFTINGS

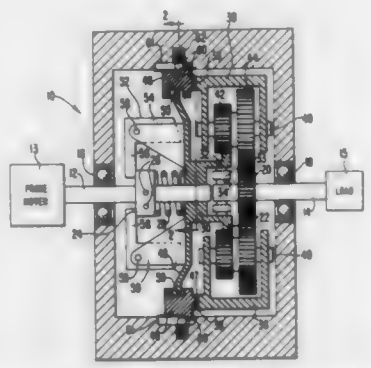
Friedrich Jarchow, Am Ruhrstein 37, 4300 Essen 1, and Peter Tenberge, Nelkenweg 8, 7990 Friedrichshafen, both of Fed. Rep. of Germany

Continuation of Ser. No. 160,905, Feb. 26, 1988, abandoned, which is a continuation-in-part of Ser. No. 10,451, Feb. 3, 1987, abandoned, which is a continuation of Ser. No. 842,488, Mar. 21, 1986, abandoned. This application Sep. 28, 1989, Ser. No. 414,098
Claims priority, application Fed. Rep. of Germany, Apr. 6, 1985, 3512523; May 21, 1985, 3510265; Feb. 19, 1986, 3605203
Int. Cl.[5] F16H *47/04*
U.S. Cl. 475—74 **16 Claims**

1. An infinitely variable hydrostatic mechanical power shift gear consisting of a four shaft epicyclic gear including at least two planetary stages, each having a shaft, one of said shafts being an input shaft (in) which is connected via first gear wheels (6, 5), second gear wheels (4, 3) and an infinitely variable hydrostatic gear (a, b) with a second shaft (1, 1'), the two remaining shafts of said epicyclic gear being connecting shafts (E and A) which, in one extreme position of the hydrostatic gear, have the same speed and during adjustment of the hydrostatic gear into the other extreme position vary their speed in such a way that one (E) becomes constantly slower and the other (A) constantly faster, a pair of countershafts **19** and **18** and a plurality of gear pairs connecting one or the other of said shafts A and E to one or the other and said countershafts **19** and **18**, a plurality of clutches, each of said clutches being responsive to speed changes for selectively connecting one of said gear pairs between shafts to a shaft driven through said planetary stages to transmit motion between one of said shafts A or E to said countershaft **19** or to transmit motion between one of said shafts A or E to said countershaft **18**, an output gear on each of said shafts **18** and **19**, an output shaft having a pair of output receiving gears thereon, one output receiving gear engaging an output gear on countershaft **19** and the other engaging an output gear on countershaft **18** and clutch means on said output shaft for selectively connecting one or the other of said gears to said output shaft.

5,011,464

TWO-SPEED AUTOMATIC TRANSMISSION



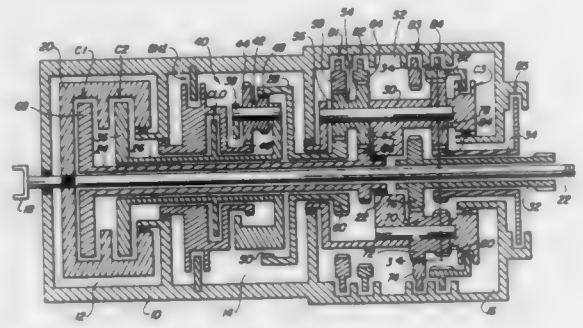
Robert C. White, San Diego, Calif., assignor to Sundstrand Corporation, Rockford, Ill.

Filed Mar. 23, 1990, Ser. No. 498,211
Int. Cl.[5] F16H *3/44*
U.S. Cl. 475—260 **12 Claims**

1. A two speed transmission comprising:
an input shaft having a drive sun gear adapted to rotate about an axis;
an output shaft having a driven sun gear;
a planetary gear assembly having a planet carrier supporting a shaft containing a plurality of gears for engagement with said drive and driven sun gears respectively;
a clutch which prevents the output shaft from rotating at a

rotational speed less than the instantaneous rotational speed of the input shaft; and

a speed change mechanism including a non-rotating slide member which axially shifts in response to input shaft speed between a first axial position and a second axial position, said first axial position being effective to engage



the planet gear carrier to prevent rotation of the planet gear carrier thereby to drive the output shaft at a rotational speed greater than the rotational speed of the input shaft, and said second axial position being effective to allow said planet gear carrier to rotate freely and the clutch to drive the output shaft at the rotational speed of the input shaft.

5,011,465

WIDE SPEED-RANGE MULTI-SPEED POWER SHIFT TRANSMISSION

Dennis L. Jeffries, Waterloo; Gordon L. Marquart, Jesup, both of Iowa, and Timothy J. Mattson, Golden Valley, Minn., assignors to Deere & Company, Moline, Ill.

Filed Apr. 20, 1990, Ser. No. 511,697
Int. Cl.[5] F16H *57/10*
U.S. Cl. 475—279 **14 Claims**

1. A vehicle transmission comprising:

(a) a transmission housing;

(b) an input shaft extending into said transmission housing;

(c) a main planetary carrier within said housing carrying a first set, a second set and a third set of planetary gears, at least the first and second of said three sets being comprised of double gears having first and second sides. the gears of said third set meshing with the second side of the gears of said second set;

(d) first and second clutches controlling power flow from said input shaft through first and second main drive paths to said main planetary carrier;

(e) a hi-lo planetary in said second main drive path;

(f) a first ring gear and a first sun gear meshing with the first side of said first set of planetary gears, said second main drive path providing lower to said first sun gear;

(g) first brake means for selectively braking said first ring gear against rotation relative to said housing;

(h) a second ring gear and a second sun gear meshing with the second side of said first set of planetary gears, said first main drive path providing power to said second sun gear;

(i) second brake means for selectively braking said second ring gear against rotation relative to said housing;

(j) a third ring gear and a third sun gear meshing with the first side of said second set of planetary gears;

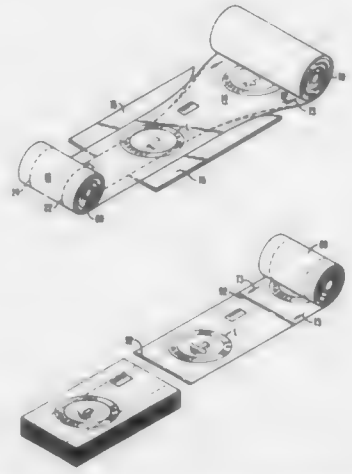
(k) third brake means for selectively braking said third ring gear against rotation relative to said housing;

(l) a fourth ring gear and a fourth sun gear meshing with said third set of planetary gear;

(m) fourth brake means for selectively braking said fourth ring gear against rotation relative to said housing;

(n) fifth brake means for selectively braking said fourth sun gear against rotation relative to said housing;

(o) third clutch means for selectively clutching said fourth sun gear against rotation relative to said main planetary carrier; and



(p) an output shaft fixed for rotation with said fourth sun gear and extending out of said transmission.

5,011,466

METHOD OF MAKING A T-SHIRT GROCERY BAG HAVING A COUPON

Robert B. DeMatteis, Grass Valley, Calif., and Wayne A. Pflueger, Salt Lake City, Utah, assignors to Cupples Paper Bag Company, La Mirada, Calif.

Continuation-in-part of Ser. No. 185,633, Apr. 26, 1988, Pat. No. 4,909,636. This application Sep. 21, 1989, Ser. No. 410,697
The portion of the term of this patent subsequent to Mar. 20, 2007, has been disclaimed.
Int. Cl.[5] B31B *23/88, 37/88*
U.S. Cl. 493—188 **6 Claims**

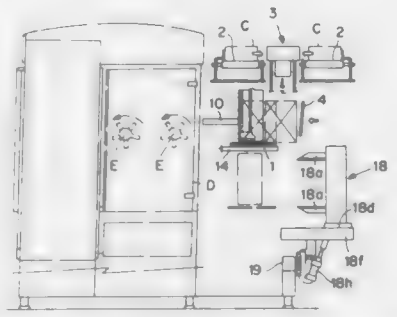
1. A process of forming a coupon and a plastic bag, comprising the steps of:

imprinting a collapsed endless tube with coupon indicia adjacent an intended opening of said bag, said coupon being disposed approximately centrally of said endless tube, and said tube having a first and a second side edge;

imparting a first and a second "W" fold to said imprinted collapsed endless tube, each said imparted "W" fold being to a respective side edge of said bag and not under said imprinted coupon indicia;

sealing and severing said tubing to form a sealed bottom and a sealed top defining the bag, said bag including a side;

cutting said top to form said opening in said bag; and



defining during said cutting step at least one detachable coupon overlying said coupon imprinted indicia whereby said bag is formed with a severable coupon.

5,011,467

TRANSPORT DEVICE FOR PACKING CONTAINER BLANKS

Paul Traegaardh, Tokyo, Japan, assignor to AB Tetra Pak, Lund, Sweden

Filed Aug. 31, 1989, Ser. No. 401,004
Claims priority, application Japan, Sep. 1, 1988, 63-220025
Int. Cl.[5] B32B *1/78*
U.S. Cl. 493—309 **4 Claims**

1. A transport device for packaging container blanks comprising:

vertically movable platform means for positioning a package of a plurality of flattened packaging container blanks covered with packaging material disposed around the plurality of flattened packaging container blanks;

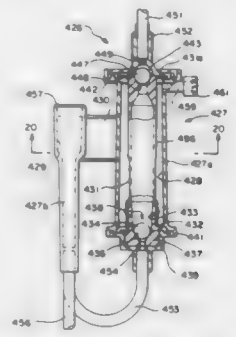
cutting means for cutting the packaging material disposed around the plurality of flattened packaging container blanks to expose the flattened packaging container blanks for further processing;

main magazine means for stacking the plurality of exposed blanks after removal of the packaging material;

supply means for supplying individual blanks, one at a time from said main magazine means for further processing;

robot means including grasping means for grasping a predetermined number of blanks disposed on said platform and delivering said predetermined number of blanks to said main magazine; and

raising means receiving individual blanks from said supply means for opening said individual blanks into blanks which are parallelpiped in shape solely by pressure exerted on exterior corners of the individual blanks.



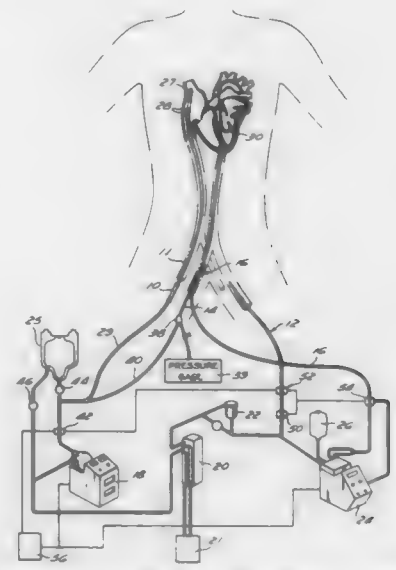
5,011,468

RETROPERFUSION AND RETROINFUSION CONTROL APPARATUS, SYSTEM AND METHOD

Ingemar H. Lundquist, Pebble Beach; Zoltan Tarczy-Hornoch, Berkeley, and Thomas J. Kardos, Laguna Beach, all of Calif., assignors to Retroperfusion Systems, Inc., Costa Mesa, Calif.

Continuation of Ser. No. 198,441, May 25, 1988, abandoned, which is a continuation-in-part of Ser. No. 120,591, Nov. 13, 1987, abandoned, which is a continuation-in-part of Ser. No. 56,401, May 29, 1987, abandoned. This application Apr. 16, 1990, Ser. No. 511,930
Int. Cl.[5] A61M *1/00*
U.S. Cl. 600—18 **12 Claims**

1. In a control apparatus for supplying arterial blood of a patient to the venous side of a patient's organ, the apparatus comprising a balloon catheter having a distal extremity and an inflatable balloon carried by the distal extremity, the catheter having a balloon inflation lumen in communication with the balloon and a blood flow lumen extending through the balloon, a blood pump having an inlet adapted to be connected to an arterial blood vessel of the patient and having an outlet adapted to be connected to a venous blood vessel of the patient, motorized means for operating the blood pump in synchronism with the operation of the heart and gas pressure generation means connected to the balloon inflation lumen for inflating and



deflating the balloon out of synchronism with the motorized means for operating the blood pump.

5,011,469

PERIPHERAL CARDIOPULMONARY BYPASS AND CORONARY REPERFUSION SYSTEM

Gerald D. Buckberg; James V. Maloney, Jr., both of Los Angeles; Kenneth A. Jones, Lake Elsinore, and Weldon D. West, Mission Viejo, all of Calif., assignors to Shiley, Inc., Irvine, Calif.

Filed Aug. 29, 1988, Ser. No. 237,969
Int. Cl.[5] A61M *37/00*
U.S. Cl. 604—4 **35 Claims**

1. An extracorporeal bypass apparatus, comprising:

a venous catheter for insertion into a femoral vein, such catheter being sufficiently long and flexible to reach the atrium area of a patent's heart;

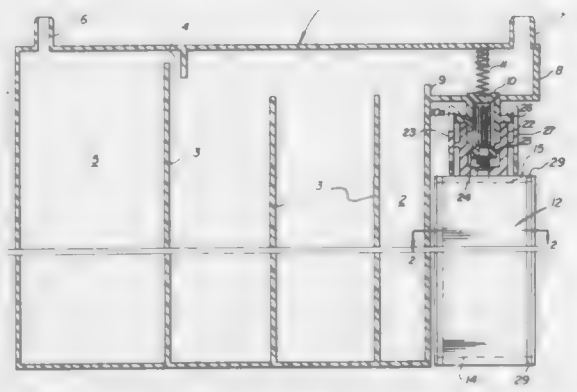
an arterial cannula;

a single pump connected between the venous catheter and the arterial cannula for withdrawing blood from a patient through said venous catheter and pumping it into a patient through the arterial cannula; and

a vent catheter for insertion into an artery sufficiently long and flexible to reach the left ventricle of the heart, said vent catheter being connected in parallel with the venous catheter connected to the pump in a manner such that the negative pressure developed by said pump is applied to the venous catheter and the vent catheter,

said venous catheter and said pump being constructed such that substantially all of the patient's blood which would normally be returned to the heart is bypassed through the

venous catheter, and the blood reaching the left ventricle of the heart is withdrawn through the vent catheter so that the ventricle is decompressed;



said vent catheter being a thin-walled flexible tube which has a coiled distal end, which is adapted to conform to a guide wire used in inserting the vent catheter.

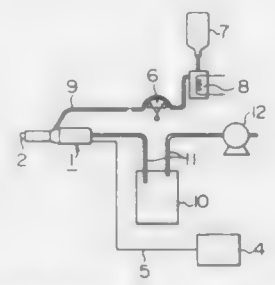
5,011,470

COMBINED SURGICAL DRAINAGE AND AUTOTRANSFUSION APPARATUS

Robert J. Kurtz, New York, and Joseph LiCausi, Port Jefferson Station, both of N.Y., assignors to BioResearch, Inc., Farmingdale, N.Y.

Filed Aug. 29, 1990, Ser. No. 574,114
Int. Cl.[5] A61M *37/00, 1/00*
U.S. Cl. 604—4 **14 Claims**

10. An autotransfusion apparatus comprising, in combination, a drainage device including a collection chamber, a suction regulator for said drainage device, an inlet passageway in said drainage device communicating with said collection chamber, an outlet passageway to a suction source, a fluid retention chamber disposed in the fluid flow path between the inlet passageway and the collection chamber, an outlet opening in said fluid retention chamber, a collapsible autotransfusion bag, a single connector means on said autotransfusion bag, said single connector means extending through the outlet opening in said fluid retention chamber, and means operatively associated with said autotransfusion bag for maintaining the autotransfusion bag in an expanded condition, said single connector means having a passageway therein to provide an air flow path from the autotransfusion bag to the suction source and to provide a passageway for blood flow from the fluid retention chamber into the autotransfusion bag.



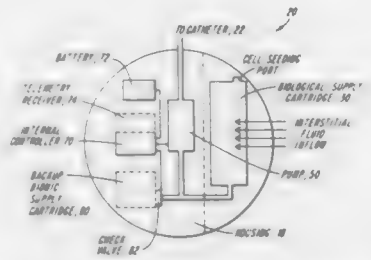
5,011,471

EXCRETIONS TREATING APPARATUS

Kazuoki Miyazaki, Odawara; Yasuo Noguchi; Naohiko Inoue, both of Yokohama, and Morito Idemoto, Yokohama, all of Japan, assignors to Sumitomo Bakelite Company Limited, Tokyo, Japan

PCT No. PCT/JP88/01319, § 371 Date Aug. 16, 1989, § 102(e) Date Aug. 16, 1989, PCT Pub. No. WO89/05612, PCT Pub. Date Jun. 29, 1989
PCT Filed Dec. 23, 1988, Ser. No. 399,549
Claims priority, application Japan, Dec. 24, 1987, 62-325506; May 17, 1988, 63-64020[U]
Int. Cl.[5] A61B *17/20*
U.S. Cl. 604—22 **18 Claims**

1. An excretions treating apparatus for evacuating excrements in a rectum comprising an insert accomodating a horn which is mechanically vibrated by ultrasonic oscillation means, irrigation means for injecting cleaning liquid into the rectum, and means for excreting and removing excrements which has



been crushed and emulsified, wherein said irrigation means includes a preheater for previously heating said cleaning liquid.

5,011,472

IMPLANTABLE DELIVERY SYSTEM FOR BIOLOGICAL FACTORS

Patrick Aebischer; Pierre M. Galletti, both of Providence; George Panol, Warwick, all of R.I., and Luigi Miracoli, Genoa, Italy, assignors to Brown University Research Foundation, Providence, R.I.

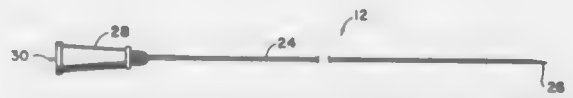
Filed Oct. 6, 1988, Ser. No. 240,939
Int. Cl.[5] A61M *31/00*
U.S. Cl. 604—50 **12 Claims**

1. A delivery device for delivering a biologically active factor to a subject, the device comprising: a cell reservoir means for receiving at least one active, factor-secreting cell, said means including a chamber having at least one semipermeable membrane, said membrane adapted to be held in contact with a source of body fluid for introducing body fluid into said reservoir means; and

pumping means for transporting a secreted active factor from said reservoir means to a selected region in a subject, whereby at least one active, factor-secreting cell is located within said reservoir means for secreting an active factor, which active factor is carried to said selected region via body fluid introduced into said reservoir through said membrane.

5,011,473

DEVICE FOR SECURING AND POSITIONING A WIRE TO A NEEDLE



Roland F. Gatturna, Walpole, Mass., assignor to Mitek Surgical Products Inc., Dedam, Mass.

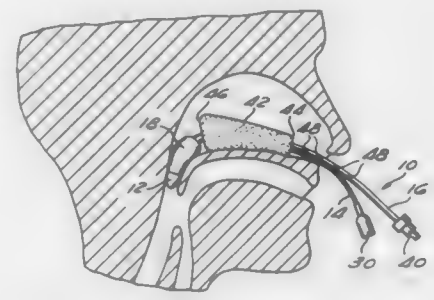
Filed Jun. 6, 1989, Ser. No. 362,013
Int. Cl.[5] A61M *31/00*
U.S. Cl. 604—51 **14 Claims**

1. A device for locking and positioning a probe wire for use with a straight, tubular cannula needle having a sharp point at a front end and a hub at a back end, wherein the hub has an open-ended longitudinal socket, the probe wire is slidably received in the cannula needle, and the probe wire has a J-shaped hook at its distal end which end assumes the straight configuration of the cannula needle when sheathed therein but assumes a hook configuration when pushed through the cannula needle, said device comprising:

(a) a clamp having a medial body, guide means and clamping means, said guide means longitudinally extending from a front end of said body, said clamping means longitudinally extending from a back end of said body, said clamping means having a frusto conical tip at its outer back end and a threaded portion at its inner front end, said guide means being sized and shaped to be received in the hub socket;

(b) a cap having a longitudinally disposed internal chamber that is open at a front end of said cap, said chamber having a frusto conical cavity at its inner back end and an internally threaded portion at its front end, wherein said frusto

conical cavity is configured to matingly receive said frusto conical tip, and said internally threaded portion is configured to receive said threaded portion of said clamping means; and



(c) said clamp and said cap each having a longitudinally-extending bore through which the probe wire is slidably received, said clamping means being designed (a) to permit the probe wire to slide in said bore when said cap is loosely threaded on said threaded portion of said clamping means and (b) to captively hold the probe wire when said cap is tightly threaded on said threaded portion of said clamping means.

5,011,474

METHODS FOR CONTROLLING NASAL HEMORRHAGING

H. George Brennan, 1137 Granville, Newport Beach, Calif. 92660

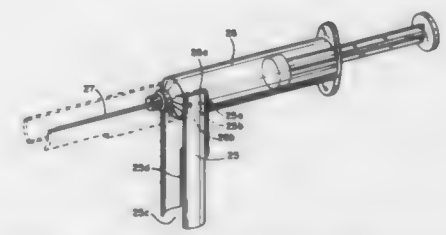
Continuation-in-part of Ser. No. 197,835, May 24, 1988, Pat. No. 4,883,465. This application May 2, 1989, Ser. No. 346,240
Int. Cl.[5] A61M *31/00*
U.S. Cl. 604—54 **6 Claims**

1. A method of controlling nasal hemorrhaging during a nasal operation or other nasal procedure without exerting direct pressure on the area of bleeding, comprising the steps of:

inserting a low pressure expandable sealing cuff into the nasal cavity of a patient through the anterior nares;

inflating said cuff to a sufficiently low intracuff pressure that will cause said cuff to occlude the choanae without causing damage to the mucosal tissue due to pressure necrosis;

absorbing the blood, mucous and other debris, collected in front of said expandable cuff within the nasal cavity; and



suctioning the blood, mucous and other debris, collected in front of said expansible cuff out of the nasal cavity.

5,011,475

PROTECTOR FOR INTRAVENOUS AND SYRINGE NEEDLES

Richard A. Olson, 210 W. Grant #122, Minneapolis, Minn. 55403

Filed Jun. 2, 1989, Ser. No. 360,770
Int. Cl.[5] A61M *5/32*
U.S. Cl. 604—192 **3 Claims**

1. A projector assembly for injection needles comprising,

a mounting hub,

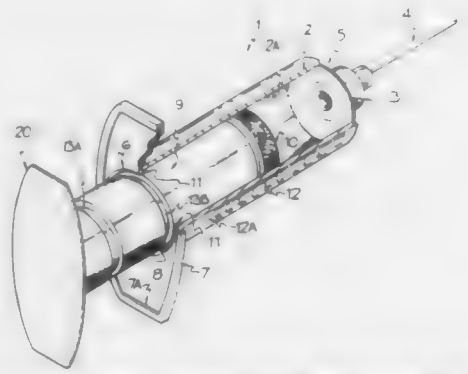
a needle attached to said mounting hub,

an elongated hollow protective sheath member mounted on said hub to normally surround the entire needle, and having openings extending longitudinally along both sides thereof to permit the needle to be inserted into one of two conduits of an IV tube assembly in place in a patient's blood vessel,

the sheath being pivotally mounted on the mounting hub to permit pivotal retraction of the sheath from the needle on either side thereof to expose the needle for use and permit the sheath to be moved back into protective position around the needle after use and

a pair of respectively engageable positioning stop elements respectively mounted on the hub and the sheath for positively positioning the sheath in its desired protective position when said stop elements are engaged.

5,011,476



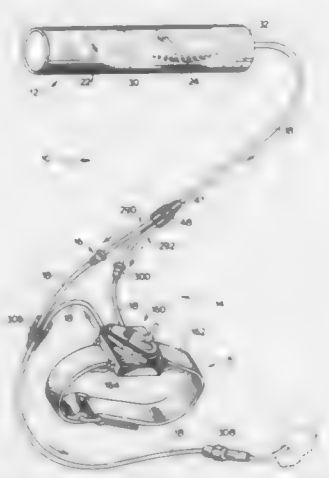
SINGLE FILL AND USE SYRINGE

Robert J. C. Foster, 6 Glasson Square, Mt. Waverley, Australia

PCT No. PCT/AU88/00230, § 371 Date Dec. 28, 1989, § 102(e) Date Dec. 28, 1989, PCT Pub. No. WO89/00057, PCT Pub. Date Jan. 12, 1989
PCT Filed Jun. 30, 1988, Ser. No. 455,419
Claims priority, application Australia, Jul. 2, 1987, PI2840
Int. Cl.[5] A61M *5/00*
U.S. Cl. 604—110 **2 Claims**

1. A syringe (**1**) having a cylindrical barrel (**2**) and inside the barrel (**2**) a cylindrical plunger (**9**) with a resilient base (**10**) in sealing relation with the barrel (**2**), the plunger (**9**) having a first circumferential groove (**13***a*) and designed to engage an inwardly extending circumferential projection (**11**) disposed about the barrel (**2**) around its aperture (**8**) such that the first groove (**13***a*) engages the projection (**11**) to prevent withdrawal of the plunger (**9**) when base (**10**) bottoms on the end (**5**) of the barrel (**2**) and the plunger (a) having a second groove

(13*b*) designed to engage the projection (11) before the plunger (9) is pressed home and with the barrel having (2) a portion



(12*a*) which is additional to a measured dose and greater than the travel of the plunger (9) between grooves (13*a*) and (13*b*).

5,011,477

CONTINUOUS/BOLUS INFUSOR

David A. Winchell, Spring Grove, and James L. Sertic, Grayslake, both of Ill., assignors to Baxter International Inc., Deerfield, Ill.

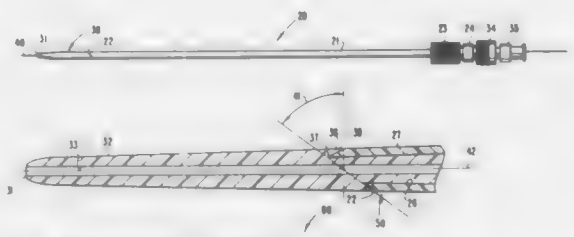
Filed Apr. 21, 1989, Ser. No. 341,527
Int. Cl.[5] A61M *37/00*
U.S. Cl. 604—132 15 Claims

1. An apparatus for dispensing a fluid comprising:

mechanical means for providing a source of fluid under pressure;

regulating means in fluid communication with the pressurized source of fluid for providing a constant flow rate of the fluid;

bolus dose means having a dose reservoir in fluid communication with the pressured source of fluid. the dose reservoir having an upper volume limit which represents the discrete dose limit of the bolus dose means, and a control means for manually expressing the fluid in the dose reservoir from the dose reservoir; and



downstream tubing means in fluid communication with the regulating means and the dose reservoir such that the regulating means provides a constant maintenance flow of the fluid to the downstream tubing means while the bolus dose means provides a manually controllable bolus dose of the fluid to the downstream tubing means/

5,011,478

RECESSED DILATOR-SHEATH ASSEMBLY AND METHOD

Constantin Cope, Elkins Park, Pa., assignor to Cook Incorporation, Bloomington, Ind.

Filed Jan. 31, 1989, Ser. No. 304,887
Int. Cl.[5] A61M *5/00*
U.S. Cl. 604—165 6 Claims

1. A dilator-sheath assembly comprising:

a sheath having one end adapted to be inserted in the body;

a dilator within said sheath and having a distal end extending beyond the one end of the sheath, said dilator having a recess within which said one end of said sheath is received whereby said dilator shields said one end of said sheath when the dilator-sheath assembly is inserted in the body, said dilator having an annular spur extending around said dilator and contiguous to said one end of said sheath, said spur defining said recess.

5,011,479

COVER AND CONNECTOR FOR HYPODERMIC NEEDLE

Son Le, 372 Christopher Dr., San Francisco, Calif. 94131, and Phillip Yang, 1557 Midvale Ave., Los Angeles, Calif. 90024

Continuation of Ser. No. 418,270, Oct. 6, 1989, abandoned, and a continuation-in-part of Ser. No. 360,261, Jun. 2, 1989, abandoned. This application May 14, 1990, Ser. No. 523,298
Int. Cl.[5] A61M *5/32*
U.S. Cl. 604—198 13 Claims

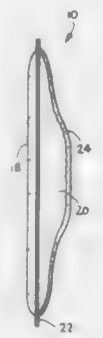
1. A needle connecting apparatus for connecting a needle to a syringe and for covering the needle for disposal, the apparatus comprising:

a connector housing including a barrel defining an enclosure;

first mounting means on the connector housing for mounting the housing to a syringe body;

second mounting means on the connector housing and within the enclosure for mounting a base of a needle to the housing; and

a rigid needle cover movably mounted to and guided by the barrel of the connector housing for exposing a needle



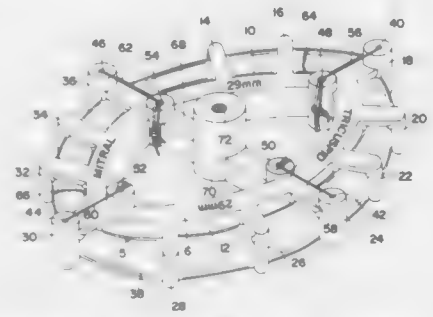
mounted to the connector housing when in a first position and for covering a needle mounted to the connector housing when in a second position.

5,011,480

ABSORBENT ARTICLE HAVING A NONWOVEN FRICTIONAL SURFACE FOR HOLDING THE ARTICLE IN PLACE AND A METHOD OF USE

Anthonette A. Gossens, Neenah, Wis., and Mary L. Schwer, New Milford, Conn., assignors to Kimberly-Clark Corporation, Neenah, Wis.

Continuation-in-part of Ser. No. 134,426, Dec. 17, 1987, abandoned. This application May 25, 1989, Ser. No. 358,320
The portion of the term of this patent subsequent to Feb. 7, 2006, has been disclaimed.
Int. Cl.[5] A61F *15/16*
U.S. Cl. 604—385.1 27 Claims



1. An absorbent article comprising first and second members cooperating to enclose an absorbent, one of said members being a fibrous, nonwoven web having an external frictional surface with a Sheffield smoothness rating of greater than 400, said frictional surface assisting in retaining said absorbent article in a desired position.

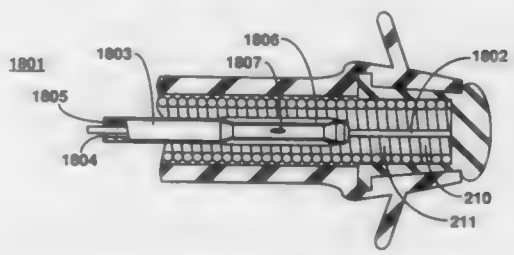
5,011,481

HOLDER FOR ANNULOPLASTY RING

David J. Myers, Garden Grove; Richard Leever, Pomona; Mary Gibbs, Garden Grove, all of Calif., and John T. M. Wright, Conifer, Colo., assignors to Medtronic, Inc., Minneapolis, Minn.

Filed Jul. 17, 1989, Ser. No. 380,345
Int. Cl.[5] A61F *2/24*
U.S. Cl. 606—1 14 Claims

1. A holder for an annuloplasty ring, comprising:



a holder member having an outer circumferential surface, said member provided with a plurality of fingers extending radially from said member, said fingers each comprising a segment extending radially from said holder member and a segment perpendicular to said radially extending segment and spaced radially outward of said outer circumferential surface, whereby an annuloplasty ring may be inserted between said circumferential surface and said perpendicular segments of said fingers.

5,011,482

APPARATUS FOR REMOVING AN ELONGATED STRUCTURE IMPLANTED IN BIOLOGICAL TISSUE

Louis Goode, Evans City; Frederick J. Shipko, Spring Church, and Neal E. Fearnot, West Lafayette, all of Pa., assignors to Cook Pacemaker Corporation, Leechburg, Pa.

Continuation-in-part of Ser. No. 298,100, Jan. 17, 1989, which is a continuation-in-part of Ser. No. 269,771, Nov. 9, 1988. This application May 3, 1989, Ser. No. 347,217
Int. Cl.[5] A61B *17/50*
U.S. Cl. 606—1 5 Claims

1. Lead removal apparatus for removing an implanted, cardiac pacemaker lead having a first longitudinal passageway therein, comprising:

control means having a distal end and a recess positioned about said distal end for inserting in said first longitudinal passageway of said implanted lead, said control means also including longitudinal passageway means for passing guide means therethrough;

expandable means positioned about said distal end and in said recess, sized for insertion in said first longitudinal passageway, and having a first position for securing said control means to said implanted lead to create a frictional engagement of the expandable means with said lead; and

said control means including a single longitudinal passageway for operating said expandable means to said first position.

5,011,483

COMBINED ELECTROSURGERY AND LASER BEAM DELIVERY DEVICE

Dennis Sleister, 11 Briarbrook Dr., East Greenwich, R.I. 02818

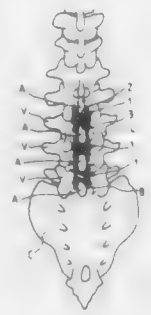
Filed Jun. 26, 1989, Ser. No. 371,744
Int. Cl.[5] A61B *17/32*
U.S. Cl. 606—37 17 Claims

1. Apparatus adapted to be coupled to a laser beam delivery device comprising:

a housing adapted to be coupled to the laser beam delivery device having means for receiving a laser beam from the

delivery device and for transmitting the laser beam to an area of medical treatment;

means disposed in the housing for receiving radio frequency electrical current and for transmitting the radio frequency electrical current to an applicator for providing the radio frequency electrical current to the area of medical treatment; and



a waveguide attached to said housing comprising means for delivering the laser beam from said housing to the area of medical treatment and further comprising means for delivering the radio frequency electrical current along the waveguide to the area of medical treatment, said waveguide being adapted to be inserted into the lumen of an endoscope for insertion into a living being, the applicator being disposed at a distal end of said endoscope for supplying the radio frequency electrical current to the area of medical treatment.

5,011,484

SURGICAL IMPLANT FOR RESTRICTING THE RELATIVE MOVEMENT OF VERTEBRAE

Francis H. Bréard, 13, rue Friant, 75014 Paris, France

Filed Oct. 10, 1989, Ser. No. 418,661
Int. Cl.[5] A61B *17/56*; A61F *2/44*
U.S. Cl. 606—61 **14 Claims**

7. Surgical implant for preventing mutual contact between vertebrae of a vertebral column during flexions of the vertebral column, said surgical implant comprising:

an inter-vertebral insert means insertable between vertebral spines of successive vertebrae which form a section to be treated of the vertebral column, said inter-vertebral insert means having two end surfaces for respectively contacting the spines of the end vertebrae of said section of the vertebral column; and

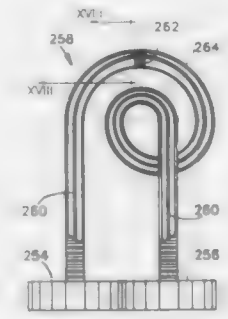
retaining means associated with said inter-vertebral insert means and having portions to be passed over said spines of said two end vertebrae, said portions of said retaining means being so distant from the end surfaces of said inter-vertebral insert means that the retaining means allow the vertebrae to have a relative limited movement away from each other upon forward flexion of the vertebral column.

5,011,485

DEPILATORY DEVICE

Yair Daar, Moshav Galia, and Shimon Yahav, 90 Tchernokovsky Street, Rehovot, both of Israel

Filed Jul. 27, 1989, Ser. No. 385,881
Claims priority, application Israel, May 26, 1989, 90433
Int. Cl.[5] A61B *17/00*
U.S. Cl. 606—133 **4 Claims**



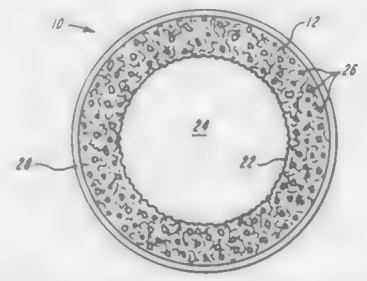
1. A human hair depilatory device comprising:

a hand held portable housing;

a hair engagement element arranged to be driven in rotational motion relative to skin bearing hair to be removed for engagement and removal of the hair from the skin; and

means for causing the hair engagement element to undergo vibration,

wherein said means for causing comprises at least one element mounted internally of the hair engagement element and



wherein said at least one element comprises a spacer disk eccentrically mounted on a stationary element located within the hair engagement element.

5,011,486

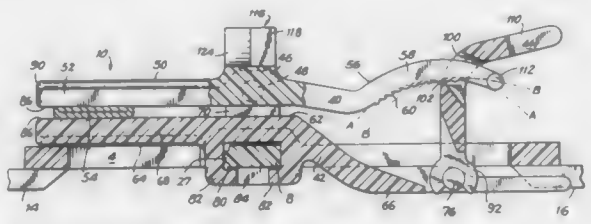
COMPOSITE NERVE GUIDANCE CHANNELS

Patrick Aebischer, Barrington, and Anastassios N. Salessiotis, Providence, both of R.I., assignors to Brown University Research Foundation, Providence, R.I.

Filed Nov. 18, 1988, Ser. No. 273,236
Int. Cl.[5] A61B *17/00*; A61F *2/04*
U.S. Cl. 606—152 **9 Claims**

1. A medical device for use in regenerating a severed nerve, said device comprising a tubular, biocompatible, porous, polymeric membrane containing an active factor incorporated within the walls of said membrane,

said device comprising an impermeable outer membrane surface and porous inner membrane surface through which said active factor may diffuse, and



said membrane having openings adapted to receive the ends of said severed nerve, and an inner lumen through which said nerve may regenerate.

5,011,487

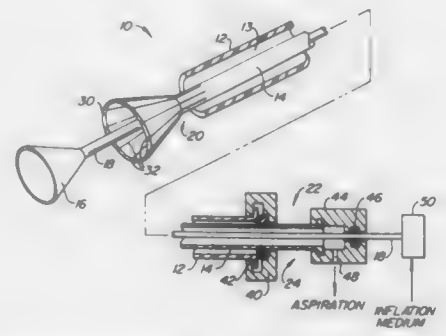
VASCULAR CLAMP ASSEMBLY

Daniel Shichman, Trumbull, Conn., assignor to United States Surgical Corporation, Norwalk, Conn.

Filed Jun. 24, 1987, Ser. No. 65,781
Int. Cl.[5] A61B *17/2*
U.S. Cl. 606—158 **16 Claims**

1. A vascular clamp assembly, which comprises:

first and second elongate members pivotally mounted together at a common pivot point, each of the first and second members including first and second end portions extending in opposite directions from the common pivot point, the first end portion of each member defining a vessel engaging surface, the vessel engaging surfaces being relatively positionable to receive therebetween and engage a blood vessel and to exert on the vessel a selectable holding force; and



a tension adjustor member at least partially interposed between and transversely disposed to the second end portions of the first and second members, the tension adjustor member having a first end pivotally mounted on the second end portion of the second member, and a contact edge spaced from the pivotal first end and slidably engagable with the second end portion of the first member over an edge engaging surface thereof wherein the second end portion of the first member is curved over at least a portion of said edge engaging surface, the distance between the pivotal axis of the first end and the contact edge being greater than the distance between the pivotal axis of the first end and the edge engaging surface of the first member along a portion of the edge engaging surface to allow the tension adjustor member to be wedged between the second end portions of the first and second members in selectable positions with respect to the edge engaging surface, thereby effecting a positioning between the first end portions of the first and second members.

ENDOTHELIUM STRIPPER AND METHOD OF USING THE SAME

Mohamed E. M. Salem, Moharem Bake, Egypt, assignor to University of South Florida, Tampa, Fla.

Filed Oct. 5, 1989, Ser. No. 417,534
Int. Cl.[5] A61B *17/00*
U.S. Cl. 606—159 **16 Claims**

1. A surgical tool for removing the endothelium of a vein, comprising:

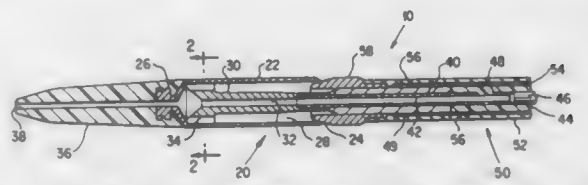
an elongate, flexible wire member having a proximal end and a distal end;

a head member, of frusto conical configuration, disposed at and fixedly secured to the distal end of said wire member; and

a distal end of said head member having a diameter greater than the diameter of a proximal end thereof;

a plurality of barb members formed on an outer surface of said head member;

said barb members being swept back at a predetermined angle to facilitate insertion of the head member into a vein;



whereby retraction of said wire member and said head member strips the endothelium from said vein.

5,011,490

ENDOLUMINAL TISSUE EXCISION CATHETER SYSTEM AND METHOD

Robert E. Fischell, Dayton, Md., and Tim A. Fischell, Los Altos, Calif., assignors to Medical Innovative Technologies R&D Limited Partnership, Dayton, Md.

Filed Dec. 7, 1989, Ser. No. 447,187
Int. Cl.[5] A61B *7/22*
U.S. Cl. 606—159 **29 Claims**

1. A catheter system for the excision of obstructive tissue from within a vessel of a living body comprising:

a guide wire able to be advanced within a vessel in a living body such that the distal end of said guide wire is advanced beyond the obstructive tissue;

a cut/collect catheter having an interior lumen forming a passageway for said guide wire and which can be advanced over said guide wire until the distal end of said cut/collect catheter is situated beyond the tissue to be excised, said cut/collect catheter having a distal portion at which is located a single, concentric, hollow cylindrical cutting blade having a tissue collection chamber formed within its interior surface and said cutting blade having a cutting edge facing toward the proximal end of said cut/-

collect catheter for cutting obstructive tissue as said cut/collect catheter is pulled back in a retrograde direction; and,

a closing catheter which surrounds the cut/collect catheter for most if its length, said closing catheter being adapted to move slidably along said cut/collect catheter and said closing catheter having a tapered distal portion which is tapered in the distal direction and adapted to make secure contact against the proximal end of said cylindrical cutting blade of said cut/collect catheter after the obstructive tissue has been cut so as to secure the cut tissue within said collection chamber.

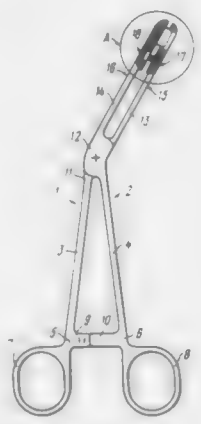
SURGICAL FORCEPS



Sergei K. Doenko, Shakhtostroitelei, 20, kv. 52, and Alexandr Y. Shvartsman, Artema, 159, kv. 94, both of Donetsk, U.S.S.R.

Filed Feb. 16, 1990, Ser. No. 480,736

Claims priority, application U.S.S.R., Feb. 27, 1989, 4651605

Int. Cl.[5] A61B *17/28*

U.S. Cl. 606—207 **1 Claim**

1. A surgical forceps, comprising:

a first blade, incorporating:

a handle having a first end and a second end;

a circular rest for a finger, said rest being located at said first end of said handle;

a lock situated at said first end of said handle;

a jaw, comprising:

a shank having a first end and a second end, said first end being connected to said second end of said handle;

a rectangular plate having a longitudinal axis, a first end face and a second end face, a flat surface, a rectangular slit situated close to said first end face and arranged along said longitudinal axis of said rectangular plate, and a projection having a rectangular base, a convex surface, a height and a longitudinal axis, said projection being so arranged close to said second face that the longitudinal axis of said projection is square with the longitudinal axis of said rectangular plate, said second end face of said rectangular plate is connected to said second end of said shank;

a second blade, comprising:

a handle having a first end and a second end;

a circular rest for a finger, said rest being located at said first end of said handle;

a lock situated at said first end of said handle and adapted to interact with said lock of said first blade;

said second ends of said handles of said first and second blades hingedly joined together;

a jaw, comprising:

a shank having a first end and a second end, said first end being connected to said second end of said handle;

a rectangular plate having a longitudinal axis, a first end face and a second end face, and a flat surface that faces towards said flat surface of said rectangular plate of said jaw of said first blade, a rectangular projection having such geometric dimensions that are smaller than those of said rectangular slit of said rectangular plate of said jaw of said first blade, said projection being located on said flat surface nearby said first end face along said longitudinal axis, and a rectangular slot having a longitudinal axis and being congruent with said projection of said rectangular plate of said jaw of said first blade, said slot having a concave bottom and whose depth is smaller than said height of said projection congruent therewith, which slot is situated close to said first end face so that the longitudinal axis of the slot is square with said longitudinal axis of said rectangular plate.

Firsova, ulitsa Ostrovityanova, 27, korpus 2, kv. 93, all of Moscow, U.S.S.R.

Continuation of Ser. No. 769,621, Jul. 1, 1985. This application Oct. 2, 1987, Ser. No. 105,460

Claims priority, application U.S.S.R., Apr. 14, 1983, 3578808

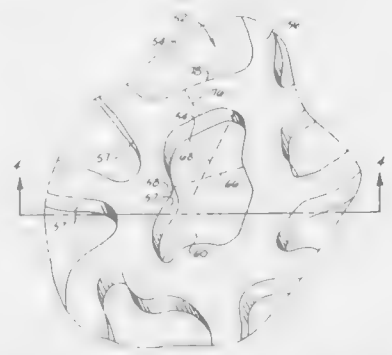
Int. Cl.[5] A61B *17/08;* **A61F** *2/00*

U.S. Cl. 606—215 **5 Claims**

1. A method wherein members of soft tissue and inner organs located within a subject have been partially or completely separated and are thereafter reconnected, which comprises reconnecting the separated portions thereof with a biodegradable synthetic polymer, consisting essentially of a copolymer of N-vinylpyrrolidone and alkyl esters of acrylic and/or methacrylic acids containing 2 to 8 carbon atoms in the alkyl group, and having an intrinsic viscosity of from 0.3 to 0.8 dl/g in the following proportions of the components, in molar per cent:

N-vinylpyrrolidone	40–90
alkyl esters of acrylic or methacrylic acids	10–60.

5,011,494



SOFT TISSUE IMPLANT WITH MICRON-SCALE SURFACE TEXTURE TO OPTIMIZE ANCHORAGE

Andreas F. von Recum, Six Mile, S.C., and Craig E. Campbell, Ridley Park, Pa., assignors to Clemson University, Clemson, S.C.

Continuation of Ser. No. 245,763, Sep. 16, 1988, abandoned. This application Apr. 20, 1990, Ser. No. 511,555

Int. Cl.[5] A61F *2/02, 2/06, 2/12, 2/24*

U.S. Cl. 623—11 **10 Claims**

1. A soft tissue implant device to be at least partially embedded at an implantation site in organic tissue of a living organism while promoting anchorage of the device at the implantation site and the growth of collagen at the implantation site, without causing encapsulation of the embedded portion of the device and without causing inflammatory tissue at the implantation site, the device comprising:

(a) a body;

(b) a surface layer secured to said body and extending over a sufficient portion of said body sot hat only said surface layer contacts the organic tissue at the implantation site;

(c) said surface layer defining a plurality of three-dimensional features;

(d) said feature defining an exterior surface for presenting itself to living cells in organic tissue at the implantation site;

(e) said exterior surface defining a plurality of spaces for presenting themselves to living cells adjacent said exterior surface;

(f) each said space having a bridging distance being the minimum distance an adjacent cell must stretch to span diametrically across said space, said bridging distance being measured in a direction parallel to said exterior surface at said space;

(g) said plurality of spaces having a mean bridging distance ranging from greater than 1.0 micron to less than 4.0 microns; and

(h) wherein said surface layer being produced by casting polymers, which are semifluid and cure over time, onto a surface produced on a glass substrate by selective etching of photoresist spincoated onto a chrome plated glass plate and which has been exposed to a light image followed by being etched down to the chrome and followed by the chrome being etched down to the glass substrate.

UNIQUE BONE REGENERATION TRICALCIUM PHOSPHATE

Jeffrey O. Hollinger, Glenwood, Md., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Feb. 16, 1990, Ser. No. 481,094

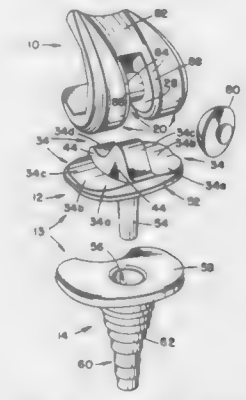
Int. Cl.[5] A61F *2/28*

U.S. Cl. 623—16 **3 Claims**

1. A biodegradable implant for implanting in a bone cavity comprising a layered disc, each strata are layers of porous tricalcium phosphate; and said disc having a sintered matrix density substantially between 65 and 90% and pores in the range of 70 to 420 microns wherein the pores are omnidirectional for more rapid regeneration of new bone tissue into the disc.

5,011,496

PROSTHETIC JOINT



Mark R. Forte, Pine Brook, N.J., and Douglas G. Noiles, New Canaan, Conn., assignors to Joint Medical Products Corporation, Stamford, Conn.

Continuation of Ser. No. 151,429, Feb. 2, 1988, Pat. No. 4,888,021. This application Jul. 24, 1989, Ser. No. 384,264

The portion of the term of this patent subsequent to Dec. 19, 2006, has been disclaimed.

Int. Cl.[5] A61F *2/38, 2/30*

U.S. Cl. 623—20 **12 Claims**

1. A prosthetic joint for providing flexion motion between two bones comprising:

(a) a convex bearing component having a first bearing area and a contiguous second bearing area, the second bearing area being a surface of revolution about a first axis and having a radius of curvature which is less than the radius of curvature of the first bearing area; and

(b) a concave bearing component having a third bearing area for engagement during flexion with the first bearing area and a contiguous fourth bearing area for engagement with the second bearing area, the fourth bearing area being a surface of revolution about a second axis and having a radius of curvature which is less than the radius of curvature of the third bearing area;

wherein:

the radius of curvature of the second bearing area is substantially the same as the radius of curvature of the fourth bearing area so that the second and fourth bearing areas may be in congruent engagement with one another; and

the flexion axis of the joint is parallel to the first and second axes when the second and fourth bearing areas are in engagement.

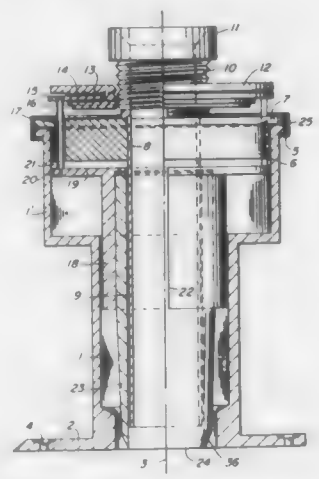
CUTTING APPARATUS FOR THE CUTTING OF A ROUND CORNEAL DISC

Jorg H. Krumeich, Propst-Hellmich-Promenade 28, 4630 Bochum 6, and Norbert Quast, Gantenberg Strasse 18, 4300 Essen, both of Fed. Rep. of Germany



Continuation of Ser. No. 164,589, Mar. 7, 1988, abandoned. This application Jan. 16, 1990, Ser. No. 465,052

Claims priority, application Fed. Rep. of Germany, Mar. 5, 1987, 3707004

Int. Cl.[5] A61B *17/32*

U.S. Cl. 606—166 **22 Claims**

17. A cutting apparatus for the excision of a corneal disc from a human eye, said apparatus comprising:
a hollow cylindrical cutting knife having a longitudinal central cylinder axis;
an exterior cylinder including on its end adjacent to the cornea during excision of a corneal disc a planar connection plate having a bore therethrough, said connection plate extending perpendicular to said cylinder axis;
a clip ring guidingly situated in a rear end portion of said cylinder for holding said cutting knife by a frictional fit;
means for rotating said cutting knife operatively connected to said clip ring, said means for rotating including a rotatable stopper having a central bore therethrough and guide cylinder fixed in said central bore of stopper, said guide cylinder having a handwheel on an exposed outer end thereof adapted for manipulation by an operator; and

means for axially moving said cutting knife operatively connected to said clip ring, said means for axially moving comprising first means threadedly engaged with said guide cylinder for axially adjusting the position of said cutting knife relative to said means for rotating,
whereby manipulation of said handwheel causes rotation of said cutting knife and separate manipulation of said first means causes axial movement of said cutting knife.

TANNING AGENT FORMULATION FOR MANUFACTURE OF SEMIFINISHED LEATHER PRODUCTS

Paul Rathfelder; Jozef Sagala, both of Boeblingen; Friedrich Landbeck, Holzgerlingen, and Heinz Matschkal, Gaertringen, all of Fed. Rep. of Germany, assignors to Schill & Seilacher GmbH & Co., Boeblingen, Fed. Rep. of Germany

Filed Apr. 3, 1989, Ser. No. 332,535

Claims priority, application Fed. Rep. of Germany, Apr. 2, 1988, 3811267

Int. Cl.[5] C14C *3/08*

U.S. Cl. 8—94.33 **12 Claims**

1. A process for manufacturing a semifinished leather product, which comprises the steps of pickling a pelt and pretanning said pickled pelt with a tanning agent formulation obtained by reacting 1 mole of an aliphatic ω, ω'-dialedehyde having 2–8 carbon atoms in the form of an aqueous solution of about 3–60% strength with about 0.2–4 moles of a hydroxy compound of the formula I

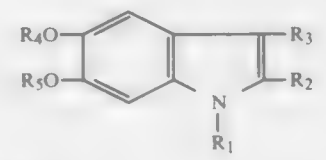
$$R_1-\text{—}[(C_2H_4O)x\text{—}(C_3H_6O)y\text{—}(C_4H_8O)z]n\text{—}H \quad \text{(I)}$$

whereby
n is an integer from 0 to 10,
x+y+z is an integer from 1 to 20, wherein the alkoxy groups may be arranged in any order, and
R_1 is H, C_1-C_{12} alkyl, or C_1-C_{12} alkyl having one or more hydroxyl groups,
wherein n is not O for R^1=H.

5,011,500

PROCESS FOR DYEING KERATINOUS FIBRES AND DYE COMPOSITION EMPLOYING INDOLE DERIVATIVES AND DIRECT NITRO DYES

Jean F. Grollier, and Chantal Fourcadier, both of Paris, France, assignors to L'Oreal, Paris, France



Filed Dec. 29, 1988, Ser. No. 291,771

Claims priority, application Luxembourg, Dec. 30, 1987, 87097

Int. Cl.[5] A61K *7/13*

U.S. Cl. 8—410 **37 Claims**

1. A process for dyeing keratinous fibers comprising applying to said fibers at least one composition (A) containing in a medium suitable for dyeing said fibers, (1) at least one indole derivative having the formula

(I)

wherein
R_1 represents hydrogen, lower alkyl or —$SiR_6R_7R_8$,
R_2 and R_3, each independently, represent hydrogen, lower alkyl, carboxyl, lower alkoxycarbonyl or —COO-$SiR_6R_7R_8$,
R_4 and R_5, each independently, represent hydrogen, linear or branched C_1-C_{20} alkyl, formyl, linear or branched C_2-C_{20} acyl, linear or branched C_3-C_{20} alkenoyl, $SiR_6R_7R_8$, —P(O) $(OR_9)_2$ or R_9OSO_2, or R_4 and R_5 together with the oxygen atoms to which they are attached form a ring optionally containing a carbonyl group, a methylene group, a thiocarbonyl group, a >P(O)OR_9 group or a >$CR_{10}R_{11}$ *group*,
R_9 and R_{10} represent hydrogen or lower alkyl, R_{11} represents lower alkoxy, monoalkylamino or dialkylamino, and
R_6, R_7 and R_8, each independently, represent linear or branched alkyl, and
the acid addition salt thereof with an inorganic or organic acid or the corresponding alkali metal, alkaline earth metal or amine salt thereof, said indole derivative being present in said composition (A) in an amount ranging from 0.01 to 5 percent by weight based on the total weight of said composition (A) and
(2) at least one substituted 2-nitro-paraphenylene diamine selected from the group consisting of 1-N-(β-hydroxyethyl)amino-2-nitro-4-N', N'-(bis-β-hydroxyethyl) aminobenzene and 1-N-(β-hydroxyethyl)amino-2-nitro-4-aminobenzene, present in an amount ranging from 0.01 to 5 percent by weight based on the total weight of said composition (A), and
developing a color on said fibers using an oxidizing system selected from the group consisting of:
(i) a source of iodide ions and hydrogen peroxide, in which case said composition (A) contains either (a) a source iodide ions or (b) hydrogen peroxide and the application of said composition (A) is preceded or followed by the application of composition (B) comprising in a medium suitable for dyeing said fibers
(a') hydrogen peroxide at a pH ranging from 2 to 12 when said composition (A) contains a source iodide ions, or
(b') a source of iodide ions at a pH ranging from 3 to 11 when said composition (A) contains hydrogen peroxide;
(ii) a nitrite source, in which case the application of said composition (A) is followed by the application of composition (B') comprising an aqueous composition having an acidic pH, said composition (A) or said composition (B') containing at least one said nitrite source;
(iii) an oxidizing agent selected from the group consisting of periodic acid, a periodate, sodium hypochlorite, potassium ferricyanide, silver oxide, Fenton's reagent, lead (IV) oxide, cesium (V) sulphate, ammonium persulfate and ferric chloride, said oxidizing agent being present in said composition (A) or being applied to said fibers simultaneously or sequentially in a composition (B'') comprising a medium suitable for dyeing said fibers and said oxidizing agent; and
(iv) an oxidizing agent selected from the group consisting of a permanganate and a dichromate, said oxidizing agent being present in an aqueous composition (B''') having a pH ranging from 2 to 10, said composition (B''') being applied to said fibers prior to the application of said composition (A) thereto.

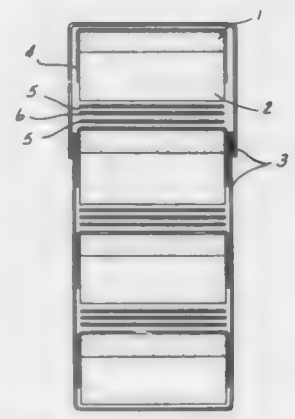
APPARATUS FOR COOLING AND PURIFYING A HOT GAS
Jacob H. Stil; Adrianus J. Ooms, and Bernardus H. Mink, all of The Hague, Netherlands, assignors to Shell Oil Company, Houston, Tex.
Division of Ser. No. 4,287, Jan. 6, 1987, Pat. No. 4,957,657, which is a continuation of Ser. No. 792,167, Oct. 25, 1985, abandoned, which is a continuation of Ser. No. 677,894, Dec. 4, 1984, abandoned, which is a continuation of Ser. No. 417,754, Sep. 13, 1982, abandoned. This application Jun. 16, 1990, Ser. No. 538,964
Claims priority, application Netherlands, Nov. 16, 1981, 8105169
Int. Cl.[5] C10K *1/00*
U.S. Cl. 48—62 R **16 Claims**



1. An apparatus for cooling and purifying a hot gas from a hydrocarbon gasification reactor containing sticky slag droplets and/or particles comprising:
(a) a substantially vertical supply pipe for the gas, in which the gas can flow upwards, in the wall of which pipe openings have been provided for injecting cold, clean synthesis gas,
(b) a flow-reversal vessel into which the top end of the supply pipe issues, the internal diameter of the vessel being larger than the internal diameter of the supply pipe, in which vessel the distance from the mouth of the supply pipe to the internal top boundary of the vessel is larger than the internal diameter of the supply pipe, while the bottom of the flow-reversal vessel slants downwards at an angle that is acute in relation to the substantially vertical supply pipe,
(c) a connecting pipe the top end of which is connected to the bottom of the flow-reversal vessel and the center line of which is at an acute angle to the vertical,
(d) a substantially vertically arranged heat exchanger comprising a flow-reversal chamber at its bottom end, the side wall of which is connected to the connecting pipe and the internal diameter of which is larger than the internal diameter of the connecting pipe,
(e) a discharge pipe for slag particles which is connected to the bottom of the flow-reversal chamber of the heat exchanger.

SHELLING-RESISTANT ABRASIVE GRAIN, A METHOD OF MAKING THE SAME, AND ABRASIVE PRODUCTS
Vernon M. Wald, and Robert S. Kirk, both of St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.
Filed Oct. 14, 1988, Ser. No. 258,196
Int. Cl.[5] B24D *3/00*
U.S. Cl. 51—293 **6 Claims**

1. A method of making ceramic abrasive grain characterized by having separated protuberant masses of inorganic material autogenously bonded to the surface thereof, said method comprising the steps of:
(a) providing a mass of first particles comprising alpha-alumina precursor material each particle of which is sinterable to an alpha-alumina-based abrasive grain;
(b) introducing into said mass second particles much finer than said first particles, said second particles being capable of autogenous bonding to the surface of said first particles upon sintering of said first particles; and
(c) heating said particles under sintering conditions to sinter said first particles and cause autogenous bonding of said second particles to the surface of each of said first particles.

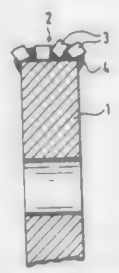
COMPOSITE COMPACT WITH A MORE THERMALLY STABLE CUTTING EDGE AND METHOD OF MANUFACTURING THE SAME
Robert H. Frushour, P.O. Box 818, Plymouth, Mich. 48170
Filed Aug. 7, 1989, Ser. No. 390,204
Int. Cl.[5] B24D *3/00*
U.S. Cl. 51—293 **7 Claims**

1. A composite body comprising:
a diamond material layer formed by chemical vapor deposition as a single, well bonded body and having a first surface;



a substrate; and
the first surface of the diamond material layer and the substrate being bonded together under high pressure and high temperature.

5,011,510
COMPOSITE ABRASIVE-ARTICLES AND MANUFACTURING METHOD THEREFOR
Izumi Hayakawa, Kamakura, and Hiroshi Soboi, Tama, both of Japan, assignors to Mitsui Mining & Smelting Co., Ltd., Tokyo, Japan
Filed Sep. 21, 1989, Ser. No. 410,591
Claims priority, application Japan, Oct. 5, 1988, 63-252252
Int. Cl.[5] B24D *3/00*
U.S. Cl. 51—293 **7 Claims**

1. A method of manufacturing composite abrasive-articles comprising the following steps of:
mixing diamond abrasive or cubic boron nitride abrasive and metal powder;
molding the mixture into a uniform small piece of abrasive articles;
then or simultaneously with said molding, completely sintering said uniform small piece of abrasive articles which has been molded; and
mixing a completely sintered piece of abrasive articles which has been sintered and any of resin, metal, or glass having a low melting point, whereby the mixture is solidified into a predetermined shape.

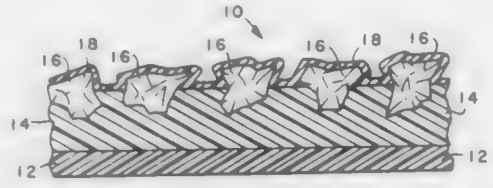
GRINDING TOOL
Alexander Beck, Rebbergstrasse 34, CH-8113 Boppelsen, Switzerland
Filed Jul. 26, 1989, Ser. No. 385,735
Claims priority, application Switzerland, Jul. 27, 1988, 2854/88
Int. Cl.[5] B24B *1/00*
U.S. Cl. 51—295 **20 Claims**



1. A material removing tool, particularly for removing material from hard objects, comprising a rigid carrier; particles of abrasive material adjacent a portion at least of said carrier, said portion of said carrier consisting of solderable material; and a binder of active solder rigidly joining said particles to said carrier.

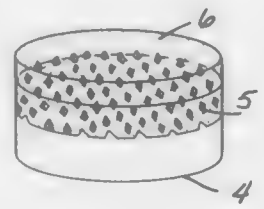
5,011,512
COATED ABRASIVE PRODUCTS EMPLOYING NONABRASIVE DILUENT GRAINS
Vernon M. Wald; Richard A. Masson; Fredrick D. Brown, and David E. Broberg, all of St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.
Continuation of Ser. No. 216,799, Jul. 8, 1988, abandoned. This application Jan. 25, 1990, Ser. No. 470,429
Int. Cl.[5] B24B *1/00*
U.S. Cl. 51—295 **20 Claims**

1. A coated abrasive article comprising a backing member having adherently bonded thereto by a bonding material a volume of particles as a layer, said particles consisting essentially of (a blend) of premium and having a Knoop hardness less than 200, said coated abrasive article having at least the same abrasive performance as the same abrasive article with all of said volume of particles consisting only of particles of said premium abrasive grains.

5,011,513
SINGLE STEP, RADIATION CURABLE OPHTHALMIC FINING PAD
Eugene Zador, Ballston Lake; Shyiguei Hsu, Watervliet; Wesley R. Kaczmarek, Ballston Lake; Sitaramaiah Ravipati, Latham; Stanley Supkis, Averill Park, and Richard H. Vogel, Saratoga Springs, all of N.Y., assignors to Norton Company, Worcester, Mass.
Filed May 31, 1989, Ser. No. 359,164
Int. Cl.[5] B24D *11/00*
U.S. Cl. 51—295 **23 Claims**

1. A coated abrasive material suitable for use as a single step fining pad comprising:
a flexible and dimensionally stable backing member;
an abrasive adhered to one surface of said backing member by a maker coat adhered to said backing member; and
an ultraviolet radiation-cured size coat overlying said abrasive grains and further adhering said abrasive grains to the maker coat, said size coat comprising a multifunctional urethane oligomer reinforced with an ultraviolet radiation transparent particulate filler having a hardness at least as great as silica.

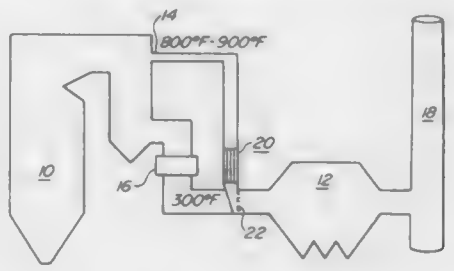
5,011,514
CEMENTED AND CEMENTED/SINTERED SUPERABRASIVE POLYCRYSTALLINE BODIES AND METHODS OF MANUFACTURE THEREOF
Hyun S. Cho; Chien-Min Sung, both of Sandy; Leo Merrill, Orem; Sy-Hwa Chen, and Frank Csillag, both of Salt Lake City, all of Utah, assignors to Norton Company, Worcester, Mass.
Continuation-in-part of Ser. No. 226,049, Jul. 29, 1988. This application Jul. 11, 1989, Ser. No. 378,123
Int. Cl.[5] B24D *11/00*
U.S. Cl. 51—295 **39 Claims**



1. A thermally stable superabrasive product comprising a plurality of "metal coated superabrasive particles", said superabrasive particles having a hardness at least equal to that of diamond or cubic boron nitride, said metal being selected from Groups IVA, VA, VIA and alloys thereof, "said coating forming a matrix cementing said superabrasive particles together into a coherent mass" of high structural strength having a

predetermined configuration, said superabrasive particles comprising at least 70% by volume of said coherent mass, said

metal coating comprising about 4 to 30% of the volume of said coherent mass.



5,011,515
COMPOSITE POLYCRYSTALLINE DIAMOND COMPACT WITH IMPROVED IMPACT RESISTANCE
Robert H. Frushour, P.O. Box 818, Plymouth, Mich. 48170
Filed Aug. 7, 1989, Ser. No. 390,208
Int. Cl.[5] E21B *10/46*
U.S. Cl. 51—307 **6 Claims**

1. A cutting element comprising:
a substrate having a first surface;
the first surface being formed with surface irregularities having angularly disposed sidewalls in which the spacing between adjacent surface irregularities is less at the base of such irregularities than at the top end of such irregularities at the first surface of the substrate; and
a polycrystalline material layer having a cutting surface and an opposed mounting surface joined to the substrate, the mounting surface having surface irregularities complimentary to and contacting the surface irregularities in the substrate; and wherein
the concentration of the higher thermal expansion material substrate continuously and gradually decreases from the substrate into the lower thermal expansion polycrystalline material layer through the region of the surface irregularities.

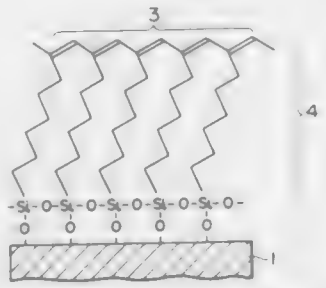
SAMPLER FOR CHEMICAL VAPORS
Brian R. Cage, Shawnee, Kans., and Arbor D. Drinkwine, Kansas City, Mo., assignors to Midwest Research Institute, Kansas City, Mo.
Filed Feb. 12, 1990, Ser. No. 478,523
Int. Cl.[5] B01D *47/00*
U.S. Cl. 55—92 **5 Claims**



1. A method of extracting chemical vapor from air and concentrating the extracted vapor, said method comprising the steps of:
delivering a preselected quantity of scrubbing liquid to an enclosed receptacle having a substantially cylindrical wall;
introducing air into the receptacle tangentially to said wall to effect swirling of the air and carrying of the liquid therewith along the wall so that the liquid scrubs the air of chemical vapor therein;
terminating the introduction of air into the receptacle after a preselected time to permit the liquid with chemical vapor therein to settle in the receptacle; and
draining the liquid with the chemical vapor therein from the receptacle.

5,011,518
PERMSELECTIVE MEMBRANE AND PROCESS FOR PRODUCING THE SAME
Kazufumi Ogawa, Hirakata, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan
Filed Mar. 5, 1990, Ser. No. 489,249
Claims priority, application Japan, Mar. 9, 1989, 1-057005
Int. Cl.[5] B01D *53/22, 71/28*
U.S. Cl. 55—158 **16 Claims**

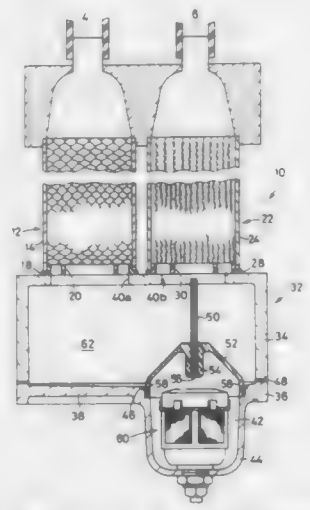
1. A permselective membrane in a state of monomolecular film polymer or monomolecular built-up polymer, which com-

prises a polymer formed by subjecting a monomolecular film or a monomolecular built-up film of a substance containing at

least one polymerizable group and a functional group to polymerization by means of a catalyst or radiation irradiation.

5,011,519

IN-LINE FILTER AND TRAP STRUCTURE DEVICE FOR COMPRESSED AIR



Sadao Maeda, Okazaki, Japan, assignor to Maeda Shell Service Co., Ltd. and J & M Co., Ltd., both of Aichi, Japan

Filed Nov. 21, 1989, Ser. No. 439,682

Claims priority, application Japan, Nov. 24, 1988, 63-152662[U]

Int. Cl.[5] B01D *19/00*

U.S. Cl. 55—216 **3 Claims**

1. An in-line filter and trap structure device for compressed air comprising first filter means which has a suitable first packing in a sleeve thereof, and second filter means which has a suitable second packing in a sleeve thereof, the first and second filter means being disposed parallel with each other on an air-tightly enclosed trap structure such that the first and second filter means extend in a vertical direction from a top wall of the trap structure, the trap structure having a trap chamber defined therewithin, and having a first and a second communication holes formed through a top wall of the trap chamber, the first and second filter means communicating with the trap chamber through the first and second communication holes, respectively, the compressed air being introduced from an intake conduit into the trap chamber through the first filter means, whereby vapor an/or liquid particles contained in the compressed air are condensed or coalesced and captured within the trap chamber, the compressed air from which the vapor or liquid particles have been separated being directed from the trap chamber into an outlet conduit through the second filter means, whereby the liquid particles remaining in the compressed air are vaporized,

said trap structure including a base which has a flat portion, and a sump portion which extends from said flat portion in a direction away from said trap chamber, so as to define a recess;

a conical hood which cooperates with said sump portion to define a reduced-pressure sump, said conical hood having a diameter which increases in an axial direction of said conical hood from said trap chamber toward said recess;

said conical hood having inlet holes formed through a large end portion thereof;

said flat portion having an inner surface which is inclined so that the liquid which has been separated from the compressed air and fallen on said inner surface is introduced into said reduced-pressure sump through said inlet holes, while flowing on an inner surface of said sump portion;

a venturi tube which is supported by and extends through a small end portion of said hood such that one end of said tube is positioned in said reduced-pressure sump, and the second end of said tube is positioned in said second communication hole through which the air flows from the trap chamber into said second filter means, said venturi tube sucking an atmosphere inside said reduced-pressure sump into said second filter means by an effect of the compressed air which flows from said trap chamber into said second filter means through said second communication hole; and

drain means provided in a bottom portion of said reduced-pressure sump, for discharging out of the reduced-pressure sump the trapped liquid introduced from said trap chamber into said reduced-pressure sump through said inlet holes.

HYDRODYNAMIC FUME SCRUBBER

William J. Carr, San Jose, and Raymond S. Krummen, Los Gatos, both of Calif., assignors to Vector Technical Group, Inc., Santa Clara, Calif.

Filed Dec. 15, 1989, Ser. No. 451,306

Int. Cl.[5] B01D *47/08*

U.S. Cl. 55—228 **18 Claims**

1. A hydrodynamic fume scrubber for scrubbing a gaseous phase effluent with a scrubbing liquid, the fume scrubber comprising:

inlet means for receiving the particulate laden gaseous effluent into the scrubber and for providing a first effluent to scrubbing fluid interface,

negative pressure providing means for drawing a stream of the effluent passing from the inlet means into a first pressurized component of the scrubbing liquid in a manner generating negative pressure with respect to the effluent,

a main scrubbing chamber including:

means for receiving the first pressurized component of the scrubbing liquid and the effluent stream from the negative pressure providing means into an upper region of the chamber,

hydrodynamic spray means driven by a second pressurized component of the scrubbing liquid for hydrodynamically spraying the second component throughout the upper region of the chamber,

filter media means disposed in a central region of the chamber for filtering and mixing the effluent gas and scrubbing liquid thereby to promote dissolution of components within the effluent which are soluble in the scrubbing liquid,

a scrubbing liquid, scrubbed gas separation region within the chamber below the filter media means for separating and discharging scrubbed gas effluent collected therein,

splash plate means at the lower boundary of the separation region for further breaking up particle masses formed within the scrubbing liquid as it drips from a lower surface of the filter media means through the separation region,

scrubbing liquid reservoir means below the splash plate means in a lowermost region of the chamber for receiving excess scrubbing liquid,

the scrubber further comprising scrubbing liquid supply means for supplying scrubbing liquid to the scrubber from a source thereof, and discharge means for discharging scrubbing liquid from the reservoir means at a flow rate approximating the flow rate of scrubbing liquid incoming from the supply means.

LOW PRESSURE STRIPPING PROCESS FOR PRODUCTION OF CRUDE HELIUM

Gerry N. Gottier, Emmaus, Pa., assignor to Air Products and Chemicals, Inc., Allentown, Pa.

Filed Jan. 25, 1990, Ser. No. 471,252

Int. Cl.[5] F25J *3/00*

U.S. Cl. 62—11 **15 Claims**

1. A process for prefractionating a pressurized, helium-containing feed gas mixture to produce a helium-enriched stream comprising the steps of:

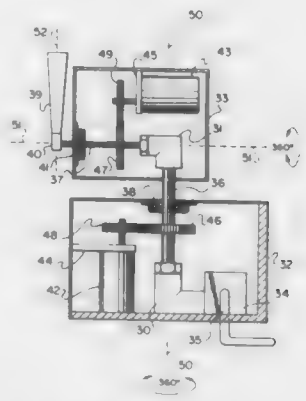
(a) liquefying and subcooling the pressurized, helium-containing feed gas mixture;

(b) expanding the liquefied, subcooled, pressurized, helium-containing feed gas mixture whereby said liquefied mixture is partially vaporized and thereby producing a partially vaporized frationation feed stream;

(c) stripping the partially vaporized frationation feed stream in a cryogenic distillation column thereby producing as an overhead, the helium-enriched stream, and a bottoms liquid, the helium-lean stream; and

(d) reboiling the cryogenic distillation column by vaporizing at least a portion of the helium-lean stream.

5,011,522



BLOWER FOR THE PRODUCTION OF A MIST OR THE LIKE

Toshimitsu Suzuki, Machida, Japan, assignor to Daichi Canada Inc., Montreal, Canada

Filed Sep. 1, 1989, Ser. No. 402,342

Int. Cl.[5] F25J *5/00*

U.S. Cl. 62—12 **20 Claims**

1. A blower comprising

a conduit means able to convey liquid CO_2 and

a support means, said conduit means having an inlet means suitable for introducing a liquid CO_2 therewithin and an outlet means able to discharge liquid CO_2 to the atmosphere so as to form a mist of the like, said inlet means being fixed to said support means, characterized in that, said outlet means is rotatably coupled to said inlet means, said outlet means being rotatable about a first axis of rotation and including a first conduit element and a second conduit element, wherein said first conduit element is rotatably coupled to said inlet means, wherein said second conduit element is rotatably coupled to said first conduit element and wherein said second conduit element is adapted to discharge liquid CO_2 to the atmosphere so as to form a mist or the like, said second conduit element being rotatable about an axis which is transverse to said first axis rotation.

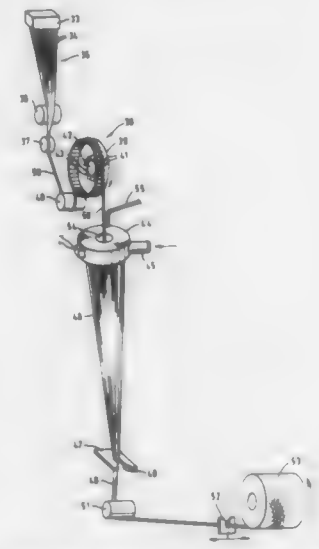
5,011,523

PROCESS AND DEVICE FOR PRODUCING A YARN OR RIBBON FORMED FROM REINFORCEMENT FIBERS AND A THERMOPLASTIC ORGANIC MATERIAL

Giordano Roncato, and Robert Federowsky, both of Aix les Bains, France, assignors to Vetrotex Saint Gobain, Chamberry, France

Filed Oct. 27, 1989, Ser. No. 428,379

Claims priority, application France, Oct. 28, 1988, 88 14104



Int. Cl.[5] C03B *37/022*

U.S. Cl. 65—2 **23 Claims**

1. A process of production of a composite yarn or ribbon, comprising:

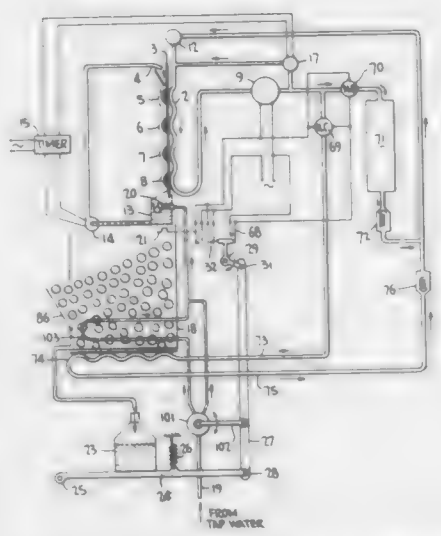
drawing reinforcement fibers from molten glass;

directing thermoplastic organic material around said reinforcement fiber for contact therewith;

forming a yarn or ribbon from the reinforcement fibers and thermoplastic organic material; and

collecting the yarn or ribbon.

5,011,524



ICE MAKER AND WATER PURIFIER EMPLOYING PRE-COOLED MAKE-UP WATER

John D. Ruff, Alexandria, Va., assignor to Thermadyne, Inc., Alexandria, Va.

Continuation-in-part of Ser. No. 278,447, Dec. 1, 1988, Pat. No. 4,897,099. This application Jan. 29, 1990, Ser. No. 471,884

Int. Cl.[5] B01D *9/04*

U.S. Cl. 62—532 **6 Claims**

5. A method for providing a supply of purified ice and a supply of purified liquid water from a source of unpurified liquid water, said method comprising the steps of:

(a) cooling selected areas of at least one ice-forming surface to a temperature below the freezing temperature of water;

(b) directing a water stream of the unpurified liquid water over said selected areas to form ice at said selected areas while washing impurities away from the formed ice with said steam;

(c) collecting in a sump portions of said water stream that do not form said ice;

(d) recycling into said water stream portions of the water stream collected in step (c);

(e) adding additional unpurified water to said sump from said source to replace water formed as ice in step (b);

(f) increasing the temperature at said selected areas at various times to remove said ice from said ice-forming surface;

(g) collecting in a bin the ice removed in step (f);

(h) warming a portion of said bin at selected times to melt some of the ice therein into purified liquid water;

(i) collecting in a container the purified liquid water derived in step (h); and

(j) flowing unpurified water from said source to said sump through a heat exchanger in thermal contact with said ice in said bin at said selected times to assist said warming of said portion of said bin and pre-cool said additional unpurified water

APPARATUS FOR HIGH EFFICIENT SYMMETRICAL QUENCHING OF ROLLER CONVEYED GLASS SHEETS

Ronald A. McMaster, Perrysburg, Ohio, assignor to Glasstech, Inc., Perrysburg, Ohio

Continuation of Ser. No. 473,912, Feb. 2, 1990, abandoned. This application Oct. 9, 1990, Ser. No. 594,684

Int. Cl.[5] C03B *35/18, 27/04*

U.S. Cl. 65—351 **10 Claims**

1. Apparatus for quenching a heated glass sheet, comprising:

a roller conveyor including horizontally extending conveyor rolls that convey the heated glass sheet in a direction of conveyance along a plane of conveyance, said conveyor rolls being spaced from each other along the direction of conveyance and having centers about which the conveyor rolls rotate to provide the conveyance, and each conveyor roll including an outer conveying surface and having a radius R;

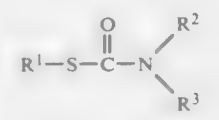
upper and lower sets of blastheads located above and below the plane of conveyance in vertical alignment with each other, each blasthead having outlets through which quenching gas is supplied for impingement with the conveyed glass sheet with the locations of impingement from the upper and lower blastheads aligned with each other, said outlets each being located closer to the conveyed glass sheet than the conveyor roll radius R, each outlet having a hydraulic diameter D and providing a gas flow path having a length L between the outlet and the impingement of the gas flow path thereof with the conveyed glass sheet, each outlet having a characteristic length of L/D less than 6, the outlets being spaced in a pattern and oriented to provide the gas flow paths thereof with different angles of incidence at the impingement thereof with the conveyed glass sheet, and the outlets being spaced and oriented to provide impingement locations spaced at the glass sheet; and

a set of roll mimics located above the conveyor rolls in a vertically aligned relationship.

5,011,526

HERBICIDE COMPOSITIONS OF EXTENDED SOIL LIFE

Daniel L. Hyzak, Austin, Tex., and Reed A. Gray, Saratoga, Calif., assignors to ICI Americas Inc., Wilmington, Del.



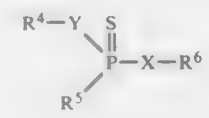
Division of Ser. No. 605,441, Apr. 30, 1984, Pat. No. 4,915,725, which is a continuation-in-part of Ser. No. 507,616, Jun. 24, 1983, abandoned, which is a continuation-in-part of Ser. No. 304,216, Sep. 21, 1981, abandoned, which is a continuation-in-part of Ser. No. 198,034, Oct. 17, 1980, abandoned, which is a continuation of Ser. No. 60,603, Jul. 27, 1979, abandoned, which is a continuation-in-part of Ser. No. 944,094, Sep. 20, 1978, abandoned. This application Jan. 22, 1990, Ser. No. 468,350

Int. Cl.[5] A01N *57/02*

U.S. Cl. 71—87 **19 Claims**

1. An herbicidal composition comprising

(a) an herbicidally effective amount of a thiolcarbamate having the formula



in which

R^1 is C_1–C_6 alkyl,

R^2 is C_1–C_6 alkyl,

R^3 is C_1–C_6 alkyl or cyclohexyl;

(b) a soil-life extending non-phytotoxic amount of an organophosphorus compound having the formula

in which

Y is oxygen or sulfur;

R^4 is C_1–C_6 alkyl other than tertiary butyl, optionally substituted with halo, or is C_3–C_6 alkenyl optionally substituted with cyano;

R^5 is C_1–C_4 alkyl, straight-chain C_1–C_6 alkoxy or C_1–C_4 alkylthio other than tertiary butylthio;

R^6 is C_1–C_4 alkyl substituted with one C_1–C_3 alkylthio group; C_5–C_7 cycloalkyl; C_1–C_4 alkylimino optionally substituted with one, two or three halogen atoms; phenyl optionally substituted with nitro, ortho-nitro and halo, C_1–C_3 alkylsulfinyl, α-pentynyl, or trifluoromethyl; benzyl optionally substituted with halo; or is $-(R^7)-\phi$ in which

R^7 is C_1–C_4 alkylene substituted with eith cyano or with one, two or three halogen atoms; and ϕ is phenyl substituted with halo when R_7 is substituted with cyano but is phenylthio substituted with halo when R_7 is substituted with one, two or three halogen atoms;

X is oxygen or sulfur; with the provisos that:

when R^6 is C_5–C_7 cycloalkyl, substituted or unsubstituted phenyl, or substituted or unsubstituted benzyl, then X must be oxygen;

when R^4 is allyl, Y is oxygen, and R^6 is para-nitrophenyl, then R^5 is other than methyl; and

when R^4 is methyl and R^6 is phenyl, then R^5 is other than C_1–C_4 alkylthio or ethoxy;

in an amount sufficient to extend the soil life of said thiolcarbamate; and

(c) a non-phytotoxic antidotally effective amount of an amide of a haloalkanoic acid.

5,011,527

HERBICIDAL HETEROCYCLIC SULFONAMIDES

Barry A. Wexler, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Division of Ser. No. 29,434, Mar. 30, 1987, Pat. No. 4,906,278, which is a continuation-in-part of Ser. No. 874,307, Jun. 13, 1986, abandoned. This application Oct. 27, 1989, Ser. No. 427,678

J-9 J-10

-continued

J-11

R is H, C_1–C_3 alkyl, phenyl, $SO_2NR_aR_b$, C_1–C_2 haloalkyl, C_2–C_4 alkoxyalkyl, C_2–C_3 cyanoalkyl, C_2–C_4 alkylthioalkyl, C_2–C_4 alkylsulfinylalkyl, C_2–C_4 alkylsulfinylalkyl, CO_2C_1–C_2 alkyl, C_1–C_4 alkylcarbonyl, C_1–C_2 alkylsulfonyl, C_3–C_4 alkenyl, C_3–C_4 alkynyl or C_1–C_2 alkyl substituted with CO_2C_1–C_2 alkyl;

R_1 is H or CH_3;

R_2 is H, C_1–C_3 alkyl, C_1–C_3 haloalkyl, halogen, nitro, C_1–C_3 alkoxy, $SO_2NR_cR_d$, C_1–C_3 alkythio, C_1–C_3 alkysulfinyl, C_1–C_3 alkylsulfonyl, CN, CO_2R_e, C_1–C_3 haloalkoxy, C_1–C_3 haloalkylthio, amino, C_1–C_2 alkylamino, di(CO_1C-$_3$alkyl) amino or C_1–C_2 alkyl substituted with C_1–C_2 alkoxy, C_1–C_2 haloalkoxy, C_1–C_2 alkylthio, C_1–C_2 haloalkylthio, CN, OH or SH;

R_a and R_b are independently C_1–C_2 alkyl;

R_c is H, C_1–C_4 alkyl, C_2–C_3 cyanoalkyl, methoxy or ethoxy;

R_d is H, C_1–C_4 alkyl or C_3–C_4 alkenyl; or

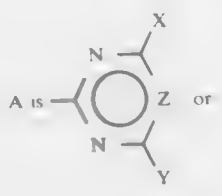
R_c and R_d may be taken together as $-(CH_2)_3-$, $-(CH_2$-$)_4-$, $-(CH_2)_5-$ or $-CH_2CH_2OCH_2CH_2-$;

R_e is C_1–C_4 alkyl, C_3–C_4 alkenyl, C_3–C_4 alkynyl, C_2–C_4 haloalkyl, C_1–C_2 cyanoalkyl, C_5–C_6 cycloalkyl, C_4–C_7 cycloalkylalkyl or C_2–C_4 alkoxyalkyl;

R′ is C_1–C_5 alkyl, C_1–C_5 haloalkyl, C_1–C_5 alkyl substituted with one or two R_3 groups, C_2–C_5 alkenyl, C_2–C_5 haloalkenyl, C_3–C_5 alkenyl substituted with one or two R_3 groups, C_3–C_5 alkenyl, C_3–C_5 haloalkynyl, C_3–C_5 alkynyl substituted with one or two R_3 groups, C_3–C_5 cycloalkyl, C_3–C_5 halocycloalkyl, C_3–C_5 cycloalkyl substituted with one or two R_4 groups, C_4–C_7 cycloalkylalkyl, C_4–C_7 halocycloalkylalkyl, C_4–C_7 cycloalkylalkyl substituted with one or two R_4 groups, phenyl or benzyl;

R_3 is C_1–C_3 alkoxy, C_1–C_3 alkylthio, C_1–C_3 haloalkoxy, C_1–C_3 alkylsulfinyl, C_1–C_3 alkylsulfonyl, CN, NO_2, OH, OR_5 or di-(C_1–C_3 alkyl)amino;

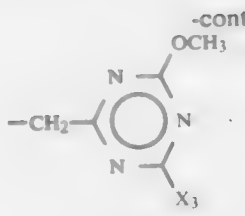
R_4 is C_1–C_3 alkyl, C_1–C_3 alkoxy, C_1–C_3 haloalkoxy, CN, NO_2, OH, OR_5 or di-(C_1–C_3 alkyl)amino;



R_5 is SO_2CH_3, $Si(CH_3)_3$, C_2–C_3 alkylcarbonyl or CO_2C-$_1$–C_2 alkyl;

E is a single bond or CH_2;

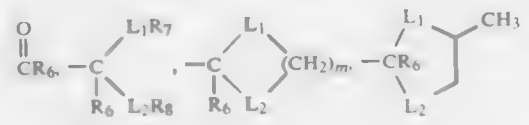
W is O or S;



n is 0 or 1;

n′ is 0 or 1;

A-1



-continued

A-6

X is H, C_1–C_4 alkyl, C_1–C_4 alkoxy, C_2–C_4 haloalkoxy, C_1–C_4 haloalkyl, C_1–C_4 haloalkylthio, C_1–C_4 alkylthio, C_2–C_5 alkoxyalkyl, C_2–C_5 alkoxyalkoxy, amino, C_1–C_3 alkylamino, di(C_1–C_3 alkyl)amino or C_3–C_5 cycloalkyl;

Y is H, C_1–C_4 alkyl, C_1–C_4 alkoxy, C_2–C_4 haloalkoxy, C_1–C_4 haloalkylthio, C_1–C_4 alkylthio, C_2–C_5 alkoxyalkyl, C_2–C_5 alkoxyalkoxy, amino, C_1–C_3 alkylamino, di(C_1–C_3 alkyl)amino, C_3–C_4 alkenyloxy, C_3–C_4 alkynyloxy, C_2–C_5 alkylthioalkyl, C_1–C_4 haloalkyl, C_2–C_4 alkynyl, azido, cyano, C_2–C_5 alkylsulfinylalkyl, C_2–C_5 alkylsulfonylalkyl,

or $N(OCH_3)CH_3$;

m is 2 or 3;

L_1 and L_2 are independently O or S;

R_6 is H or C_1–C_3 alkyl;

R_7 and R_8 are independently C_1–C_3 alkyl;

Z is N; and

X_3 is CH_3 or OCH_3;

and their agriculturally suitable salts;

provided that

(a) when W is S, then R_1 is H, A is A-1 and Y is CH_3, OCH_3, OC_2H_5, CH_2OCH_3, C_2H_5, CF_3, SCH_3, $OCH_2CH{=}CH_2$, $OCH_2C{\equiv}CH$, $OCH_2CH_2OCH_3$, $CH(OCH_3)_2$ or 1,3-dioxolan-2-yl;

(b) when the total number of carbons of X and Y is greater than four, then the number of carbons of R must be less than or equal to two;

(c) when J is J-1, J-2, J-3, or J-4 then R′ is other than C_3–C_5 cycloalkyl or phenyl;

(d) when J is J-5, J-6, or J-7 wherein E is a single bond, then R′ is other than C_1–C_5 alkyl, C_3–C_5 alkenyl, phenyl, benzyl, cyclopentyl or C_4–C_7 cycloalkylalkyl;

(e) when the total number of carbon atoms of X and Y is greater than four, then the total number of carbon atoms of R_2 and R′ must be less than or equal to 7; and

(f) when J is J-5, J-6 or J-7 and E is CH_2, then R′ is other than C_1–C_5 alkyl.

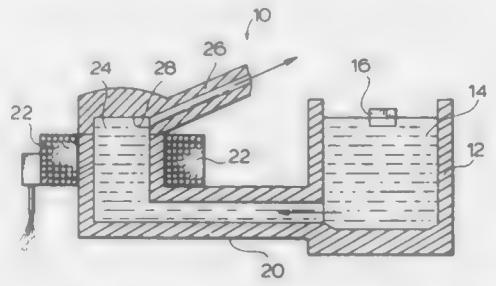
13. An agriculturally suitable composition for controlling the growth of undesired vegetation comprising an effective amount of the compound of claim 1 and at least one of the following surfactant, solid or liquid diluent.

5,011,528

PUMPING LIQUID METALS

Joseph A. Mulcahy, Brooklin, Canada, assignor to J. Mulcahy Enterprises Inc., Whitby, Canada

Filed Jun. 8, 1990, Ser. No. 535,164



Int. Cl.[5] C22B *4/00*

U.S. Cl. 75—10.16 **6 Claims**

1. A method of elevating an electromagnetic liquid metal from enclosed zone to a location above said enclosed zone, which comprises:

feeding said electromagnetic liquid metal to said enclosed zone to fill and maintain said enclosed zone substantially filled with said electromagnetic liquid metal,

forming a magnetic field rotating around said enclosed zone of sufficient intensity to cause said liquid to rotate about an axis of rotation,

providing an upwardly-inclined enclosed path extending from said enclosed zone offset from said axis of rotation to said location, and

effecting said rotation of said liquid metal so as to generate sufficient velocity to deliver said liquid metal from said enclosed zone to said location along said enclosed path.

5,011,529

CURED SURFACES AND A PROCESS OF CURING

Kathryn E. Hogue, Corning; Srinivas H. Swaroop, and Raja R. Wusirika, both of Painted Post, all of N.Y., assignors to Corning Incorporated, Corning, N.Y.

Filed Mar. 14, 1989, Ser. No. 323,291

Int. Cl.[5] C22C *29/12*

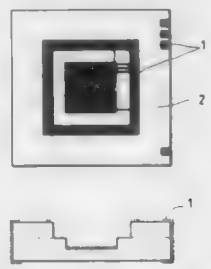
U.S. Cl. 75—235 **15 Claims**

1. A cured porous sintered metal-metal oxide structure comprising sintered aluminum and additional metal powders, wherein said structure has an open porosity of 20–60% and contains a durable uniform cured aluminum oxide layer integral on and throughout said structure.

5,011,530

METALLIZING COMPOSITION FOR USE WITH CERAMICS

Kazuo Kondo, and Asao Morikawa, both of Aichi, Japan, assignors to NGK Spark Plug Co. Ltd., Japan



Filed Dec. 23, 1988, Ser. No. 289,339

Claims priority, application Japan, Dec. 24, 1987, 62-325290

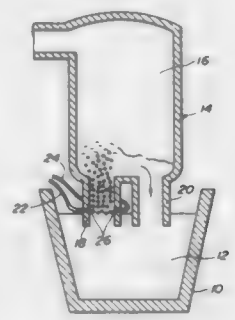
Int. Cl.[5] B05B *7/00;* **H01B** *1/02, 1/06*

U.S. Cl. 106—1.13 **2 Claims**

1. A metallizing composition for use in ceramics which comprises 100 parts by weight of a CuO-Cu combination consisting of 30–70 wt % CuO and 70–30 wt % Cu, at least one inorganic component selected from among no more than 10 parts by weight of MnO_2 based on 100 parts by weight of the CuO-Cu combination, no more than 7 parts by weight of Pt based on 100 parts by weight of the CuO-Cu combination and no more than 5 parts by weight of Au based on 100 parts by weight of the CuO-Cu combination, an organic binder and a solvent, wherein the Cu particles have a size in the range of 0.5 –20 μm and consist of at least two classes of particles having different average sizes, selected from a group having an average size of 0.8 μm, a group having an average size of 3.2 μm, and a group having an average size of 15 μm.

5,011,531

METHOD AND APPARATUS FOR DEGASSING MOLTEN METAL UTILIZING RH METHOD



Kiyoshi Takahashi; Nobuyoshi Takashiba; Shinji Kojima; Haruji Okuda; Shigeru Ohmiya, and Ryuichi Ikeda, all of Okayama, Japan, assignors to Kawasaki Steel Corporation, Hyogo, Japan

Continuation of Ser. No. 212,608, Jun. 28, 1988, abandoned. This application Dec. 27, 1989, Ser. No. 456,236

Claims priority, application Japan, Jun. 29, 1987, 62-159699

Int. Cl.[5] C21C *7/00*

U.S. Cl. 75—511 **8 Claims**

1. A method for degassing molten metal comprising the steps of:

establishing a path for circulating molten metal through a degassing chamber maintained under vacuum;

providing a high pressure has discharge pathway to said circulating path upstream of said degassing chamber for discharging high pressure gas into said molten metal;

providing a low pressure gas discharge pathway to said circulating path upstream of said degassing chamber for discharging said low pressure gas into said molten metal;

supplying a high pressure gas to said high pressure gas discharge pathway, the pressure of said high pressure gas adjusted to reach the center portion of said path;

supplying a low pressure gas to said low pressure gas discharge pathway, the pressure of said low pressure gas adjusted to reach the peripheral portion of said path,

forming a substantially uniform distribution of gases across said path with said high pressure gas in said center portion of said path and said low pressure gas in said peripheral portion of said path.

5,011,532
DISPERSED SYSTEMS AND METHOD OF MANUFACTURE

Richard C. Fuisz, Washington, D.C., assignor to Fuisz Pharmaceutical Ltd., Washington, D.C.

Continuation-in-part of Ser. No. 169,838, Mar. 18, 1988, Pat. No. 4,855,326, which is a continuation-in-part of Ser. No. 44,371, Apr. 20, 1987, abandoned. This application Dec. 13, 1988, Ser. No. 283,742

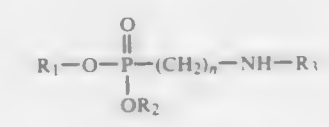
Int. Cl.[5] C09D *105/00*

U.S. Cl. 106—215 **12 Claims**

1. A mass of spun fibers consisting essentially of one or more sugars where the sugars are capable of being spun into fibers that are readily water-soluble, and an olegginous substance that in its separate state is hydrophobic, said olegginous substance being distributed on or incorporated in the fibers of said mass such that said mass of fibers when added to water disperses therein to form a colloidal or pseudo-colloidal dispersion.

5,011,533
METALLIC PIGMENT COMPOSITION

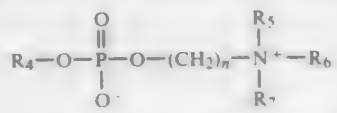
Teruaki Kuwajima, Higashiosaka; Satoshi Nagahata, Suita, and Akihiro Kanakura, Hirakata, all of Japan, assignors to Nippon Paint Co., Ltd., Osaka, Japan



Filed Jun. 26, 1989, Ser. No. 380,594

Claims priority, application Japan, Jun. 24, 1988, 63-157651

Int. Cl.[5] C09C *1/62*



U.S. Cl. 106—404 **6 Claims**

1. A metallic pigment composition comprising a metallic pigment and a phosphorus compound selected from the group consisting of a phosphite represented by the following formula (I);

(I)

wherein R_1, R_2 and R_3, which are the same or different, represent a hydrogen atom, an alkyl group having 1 to 24 carbon atoms, a halogen-substituted alkyl group having 1 to 24 carbon atoms, an aryl group, a cycloalkyl group, an alkenyl group or an alkanol group, and n is an integer of 2 to 4, and a phosphobetain represented by the following formula (II):

(II)

wherein R_4, R_5, R_6 and R_7, which are the same or different, represent a hydrogen atom, an alkyl group having 1 to 24 carbon atoms, a halogen-substituted alkyl group having 1 to 24 carbon atoms, an aryl group, a cycloalkyl group, an alkenyl group or an alkanol group, n is the same as mentioned above.

5,011,534
CALCINED KAOLIN CLAY FILLER PIGMENT FOR ENHANCING OPACITY AND PRINTING PROPERTIES OF NEWSPRINT AND MECHANICAL PAPERS

Richard R. Berube, Holmdel, N.J.; John S. Babiec, Jr., Berwyn, Pa.; M. Phillip Jameson, Sommerville; Andrew R. Negele, Edison, both of N.J., and Mitchell J. Willis, Macon, Ga., assignors to Engelhard Corporation, Iselin, N.J.

Filed Feb. 14, 1990, Ser. No. 479,793

Int. Cl.[5] C04B *14/10*

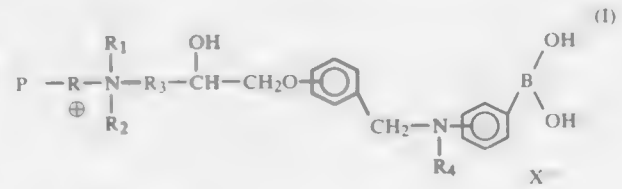
U.S. Cl. 106—416 **3 Claims**

1. A method for making a low abrasion kaolin clay pigment suitable for filling paper produced from mechanical pulp which comprises selecting a kaolin crude composed of kaolin particles having a low crystallinity index, a G.E. brightness below 82%; a particle size distribution such that at least 75% by weight is finer than 2 microns; said kaolin containing at least 1.2%, by weight Fe_2O_3 and at least 2% by weight TiO_2, forming said selected crude clay into a dispersed aqueous pulp containing at least about 55% clay solids, centrifuging said pulp to remove grit, and, without subjecting the resulting degritted slip to bleaching or further particle size fractionation, spray drying said slip to produce pulverulent microspheres, pulverizing the microspheres, calcining the pulverized microspheres until the kaolin undergoes at least partially the characteristic kaolin exotherm, and repulverizing the resulting calcined clay having a G.E. brightness from 70 to 84%.

5,011,535
STABLE BORON RESINS OF HIGH SELECTIVE ABSORBENT POWER

Renato Carobbi, Pistoia, and Franco Innocenti, Bagno A Ripoli, both of Italy, assignors to Inalco S.p.A., Milan, Italy

Continuation-in-part of Ser. No. 171,447, Mar. 21, 1988, Pat. No. 4,937,294. This application May 24, 1990, Ser. No. 527,837



Claims priority, application Italy, Apr. 3, 1987, 19965 A/87

Int. Cl.[5] C13J *1/06*

U.S. Cl. 127—46.1 **7 Claims**

1. A method for purifying an aqueous lactulose syrup containing other carbohydrates, said method comprising the steps of:

(a) activating a boron resin of general formula (I)

(I)

in which:

P is a polyacrylic matrix,

R is $-(CH_2)_n-$ where n lies between 0 and 5,

R_1 and R_2, which can be the same or different, are C_1-C_5 alkyl,

R_3 is $-(C_nH_{2n})$ where n varies from 1 to 5,

R_4 is H or C_1-C_5 alkyl,

X^- is an anion chosen from halogens and hydroxyl; by salifying the resin with HCl 1N, then by treating with deionized water up to a pH value of the eluate higher than 5, then with NaOH 0.2N and finally with deionized water up to a pH value of the eluate lower than 9;

(b) contacting an aqueous lactulose syrup containing from 15% to 30% by wt. of lactulose and from 5% to 30% by wt. of other carbohydrates with said activated boron resin; and

(c) eluting the carbohydrates absorbed on the boron resin with water and then with HCl from 0.5N to 1N, separately collecting the eluates.

5,011,536
HANDLE FOR BABY WIPE CONTAINER

Mark V. Boom, 22627 Carolina, St. Clair Shores, Mich. 48080

Filed Aug. 24, 1990, Ser. No. 572,930

Int. Cl.[5] B08B *7/00*

U.S. Cl. 134—6 **8 Claims**

1. A method of utilizing a wipe to clean an infant comprising the steps of:

placing a handle on a wipe container;

placing the wipe container on one hand of a user such that the container is on an outer side of the one hand;

using the one hand to secure the infant's legs; and

using the user's other hand to remove wipes from the container and manipulate them to clean the infant.

5,011,537
PRESSURE GAUGE CLEANING METHOD

Gerald G. Voegele, St. Bonifacius, and William H. Penny, St. Anthony, both of Minn., assignors to SciMed Life Systems, Inc., Maple Grove, Minn.

Filed Nov. 3, 1988, Ser. No. 266,528

Int. Cl.[5] B08B *9/04*

U.S. Cl. 134—22.11 **10 Claims**

1. A method for cleaning the interior surface of a pressure gauge, the gauge having a stem, a bore in the stem, and a pressure sensitive Bourdon Tube, closed at a distal end and connected at a proximal end at an angle to the bore at a port, the method comprising:

inserting a guide tool in the bore of the stem;

aligning the guide tool with the port;

inserting a flexible tubing through the guide tool and into the Bourdon tubing and

dispensing a fluid from the distal end of the flexible tube to flush the interior surfaces of the Bourdon Tube and the bore of the stem.

5,011,538
VISCOELASTIC CLEANING COMPOSITIONS AND METHODS OF USE THEREFOR

William L. Smith, Pleasanton, Calif., assignor to The Clorox Company, Oakland, Calif.

Division of Ser. No. 121,549, Nov. 17, 1987. This application Sep. 6, 1989, Ser. No. 403,553

Int. Cl.[5] B08B *9/02*

U.S. Cl. 134—22.13 **5 Claims**

1. A method for cleaning restrictions caused by organic materials in drain pipes comprising

(a) introducing to a drain pipe having an organic restriction therein a drain opening composition comprising a drain opening active and a viscoelastic thickening system wherein the composition has a relative elasticity of greater than about 0.03 sec/Pa a delivery percentage-of above about 75%, as determined by pouring a first quantity of composition through a second quantity of standing water and measuring an amount of undiluted product delivered, and a flow rate of less than about 150 mL/minute through a US 230 mesh screen;

(b) allowing the composition to remain in contact with the organic restriction material to react therewith; and

(c) rinsing the composition and restriction away.

5,011,539
DESCALING OF JACKET OF GLASS-LINED INSTRUMENTS

Teruo Matsuda, Chiba; Masayoshi Miki, and Hiromu Ochi, both of Ehime, all of Japan, assignors to Sumitomo Chemical Company, Limited, Osaka, Japan

Filed Apr. 14, 1989, Ser. No. 338,000

Claims priority, application Japan, Dec. 2, 1988, 62-306664; Feb. 2, 1989, 1-25292

Int. Cl.[5] C23F *1/44, 1/00*

U.S. Cl. 134—22.14 **11 Claims**

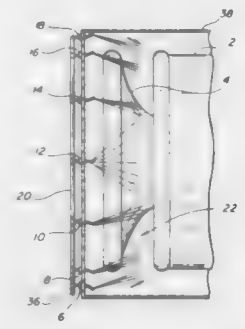
1. A method for descaling the inside of a jacket of a glass-lined instrument by circulating an aqueous hydrochloric acid solution containing at least one acid inhibitor selected from the group consisting of laurylamine, lauryldimethylamine and propargyl alcohol, which comprises the steps of:

(a) measuring a rate of hydrogen permeation through the jacket material or a test piece fitted to the circulation line of the aqueous hydrochloric acid solution;

(b) inserting the measured value into a previously established relationship between thickness of a steel plate and a rate of hydrogen permeation;

(c) estimating the rate of hydrogen permeated through the matrix of the instrument to the lining glass side from the relationship; and

(d) controlling the concentrations of the hydrochloric acid and the acid inhibitor, the descaling temperature or the descaling time so that the amount of hydrogen permeated through the matrix may not exceed 30 ml per m^2 of the matrix during the descaling.



5,011,540
METHOD AND APPARATUS FOR CLEANING A GAS TURBINE ENGINE

Peter McDermott, 79 Thurleigh Road, London SW12, England

Filed Dec. 24, 1986, Ser. No. 946,360

Int. Cl.[5] B08B *3/02*

U.S. Cl. 134—23 **4 Claims**

1. A method of cleaning a compressor of a gas turbine engine comprising the steps of:

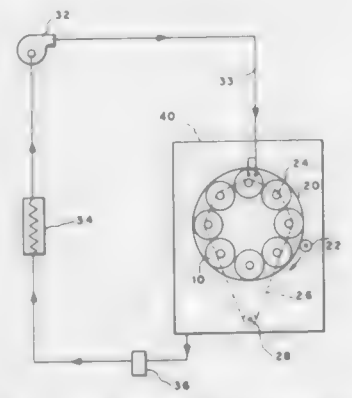
operating the engine at or near full engine speed and load;

injecting cleaning solution into the air intake area of the engine at a position of said air intake where the intake air velocity is relatively low; and

performing said injection at an entrance angle such that resultant air/cleaning solution mixture is injected in a pattern at an angle of approximately 60°.

5,011,541
CLEANING OF FOULED SPINNERET PARTS

Danny R. Leech, Waynesboro, Va., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.



Filed May 30, 1989, Ser. No. 357,847

Int. Cl.[5] B08B *3/00*

U.S. Cl. 134—34 **4 Claims**

1. A process for cleaning parts of fouled spinneret assemblies, wherein polymeric residues and inorganic particles deposited during the spinning of synthetic organic fibers are

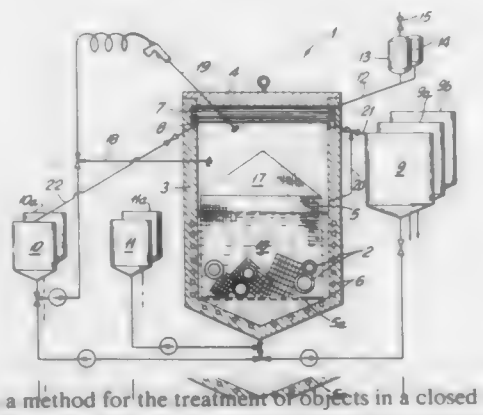
removed from the part, the process comprising, impacting a part of the fouled assembly with a substantially columnar jet of water for a time sufficient to remove the polymeric and inorganic residues from the part, the jet exiting from a nozzle being

located at a distance in the range of 0.5 to 10 centimeters from the surface of the piece being cleaned, the nozzle having an exit orifice diameter in the range of 0.01 to 0.1 centimeter and the water being supplied at a pressure just upstream of the exit orifice in the range of 17,000 to 69,000 kiloPascals.

5,011,542

METHOD AND APPARATUS FOR TREATING OBJECTS IN A CLOSED VESSEL WITH A SOLVENT

Peter Weil, Helene-Mayer-Ring 10, D-8000 Munich, Fed. Rep. of Germany



PCT No. PCT/EP88/00671, § 371 Date Mar. 9, 1989, § 102(e) Date Mar. 9, 1989, PCT Pub. No. WO89/01057, PCT Pub. Date Feb. 9, 1989

PCT Filed Jul. 21, 1988, Ser. No. 332,274

Claims priority, application Fed. Rep. of Germany, Aug. 1, 1987, 3725565

Int. Cl.[5] B08B *3/02, 3/08, 3/10*

U.S. Cl. 134—38 **7 Claims**

1. In a method for the treatment of objects in a closed vessel with solvents for stripping enamel and removing coatings from the objects, in which the objects to be treated are treated for at least part of the time by immersion in solvents and subsequently washed by spraying in a solvent-free region of the vessel, the improvement which comprises that said method includes at least the following additional steps:

a) as solvents after closure of the treating vessels, a treating agent mixture with at least a preponderance of a solvent such as methylene chloride, and an amount of water in excess of that required to form an azeotropic mixture is used;

b) the treating agent mixture is heated to the boiling point of the mixture;

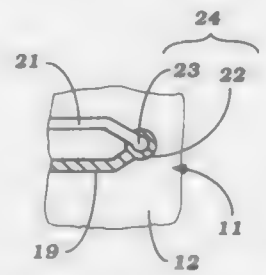
c) at the end of the treatment time, the settling and, if necessary, condensing solvent is removed from the treating vessel;

d) water is heated in the treating vessel and evaporated, whereby the water acts as a heat carrier;

e) the solvent on or in the coating or enamel residues and the objects to be treated is distilled off azeotropically from the system with water and removed before the vessel is opened.

5,011,543

THERMOCOUPLE TYPE TEMPERATURE SENSOR



Hidetoshi Yokoi, Tokyo, Japan, assignor to Yamaha Hatsudoki Kabushiki Kaisha, Iwata, Japan

Filed May 19, 1988, Ser. No. 195,941

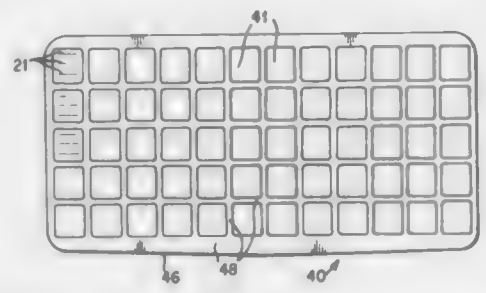
Claims priority, application Japan, May 22, 1987, 62-123662

Int. Cl.[5] H01L *35/28*

U.S. Cl. 136—211 **6 Claims**

1. A thermocouple comprised of a base, a first metal strip having an elongated portion extending from one end of said base and deposited on said base, a second metal strip having an elongated portion extending from said one end of said base and deposited on said base in spaced relationship to said first strip along at least a major portion of its length, the metals of said strips having different theoelectric characteristics, portions of said strips spaced from said one end of said base being in contacting relationship to form a thermocouple that generates an electrical potential across the unconnected ends of said strips at said one end of said base depending on the temperature at said contacting portions.

5,011,544



SOLAR PANEL WITH INTERCONNECTS AND MASKING STRUCTURE, AND METHOD

Edward M. Gaddy, Potomac, and Ramon Dominguez, Rockville, both of Md., assignors to Solarex Corporation, Rockville, Md.

Filed Sep. 8, 1989, Ser. No. 404,999

Int. Cl.[5] H01L *31/05, 31/052*

U.S. Cl. 136—246 **26 Claims**

1. A solar panel comprising:

a plurality of solar cells having radiation absorbing surfaces and opposed back surfaces;

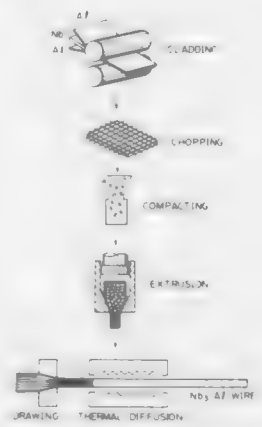
conducting means for interconnecting the solar cells;

a transparent superstrate upon one surface of which the radiation absorbing surfaces are mounted; and

means upon a surface of said transparent superstrate for masking said interconnecting means and for masking the peripheral edge portions of said radiation absorbing surfaces of said solar cells so as to present a uniform visual appearance to the panel.

5,011,545

METHOD OF MANUFACTURING HARD-TO-WORK ALLOY ARTICLES SUCH AS OF INTERMETALLICS AND SUPERCONDUCTING COMPOUNDS



Senri Ikeda, 7-54 Miyamachi 3-chome; Sakae Saito, 5-5-304 Tsurugaya 2-chome, both of Sendai-shi, Miyagi-ken; Shuji Hanada, Sendai, and Hironobu Hoshi, Tokyo, all of Japan, assignors to Nippon Stainless Steel Co., Ltd., Tokyo; Senri Ikeda and Sakae Saito, both of Sendai, all of, Japan

Filed Sep. 18, 1989, Ser. No. 408,364

Claims priority, application Japan, Sep. 19, 1988, 63-234256

Int. Cl.[5] H01L *39/24;* **C22B** *7/00*

U.S. Cl. 148—11.5 F **10 Claims**

1. A method for manufacturing a hard-to-work alloy article comprising the steps of:

preparing a laminate member comprising a plurality of layers of different metals in a stoichiometric ratio for the intended alloy composition;

dividing the laminate member into pieces;

combining the pieces in a random arrangment to a body for plastic deformation;

subjecting the body to plastic deformation under pressure to form an article having a given shape and dimensions; and

applying a thermal diffusion treatment to the article.

5,011,546

WATER SOLUBLE SOLDER FLUX AND PASTE

Janice D. Frazier; Robert L. Jackson, both of San Jose, Calif., and Richard A. Reich, Georgetown, Tex., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Apr. 12, 1990, Ser. No. 508,740

Int. Cl.[5] B23K *35/34*

U.S. Cl. 148—23 **17 Claims**

1. An improved essentially non-corrosive, low toxicity, water-soluble, solder paste characterized by high tack and long tack life, consisting essentially of about 80% to 96% by weight of a solder metal powder; and about 4 to 20% by weight of a non-corrosive, water soluble flux, said water-soluble flux comprising a mixture of two non-corrosive, water-soluble components, one component being about 3 to 15% by weight of an organic moiety with a polar group selected from a group consisting of carboxylic acids, sulfonic acids, phosphoric acids, sulfate monoesters and phosphate esters or mixtures thereof, the other component being about 1 to 5% by weight of a non-halogenated amine.

5,011,547

ALUMINUM ALLOY COMPOSITE MATERIAL FOR BRAZING

Hideo Fujimoto, Ninomiya; Masakazu Hirano, Utsunomiya; Mituo Hashiura, and Toshiaki Murao, both of Kariya, all of Japan, assignors to Kabushiki Kaisha Kobe Seiko Sho, Kobe and Nippondenso Company, Ltd., Kariya, both of, Japan

Filed Sep. 11, 1989, Ser. No. 405,292

Claims priority, application Japan, Sep. 12, 1988, 63-229679; Aug. 11, 1989, 1-208716

Int. Cl.[5] B23K *35/34*

U.S. Cl. 148—24 **12 Claims**

1. An aluminum alloy composite material for brazing, comprising:

a core member having two surfaces made of aluminum alloy, the content of Mg being restricted to 0.2% or less by weight as an impurity;

an Al-Si member clad on one surface of said core member; and

a supplying member made of aluminum alloy consisting essentially of 0.3% to 2.5% by weight of Mg and clad on the opposite surface of said core member.

COMPOSITION FOR DEBORONIZING GRAIN-ORIENTED SILICON STEEL

Douglas C. Dean, Pittsburgh, Pa., assignor to Allegheny Ludlum Corporation, Pittsburgh, Pa.

Division of Ser. No. 57,559, Jun. 3, 1987, Pat. No. 4,798,873. This application Jul. 28, 1988, Ser. No. 225,689

Int. Cl.[5] C21D *1/70*

U.S. Cl. 148—27 **5 Claims**

1. A composition of matter for use in deboronizing grain-oriented silicon steel having boron therein, said composition being in the form selected from the group consisting of dry powder and aqueous slurry made therefrom, said composition consisting essentially of boron, on a dry-solids basis, 5 to 20% by weight of an agent selected from the group consisting of molybdenum compounds and tungsten compounds and the remainder magnesium oxide, wherein the composition contains, per one part by weight boron, at least 2 parts by weight of molybdenum or at least 4 parts by weight of tungsten.

HOMOEPITAXIAL GROWTH OF ALPHA-SIC THIN FILMS AND SEMICONDUCTOR DEVICES FABRICATED THEREON

Hua-Shuang Kong, Raleigh; Jeffrey T. Glass, Apex, and Robert F. Davis, Raleigh, all of N.C., assignors to North Carolina State University, Raleigh, N.C.

Division of Ser. No. 113,573, Oct. 26, 1987, Pat. No. 4,912,064. This application Oct. 16, 1989, Ser. No. 422,032

Int. Cl.[5] H01L *21/20, 21/203*

U.S. Cl. 148—33.1 **9 Claims**

1. A silicon carbide semiconductor product useful in the

fabrication of semiconductor devices which will operate at high powers, high frequencies, high radiation densities, and temperatures over 500° C., said product comprising:

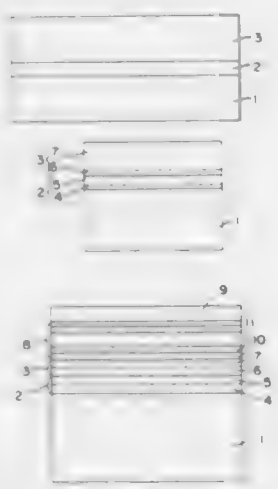
a 6H SiC substrate having a flat interface surface that is

inclined more than one degree off axis with respect to a basal plane thereof substantially towards one of the <1120> directions; and

a 6H SiC thin film homoepitaxially deposited on said substrate interface surface.

5,011,550

LAMINATED STRUCTURE OF COMPOUND SEMICONDUCTORS



Fumihiro Konushi; Akinori Seki; Jun Kudo, and Masayoshi Koba, all of Nara, Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Filed May 12, 1988, Ser. No. 193,400

Claims priority, application Japan, May 13, 1987, 62-117575; Jul. 6, 1987, 62-169162; Dec. 3, 1987, 62-306185

Int. Cl.[5] H01L *21/20*

U.S. Cl. 148—33.5 **6 Claims**

1. A laminated structure of compound semiconductors comprising a IV semiconductor underlying substrate, a first III-V compound semiconductor layer that is formed as an intermediate layer on said IV compound semiconductor underlying substrate, and a second III-V compound semiconductor layer that is formed on said intermediate layer, wherein the thermal expansion coefficients of said IV compound semiconductor underlying substrate, E_b, said first III-V compound semiconductor layer, E_{l1}, and said second III-V compound semiconductor layer, E_{l2}, have the following relationship: $E_{l1} > E_{l2} > E_b$.

5,011,551

PROTECTIVE COATING FOR STEEL SURFACES AND METHOD OF APPLICATION

Dario A. Emeric, Alexandria; Christopher E. Miller, Burke, and Bryan Westich, Woodbridge, all of Va., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Division of Ser. No. 288,357, Dec. 22, 1988. This application Sep. 1, 1989, Ser. No. 401,6[illegible]

Int. Cl.[5] C23C *22/13*

U.S. Cl. 148—248 **5 Claims**

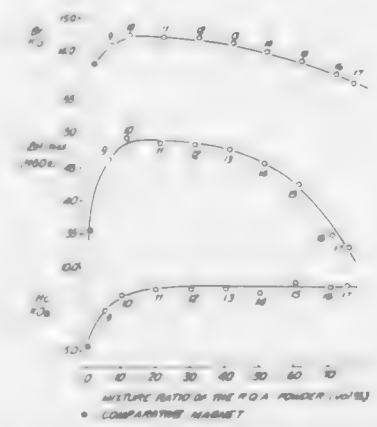
1. A composition for converting corroded steel surfaces to a substrate suitable for accepting organic coatings comprising the following ingredients, with their respective volume or weight percentage ranges:

an aliphatic alcohol, 2–20% v/v
phosphoric acid, 5–15% v/v
an alkali nitrate, 0.3–3% w/v
tannic acid, 0.1–2% w/v
zinc nitrate, 0.3–3% w/v
surface active agent, 0.1–1% w/v and
water, softened balance

wherein % v/v denotes volume percent, e.g. ml per 100 ml of solution, and % w/v denotes weight percent, e.g. grams per 100 ml of solution.

5,011,552

METHOD FOR PRODUCING A RARE EARTH METAL-IRON-BORON PERMANENT MAGNET BY USE OF A RAPIDLY-QUENCHED ALLOY POWDER



Tsutomu Otsuka, and Etsuo Otsuki, both of Miyagi, Japan, assignors to Tokin Corporation, Sendai, Japan

Continuation of Ser. No. 97,656, Sep. 18, 1987, abandoned. This application Nov. 17, 1989, Ser. No. 438,724

Claims priority, application Japan, Sep. 16, 1986, 61-217629; Jan. 30, 1987, 62-18709; Apr. 9, 1987, 62-85676; Apr. 11, 1987, 62-87917; May 18, 1987, 62-12[illegible]26

Int. Cl.[5] H01F *1/053*

U.S. Cl. 148—302 **12 Claims**

1. An iron-rare earth metal-boron permanent magnetic body with a high coercive force produced by liquid phase sintering, said magnetic body being characterized by a solid solution phase ranging up to about 70% by volume of said body, said solid solution phase being formed of at least one metal element (R) selected from the group consisting of yttrium and rare earth metals and at least one of boron (B) and a transition metal (T), with magnetic crystalline particles making up substantially the balance uniformly dispersed in said solid solution phase, each of said magnetic crystalline particles being a magnetic intermetallic compound represented by the chemical formula $R_2T_{14}B$, where R is at least one element selected from the group consisting of yttrium (Y) and rare earth metals, T being a transition metal but comprising Fe 50–100 wt. % of the transition metal present, said magnetic body being further

characterized in that the oxygen content does not exceed 2,000 ppm and that the body exhibits a maximum energy product of at least about 40 MGOe.

5,011,553

IRON-RICH METALLIC GLASSES HAVING HIGH SATURATION INDUCTION AND SUPERIOR SOFT FERROMAGNETIC PROPERTIES

V. R. V. Ramanan, Dover, N.J., assignor to Allied-Signal, Inc., Morris Township, N.J.

Filed Jul. 14, 1989, Ser. No. 379,762

Int. Cl.[5] H01L *41/06*

U.S. Cl. 148—403 **9 Claims**

1. A magnetic metallic glass alloy that is at least about 80% glassy and characterized by the presence, in combination of high saturation induction and high Curie temperature, having a composition described by the formula $Fe_aCo_bNi_cB_dSi_eC_f$, where "a" - "f" are in atom percent, "a" ranges from about 75 to about 81, "b" ranges from 0 to about 6, "c" ranges from about 2 to about 6, "d" ranges from about 11 to about 16, "e" ranges from 0 to about 4, and "f" ranges from 0 to about 4, with the provisos that (i) the sum of "b" and "c" may not be greater than about 8, (ii) "d" may not be greater than about 14 when "b" is zero, (iii) "e" may be zero only when "b" is greater than zero, and (iv) "f" is zero when "e" is zero.

5,011,554

RUTHENIUM ALUMINUM INTERMETALLIC COMPOUNDS

Robert L. Fleischer, Schenectady, N.Y., assignor to General Electric Company, Schenectady, N.Y.

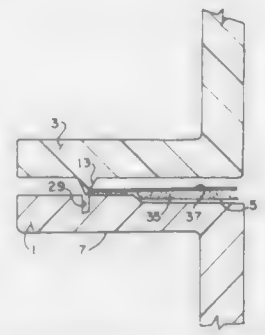
Filed Dec. 26, 1989, Ser. No. 457,009

Int. Cl.[5] C22C *21/00*

U.S. Cl. 148—430 **18 Claims**

1. An intermetallic compound of ruthenium and aluminum comprising: about 40 to 51 atomic percent aluminum and the balance substantially ruthenium, the intermetallic compound having a high hardness up to about 1150° C., and good room temperature toughness.

5,011,555



METHOD OF ULTRASONICALLY CUTTING AND SEALING THERMOPLASTIC WORKPIECES PARTICULARLY A FILTER

Thomas B. Sager, Newtown, Conn., assignor to Branson Ultrasonics Corporation, Danbury, Conn.

Filed Sep. 15, 1989, Ser. No. 407,638

Int. Cl.[5] B29C *65/08*

U.S. Cl. 156—73.1 **12 Claims**

1. A two step method for ultrasonically welding two pieces of thermoplastic material together with a membrane between said pieces, each piece having a peripheral rim; a first said piece having a continuous annular bead on the inside of the rim of said first piece; a second of said pieces having a continuous annular energy director on the inside of the rim of said second piece; said method comprising

a. placing said membrane over the inside of said first piece such that said membrane covers said bead, ultrasonically cutting said membrane and creating a groove in the rim of said first piece, and ultrasonically melting said bead so as to weld said membrane to said first piece; and

b. bringing together said first and second pieces so that said energy director lines up with said groove, and ultrasonically melting said energy director so that it fills said groove creating a strong weld between said pieces.

5,011,556

PROCESS FOR THE PRODUCTION OF POLYVINYLIDENE FLUORIDE LAMINATED PRODUCT

Takashi Yamaguchi, Yokkaichi; Tadahiko Tsutsumi, Suzuka, and Toshie Watanabe, Sendai, all of Japan, assignors to Japan Synthetic Rubber Co., Ltd., Tokyo, Japan

Filed Aug. 17, 1989, Ser. No. 394,968

Int. Cl.[5] B32B *31/02*

U.S. Cl. 156—83 **9 Claims**

1. A process for producing a laminated product of a polyvinylidene fluoride layer (A) and a rubber-like polymer layer (B) which comprises:

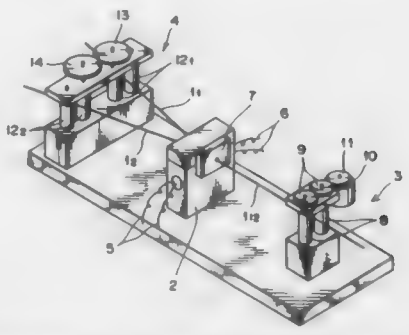
providing an adhesive containing (a) a rubber-like polymer, (b) one or more metal compounds selected from oxides and hydroxides of an element belonging to Groups II to IV of the Periodic Table, and (c) an organic solvent which is capable of dissolving or swelling said polyvinylidene fluoride layer (A), said rubber-like polymer layer (B), or both,

applying said adhesive to the surface of said polyvinylidene fluoride layer (A), said rubber-like polymer layer (B), or both and

pressing said polyvinylidene fluoride layer (A) and said rubber-like polymer layer (B) together to adhere them at a temperature not higher than the melting point of said polyvinylidene fluoride.

5,011,557

METHOD FOR FORMING JOINED SECTION OF OPTICAL BRANCH FIBERS PRODUCT, AND APPARATUS THEREFOR



Hiroshi Tsugita, Ueda, and Takao Shimizu, Kousboku, both of Japan, assignors to Kurashiki Boseki Kabushiki Kaisha, Okayama and Chikuma Koki Co., Ltd., Nagano, both of, Japan

Filed Feb. 28, 1990, Ser. No. 486,103

Claims priority, application Japan, Mar. 1, 1989, 1-49028

Int. Cl.[5] D04H *3/08; G02B 6/26, 5/14*

U.S. Cl. 156—180 **4 Claims**

2. An apparatus for forming the joined section of a plurality of optical branch fibers, said apparatus comprising:

a die having a through-hole extending therethrough for shaping optical fibers drawn therethrough;

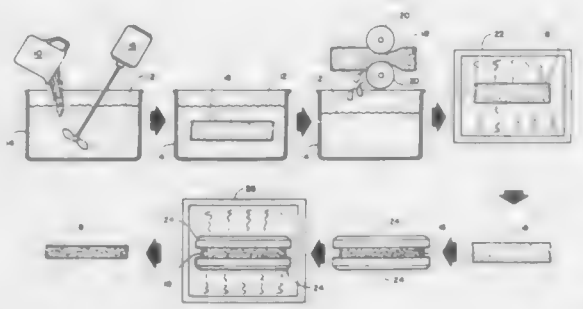
heating means operatively associated with said die for heating said die;

means for supplying a plurality of optical fibers to said die in amounts of a predetermined ratio corresponding to a

predetermined signal branching ratio of the intensities of light which will be transmitted by the fibers based on a distribution to the fibers of a given amount of light transmitted to the fibers, collectively; and

driving means for simultaneously drawing the plurality of fibers through the through-hole of said die.

5,011,558



METHOD OF IMPROVING FOAM FIRE RESISTANCE THROUGH THE INTRODUCTION OF INORGANIC PARTICLES THEREINTO

Francis U. Hill, and Lola E. Crosswhite, both of San Diego, Calif., assignors to Sorrento Engineering Corporation, National City, Calif.

Division of Ser. No. 448,540, Dec. 11, 1989, Pat. No. 4,912,132, which is a continuation-in-part of Ser. No. 373,900, Jun. 30, 1989. This application Feb. 21, 1990, Ser. No. 478,825

Int. Cl.[5] **C09J** *5/02*

U.S. Cl. 156—307.5 **2 Claims**

1. The method of improving the flame resistance of open-cell polyimide foam products which comprises the steps of:

adding very finely divided non-metallic inorganic particles which are gel forming and insoluble in water and polar organic liquids, to water or a highly polar organic liquid to form a gel;

placing an open-cell synthetic resin foam product in said gel;

manipulating said foam product so as to substantially entirely fill said cells with gel;

removing said foam product; and

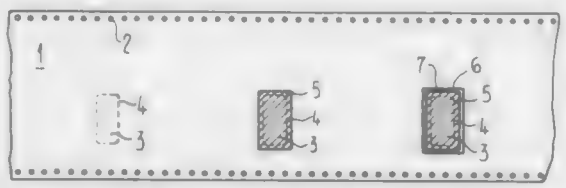
drying said foam product;

whereby said inorganic particles remain dispersed throughout said cells; and

compressing the dried foam product to a selected extent and heating the compressed foam product to a temperature at which the foam is stabilized at the compressed dimensions whereby a high density, rigid foam product results.

5,011,559

PROCESS FOR THE MANUFACTURE OF SHEETS OR PAGES WITH SEPARABLE SELF-ADHESIVE LABELS



Willi Felix, Strengelbach, Switzerland, assignor to Jos. Hunkeler Ltd., Wikon, Switzerland

Continuation of Ser. No. 810,287, Jan. 27, 1986. This application Jun. 23, 1988, Ser. No. 210,398

Claims priority, application Switzerland, Mar. 29, 1984, 1605/84

Int. Cl.[5] **B32B** *31/12, 31/10, 31/06;* **B31F** *1/00*

U.S. Cl. 156—257 **14 Claims**

1. A process for manufacturing a first sheet containing at least on integral but separable self-adhesive label comprising the steps of:

a. creating at least one integral but separable label in said sheet by applying attenuating lines to said sheet,

b. applying an adhesive coating selectively to at least a portion of the area of said at least one label, and

c. applying to said adhesive coating a second, protective sheet to which the adhesive coating adheres significantly less to said at least one label, such that said protective sheet having edges, such that said protective sheet entirely covers said adhesive coating and that such that the edges of said protective sheet project beyond said adhesive coating,

wherein steps b. and c. are performed consecutively without interposition of step a.

5,011,560

METHOD OF ADHESION AND COMPOSITION THEREFOR

Yoshikazu Nakai, Itami, and Tsutomu Kubota, Mishima, both of Japan, assignors to Takeda Chemical Industries, Ltd., Osaka, Japan

Continuation of Ser. No. 928,656, Nov. 5, 1986, abandoned, which is a continuation of Ser. No. 700,673, Feb. 11, 1985, abandoned. This application Aug. 19, 1988, Ser. No. 234,159

Claims priority, application Japan, Feb. 13, 1984, 59-25691; Apr. 5, 1984, 59-68636; Jan. 8, 1985, 60-1800

Int. Cl.[5] **B32B** *1/10, 31/12;* **C08G** *18/42, 18/58*

U.S. Cl. 156—273.3 **5 Claims**

1. A method of adhesion which comprises (a) applying onto a substrate having a curved surface a liquid two-step reactive type tacky adhesive agent comprising (1) a non-solvent or high-solid isocyanate compound, (2) a curing agent therefor and (3) a component consisting of a vinyl compound having one photopolymerizable vinyl group per molecule and a vinyl compound having at least two photopolymerizable vinyl groups per molecule, the weight of the former vinyl compound being in the range of 30 to 100 weight % of component (3) and the porportion of component (3) being about 5 to 80 weight % of the total amount of the tacky adhesive agent, (b) irradiating the whole applied surface with light to develop tackiness at a glass transition temperature of the applied agent after irradiating with light not exceeding about 20° C., and (c) adhering the substrate to a material to be bonded to the said curved surface through the said adhesive agent without clamping, while the tackiness is retained, followed by curing at room temperature.

LABELLING MACHINE

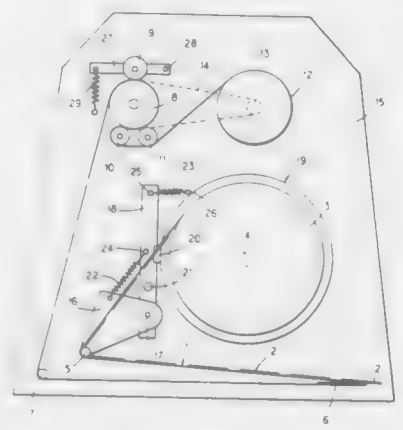
Jean-Claude Carolus, Marcq-en-Baroeul, and Francois Delvinquiere, Lys-lez-Lannoy, both of France, assignors to Nord Techniques Etiquetage - SARL, Roubaix, France

Filed Oct. 19, 1989, Ser. No. 423,878

Claims priority, application France, Oct. 21, 1988, 88 14837

Int. Cl.[5] **B32B** *31/00*

U.S. Cl. 156—495 **1 Claim**



1. A labelling machine of the type comprising a supply reel, supplying a band carrying labels, a receiving reel for said band after stripping of the labels, a distribution plate placed close to two deviating bars deviating the band so that said band forms a sharp angle in its path between the first deviating bar, the distribution plate and the second deviating bar, and a band pulling system placed after the second deviating bar, wherein said machine comprises:

(a) an arm on one end of which is fixed the first deviating bar, said arm being mounted for pivoting about a first pin,

(b) a piece on which are mounted, on the one hand a stop member, and on the other hand, the first pin, said piece being itself mounted for pivoting about a second pin, fixed on a frame of the machine,

(c) a first return means, fast with the pivoting piece and the frame of the machine and capable of causing the piece to pivot about the second pin so that the stop member is directly or indirectly applied on a pivoting spindle of the supply reel,

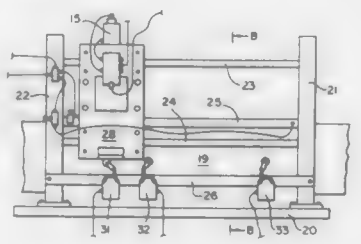
(d) a second return means, fast with the pivoting piece and

the arm, and capable of causing the arm to pivot about the first pin, in such a way as to bring the first deviating bar closer to the stop member, and

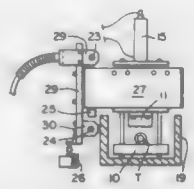
(e) another stop member to restrict the pivoting movement therefore about the first pin.

5,011,562

APPARATUS FOR FORMING SEALED LENGTHS OF PLASTICS COATED TUBE



Itzhak Barnoach, London, England, assignor to Kitechnology B.V., Amsterdam, Netherlands



Filed Mar. 29, 1989, Ser. No. 330,258

Claims priority, application United Kingdom, Aug. 3, 1988, 8818464

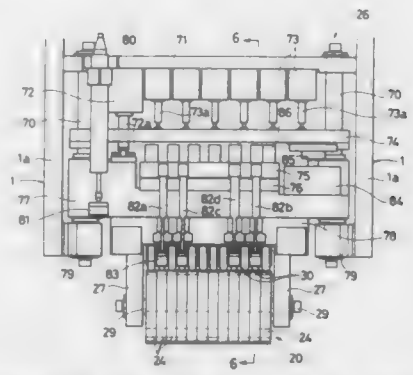
Int. Cl.[5] **B32B** *31/18;* **B21D** *9/08*

U.S. Cl. 156—498 **5 Claims**

1. Apparatus for forming sealed lengths of plastics coated metal tube, said tube being a folded tubular strip of metal having longitudinal edges sealed together and extruded plastics material on inner and outer surfaces of the metal tube and containing a gas under pressure, the apparatus comprising a cooling bath having an inlet and an opposed outlet for passage of the tube through a cooling liquid adapted to cool the plastics material; clamping jaw means within the bath for clamping around to flatten and seal the tube; and control means positioned and arranged with respect to said clamping jaw means so as to (1) provide the actuating of said clamping jaw means at a first station adjacent the inlet to the bath, and (2) move said jaws along the bath with the tube clamped in said jaw means at a rate such that said jaw means exert no pulling action on the tube, and (3) release said jaw means from the tube upon reaching a second station downstream of the first station, and (4) return said jaw means to the first station.

5,011,563

AUTOMATIC TAPE AFFIXING APPARATUS



Nobuo Shinno, and Yasuhiro Ohnishi, both of Osaka, Japan, assignors to Shinnippon Koki Kabushiki Kaisha, Osaka, Japan

Filed May 15, 1989, Ser. No. 351,681

Claims priority, application Japan, May 18, 1988, 63-122811

Int. Cl.[5] **B32B** *31/00*

U.S. Cl. 156—574 **16 Claims**

1. A tape affixing head for an automatic tape affixing apparatus in which the tape affixing head is moveable in multiple directions for affixing tape on an affixing surface, said tape affixing head comprising:

a structure means mounting a tape supply reel and a take-up reel for said tape;

a roller carrier means moveable mounted on said structure means, said carrier means carrying a shaft, a plurality of rotatable and transversely moveable roller means on said shaft such that each of said roller means is separately transversely moveable relative to said shaft in a direction perpendicular to the axis of said shaft;

first cylinder means on said carrier means operable to apply a first pressing force to each of said roller means to thereby individually presss said roller means against said affixing surface; and

second cylinder means operably disposed between said structure means and said carrier means for applying a second pressing force to said carrier means such that said second cylinder means is thereby operable to apply said second pressing force simultaneously to all of said roller means while said first cylinder means applies said first pressing force to individual roller means.

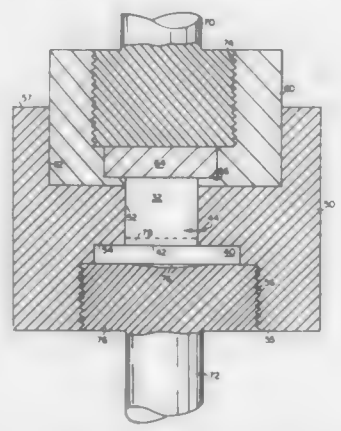
EPITAXIAL GROWTH

Barbara G. Bryskiewicz; Tadeusz R. Bryskiewicz, both of Watertown; Ferdynand P. Dabkowski; Jacek Lacowski, both of Woburn, and Harry C. Gatos, Weston, all of Mass., assignors to Massachusetts Institute of Technology, Cambridge, Mass.

Continuation of Ser. No. 121,513, Nov. 17, 1987, abandoned, which is a continuation of Ser. No. 868,136, May 28, 1986, abandoned. This application Mar. 17, 1989, Ser. No. 324,900

Int. Cl.[5] **C30B** *9/06*



U.S. Cl. 156—624 **18 Claims**

1. The process of forming an equilibrium growth dispersion for use in the liquid epitaxial growth at a growth temperature of a compound including at least two constituents, the melting point of one of said constituents being higher than that of another of said constituents and the relative solubility of said constituents being such that cooling saturated solutions thereof tends to cause precipitation of particles of the solute constituent, said process comprising the steps of:

placing each of said constituents in a container in a quantity

such that the total relative proportions of constituents will provide a saturated solution of one of said constituents (the solute constituent) in another of said constituents (the solvent constituent) at said growth temperature;

heating said container with said constituents therein a temperature not less than the growth temperature to dissolve said constituents and maintaining said container with said container with said constituents therein at a temperature

not less than said growth temperature for a period of time sufficient to produce a solution of said solute constituent in said solvent constituent; and

rapidly quenching the contents of said container at a rate of cooling sufficiently rapid to prevent said precipitation of particles of said solute constituent and to form a said equilibrium growth dispersion comprising an essentially homogeneous dispersion of fine particles of said solute constituent in and throughout said solvent constituent.

5,011,565

DOTTED CONTACT SOLAR CELL AND METHOD OF MAKING SAME

Christopher E. Dube, Arlington, and Ronald C. Gonsiorawski, Danvers, both of Mass., assignors to Mobil Solar Energy Corporation, Billerica, Mass.

Continuation-in-part of Ser. No. 447,211, Dec. 6, 1989, abandoned. This application May 17, 1990, Ser. No. 524,346

Int. Cl.[5] B44C *1/22;* **C03C** *15/00, 25/06*

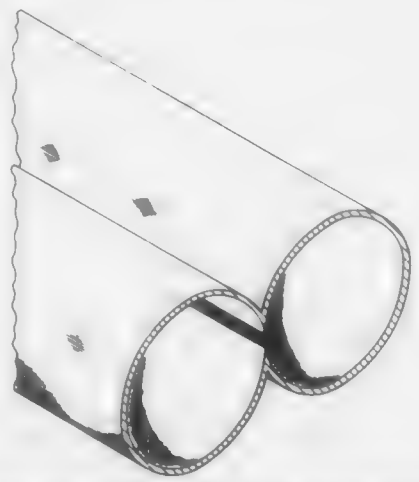
U.S. Cl. 156—643 **32 Claims**

1. A method of forming an electrode grid on the front surface of a solar cell substrate comprising the following steps:

providing a silicon solar cell substrate having front and back surfaces, a p/n junction adjacent said front surface, and a dielectric coating on said front surface; and

subjecting said dielectric coating to a laser beam of an intensity and for a duration sufficient to remove selected portions of said dielectric coating and thereby form in said dielectric coating an electrode pattern comprising a a plurality of finger-like sections, with said said laser beam being controlled so that each of said fingers comprises a plurality of microscopically-sized holes in said dielectric coating with said holes being spaced from one another a selected distance not exceeding 20 microns.

5,011,566



METHOD OF MANUFACTURING MICROSCOPIC TUBE MATERIAL

Wesley P. Hoffman, Lancaster, Calif., assignor to The United States of America as represented by the Secretary of the Air Force, Washington, D.C.

Filed Mar. 15, 1989, Ser. No. 324,280

Int. Cl.[5] C03C *25/06*

U.S. Cl. 156—643 **14 Claims**

1. A method for forming microscopic hollow tubes comprising the steps of:

positioning fibers having a diameter of about 1 micron to about 1000 microns and having a predetermined rate of oxidation at specific temperatures in a preform;

cleaning said fibers;

placing an inert environment about said fibers;

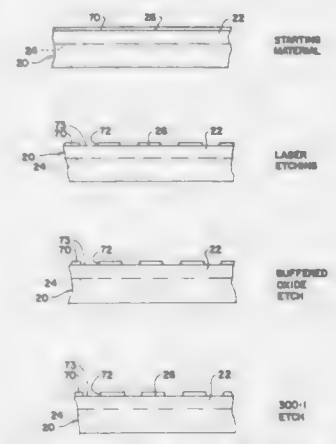
adjusting the temperature of said fibers to a deposition temperature of a tube material in the inert environment;

depositing said tube material on said fibers to coat said fibers, said tube material having a predetermined rate of oxidation at specific temperatures which is lower than the predetermined rate of oxidation at specific temperatures of said fibers;

placing the coated fibers in an oxidizing environment;

heating said fibers coated with said tube material in the oxidizing environment to a temperature at which the fibers oxidize at a rate which is at least 10 times faster than the rate of oxidation of said tube material in order to thereby remove said fibers from said tube material by oxidation without damaging the tube material and thereby forming said microscopic hollow tubes.

5,011,567



METHOD OF FABRICATING SOLAR CELLS

Ronald C. Gonsiorawski, Danvers, Mass., assignor to Mobil Solar Energy Corporation, Billerica, Mass.

Continuation of Ser. No. 447,211, Dec. 6, 1989, abandoned. This application Jul. 17, 1990, Ser. No. 555,659

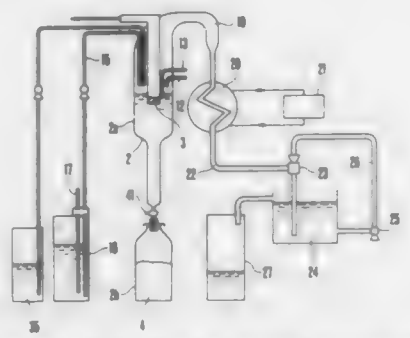
METHOD FOR TREATING PHOTOGRAPHIC PROCESS WASTE LIQUOR THROUGH CONCENTRATION BY EVAPORATION AND APPARATUS THEREFOR



Kazuhiro Kobayashi; Shigeharu Koboshi; Nobutaka Goto; Masayuki Kurematsu, and Naoki Takabayashi, all of Hino, Japan, assignors to Konica Corporation, Tokyo, Japan

Continuation of Ser. No. 131,651, Dec. 11, 1987, abandoned. This application Jan. 8, 1990, Ser. No. 463,929

Claims priority, application Japan, Dec. 17, 1986, 61-300510; Dec. 17, 1986, 61-302543

Int. Cl.[5] B01D *1/00*

U.S. Cl. 159—47.3 **9 Claims**

1. A method of treating photographic process waste liquor containing a component selected from the group consisting of thiosulfate, sulfites, and ammonium salts, through concentration by evaporation, consisting essentially of the steps:

(a) supplying waste liquor containing a component selected from the group consisting of thiosulfate, sulfites, and ammonium salts, to an evaporating vessel;

(b) evaporating liquid from photographic process waste liquor by heating the photographic process waste liquor in the upper part of said evaporating vessel;

(c) maintaining both a reduced pressure of 610 mm Hg or less and at least 5° C. differential between the temperature of the photographic process waste liquor in the upper part of the vessel and the temperature of the photographic process waste liquor in the bottom part of the evaporating vessel thereby concentrating the photographic waste liquor whereby solute precipitates; and

(d) allowing solute which precipitates from the photographic process waste liquor to settle toward said bottom part;

thereby to restrain decomposition of the solute and the formation of noxious cases.

TWO STAGE PROCESS FOR THE OXYGEN DELIGNIFICATION OF LIGNOCELLULOSIC FIBERS WITH PEROXIDE REINFORCEMENT IN THE FIRST STAGE

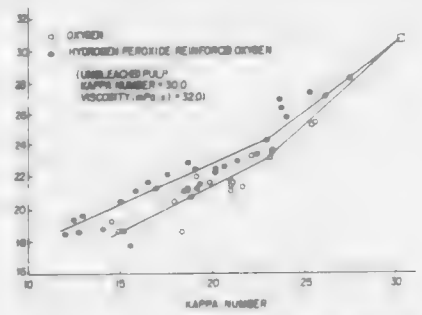
V. R. Parthasarathy; Meenaksi Sundaram; Hasan Jameel, all of Raleigh; Josef S. Gratzl, Cary, all of N.C., and Ronald J. Klein, Edison, N.J., assignors to FMC Corporation, Philadelphia, Pa. and North Carolina State University, Raleigh, N.C.

Filed May 19, 1989, Ser. No. 354,522

Int. Cl.[5] D21C *9/147, 9/16, 9/18*

U.S. Cl. 162—56 **10 Claims**

1. A process employing molecular oxygen for unbleached delignifying lignocellulose fibers in a slurry from a digester without significant loss of fiber strength consisting essentially of the steps of:



a. thickening the unbleached slurry from a digester by extracting therefrom a first liquor portion,

b. incorporating sufficient thickened slurry from step (a) into a first reaction mixture to provide a consistency of from about 8% to about 25% by weight fibers on an oven dry basis, said reaction mixture also containing sufficient alkalinity to be equivalent to from about 1.5% to about 4% sodium hydroxide and about 0.01% to about 1% of hydrogen peroxide based on the oven dry weight of fibers,

c. maintaining the first reaction mixture at a temperature of about 80° C. to about 110° C., for about 30 to about 60 minutes in the presence of molecular oxygen at a partial pressure of about 620 to 860 kPa,

d. thickening the first reaction mixture from step (c) by extracting therefrom a second liquor portion,

e. incorporating sufficient thickened slurry from step (d) into a second reaction mixture to provide a consistency of from about 8% to about 25% by weight fibers on an oven

dry basis, said reaction mixture also containing sufficient alkalinity to be equivalent to from about 1.5% to about 4% sodium hydroxide and 0% to 0.5% hydrogen peroxide,

f. maintaining the second reaction mixture at a temperature of about 70° C. to about 110° C. for about 30 to about 60 minutes in the presence of molecular oxygen at a partial pressure of about 170 to 860 kPa, and

g. recovering delignified fibers from the second reaction mixture, said delignified fibers having equal or increased strength compared with the fibers delignified by a single oxygen stage.

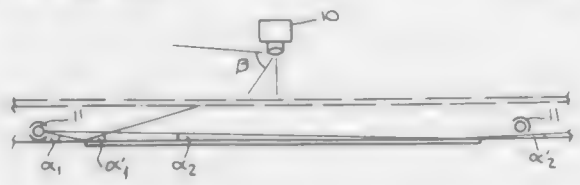
METHOD AND APPARATUS FOR CONTROL OF DRY-LINE ON THE WIRE OF A FOURDRINIER PAPER MACHINE

Antti J. Niemi, Yrjo Liipolantie 5, SF-02700 Kauniainen, Finland, assignor to Antti Johannes Niemi and Ulli Riitta Annelli Niemi, both of Kauniainen, Finland



PCT No.; PCT/F187/00180, 371 Date Aug. 15, 1989, 102(e) Date Aug. 15, 1989, PCT Pub. No. WO88/05099, PCT Pub. Date Jul. 14, 1988

PCT Filed Dec. 30, 1987, Ser. No. 377,852

Claims priority, application Finland, Dec. 30, 1986, 865329

Int. Cl.[5] D21F *7/06*

U.S. Cl. 162—198 **8 Claims**

1. A method of controlling a dry line in a Fourdrinier paper machine on the basis of differing optical properties of the parts of the pulp web preceding and following the dry line, comprising: illuminating a wire with the pulp web at such a small angle with regard to its plane that when observing the pulp web from above, the direction of observing substantially deviates from the directions of mirror reflections from a surface of the pulp web, observing the pulp web in such a manner that the pulp web part preceding the dry line is found darker than the pulp web part following the dry line with an optoelectric camera forming a two-dimensional image of the web and material on it, thresholding and supplying the repeatedly outgoing electric image signal from the camera to a digital computer programmed to distinguish from each other such parts of the wire preceding and following, respectively the dry line, on the basis of information of the degree of brightness transmitted by said signal, and to determine the position of the dry line in a longitudinal direction of the paper machine having a wire moving in a longitudinal direction and the web, for different values of a transversal coordinate, and effecting control actions based upon the determined dry line position.

INCLINED MULTIPLYFORMER

Martin B. Keller, Hudson Falls, N.Y., assignor to Sandy Hill Corporation, Hudson Falls, N.Y.

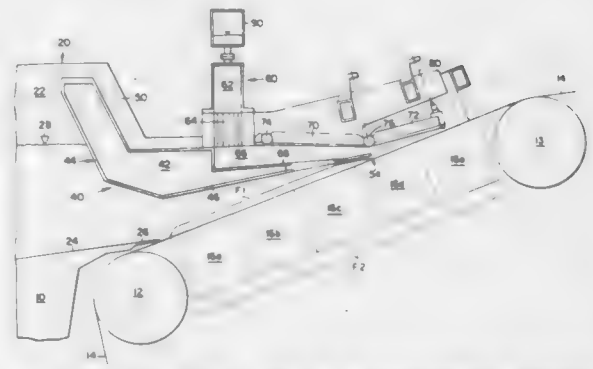
Filed Jun. 14, 1990, Ser. No. 537,643

Int. Cl.[5] D21F *1/00*

U.S. Cl. 162—299 **1 Claim**

1. In a delivery system in a machine for forming a continuous multi-ply web upon a moving foraminous-forming wire, the combination of:

an endless forming wire having an upwardly-inclined run defining adjacent primary and secondary areas of a web-forming zone,



a primary opened headbox for delivering a primary slurry,

a pond regulator having an upper surface and being positionable within the primary headbox,

the upward angularization of the run of forming wire and a downward angularization of the pond regulator defining converging bottom and top walls of a primary approach passage with a forward edge of the pond regulator and the forming wire spaced below defining a primary slice,

a secondary closed headbox supported by and upwardly of the pond regulator for delivering a secondary slurry and including a secondary roof supported by and forwardly of the secondary headbox for defining a top wall of a secondary approach passage,

the upper surface of the pond regulator defining a bottom wall of the secondary approach passage,

the upper and bottom walls of the secondary approach passage converging relative to the forming wire in defining a secondary slice,

said secondary headbox including a perforated plate arranged above and substantially perpendicular to said secondary approach passage,

a two-part dewatering zone beneath the inclined run of the forming wire and divided between a primary forming length and a secondary forming length,

each part of the dewatering zone being provided with cooperant suction compartments for assisting in the web formation by the drainage of excess fluent media from the slurries through the forming wire with a resultant deposit of successive webs of fibers on the forming wire.

BREAST BOX NOZZLE FOR A PAPER MACHINE

Dieter Egelhof, Heidenheim, Fed. Rep. of Germany, assignor to J. M. Voith GmbH, Heidenheim, Fed. Rep. of Germany

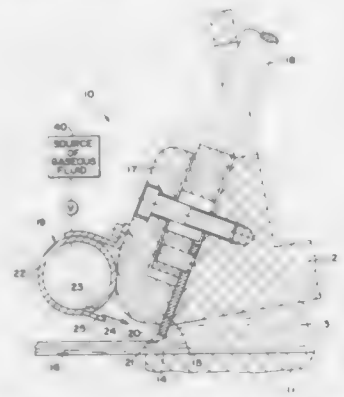
Continuation of Ser. No. 311,938, Feb. 16, 1989, abandoned. This application May 25, 1990, Ser. No. 529,780

Claims priority, application Fed. Rep. of Germany, Feb. 17, 1988, 3804827

Int. Cl.[5] D21F *1/02*

U.S. Cl. 162—344 **2 Claims**

1. In a paper machine, a head box comprising:



(a) a first and a second machine-wide stream-guiding walls with the first and second walls facing each other, the first and second machine-wide stream-guiding walls defining a nozzle-like and machine-wide pulp stock duct which forms a machine-wide pulp stock discharging gap which discharges a pulp stream in a direction;

(b) at least one of the first and second stream-guiding walls having a surface not touched by the pulp stock, the surface being located close to the pulp stock discharging gap;

(c) a source consisting of gaseous fluid connected to at least one gaseous fluid containing duct which extends at least partly across the width of the machine, the at least one gaseous fluid containing duct having a plurality of openings adapted to discharge a fluid onto the surface in a direction opposite to the direction of the pulp stream; and

at least one shutter for limiting one of the first and the second stream-guiding walls at the stream discharge gap and

a claw, wherein the shutter comprises the surface and the claw is positioned to overlap the shutter on a side not touched by the pulp stock, the claw having a cross section

which is rounded between its surface facing away from the shutter and the shutter, and wherein the duct is positioned and arranged for delivery of the gaseous fluid in a direction towards the shutter

PRESSURE CONTROL FORMING SECTION

Victor E. Hansen, Jacksonville, Fla.; David T. Smith, Monson; Douglas R. McPherson, East Longmeadow, both of Mass., and Richard H. Pitt, Carleton Place, Canada, assignors to JWI Ltd., Kanata, Canada

Filed Jun. 8, 1989, Ser. No. 362,938
Int. Cl.[5] D21F *1/48, 9/02*
U.S. Cl. 162—352 **28 Claims**

1. In a paper making machine having an open surface forming section, including at least a travelling continuous forming fabric which passes over a breast roll adjacent a head box having a head box slice through which aqueous stock is deposited onto the forming fabric, in which forming section the solids content rises from an initial low value as deposited from the head box through the head box slice onto the forming fabric to a value of from about 2% to about 4%, an apparatus for improving paper formation consisting essentially of in combination:

(a) a drainage means located beneath the forming fabric and which includes a first part, a second part, and a third part, and which extends from a point adjacent the head box slice to the end of the forming section;

(b) a foraminous support surface for the open surface forming fabric on the drainage means; and

(c) air supply means, including both vacuum pump means, air pressure pump means, and air pressure control means, whereby the air pressure in the drainage means is controlled,

wherein:

(i) the drainage means comprises either a single drainage box divided into a plurality of separate compartments by a plurality of air tight divisions extending across the width of the drainage box, each compartment of which is provided with a separate air supply means and a separate air pressure tight drainage means, or a plurality of contiguously adjacent drainage boxes which in effect forms a plurality of separate compartments, each of which extends across the width of the forming fabric, and each of which is provided with a separate air supply means and a separate air pressure tight drainage means;

(ii) the air supply means is structured and arranged to provide an air pressure in the compartments which decreases from a positive value above ambient atmospheric in the first part adjacent the headbox slice sufficient to hinder water drainage from the stock through the forming fabric but insufficient to interfere with paper formation on the forming fabric, to ambient atmospheric pressure in the second part and to a negative value of no more than 50 cms water gauge below ambient atmospheric pressure in the third part at the end of the forming section;

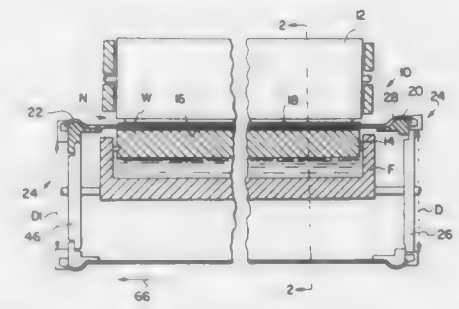
(iii) the foraminous support surface provides apertures through which the forming fabric drains, and a path through which the forming fabric moves which will cause a controlled level of uniformly spaced periodic harmonic agitation within the stock on the forming fabric, and provides an air pressure tight seal between the compartments and the forming fabric; and

(iv) the foraminous support surface over the third part of the drainage means comprises a slotted-type fabric cover comprising a series of spaced forming fabric supporting blades having a generally planar top surface transverse to the direction of travel of the forming fabric in a common essentially horizontal plane providing therebetween suction-accessible gaps in which the forming fabric is substantially unsupported and is drawn downward to form stock-agitating undulations in said gaps, said cover including water seal forming blades disposed intermediately in the gaps between the fabric supporting blades and having top surfaces transverse to the direction of travel of the forming fabric at a level lower than the top surfaces of the fabric supporting blades and at least forming water seals at the downward undulations of the forming fabric, thereby interrupting the suction temporarily to limit drainage while causing vertical agitation of fibers on the fabric passing through the forming section; wherein both the first, the last, and any intermediate blades placed over either an internal vacuum tight division or a pair of contiguous transverse walls of two adjacent drainage boxes are all forming fabric-supporting blades; and wherein sealing strips are interposed between the ends of the blades adjacent the lateral edges of the forming fabric;

(v) the foraminous support surface over the first and the second parts adjacent the head box slice includes a plurality of static support elements uniformly spaced so as to generate uniform periodic harmonic agitation in the stock;

(vi) the static support elements comprise a plurality of thin elongate blades having top fabric supporting faces extending across the full width of the forming fabric, together with sealing strips interposed between the ends thereof adjacent the lateral edges of the forming fabric,

(vii) the static support elements include at least one static support element in the first part having a top support face for the forming fabric which contributes to the desired level of periodic harmonic agitation in the stock, and which comprises a flat surface having a leading and a trailing portion in the direction of forming fabric travel separated by at least one shallow depression extending along the blade for the width of the forming fabric and wherein each of the leading and trailing portions, and of any flat portions intermediate shallow depressions, are of sufficient width in the direction of forming fabric travel to provide a hydraulic seal to the forming fabric; and



(viii) one of the plurality of thin elongate blades is placed both above either an internal transverse division in the drainage box or a pair of contiguous walls of adjacent drainage boxes and above the first wall of the first part of the drainage means.

EXTENDED NIP PRESS APPARATUS WITH BLANKET EDGE SEALS

David V. Lange, Beloit, and Scott E. Filzen, Eau Claire, both of Wis., assignors to Beloit Corporation, Beloit, Wis.

Filed Oct. 24, 1990, Ser. No. 602,602
Int. Cl.[5] D21F *3/02*
U.S. Cl. 162—358 **3 Claims**

1. An extended nip press apparatus for pressing water from a web of paper, said press apparatus comprising:

a press frame;

a backing roll rotatably supported relative to said frame;

an elongate shoe defining a concave surface, said concave surface cooperating with said backing roll for defining therebetween an extended nip for the passage therethrough of the web;

a blanket defining an endless loop, said blanket extending through said nip such that the web is disposed between said blanket and said backing roll, said blanket further defining a first and second lateral edge, said edges being spaced relative to each other;

edge seal means cooperating with said edges for sealing said edges of said blanket against egress of lubricant disposed between said shoe and said blanket;

said edge seal means including:

a head having an outside diameter and being rotatably secured to said frame;

an extension which extends from said head, said extension cooperating with said first edge of said blanket, said extension defining a duck's bill configuration in a cross-machine sectional view, such that said first edge of said blanket conforms to a surface defined by said extension, said surface having a first portion which undulates radially away from said head in an outward direction and a second portion which undulates radially inwardly towards said head in an outward direction; and

clamp means adjustably secured to said extension for clamping said first edge of said blanket to said extension, said clamp means defining a tapered surface which cooperates with said first edge such that said first edge is clamped between said tapered surface and said second portion so that flow of said lubricant from between said shoe and said blanket past said head is inhibited.

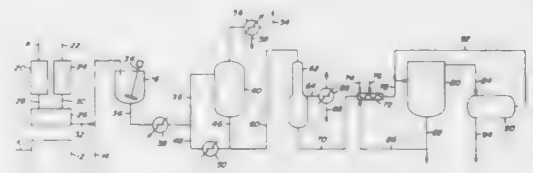
NEUTRAL OIL RECOVERY PROCESS FOR THE PRODUCTION OF NAPHTHENIC ACIDS

Gerald E. Davis, Berry, Ala., assignor to Merichem Company, Houston, Tex.

Filed Jan. 16, 1990, Ser. No. 465,445
Int. Cl.[5] B01D *3/06, 3/34*
U.S. Cl. 203—37 **8 Claims**

1. A process for treating a naphthenic fraction containing phenolics, neutral oils and sulfur compounds in the production of napthenic acid which comprises:

mixing with the naphthenic fraction a blend of sodium and potassium hydroxide in an amount sufficient to form a naphthenate salt of between 65% to 90% of the naphthenic acid present in the fraction, wherein the potassium hydroxide is at least 35% of the blend, to form a moist naphthenate stream;



flashing water from the moist naphthenate stream at a temperature above 360° F. to produce a dewatered naphthenate stream;

flashing the neutral oils, phenolics and sulfur compound contaminants from the dewatered naphthenate stream; and

recovering said naphthenic acid having an acid number greater than 300.

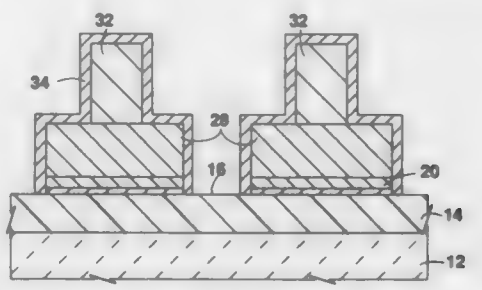
5. A process for the recovery of naphthenic acids from a naphthenic acid containing fraction which comprises:

mixing a mixture of sodium and potassium hydroxide with a naphthenic acid containing fraction in an amount sufficient to form an alkali metal naphthenate of 70% to 80% of the naphthenic acid, potassium hydroxide being fro 40% to 50% of the hydroxide mixture, to form a water containing moist naphthenate stream;

flashing water from said moist naphthenate stream at a temperature above 360° F. to produce a dewatered naphthenate stream;

flashing neutral oils, phenolics and sulfur compound contaminants from the dewatered naphthenate stream to form a naphthenate stream;

acidifying said naphthenate stream to produce the naphthenic acids; and



recovering said naphthenic acids having acid numbers greater than 300.

METHOD OF REWORKING AN ELECTRICAL MULTILAYER INTERCONNECT

Ju-Don T. Pan, Cupertino, Calif.; John W. Curry, II, Austin, Tex., and Laurence D. Schultz, Boise, Id., assignors to Microelectronics and Computer Technology Corporation, Austin, Tex.

Continuation-in-part of Ser. No. 426,619, Oct. 24, 1989. This application Jun. 25, 1990, Ser. No. 543,317
Int. Cl.[5] C25D *5/02*
U.S. Cl. 204—15 **24 Claims**

1. A method of reworking an electrical multilayer interconnect comprising:

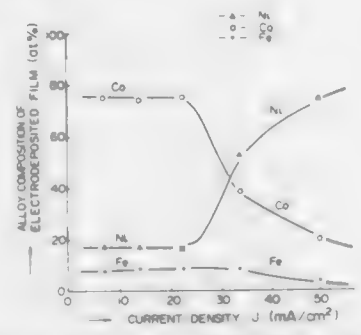
removing a defective metallization layer from the top of an interconnect substrate,

depositing an electrically conductive layer on the substrate,

forming a base plating mask on the electrically conductive layer,

plating a copper base into an opening in the base plating mask onto the electrically conductive layer,

stripping the base plating mask,



forming a pillar plating mask on top of the copper base,
plating an electrically conductive metal pillar into an opening in the pillar plating mask onto the top of the copper base,
stripping the pillar plating mask, and
stripping the electrically conductive layer below the stripped base plating mask.

PROCESS FOR PRODUCING A THIN ALLOY FILM HAVING HIGH SATURATION MAGNETIC FLUX DENSITY

Yuuji Omata, Ibaraki, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Sep. 25, 1989, Ser. No. 412,221
Claims priority, application Japan, Sep. 28, 1988, 63-243016
Int. Cl.[5] C25D *3/56*
U.S. Cl. 204—38.4 **1 Claim**

1. A process for producing an FeCoNi alloy film exhibiting a high magnetic flux density, which comprises using a ternary FeCoNi alloy film or FeNi (Permalloy) film formed by evaporation as a material of a cathode, using an electrodepositing bath containing divalent ions of each of Fe, Co and Ni in a form of either or both of a sulfate and chloride, said bath containing a composition having ratios of the concentration of the divalent ions within the ranges of

$$0.05 \leqq [Co^{2+}]/[Ni^{2+}] \leqq 0.06 \text{ and}$$

$$0.05 \leqq [Fe^{2+}]/[Ni^{2+}] \leqq 2.0,$$

and electrodepositing the FeNiCo alloy film on said cathode at an electrodepositing current density J at the cathode of

$$1 < J < 60 \text{ (mA/cm}^2\text{)}$$

a bath of pH of

$$1.5 < pH < 5.5$$

and a bath temperature T of

$$15 \leqq T \leqq 60° \text{ C.}$$

METHOD FOR PRODUCING ELECTROCHROMIC DEVICE WITH APPLICATION OF AC VOLTAGE BETWEEN THE ELECTRODE LAYERS

Satoru Oshikawa, Yokohama, and Tatsuo Niwa, Sakura, both of Japan, assignors to Nikon Corporation, Tokyo, Japan

Continuation of Ser. No. 288,950, Dec. 23, 1988, abandoned. This application May 14, 1990, Ser. No. 522,451
Claims priority, application Japan, Jan. 5, 1988, 63-454; Sep. 14, 1988, 63-230694
Int. Cl.[5] G02F *1/23;* **C25B** *1/00*
U.S. Cl. 204—140 **17 Claims**

1. A method for producing an electrochromic device, comprising the steps of:
(a) preparing a 5-layered laminate structure consisting of:
A: electrode layer;
B: reductive coloring electrochromic layer;
C: ionic conductive layer;
D_0: dispersion layer consisting of metallic iridium or lower oxide thereof and a dispersion medium; and
E: electrode layer;
wherein at least one of the electrode layers A and E is transparent; and thereafter
(b) applying an AC voltage between the electrode layers A and E in a gas atmosphere containing oxygen or water vapor, thereby converting the metallic iridium or lower oxide thereof in the layer D_0 into oxide or higher oxide thereof.
8. A method for producing an electrochromic device, comprising the steps of:

(a) preparing a 5-layered laminate structure consisting of, in succession from the top:
A: electrode layer;
D_0: layer containing metallic iridium or lower oxide thereof;
C: ionic conductive layer;
B: reductive coloring electrochromic layer;
E: electrode layer; and
S: substrate;
wherein at least one of the electrode layers A and E is transparent; and thereafter
(b) applying an AC voltage between the electrode layers A and E in a gas atmosphere containing oxygen or water vapor, thereby converting the metallic iridium or lower oxide thereof in the layer D_0 into oxide or higher oxide thereof.

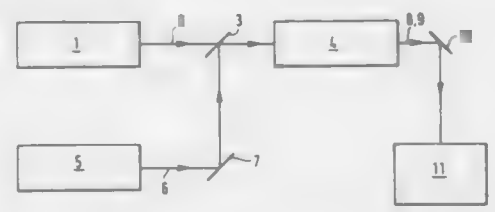
CORROSION PREVENTION FOR A MARINE PROPULSION SYSTEM

Hiroaki Tanbara, Hamamatsu, Japan, assignor to Sanshin Kogyo Kabushiki Kaisha, Hamamatsu, Japan

Filed Mar. 23, 1990, Ser. No. 497,969
Claims priority, application Japan, Mar. 31, 1989, 1-81300
Int. Cl.[5] B63H *5/06;* **C23F** *13/00*
U.S. Cl. 204—148 **9 Claims**

1. A method for using a sacrificial anode in a marine propulsion system to prevent corrosion comprising insulating a propeller of said system from said anode by mounting a propeller

of said system on a propeller shaft such that said propeller is not in electrical contact with said propeller shaft during periods of low thrust and can be in electrical contact with said propeller shaft during periods of high thrust.

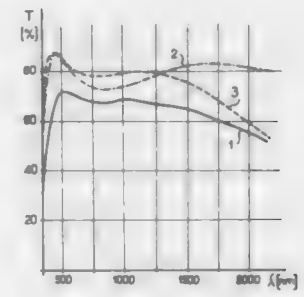


5,011,584

METHOD FOR SEPARATING A PREDETERMINED ISOTOPE OF AN ELEMENT FROM A GASEOUS COMPOUND CONTAINING SAID ELEMENT

Herman P. Godfried, Delden, Netherlands, assignor to Ultra-Centrifuge Nederland N.V., Almelo, Netherlands

Filed Aug. 31, 1989, Ser. No. 401,242
Claims priority, application Netherlands, Sep. 1, 1988, 8802160
Int. Cl.[5] B01D *5/00*
U.S. Cl. 204—157.22 **8 Claims**



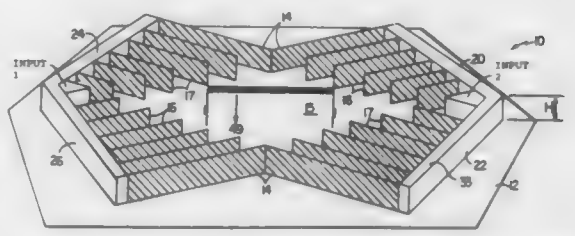
1. A method for separating a predetermined isotope of an element from a gaseous compound containing said element in which at least two isotopes of the element are present, comprising:
(a) providing a supply of said gaseous compound substantially all molecules of said compound are in one vibration state;
(b) providing at least two laser beams respectively for selectively exciting and further exciting molecules of said compound which contain the predetermined isotope, including interposing a medium-containing Raman cell between sources of the respective laser beams and said supply of gaseous compound and thereby converting the frequencies of said laser beams to different respective output frequencies by means of said Raman cell relative to the frequencies of said laser beams had as inputs to said cell; one of said laser beams as input to said cell being a train of very short pulses with a respective distance between each successive two such pulses, said distance being so short, and therefore pulse repetition frequency being so high, whereby the response of the medium in the Raman cell to the arrival of each said pulse in the cell is unfinished when the respective next said pulse arrives in the cell; and
(c) removing from said supply the predetermined isotope contained in said further excited molecules.

5,011,585

PROCESS FOR PRODUCING A TRANSPARENT LAYER WITH LOW RESISTIVITY

Jean-Pierre Brochot, Paris; Danielle Pilliss, Aulnay Sous Bois; Isabelle Wuest, Paris, all of France; Jean-Pierre Beaufays, Jemeppe Sur Sambre, and Maurice Darmont, Sambreville, both of Belgium, assignors to Saint-Gobain Vitrage, France

Filed Jul. 7, 1989, Ser. No. 376,711
Int. Cl.[5] C23C *14/54*
U.S. Cl. 204—192.130 **18 Claims**



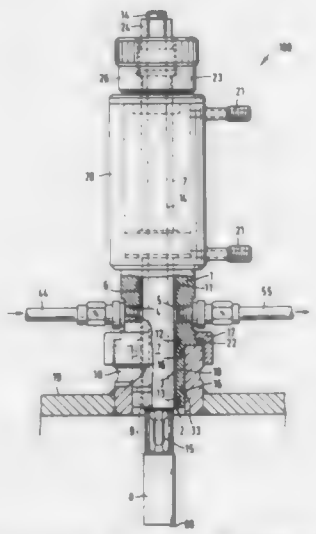
1. A process for coating a transparent substrate with a highly conductive, transparent layer having an indium based doped with tin and oxidized and having a resistivity less than 3.5×10^{-4} ohms.cm, comprising the following steps:
depositing a layer of indium tin oxide on glass at substoichiometric conditions by cathode sputtering from a target of an indium alloy comprising at least 2% tin by weight,
controlling said cathode sputtering to produce a layer having an intrinsic absorption coefficient that is equal to or greater than 7,500 cm^{-1} at a wavelength of 550 nm, and
heat treating said layer after deposition on said glass using a reducing phase.

5,011,586

CONSTRAINED UNIFORM FIELD GEL ELECTROPHORESIS

John D. Finney, Boston, and Michael J. Finney, Arlington, both of Mass., assignors to MJ Research, Inc., Cambridge, Mass.

Continuation-in-part of Ser. No. 231,821, Aug. 12, 1988. This application Dec. 23, 1988, Ser. No. 289,966
Int. Cl.[5] G01N *27/26;* **B01D** *57/02*
U.S. Cl. 204—299 R **17 Claims**



1. Gel electrophoresis apparatus for separating DNA molecules of high molecular weight comprising:
means for generating a first electric field and a second electric field, said fields being oriented transversely to each other, and
a gel box shaped and contoured to simultaneously form both said first and second fields into generally uniform electric fields, said gel box comprising a baffle means formed of electrically non-conducting material, said baffle means positioned and arranged to limit formation of a non-uniform electric field in said gel box.

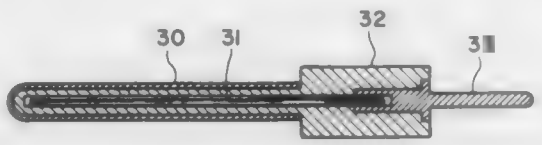
5,011,587

APPARATUS FOR THE DETECTION OF CHEMICAL EQUALIZATION PROCESSES IN AN AQUEOUS SOLUTION

Wilhelm Schmidt, Lörrach, Fed. Rep. of Germany, assignor to Ciba-Geigy Corporation, Ardsley, N.Y.

Filed Feb. 26, 1990, Ser. No. 484,715
Claims priority, application Switzerland, Mar. 2, 1989, 775/89
Int. Cl.[5] G01N *27/28*
U.S. Cl. 204—401 **12 Claims**

1. Apparatus for the detection of chemical equalization processes in aqueous solutions comprising an essentially cylindrical probe body, provided with at least one inlet and one outlet opening for calibrating or flushing liquids, which open into a calibrating chamber in the forward area of the probe body;



an immersion pipe axially displaceable in a bore of the probe body and including a protective cylinder with a front end into which an electrode is set, with the head of said electrode being located within a basket-like perforated area of the protective cylinder; and, an annular gap between the immersion pipe and the inner wall of the probe body which is sealed by at least three spaced apart gaskets located on the inner wall of the probe body, a distance between two adjacent gaskets being larger than the length of the perforated area of the protective cylinder, and a first gasket being located above the calibrating chamber and a second and third gasket being located under the calibrating chamber.

ION SELECTIVE DIP ELECTRODE ASSEMBLY

K. Jagan M. Rao, and K. Savitri Rao, both of 2 Baldwin Hill Pl., Moorestown, N.J. 08052

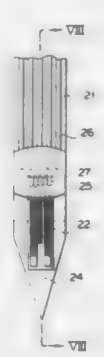
Continuation-in-part of Ser. No. 138,361, Dec. 26, 1987, abandoned, which is a continuation-in-part of Ser. No. 908,363, Sep. 17, 1986, abandoned. This application Mar. 15, 1989, Ser. No. 324,294
Int. Cl.[5] G01N *27/30*
U.S. Cl. 204—409 **3 Claims**

1. A dip electrode assembly of the ion-selective type used for the analytical determination of ion concentrations in a solution and comprising, in combination:

(a) A tube having a closed end and an open end and adapted for emersion of said closed end portion of said tube into a solution to be analyzed, said tube comprising a porous material having pores generally uniformly distributed there through, said pores communicating between the inside and the exterior of said tube, the maximum pore size of the pores in said tube being 100 microns in diameter;

(b) An electrode extending through said open end of said tube and adapted to be connected to an electrometer;

(c) Means for sealing said electrode to said tube adapted to permit connection of said electrode to an electrometer; and



(d) A membrane matrix material comprising an organic plastic material comprising a nonvolatile solvent plasticizer and an ion-active material dissolved in said plasticizer, said plasticizer being essentially nonreactive with and a nonsolvent for said tube, said membrane matrix material impregnating the pores of said tube and directly contacting said electrode.

SOLUTION COMPONENT SENSOR DEVICE

Isao Amemiya; Tadashi Sakai, both of Yokohama, and Shigeki Uno, Tokyo, all of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Sep. 22, 1989, Ser. No. 411,112
Claims priority, application Japan, Sep. 30, 1988, 63-246442
Int. Cl.[5] G01N *27/333, 27/414*
U.S. Cl. 204—416 **9 Claims**

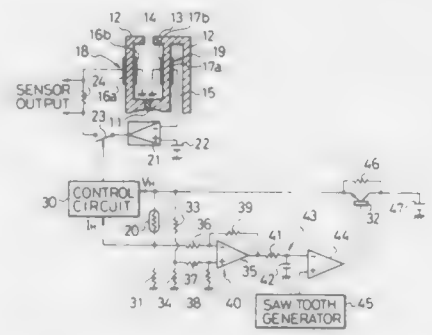
1. A sensor device for detecting a specified chemical component of a solution, comprising:

means for generating a potential corresponding to a concentration of a specified component of a solution;

reference means including an insulated-gate FET having a film insensitive to said component of the solution formed on the gate region, said insensitive film comprising a graft copolymer of a siloxane monomer and a comonomer other than a siloxane monomer which contains at least 1.5% by weight of siloxane groups; and

means for detecting a potential difference between the potential generating means and the reference means.

5,011,590



TEMPERATURE CONTROL DEVICE FOR OXYGEN CONCENTRATION SENSOR

Toyohei Nakajima, and Toshiyuki Mieno, both of Wako, Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Dec. 14, 1988, Ser. No. 284,284
Claims priority, application Japan, Dec. 14, 1987, 62-316569
Int. Cl.[5] G01N *27/41, 27/409*
U.S. Cl. 204—425 **2 Claims**

1. In an oxygen concentration sensor having first and second solid oxygen ion conductive electrolytic members insulated from each other, a gas diffusion-limiting zone defined by said first and second solid electrolytic members and into which is introduced a gas in which the concentration of oxygen is to be examined, a first pair of electrodes on opposite sides of said first solid electrolytic member, a second pair of electrodes on opposite sides of said second electrolytic member, and means for supplying pumping current to said first solid electrolytic member in response to a voltage generated across said second pair of electrodes so that said current flows in said first solid electrolytic member between said first pair of electrodes to cause an oxygen ion flow in said first solid electrolytic member between said first pair of electrodes, whereby the concentration of oxygen present within said gas diffusion-limiting zone varies, and said voltage is responsive to the concentration of oxygen within said gas diffusion-limiting zone for varying said pumping current, whereby the concentration of oxygen in said gas is detected from the value of said pumping current, a temperature control device for controlling the temperature of said oxygen concentration sensor comprising:

an electrical heating element for heating said first and second solid electrolytic members;

a switching element serially connected to said electrical heating element and forming a series circuit together therewith;

a power supply for supplying a direct current voltage to said electrical heating element and said switching element;

current detecting means for constantly detecting heating current flowing in said electrical heating element;

driving means for selectively energizing said switching element with pulses of a predetermined repetition period having a duty factor corresponding to the value of said heating current detected by the current detecting means for selectively energizing and deenergizing said switching element; and,

a resistance connected between input and output terminals of said switching element for constantly supplying a small amount of current to said electrical heating element for detecting the resistance value of said electrical heating element irrespective of whether said switching element is energized or deenergized.

5,011,591

LARGE-PORED CRYSTALLINE TITANIUM MOLECULAR SIEVE ZEOLITES

Steven M. Kuznicki, Easton, Pa., assignor to Engelhard Corporation, Edison, N.J.

Division of Ser. No. 94,237, Sep. 8, 1987, Pat. No. 4,853,202. This application Jun. 5, 1989, Ser. No. 348,226
Int. Cl.[5] C01G *35/06*
U.S. Cl. 208—46 **6 Claims**

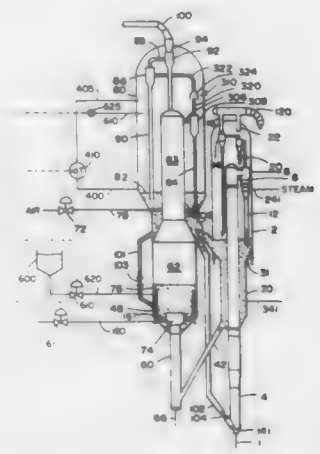
1. A process for conversion of an organic compound which comprises contacting the same at conversion conditions with a crystalline titaniumsilicate molecular sieve zeolite having a pore size of approximately 8 Angstrom units and a composition in terms of mole ratios of oxides as follows:

$$1.0 \pm 0.25\ M_{2/n}O : TiO_2 : y\ SiO_2 : z\ H_2O$$

wherein M is at least one cation having a valence of n, y is from 2.5 to 25, and z is from 0 to 100, said zeolite being characterized by an X-ray powder diffraction pattern having the lines and relative intensities set forth in Table I of the specification.

2. A process for reforming a naphtha which comprises contacting the same in the presence of added hydrogen and a hydrogenation/dehydrogenation component with a crystalline titaniumsilicate molecular sieve zeolite having a pore size of approximately 8 Angstrom units and a composition in terms of mole ratios of oxides as follows:

$$1.0 \pm 0.25\ M_{2/n}O : TiO_2 : y\ SiO_2 : z\ H_2O$$



wherein M is at least one cation having a valence of n, y is from 2.5 to 25, and z is from 0 to 100, said zeolite being characterized by an X-ray powder diffraction pattern having the lines and relative intensities set forth in Table I of the specification.

5,011,592

PROCESS FOR CONTROL OF MULTISTAGE CATALYST REGENERATION WITH FULL THEN PARTIAL CO COMBUSTION

Hartley Owen, Belle Mead, N.J., and Paul H. Schipper, Wilmington, Del., assignors to Mobil Oil Corporation, Fairfax, Va.

Filed Jul. 17, 1990, Ser. No. 554,309
Int. Cl.[5] C10G *11/00*
U.S. Cl. 208—113 **18 Claims**

1. A fluidized catalytic cracking process wherein a heavy hydrocarbon feed comprising hydrocarbons and sulfur and nitrogen compounds and having a boiling point above about 650 F. is catalytically cracked to lighter products comprising the steps of:

a. catalytically cracking the feed in a catalytic cracking zone operating at catalytic cracking conditions by contacting the feed with a source of hot regenerated catalyst to produce a cracking zone effluent mixture having an effluent temperature and comprising cracked products and spent cracking catalyst containing strippable hydrocarbons and coke containing nitrogen and sulfur compounds;

b. separating the cracking zone effluent mixture into a cracked product rich vapor phase and a solids rich phase comprising the spent catalyst and strippable hydrocarbons;

c. stripping the separated spent catalyst with a stripping gas to remove strippable compounds from spent catalyst and produce stripped catalyst;

d. regenerating said stripped catalyst in a primary regeneration stage, comprising a fast fluidized bed coke combustor having at least one inlet for primary combustion gas and for spent catalyst, and an overhead outlet for at least partially regenerated catalyst and flue gas, and also comprising a contiguous, superimposed, dilute phase transport riser having an opening at the base connective with the coke combustor and an outlet at an upper portion thereof

for discharge of partially regenerated catalyst and primary flue gas, at primary regeneration conditions adapted to completely afterburn CO formed during coke combustion to CO2, and sufficient to burn at least 40 % of the coke and sulfur compounds on the catalyst under oxidizing conditions while retaining at least 30% of the nitrogen compounds on said catalyst to produce partially regenerated catalyst containing nitrogen compounds and flue gas comprising SOx;

e. discharging and separating the primary flue gas from partially regenerated catalyst and collecting said partially regenerated catalyst as a second fluidized bed of partially regenerated catalyst in a secondary regeneration zone maintained at catalyst regeneration conditions and regenerating under partial CO oxidation conditions said partially regenerated catalyst to remove additional coke from said catalyst and to burn the nitrogen compounds present in said stripped catalyst under reducing conditions to produce regenerated catalyst and a secondary flue gas stream comprising at least 1 mole % CO; and

f. recycling to the catalytic cracking process hot regenerated catalyst from said second fluidized bed.

5,011,593

CATALYTIC HYDRODESULFURIZATION

Robert A. Ware, Wyndmoor, Pa., and Stephen S. Wong, Medford, N.J., assignors to Mobil Oil Corporation, Fairfax, Va.

Filed Nov. 20, 1989, Ser. No. 442,870

Int. Cl.[5] C10G *1/00*

U.S. Cl. 208—213 **19 Claims**

1. A process for the hydrodesulfurization of a aromatic hydrocarbon fraction having an aromatic content of at least 50 weight percent, which comprises contacting the fraction in the presence of hydrogen at a hydrogen partial pressure from 400 to 1200 psig, a temperature from 600° to 750° F and at a conversion relative to the initial boiling point of the hydrocarbon fraction of less than 10 percent by weight, with a hydrodesulfurization catalyst comprising a metal hydrogenation component and zeolite beta.

5,011,594

PROCESS FOR THE CONTINUOUS EXTRACTION OF MIXTURES OF ORGANIC SUBSTANCES WITH SUPERCRITICAL SOLVENTS

Eckhard Haeffner, Clausthal-Zellerfeld; Hedi Ben-Nasr, Gelsenkirchen; Bernd Knuth, Essen; Hubert Jasper, Haltern, and Klaus Reimann, Essen, all of Fed. Rep. of Germany, assignors to Fried. Krupp GmbH, Essen, Fed. Rep. of Germany

Filed Dec. 16, 1988, Ser. No. 285,387

Claims priority, application Fed. Rep. of Germany, Dec. 18, 1987, 3743058

Int. Cl.[5] C10G *21/00*

U.S. Cl. 208—320 **33 Claims**

1. A process for continuous, supercritical phase extraction of a mixture of organic substances with at least one solvent in the supercritical state, which mixture includes at least one extractable organic substance capable of being taken up into the supercritical phase and having at least one of (a) a high boiling point and (b) a melting point or melting range but no boiling point, and which at least one solvent is selected from the group consisting of CO_2, propane, butane, pentane, petroleum ether, and water and therein the at least one solvent has a critical temperature, T_k, and has a critical pressure, P_k, the process comprising:

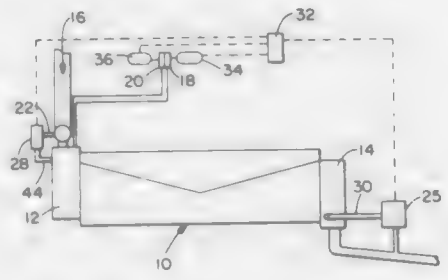
a. providing an extraction vessel comprised of an extraction column, the extraction column extending vertically, having a head portion at the upper end thereof and a sump portion at the lower end thereof, and having a temperature gradient which deceases from the sump portion to the head portion,

wherein the sump portion has a temperature effective to maintain extraction residue in a flowable state thereby permitting continuous removal thereof from the sump portion, and

wherein the head portion has a temperature effective to provide an optimum take up of the extractable substances into the at least one solvent in the critical state; and

b. extracting the mixture of organic substances with the at least one solvent in the supercritical state at a pressure, P, ranging from $P > P_k$ up to $P < 400$ bar and at a temperature, T, of at least $T > T_k$ to provide a charged fluid phase comprised of extracted substances, and an extraction residue.

5,011,595



COMBINATION FEEDFORWARD-FEEDBACK FROTH FLOTATION CELL CONTROL SYSTEM

Gary F. Meenan, and Hayward Oblad, both of Bethel Park, Pa., assignors to Consolidation Coal Company, Pittsburgh, Pa.

Continuation-in-part of Ser. No. 360,820, Jun. 2, 1989, abandoned. This application Aug. 2, 1990, Ser. No. 562,056

Int. Cl.[5] B03D *1/00, 1/02*

U.S. Cl. 209—166 **2 Claims**

1. A system apparatus for automatically controlling the recovery of solids from a feed slurry passing into a froth flotation cell to which additives are supplied to separate the solids from impurities with the solids and impurities having different light reflective characteristics and the impurities passing from the flotation cell as tailings comprising:

(a) a flotation cell apparatus comprising a flotation cell, means to feed said slurry containing said solids and impurities to said flotation cell, means for removing a fraction from said flotation cell containing a concentrated portion of said solids and means for removing a tailings fraction from said flotation cell containing a concentrated portion of impurities and a minor amount of said solids,

(b) a first means coacting with the feed slurry passing into the cell responsive to the light reflective characteristics of the solids, said first means comprising a first optoelectric detector having a transparent tube containing light emitting diode means for emitting light into the feed slurry and a photoconductor means for generating a signal in response to light reflected from the solids and means to send said signal to a controller means,

(c) a second means coacting with said feed slurry passing into the cell responsive to the light reflective characteristics of the impurities and comprising a second optoelectric detector having a transparent tube containing light emitting diode means for emitting light onto the feed slurry and a photoconductor means for generating a second signal in response to light reflected from the impurities and means to send said second signal to said controller means,

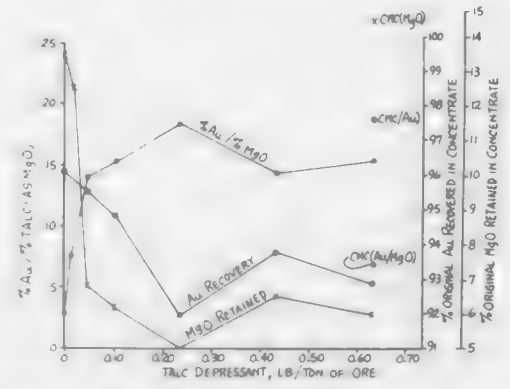
(d) said first and second detectors each have opaque barriers separating the diode means from the photoconductor means, the barrier in said first detector extending from between said diode means and said photoconductor means to at least the inner surface of the tube and the barrier in said second detector extending from between said diode means and said photoconductor means to a location spaced from the inner surface of the tube, and

(e) a third means coacting with the tailings having means responsive to the light reflective characteristics of the impurities and means to generate and send a feedback signal to said controller means of the impurities concentration of the tailings,

(f) said controller means comprising means to receive said signals from said first, second and third means and means to generate a control signal in response to said received signals,

(g) additive feed means for variably supplying said additives to the flotation cell comprising means to receive said control signal from said controller means and means to vary the addition of said additives to the flotation cell in response to said received control signal.

5,011,596



METHOD OF DEPRESSING READILY FLOATABLE SILICATE MATERIALS

Douglas R. Shaw, Denver, Colo., assignor to Weyerhaeuser Company, Tacoma, Wash.

Continuation-in-part of Ser. No. 489,118, May 5, 1990, abandoned. This application Sep. 19, 1990, Ser. No. 586,331

Int. Cl.[5] B03D *1/004, 1/106, 1/02*

U.S. Cl. 209—167 **28 Claims**

1. A method of depressing readily floatable silicate minerals in a froth flotation process of an ore containing said readily floatable silicate minerals and at least one value mineral which comprises subjecting a ground aqueous mineral pulp of said ore to froth flotation in the presence of a sufficient amount of a bacterial cellulose to depress the readily flotable silicate minerals into the flotation tailings and recovering the at least one value mineral in the froth.

5,011,597

SINGLE CELL VERTICAL STATIC FLOW FLOTATION UNIT

Anthony S. Canzoneri, 2408 Kentucky Ave., Kenner, La. 70063, and Ronald A. Boze, 19 Wisteria La., Covington, La. 70433

Continuation-in-part of Ser. No. 255,505, Oct. 11, 1988, abandoned. This application Jul. 25, 1989, Ser. No. 384,833

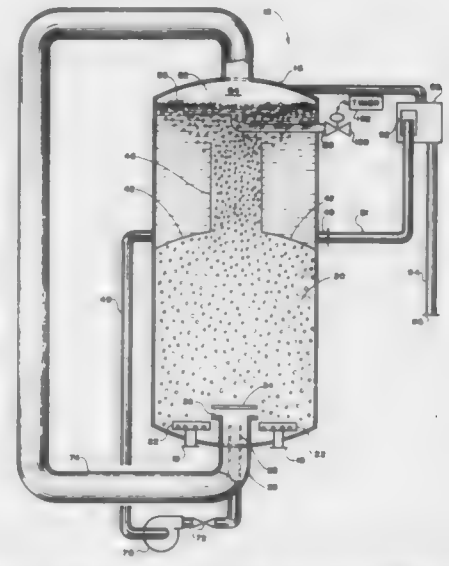
Int. Cl.[5] B01D *17/035*

U.S. Cl. 210—104 **11 Claims**

1. An apparatus for removing suspended matter from a liquid, comprising:

a substantially cylindrical vertically oriented vessel having a convex down bottom, a convex up top and a continuous side wall forming an interior chamber adapted to receive a flow of liquid having suspended matter therein, said vessel having a vertical axis;

an annular separation wall means having a central opening therein and being mounted in the vessel transversely to the vertical axis of the vessel for separating a lower gasification chamber from an upper degasification chamber;



said degasification chamber formed above said separation wall means in fluid communication with the gasification chamber through said opening in said annular wall means;

means for introducing the flow of liquid into the gasification chamber;

means for introducing a flow of gas into the gasification chamber for attracting the suspended matter and for carrying the suspended matter upwardly to the gasification chamber;

means for concentrating the upwardly moving suspended matter extending vertically through at least a portion of the degasification chamber;

a skim collection means for collecting the suspended matter in the upper portion of the degasification chamber and delivering the skim outside of the vessel, said skim collection means being positioned at a level above said suspended matter concentrating means;

means for removing treated liquid from the vessel positioned in a lower part of the degasification chamber; and

a means for controlling a volume of skim collection by changing a volume of liquid in the vessel at predetermined intervals, wherein said means for controlling skim collection volume comprise a normally closed skim collection outlet valve means, an adjustable timer means operatively connected to said valve means, said timer means having a means to send intermittent signals to said valve means causing the valve means to open, and a normally open, vertically adjustable nozzle means connected to said treated liquid outlet means for maintaining a predetermined volume of liquid in the vessel.

5,011,598

DOMESTIC LEAD PURGING SYSTEM FOR TREATING STAGNATED WATER

Alan G. Nathanson, 15 Pettit Dr., Dix Hills, N.Y. 11746

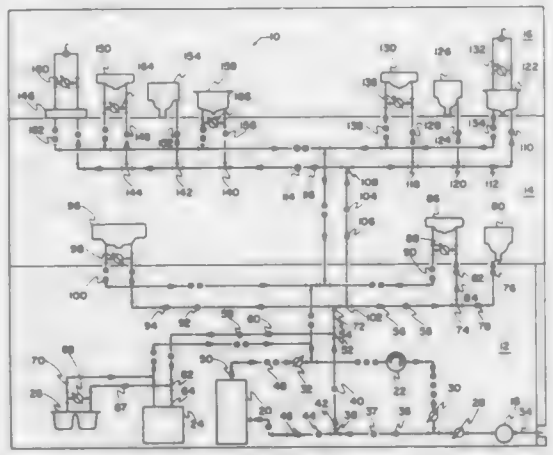
Continuation-in-part of Ser. No. 301,981, Jan. 26, 1989, abandoned. This application Feb. 16, 1990, Ser. No. 480,791

Int. Cl.[5] E03B *7/04*

U.S. Cl. 210—136 **3 Claims**

1. A system for removing lead from a stagnated domestic hot and cold water system having a plurality of fixtures with a plurality of faucets, respectively, comprising:

(a) a plurality of cold water pipes containing stagnated domestic cold water and connected to a plurality of fixtures, respectively, said stagnated domestic cold water being reuseable and not having to be wastefully dumped;



(b) a plurality of hot water pipes containing stagnated domestic hot water and connected to the plurality of fixtures, respectively, said stagnated domestic hot water being reuseable and never having to be wastefully dumped;

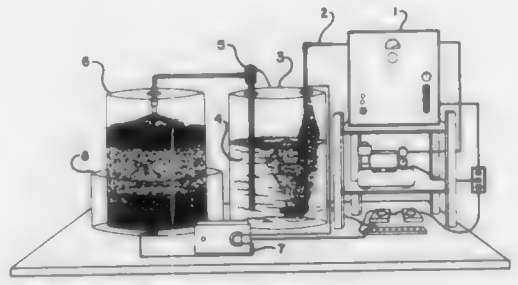
(c) means for fluidly connecting said plurality of cold water

pipes to said plurality of hot water pipes, respectively, so that said cold water can enter said plurality of hot water pipes, said connecting means include a plurality of crossover pipes so that said cold water can enter said hot water, when said fixtures are turned off, and a reverse flush is required;

(d) means for assuring that said cold water enters all of said plurality of hot water pipes and said hot water does not enter any of said plurality of cold water pipes, said assuring means include a plurality of check valves for assuring that an entire flow volume of said cold water enters all of said plurality of hot water pipes and that none of an entire flow volume of said hot water enters any of said plurality of cold water pipes, said plurality of check valves being located inside said plurality of crossover pipes, respectively, said plurality of check valves assuring that said cold water flows in a direction when it enters said plurality of crossover pipes to mix with said hot water;

(e) a hot water heater and means for circulating said cold water and said hot water through said plurality of cold

and hot water pipes when the plurality of faucets are closed so that the hot water and the cold water circulate in a reverse flow that assures that said hot water does not back up into the hot water heater, said circulating means including a circulation pump, said circulating pump circulating said cold water, as said cold water enters said hot water and achieving said reverse flow when said fixtures are not being used; and



(f) means for removing sediment and numerous other water contaminants from said stagnated domestic hot and cold water system including lead which has been leached into said hot water by stagnation without having to flush the stagnated domestic hot and cold water, said sediment removing means being located such that all of said stagnated hot water and stagnated cold water passes through said sediment removal means and including a purifier, said purifier containing activated charcoal, and a plurality of filter screens wherein each successive filter of said plurality of filters contain a filter whose screen is lower in gauge than the previous screen so that the filtering becomes finer and finer.

Int. Cl.[5] **B01D** *61/24, 61/28, 61/32, 63/02*

U.S. Cl. 210—637 **8 Claims**

1. A process for purifying a body fluid by combined dialysis and filtration, comprising:

(a) flowing the body fluid to be purified past one side of a semi-permeable membrane;

(b) simultaneously flowing dialyzate past the opposite side of said semi-permeable membrane, said flowing steps (a) and (b) being under conditions sufficient to permit purification of the body fluid by dialysis;

(c) over a first time span, and concurrently with said dialysis, causing the pressure on the dialyzate side of said semi-permeable membrane to be less than the pressure on the body fluid side thereof, said first time span and said pressure difference being sufficient to force middle and small molecular weight molecules to travel from the body fluid side to the dialyzate side of said semi-permeable membrane by filtration;

(d) over a second time span, subsequent to said first time span and concurrently with said dialysis, causing the pressure on the dialyzate side of said semi-permeable membrane to be greater than the pressure on the body fluid side thereof, said second time span and said pressure difference being sufficient to cause infusion through said semi-permeable membrane of an amount of dialyzate which is compensatory for the amount of fluid passing from the body fluid side to the dialyzate side during said first time span; and

(e) repeating said steps (c) and (d) in a manner such that alternating pressure differences occur across the same portion of said semi-permeable membrane at a rate which ensures efficient combined filtration and dialysis.

BIOGENIC AMINE ASSAY USING HPLC-ECD

Dragana Damjanovic, 10101 Saskatchewan Drive, Apt. 1601, Edmonton, Alberta, Canada T6E 4R6

Filed Nov. 18, 1988, Ser. No. 273,449

Int. Cl.[5] **B01D** *15/08*

U.S. Cl. 210—656 **60 Claims**

1. A method for the assaying of low concentrations of an oxidizable or reducible biogenic amine or derivative or metabolite thereof, comprising the steps of:

(a) preparing a sample of at least one said compound, said sample being suitable for quantitative analysis;

(b) injecting said sample into a high pressure liquid chromatography apparatus to thereby form a chromatogram, said apparatus including:

(1) a chromatography column containing a quantity of microparticulate material as a stationary phase;

(2) a mobile phase passing through said stationary phase, said mobile phase comprising the following components:

(a) from about 50 mM to about 250 mM of a buffer having a pH of from about 2 to about 8;

(b) from about 0.1 mM to about 10.0 mM of a chelating agent;

(c) from about 0.1 mM to about 10.0 mM of an alkyl sulfonate, said alkyl sulfonate having from about 4 to about 14 carbon atoms; and

(d) from about 0.1% to about 10% by volume methanol in water solution;

(3) an injector for injecting said sample;

(4) a pump for pumping said mobile phase through said stationary phase; and

(5) a guard column positioned upstream of said chromatography column;

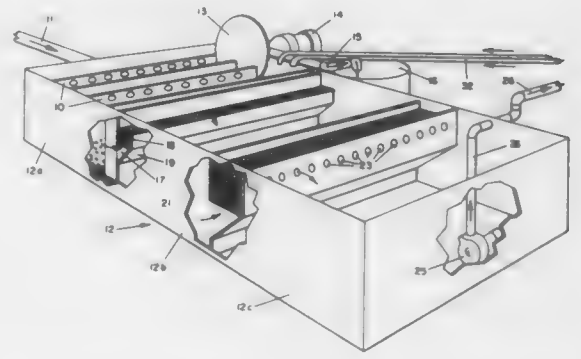
(c) eluting said compounds from said chromatography column;

(d) passing said eluted compounds through an electrochemical detector cell thereby producing a current output from said detector;

(e) measuring and integrating the current output from said electrochemical detector to obtain a quantitative analysis of said compound; and

(f) maintaining a substantially constant base line noise at a sensitivity of said electrochemical detector cell sufficient to measure the quantity of said compound present in resting, human plasma by maintaining all portions of said apparatus contacting said mobile phase and said stationary phase substantially residue-free, wherein the signal to noise ratio of said current output is at least 2 to 1.

5,011,609



ULTRASORB SYSTEM

Ronald G. Fink, 191 Commodore Dr., Jupiter, Fla. 33477

Division of Ser. No. 144,412, Jan. 15, 1988, Pat. No. 4,859,329. This application May 25, 1989, Ser. No. 357,004

Int. Cl.[5] **C02F** *9/00*

U.S. Cl. 210—665 **4 Claims**

1. A method of decontaminating water in a closed loop system, said water containing oil, grease, grit and fuel in the form of heavy solids, smaller solids, free oil, emulsified oil, and large oil globules, said method comprising the steps of:

(a) separating the heavy solids from the water;

(b) coalescing the emulsified oil products;

(c) absorbing free oil by an absorption cartridge;

(d) coalescing oil product globules and separating solids in the low micron range;

(e) absorbing the large oil globules with a mechanical filter; whereby water having a greatly reduced oil, grease, grit and fuel levels is produced, thereby producing a semi-decontaminated water, said method further comprising the steps of:

(f) further filtering said semi-decontaminated water to remove any remaining contaminants; and,

(g) injecting chemicals from a chemical feed system into said semi-decontaminated water to prolong water life and lower bacteria build-up.

5,011,610

WATER TREATMENT METHOD

Frank S. Martin, Farmersville, and Gary L. Silver, Centerville, both of Ohio, assignors to The United States of America as represented by the United States Department of Energy, Washington, D.C.

Filed Feb. 2, 1990, Ser. No. 473,794

Int. Cl.[5] **C02F** *1/28*

U.S. Cl. 210—667 **3 Claims**

1. Method for treating contaminated waste water containing dissolved metals including barium, silver, lead palladium, copper, strontium, or vandium, for the partial or substantially complete extraction thereof, comprising (a) dispersing uniformly throughout said contaminated waste water in the absence of molecular oxygen finely divided calcium sulfite in excess amounts sufficient to provide unreacted calcium sulfite to function as an ion adsorption solid which adsorbs at least some of said metals, to yield an intimate reaction mixture thereof under conditions which cause a reduction and insolubilization of said metals by reaction of a portion of said calcium sulfite with said metals and (b) separating the unreacted portion of said calcium sulfite and the insolubilized metal reaction products from the waste water.

5,011,611

METHOD OF SEPARATION OF FURFURAL FROM DILUTED AQUEOUS SOLUTIONS

Karel Jerábek; Karel Setínek, and Frantisek Kastánek, all of Praha, Czechoslovakia, assignors to Ceskoslovenska akademie ved, Praha, Czechoslovakia

Filed Dec. 15, 1989, Ser. No. 452,269

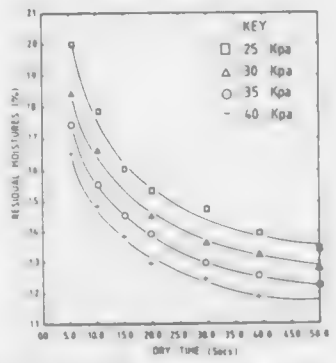
Claims priority, application Czechoslovakia, Dec. 16, 1988, 8371-88

Int. Cl.[5] B01D *15/00*

U.S. Cl. 210—674 **1 Claim**

1. A method for the separation of furfural from a diluted aqueous solution comprising contacting a furfural containing aqueous solution with a polymer adsorbent which comprises porous crosslinked copolymers of styrene and derivatives thereof having an internal surface area greater than 30 m^2/g and desorbing furfural from the adsorbent by contacting said adsorbent with at least one alcohol containing from 1–3 carbon atoms.

5,011,612



DEWATERING OF ALUMINA TRIHYDRATE

Mark Keeney, Bentley, Australia, assignor to Industrial Minerals Research & Development Pty. Ltd., Bentley and Nabalco Pty. Ltd., Sydney, both of, Australia

Filed Sep. 15, 1989, Ser. No. 407,667

Int. Cl.[5] B01D *37/03*

U.S. Cl. 210—712 **18 Claims**

1. A method which involves reducing the moisture content of an alumina trihydrate filter cake which is produced by filtering a slurry of alumina trihydrate solids obtained by the Bayer process in the processing of alumina, comprising contacting the alumina trihydrate filter cake with a product obtained by mixing an alkaline liquor and a C_8 to C_{20} fatty acid or fatty acid precursor or blend of said fatty acid and precursor.

5,011,613

METHOD FOR REGULATING THE RESIDUAL FREE CHLORINE IN WATER

Cathy Feray, Suresnes, and Conrad Hubele, L'Etang La Ville, both of France, assignors to Lyonnaise des Eaux, Paris, France

Filed Jan. 18, 1990, Ser. No. 466,908

Claims priority, application France, Feb. 16, 1989, 89 02042

Int. Cl.[5] C02F *1/76*

U.S. Cl. 210—739 **3 Claims**

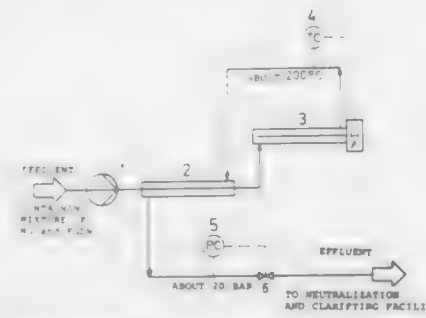
1. A method for regulating the residual-free chlorine in drinking water wherein regulation is carried out by introducing a quantity of chlorine determined as a function of the chlorine demand upstream of a water treatment of storage line, while producing water in a distribution network having a residual-free chlorine content at a set point; wherein

the chlorine demand for the water at a treatment or storage line inlet is determined by accelerating, by heating to a preselected temperature, chlorine reactions with untreated water samples so as to obtain, over a period of time, from about 5–10 minutes, water having a residual-free chlorine content corresponding to a value required for drinking; wherein

heating allows for a measure of the chlorine demand due to compounds including ammonia, organic matter, and iron ions, whereby chlorine disinfection is completed within 10 minutes.

5,011,614

PROCESS FOR THE DECOMPOSITION OF EXPLOSIVE NITRIC ACID ESTERS DISSOLVED IN WASTEWATERS



Wilhelm Gresser, Ludinghausen; Klaus Schelhase, Troisdorf-kriegdorf; Heinz Frisch, Haiger-Allendorf; Klaus Kaschel, Cologne; Berent Reinecke, and Wilhelm H. Trautmann, both of Burbach, all of Fed. Rep. of Germany, assignors to Dynamit Nobel AG, Troisdorf, Fed. Rep. of Germany

Filed Apr. 20, 1989, Ser. No. 340,685

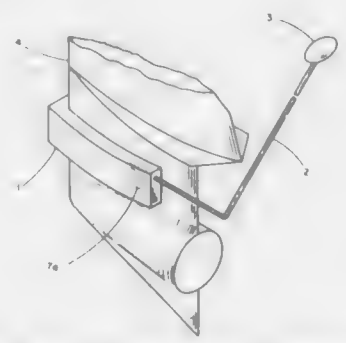
Claims priority, application Fed. Rep. of Germany, Apr. 20, 1988, 3813184

Int. Cl.[5] C02F *1/72;* **C06B** *21/00*

U.S. Cl. 210—761 **19 Claims**

1. A process for the decomposition of explosive nitric acid esters dissolved in wastewaters obtained from the manufacture of explosives and not being biodegradable, which comprises heating the wastewater containing the nitric acid esters dissolved therein, while maintaining the wastewater under pressure and in the liquid phase, to temperatures of between 150° C. and 300° C. to decompose the nitric acid esters without explosion.

5,011,615



METHOD AND APPARATUS FOR INHIBITING ORGANISM GROWTH IN MARINE MOTORS

David J. Minderman, 25901 Rustic La., Westlake, Ohio 44145

Filed Nov. 13, 1989, Ser. No. 434,353

Int. Cl.[5] B01D *1/50, 21/14*

U.S. Cl. 210—764 **8 Claims**

1. A method for chemically treating statically contained water within cooling water passages of outboard or stern-drive motors, the method comprising:

providing a substance holder having a cavity being adapted for fluid communication with inlets of the cooling water passages;

placing a biocidic treatment substance in the cavity of the substance holder;

placing said substance holder over the inlets of said cooling water passages to seal the cooling water passages and cavity against egress of the treatment substance and the statically contained water; and,

diffusing said biocidic treatment substance throughout the statically contained water in said cooling water passages.

5,011,616

FINISH COMPOSITION FOR FINE DENIER POLYAMIDE YARN

Robert M. Marshall, Chesterfield, Va.; James C. Raybon, Jr., Columbia, and Robert W. Medeiros, Irmo, both of S.C., assignors to Allied-Signal Inc., Morris Township, Morris County, N.J.

Filed Feb. 23, 1990, Ser. No. 484,132

Int. Cl.[5] D06M *13/17, 13/224, 13/256, 15/53*

U.S. Cl. 252—8.7 **16 Claims**

1. A finish composition for fine denier apparel polyamide yarn comprising an oil portion comprising

(a) 25 to 65 weight percent of an ester selected from the group consisting of n-butyl stearate, iso-butyl stearate, and combinations thereof, said ester being present in an effective amount to provide enhanced knitting performance of said yarn;

(b) 2 to 20 weight percent polyoxyethylene (9) perlargonate;

(c) 4 to 16 weight percent polyoxyethylene (3) cetyl-stearyl ether;

(d) 5 to 25 weight percent polyoxyethylene (25) castor oil;

(e) 0.2 to 2 weight percent tridecyl phosphate;

(f) 0.1 to 4 weight percent sodium dinonyl sulfosuccinate.

5,011,617

COMPLEX TOLYLENE POLUREA GREASE COMPOSITION AND PROCESS

Gian L. Fagan, Benicia, Calif., assignor to Chevron Research and Technology Company, San Francisco, Calif.

Filed Feb. 9, 1990, Ser. No. 478,130

Int. Cl.[5] C10M *1/10*

U.S. Cl. 252—18 **27 Claims**

1. A complex tolylene polyurea-thickened grease containing less than 7 parts per million 2,4-diaminotoluene.

12. A method for preparing a grease composition which comprises:

mixing a diisocyanate containing 4 to 32 carbon atoms, a polyamine containing 2 to 40 carbon atoms and a monoamine containing 1 to 30 carbon atoms with a major portion of a lubricating oil, the molar ratio of diisocyanate to polyamine to monoamine being 1:0–2:0.1–2;

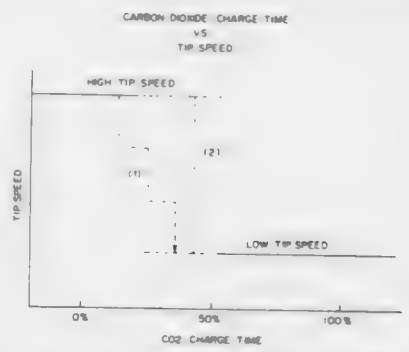
maintaining said mixture at a temperature of 60° to 320° F. for a period of 0.5 to 10 hours;

thereafter adding an alkaline earth metal oxide or hydroxide, a carboxylic acid anhydride containing 2 to 20 carbon atoms and a promoting amount of water to said mixture;

thereafter milling said mixture to the consistency of grease.

5,011,618

PROCESS FOR PRODUCING AN OVERBASED SULFONATE



Brian L. Papke, Wappingers Falls, and Leonard S. Bartley, Jr., Newburgh, both of N.Y., assignors to Texaco Inc., White Plains, N.Y.

Filed Sep. 5, 1989, Ser. No. 402,283

Int. Cl.[5] C10M *135/10*

U.S. Cl. 252—33 **4 Claims**

1. In a process for preparing an overbased oil soluble calcium sulfonate having a TBN of 400 to 450 in which calcium base is added to a diluted calcium sulfonate mixture and stirred for a sufficient length of time at a temperature of 50° to 60° C., and CO_2 is added to the heated mixture which is filtered to recover the sulfonate product wherein the improvement comprises stirring the calcium base and calcium sulfonate mixture at a variable tip speed ranging from a high tip speed sufficient to ensure full CO_2 reactivity for a period of time until the CO_2 reactivity of the sulfonate mixture increases at which time the tip speed is reduced to the lowest tip speed at which full CO_2

reactivity maintained until said CO_2 has reacted with 75% to 85% of the calcium base in said sulfonate mixture, wherein the sulfonate product's filterability is enhanced and viscosity reduced.

Patent Not Issued For This Number

5,011,620

CLEANING COMPOSITION OF DIBASIC ESTER AND HYDROCARBON SOLVENT

Kenneth T. Dishart, and Mark C. Wolff, both of Wilmington, Del., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Aug. 7, 1989, Ser. No. 392,996

Int. Cl.[5] C11D *9/30, 15/04, 17/00, 7/50*

U.S. Cl. 252—118 **10 Claims**

1. A cleaning composition designed for cleaning a printed circuit board consisting essentially of (1) a dibasic ester, (b) an aliphatic hydrocarbon solvent wherein the term hydrocarbon solvent excludes a terpene wherein a ratio of dibasic ester to hydrocarbon solvent is in a range from 5:95 to 25:75 by weight.

5,011,621

PAINT STRIPPER COMPOSITIONS CONTAINING N-METHYL-2-PYRROLIDONE AND RENEWABLE RESOURCES

Carl J. Sullivan, Exton, Pa., assignor to Arco Chemical Technology, Inc., Wilmington, Del.

Filed Jun. 4, 1990, Ser. No. 532,766

Int. Cl.[5] C09D *9/00;* **C11D** *7/50;* **C23G** *5/02*

U.S. Cl. 252—162 **18 Claims**

1. A coating remover composition based in part on renewable resources comprising:

(a) from about 20 to 80 weight percent of N-methyl-2-pyrrolidone;

(b) from about 20 to 80 weight percent of an oil selected from the group consisting of soybean, tall, tung, castor, sunflower, sesame, tallow, coconut, palm, cottonseed, peanut, olive, pine, linseed, rapeseed, corn, fish, whale and mixtures thereof;

(c) from 0 to about 50 weight percent of a cosolvent selected from the group consisting of one or more of aliphatic and aromatic hydrocarbons, terpenes, alcohols, glycols, carboxylic acids, aminoalcohols, nitriles, ethers, ketones, esters, glycol ethers, and glycol ether esters;

(d) from 0 to about 10 weight percent of a surfactant; and

(e) from 0 to about 15 weight percent of a thickener.

5,011,622

LIQUID CLEANING COMPOSITIONS AND PROCESS FOR THEIR PREPARATION

Frederik J. Schepers, Vlaardingen, Netherlands, assignor to Lever Brothers Company, Division of CONOPCO, Inc., New York, N.Y.

Filed Oct. 6, 1989, Ser. No. 418,048

Claims priority, application United Kingdom, Oct. 10, 1988, 8823705

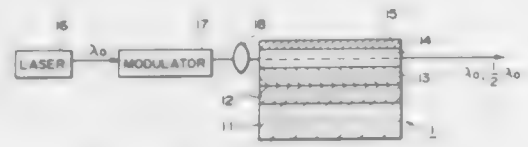
Int. Cl.[5] C11D *3/08, 7/54;* B08B *7/02, 5/00*

U.S. Cl. 252—174.15 17 Claims

1. A liquid cleaning composition having about 5% by weight or less water comprising a liquid phase having from 1% to 90% by weight of a solid phase having a particle size of from 0.1 to 100 microns dispersed therein, wherein the solid phase comprises aluminosilicate, zeolite builder particles having the general formula $Na_Z(AlO_2)_Z(SiO_2)_Y \cdot X\ H_2O$ wherein Z and Y are integers of at least 6, the molar ratio of Z to Y is in the range from 1.0 to 0.5, and X is an integer from 6 to 189 such that the moisture content is from about 4% to about 20% by weight, which particles have been deactivated by treatment thereof with a solution of an ammonium or substituted ammonium compound such that the molar ratio of ammonium ions to sodium ions in the solution is from about 0.05:1 to about 0.8:1 resulting in a percentage mole exchange of ammonium ions for sodium ions of 1% to 38%, and which particles are thereafter heated to a temperature above 100° C. to reduce the water content thereof to below 24% by weight before being dispersed in the liquid phase.

5,011,623

NONLINEAR OPTICAL MATERIAL AND NONLINEAR OPTICAL DEVICE



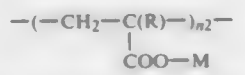
Kazuo Yoshinaga, Machida; Takashi Kai, Hadano; Koichi Egara, Tokyo; Yomishi Toshida, Yokohama; Hideaki Mitsutake, Tokyo; Koichi Sato, Atsugi, and Takeshi Miyazaki, Ebina, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Jul. 18, 1989, Ser. No. 381,277

Claims priority, application Japan, Jul. 20, 1988, 63-179097; Dec. 30, 1988, 63-334239

Int. Cl.[5] C09K *19/54*

U.S. Cl. 252—299.5 6 Claims



1. A nonlinear optical material, comprising:

a ferroelectric polymer liquid crystal and a nonlinear optical compound forming a solid solution, wherein

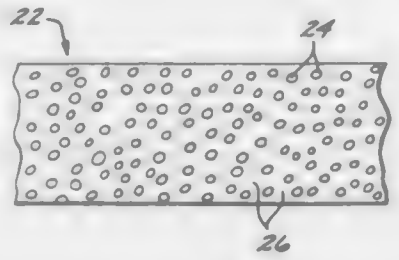
said nonlinear optical compound has a skeleton comprising a π-electron system and at least one member selected from the group consisting of electron-donating and electron-attracting groups, said nonlinear optical compound having a second order hyperpolarizability of at least 10×10^{-30} e.s.u.; and

said ferroelectric liquid crystal being a side chain-type polymer having a mesogen unit in its side chain represented by

wherein N2 is 5–5000, R is H, Cl or CH_3, and M is a mesogen unit including an asymmetric carbon atom.

5,011,624

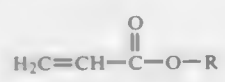
ACRYLATE POLYMER-DISPERSED LIQUID CRYSTAL MATERIAL AND DEVICE MADE THEREFROM



Frederick G. Yamagishi, 247 Mesa Ave., Newbury Park, Calif. 91320, and Leroy J. Miller, 8313 Hillary Dr., Canoga Park, Calif. 91304

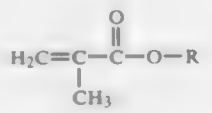
Continuation of Ser. No. 139,402, Dec. 30, 1987, abandoned.

This application Dec. 19, 1989, Ser. No. 453,077



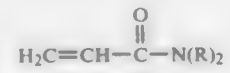
Int. Cl.[5] C09K *19/54*

U.S. Cl. 252—299.5 14 Claims



1. A composite material, comprising a plurality of droplets of a liquid crystal material within a matrix of a polymer formed by mixing and then polymerizing by photoinduced reaction a mixture consisting essentially of a photopolymerizable monomer, a photoinitiator, and a liquid crystal having a solubility in the polymer that is less than its solubility in the corresponding monomer, wherein the monomer is selected from the group consisting of

an ester having the structure



wherein R is selected from the group consisting of alkyl, aryl, hydroxyalkyl, and epoxyalkyl,

an ester having the structure

wherein R is selected from the group consisting of alkyl, aryl, hydroxyalkyl, and epoxyalkyl, and

an amide having the structure

wherein R is selected from the group consisting of alkyl, aryl, hydroxyalkyl, and epoxyalkyl.

5,011,625

AUTOTHERMAL STEAM REFORMING PROCESS

Joseph R. Le Blanc, Houston, Tex., assignor to The M. W. Kellogg Company, Houston, Tex.

Filed Dec. 11, 1989, Ser. No. 448,422

Int. Cl.[5] C10J *1/02;* C01B *3/38*

U.S. Cl. 252—376 6 Claims

1. A method for producing a raw ammonia synthesis gas from a fresh hydrocarbon feed which consists of:

(a) forming a first mixed feed comprising steam, a major portion of the fresh hydrocarbon feed, and an oxidant selected from the group consisting of air and oxygen-enriched air, introducing the first mixed feed to an exothermic catalytic steam reforming zone wherein there is produced a first reformed gas containing less than 1.0 volume percent, dry basis, residual hydrocarbon, and withdrawing the first reformed gas therefrom;

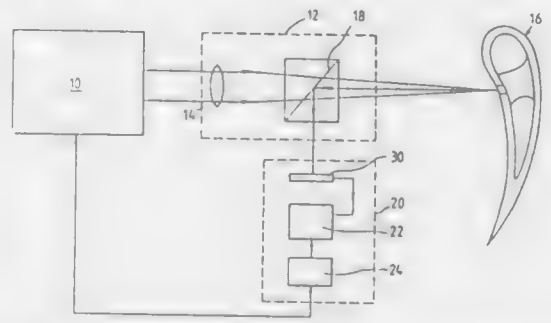
(b) forming a second mixed feed comprising steam and a remaining minor portion of the fresh hydrocarbon feed, introducing the second mixed feed to an endothermic catalytic steam reforming zone wherein there is produced a second reformed gas containing less than 4.0 volume percent, dry basis, residual hydrocarbon, and withdrawing the second reformed gas therefrom;

(c) combining the first and second reformed gases and cooling the combined first and second reformed gases by passing the combined gases in indirect heat exchange with the second mixed feed within the endothermic catalytic steam reforming zone whereby all of the heat required for the endothermic catalytic steam reforming of the second mixed feed therein is provided; and

(d) withdrawing and recovering the resulting cooled combined gases as raw ammonia synthesis gas product.

5,011,626

BARRIER MATERIALS FOR LASER DRILLING



Kong Ma, Duluth, and John T. Pinder, Marietta, both of Ga., assignors to Rolls-Royce Inc., Greenwich, Conn.

Filed Jun. 13, 1988, Ser. No. 206,123

The portion of the term of this patent subsequent to Oct. 10, 2006, has been disclaimed.

Int. Cl.[5] F21V *9/00;* B01F *3/00;* B23K *26/04, 26/00*

U.S. Cl. 252—582 7 Claims

1. A barrier material for use in laser machining to protect a surface which is in the path of the laser beam from being machined, the barrier material comprising a thixotropic aqueous suspension of acrylamide and including, as a laser light dispersant, acrylic particles.

5,011,627

SCREEN-PRINTABLE PASTE FOR MANUFACTURING ELECTRICALLY CONDUCTIVE COATINGS

Klaus Lutz, Rodenbach; Hans-Joachim Baer, Frankfurt; Karl-Anton Starz, Rodenbach; Werner Leske, Gelnhausen, and Harry Mueller, Rodenbach, all of Fed. Rep. of Germany, assignors to Degussa Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany

Filed Mar. 7, 1989, Ser. No. 319,683

Claims priority, application Fed. Rep. of Germany, Mar. 19, 1988, 3809331

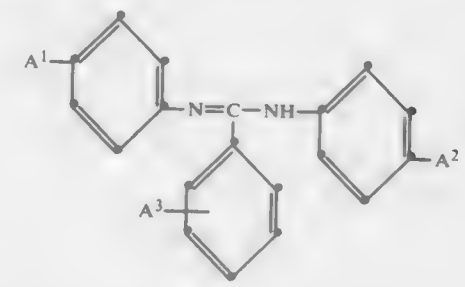
Int. Cl.[5] H01B *1/06*

U.S. Cl. 252—512 3 Claims

1. A screen-printable paste consisting essentially of 40 to 75% by weight of an electrically conductive metal powder selected from the group consisting of silver, aluminum, copper and mixtures thereof, 5 to 20% by weight of an organic synthetic resin and 5 to 55% by weight of an organic solvent for producing electrically conductive coatings on a flexible plastic sheet wherein a thermoplastic epoxy or phenoxy resin with an average molecular weight of 10,000 to 250,000 and an epoxy content of 0 to 1 equ./kg is the organic synthetic resin.

5,011,628

N,N'-DIARYLBENZAMIDINES USEFUL AS ULTRAVIOLET LIGHT ABSORBERS



Isaac D. Cohen, Brooklyn, N.Y., and Joseph A. Virgilio, Wayne, N.J., assignors to Givaudan Corporation, Clifton, N.J.

Continuation-in-part of Ser. No. 207,088, Jun. 15, 1988, abandoned. This application Apr. 11, 1989, Ser. No. 336,286

Int. Cl.[5] F21V *9/04;* C07C *257/00, 229/00, 255/00*

U.S. Cl. 252—589 20 Claims

11. An ultraviolet-absorbing composition comprising a compound of the formula

I

wherein:

A^1 and A^2 may be the same or different and represent $-COOR^1$, $-CONR^1R^2$, $-C{\equiv}N$ or $-C_6H_5$;

A^3 represents —H, —OH, —OR, —Cl, $-NO_2$, $-C{\equiv}N$, $-C_6H_5$, or an alkyl group of one to five carbon atoms;

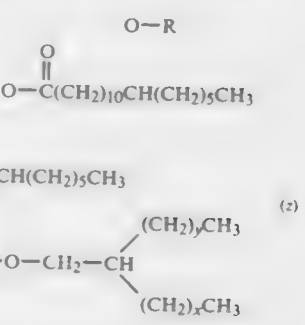
R^1 and R^2 may be the same or different and represent hydrogen or an alkyl group of one to ten carbon atoms; and,

R represents an alkyl group of one to ten carbon atoms,

and at least one organic material subject to degradation by ultraviolet light.

5,011,629

HYDROXYSTEARIC POLYESTERS OF GUERBET ALCOHOLS AS POLYCARBONATE LUBRICANTS



Raymond E. Bilbo, 1008 Olde Hinge Way, Sneville, Ga. 30278

Filed Apr. 17, 1989, Ser. No. 338,897

Int. Cl.[5] C11C *3/100*

U.S. Cl. 260—405 4 Claims

1. A compound conforming to the following structure;

(z)

Wherein;

x and y are independently integers from 2 to 33;

z is an integer ranging from 1 to 200;

R is selected from H, or —C(O)R';

R' is alkyl or aryl having from C1H3 to C40H82.

5,011,630

EMULSIFIABLE TRIGLYCERIDE COMPOSITIONS

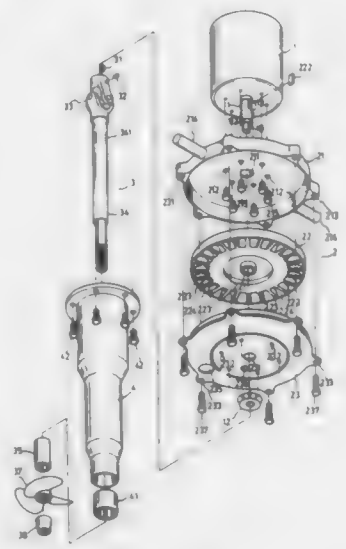
Gary T. Martino, Dayton, and Martin M. Tessler, Edison, both of N.J., assignors to National Starch and Chemical Investment Holding Corporation, Wilmington, Del.

Filed Jun. 7, 1985, Ser. No. 742,664
Int. Cl.[5] C11C *3/04*
U.S. Cl. 260—410.7 4 Claims

1. A water dispersible triglyceride composition comprising the amidification reaction product of:

(a) an addition product of a triglyceride oil of an unsaturated fatty acid having at least 12 carbon atoms in the fatty acid chain and an olefin selected from the group consisting of acyclic olefinic carboxylic acids and the acid anyhydrides thereof having less than 10 carbon atoms in their carbon chains and wherein the double bond of the olefin is α,β- to the carboxylic acid group; and

(b) a water soluble monoamino-terminated blocked polyalkylene oxide having a molecular weight of at least about 300;



wherein the reaction product is dispersible and self-emulsifiable in water.

5,011,631

TURBO-JET AERATOR

Sean Hwang, Lung An No. 11, Chungho Tsun, Hsinshe Hsiang, Taichung Hsien, Taiwan

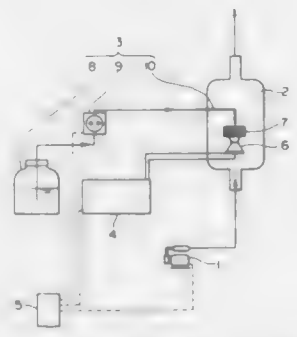
Filed Nov. 14, 1989, Ser. No. 436,292
Int. Cl.[5] B01F *3/04*
U.S. Cl. 261—30 1 Claim

1. A turbo-jet aerator comprising:

a motor;

a turbo-jet means having an upper cover, a turbine and a lower cover and connected to said motor, said upper cover being a cylindrical member with a center hole and threaded holes on the circumference and the surface, said lower cover being a cylindrical member with a center hole, threaded holes on the circumference and the surface, a sucking hole and an outlet on the surface, said turbine having a center hole and a plurality of equidistant radial leaves;

a stirring mechanism connected to said motor at one end and a fan at the other;



whereby when the motor is turned on, the turbine and the stirring mechanism will be rotated and recesses between leaves of said turbine will immediately reduce pressure inside said turbo-jet means and a large amount of air will be sucked in from the outside and ejected out through the outlet of said turbo-jet means and then the air will pass and dissolve into water of a pond.

5,011,632

ULTRASONIC FRAGRANCE GENERATION APPARATUS

Hisato Yano; Shusa Hashimoto, and Tsuyoshi Horiyama, all of Tokyo, Japan, assignors to Shimizu Construction Co., Ltd., Tokyo, Japan

Filed Feb. 7, 1990, Ser. No. 476,589
Claims priority, application Japan, Feb. 7, 1989, 1-[illegible]242
Int. Cl.[5] B01F *3/04*
U.S. Cl. 261—81 3 Claims

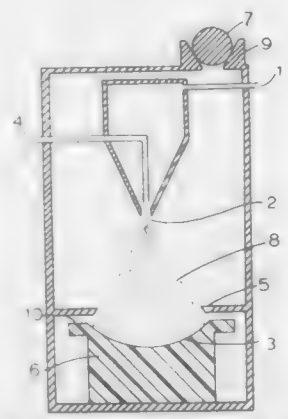
1. An ultrasonic fragrance generation apparatus comprising:

a fragrance solution vaporization vessel having an air inlet, a fragrant mist outlet, and a central line of air flow between said inlet and said outlet;

an air supply device supplying pressurized air through said air inlet;

an ultrasonic wave generation device located in said fragrance solution vaporization vessel along said central line of air flow;

a fragrance solution supply device supplying a fragrance solution to said ultrasonic wave generation device, said ultrasonic wave generation device including a vibrating surface by which the fragrance solution is vaporized within the fragrance solution vaporization vessel; and



a vaporization promoting material disposed above and in contact with said vibrating surface, said vaporization promoting material being of relatively increased surface area for facilitating vaporization of the fragrance solution within said fragrance solution vaporization vessel.

5,011,633

METHOD OF CONTROLLING THE THICKNESS OF CAST LENSES

Charles W. Neefe, Big Spring, Tex., assignor to Sunsoft Lenses, Albuquerque, N. Mex.

Filed Dec. 11, 1989, Ser. No. 448,243
Int. Cl.[5] B29D *11/00*
U.S. Cl. 264—1.1 20 Claims

1. A method of controlling the thickness of a spin cast lens by the steps of, providing a pressure controlled source of an inert gas and a time controlled valve, supplying the pressure controlled inert gas to a spray nozzle for a predetermined time, and providing a liquid lens monomer to the spray nozel, allowing the liquid lens monomer to be atomized by the inert gas leaving the spray nozzle to form a cone shape pattern, placing a concave lens mold in the cone shaped spray to collect the atomized spray on the concave optical mold surface, allowing the inert gas to flow for the predetermined time thereby controlling the volume of monomer deposited on the optical mold surface then polymerizing the monomer while spinning the mold, thereby controlling the thickness of the finished lens.

MICROCAPSULES AND MICROCAPSULE PRODUCTION PROCESS

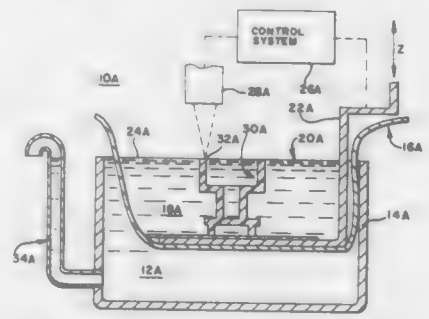
Gunter Pietsch, Isernhagen, and Karl-Heinz Schrader, Hanover, both of Fed. Rep. of Germany, assignors to Papierfabrik August Koehler AG, Oberkirch, Fed. Rep. of Germany

Continuation-in-part of Ser. No. 169,630, Mar. 18, 1988, Pat. No. 4,965,025, which is a continuation-in-part of Ser. No. 922,591, Oct. 24, 1986, Pat. No. 4,824,823. This application Dec. 16, 1988, Ser. No. 285,506
Claims priority, application Fed. Rep. of Germany, Dec. 21, 1987, 3743427; Jun. 1, 1988, 3818712
The portion of the term of this patent subsequent to Apr. 25, 2006, has been disclaimed.
Int. Cl.[5] B01J *13/16*
U.S. Cl. 264—47 37 Claims

1. A process for microencapsulating hydrophobic oils within discrete aminoplastic microcapsules, comprising the steps of:

combining a hydrophobic oil, a cationic compound, and an anionic sulphonated melamine/formaldehyde precondensate in an aqueous medium, wherein the oil is added under turbulent stirring conditions, to form a stable dispersion of said oil in said medium,

acidifying said aqueous medium,



contacting an aminoplastic wall-forming compound with the dispersed oil of said acidified medium, under laminar stirring conditions, to form said microcapsules.

STEREOLITHOGRAPHIC METHOD AND APPARATUS IN WHICH A MEMBRANE SEPARATES PHASES

Edward J. Murphy, Arlington Heights; John J. Krajewski, Wheeling, and Robert E. Ansel, Hoffman Estates, all of Ill., assignors to DeSoto, Inc., Des Plaines, Ill.

Filed May 18, 1989, Ser. No. 353,538
Int. Cl.[5] B29C *35/08, 41/00, 71/04*
U.S. Cl. 264—22 14 Claims

1. An apparatus for producing a three-dimensional object comprising means for containing a fluid phase positioned therein, a substantially impermeable, movable membrane positioned on top of the fluid phase in said first recited means, a radiation-polymerizable liquid organic phase positioned in the containing means on top of the membrane such that contact of the phase is inhibited, a radiation source positioned above the liquid organic phase adapted to radiate the liquid organic phase to form a polymerized organic layer, movable support means and means for forming and combining successive adjacent polymerized organic layers to form a three-dimensional object.

6. A method of producing a three-dimensional object comprising the steps of:

(a) providing a fluid phase in a container;

(b) providing a substantially impermeable, movable membrane positioned on top of the fluid phase;

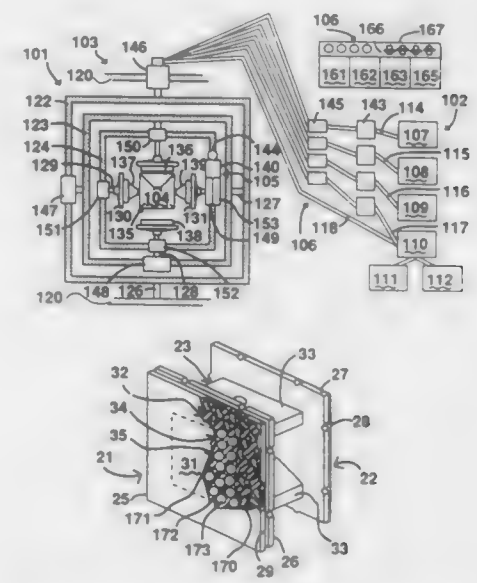
(c) providing a radiation-polymerizable liquid organic phase positioned on top of the membrane, the liquid organic phase having an upper surface;

(d) providing a radiation source positioned above the upper surface;

(e) exposing at least a portion of the upper surface to radiation in an amount effective to at least partially polymerize the liquid organic phase at and just below the upper surface to form an at least partially polymerized organic layer;

(f) covering the at least partially polymerized organic layer with additional liquid organic phase, the additional liquid organic phase having an upper surface;

(g) exposing at least a portion of the upper surface to radiation in an amount effective to at least partially polymerize the additional liquid organic phase at and just below the upper surface to form another at least partially polymerized organic layer; and



(h) repeating steps (f) and (g) to form a three-dimensional object.

5,011,636

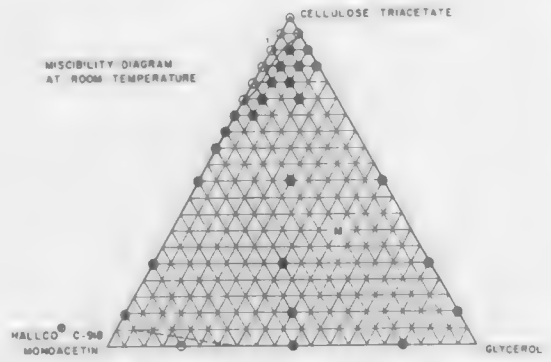
STRUCTURAL UNIT AND METHOD FOR MOLDING SAME

LeRoy Payne, 3300 Nicholas La., Molt, Mont. 59057

Continuation-in-part of Ser. No. 271,717, Nov. 19, 1988, Pat. No. 4,909,718, which is a continuation-in-part of Ser. No. 202,267, Jun. 6, 1988, Pat. No. 4,956,135, which is a continuation-in-part of Ser. No. 890,742, Jul. 30, 1986, Pat. No. 4,749,533, which is a division of Ser. No. 766,498, Aug. 19, 1985, Pat. No. 4,671,753. This application Mar. 19, 1990, Ser. No. 495,621
Int. Cl.[5] B29C *41/06, 41/52;* B32B *5/20*
U.S. Cl. 264—40.7 30 Claims

1. An integrally molded plastic structural unit including spaced support members joined by a web section disposed therebetween, each of said support members including spaced face sections and an intermediate section therebetween, each face section including a stressed hard outer skin, said intermediate section including a peripheral frame section of high density, said web section including high density connector mem-

bers extending between adjoining face sections of said spaced support members, each of said support members including mateable sections along at least two edges thereof, each of said mateable sections including at least five alternating raised and recessed areas forming an asymmetrical pattern along the length of each mateable section, the pattern being the same or a reverse pattern thereof along each mateable section of the same unit and of adjacent units with which it will be assembled, said mateable sections extending beyond said face sections or being recessed below said face sections on said edges of said unit a substantially equal distance; whereby adjacent units are interconnected by engaging a recessed mateable section of one unit with a raised mateable section of an adjacent unit or vice versa.



30. A continuous method of molding a structural unit including the steps of continuously advancing raw materials from a plurality of reservoirs independently to a mixing chamber located closely adjacent to a mold assembly including separable mold sections, introducing said raw materials into said mixing chamber, passing a freshly formed mixture flowing from said mixing chamber directly into a cavity of said adjacent mold assembly in a preselected and monitored flow rate profile, rotating said mold assembly about at least three intersecting axes in a preselected and monitored rotational profile, initially flowing said mixture over surfaces of said mold cavity by said rotational movement to form a hard skin surface, flowing additional quantities of said mixture to peripheral edges of said mold cavity, forming therewith an integral high density peripheral frame section, monitoring and coordinating in a preselected profile the delivery of raw materials to said mixing chamber, the resulting mixture flowing therefrom and the multiple axis rotation of said mold assembly, separating said mold sections of said mold assembly after said unit has formed said mold cavity, removing a molded unit from said separated mold sections, closing said mold sections and repeating said steps to form a multiplicity of such molded units on a continuing basis.

PREPARING CELLULOSE ESTER MEMBRANES FOR GAS SEPARATION

Dana C. Overman, III, Vallejo; Jee I. Kau, Concord, and Robert D. Mahoney, Danville, all of Calif., assignors to The Dow Chemical Company, Midland, Mich.

Filed Jan. 23, 1989, Ser. No. 301,000
Int. Cl.[5] B29C *67/20*; D01F *2/02*
U.S. Cl. 264—41 **10 Claims**

1. A process for preparing a semi-permeable cellulose ester membrane, which process comprises the steps of:

A. forming a non-harmful or non-deleterious mixture comprising:

i. at least one cellulose ester, and

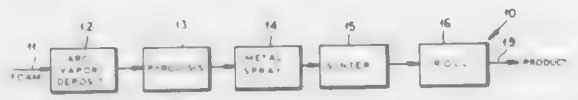
ii. at least one non-harmful or non-deleterious solvent selected from the group consisting essentially of glycol monoacetate, glycerol diacetate, glycerol triacetate, and mixtures thereof, in an amount itself sufficient to solubilize the cellulose ester at the membrane fabrication temperature;

B. heating the mixture to a temperature at which the mixture becomes a homogeneous fluid;

C. extruding, molding, or casting the homogeneous fluid into the form of a semi-permeable membrane;

D. passing the membrane through one or more quench zones wherein the membrane gels and solidifies; and

E. passing the membrane through one or more leach zones, one or more anneal zones or a combination thereof in which at least a portion of the solvent and optional non-solvent is removed from the membrane;



wherein the semi-permeable membrane so formed is useful for gas separation.

5,011,638

METHOD OF MAKING OPEN-PORE STRUCTURES

Eduard Pinkhasov, Eastchester, N.Y., assignor to Vapor Technologies, Inc., Mt. Vernon, N.Y.

Continuation-in-part of Ser. No. 208,886, Jun. 17, 1988, Pat. No. 4,975,230. This application Dec. 9, 1988, Ser. No. 283,174
The portion of the term of this patent subsequent to Dec. 4, 2007, has been disclaimed.
Int. Cl.[5] C04B *33/32*; B22D *23/00*
U.S. Cl. 264—59 **18 Claims**

1. A method of fabricating an open-pore structure, comprising:

(a) depositing by arc vapor deposition on and in an openwork synthetic-resin pyrolyzable support a coating of at least one material selected from the group which consists of metals, semiconductors and ceramics by juxtaposing said support with a pair of electrodes at least one of which is composed of at least one element of said material, advancing said electrodes into contact to strike an electric arc between said electrodes and evaporate said element from said one of said electrodes and effect deposition of said material on said support, and evacuating a space in which said support is juxtaposed with such electrodes prior to or during deposition of said coating, whereby a fraction of a total amount of said material adapted to ultimately form said open-pore structure is deposited in the form of said coating;

(b) spraying onto at least one of said support and said coating in at least one spray-deposition operation a quantity of said material sufficient to make up the remainder of said total amount;

(c) pyrolyzing said support after at least one of step (a) and step (b) to form an openwork skeleton consisting essentially of said material; and

(d) sintering said skeleton into a coherent body constituting said open-pore structure.

5,011,639

METHOD FOR THE PREPARATION OF A SINTERED BODY OF SILICON CARBIDE

Nobuaki Urasato; Minoru Takamizawa; Akira Hayashida; Hiromi Ohsaki, and Jiyunitirow Maruta, all of Niigata, Japan, assignors to Shin-Etsu Chemical Co. Ltd., Ote, Japan

Continuation of Ser. No. 179,480, Apr. 8, 1988, abandoned, which is a continuation-in-part of Ser. No. 43,603, Apr. 28, 1987, abandoned. This application Dec. 12, 1989, Ser. No. 453,038
Claims priority, application Japan, Jun. 5, 1986, 61-130914
Int. Cl.[5] C04B *35/56*
U.S. Cl. 264—65 **7 Claims**

1. A method for the preparation of a sintered body of silicon carbide having a relative density of at least 90% and an electric volume resistivity in the range from 10^{10} to 10^{13} ohm-cm, which comprises the steps of:

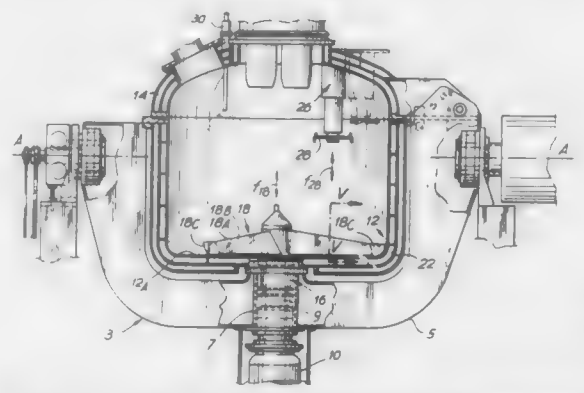
(a) pyrolyzing a methyl hydrogen silane represented by the general formula

$$(CH_3)_aSi_bH_c$$

wherein b is 1,2 or 3, 2b+1 is not less than a, a is not less than b,2b+1 is not less than c, c is a positive integer and a+c is equal to 2b+2, in the vapor phase to give a β-type silicon carbide powder;

(b) admixing the β-type silicon carbide powder with boron or a boron compound in an amount in the range of 0.1 to 5.0% by weight as boron to give a uniform powdery mixture;

(c) molding the powdery mixture by compression molding to give a green body; and



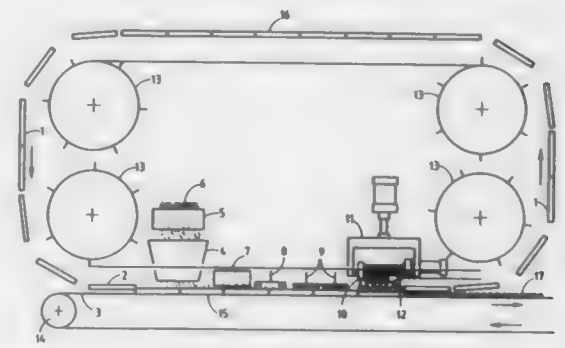
(d) heating the green body under normal pressure in an atmosphere of a rare gas containing nitrogen in a concentration in the range from 0.01 to 2% by volume at a temperature in the range from 1800° to 2200° C. to effect sintering of the green body.

5,011,640

PROCESS FOR SPHERONIZATION AND DEVICE FOR IMPLEMENTING SAID PROCESS

Aldo Zanchetta, Lucca, Italy, assignor to Zanchetta & C. s.r.l., Lucca, Italy

Filed Mar. 1, 1990, Ser. No. 486,772
Claims priority, application Italy, Mar. 1, 1989, 9356 A/89
Int. Cl.[5] B29B *9/08*
U.S. Cl. 264—69 **15 Claims**



1. A process of spheronization, that is to say of production of bulk material in the form of small-diameter spheres from pulverulent materials, wherein: one or more powders are placed in a leaktight vessel having a substantially vertical axis and comprising a bottom blade rotating about an axis parallel to the axis of said vessel, and a single or multiple spheronizing rotating tool having a substantially discoidal form; wherein said powders are mutually mixed by means of the rotation of said bottom blade, a binder solution being added thereto; and wherein the composition of powders and binder solution is spheronized by immersing said spheronizing tool in said composition and causing it to rotate simultaneously with said blade.

PREPARATION OF SHAPED AGGLOMERATED PARTICULATE MATERIAL

Marcel Buhler, Tolochenaz, and Jean-Michel Martin, Valeyres/Rances, both of Switzerland, assignors to Nestec S.A., Vevey, Switzerland

Continuation-in-part of Ser. No. 203,267, Jun. 7, 1988, Pat. No. 4,936,200. This application Dec. 12, 1989, Ser. No. 448,885
Claims priority, application Switzerland, Jun. 25, 1987, 2392/87
Int. Cl.[5] B29C *43/06*
U.S. Cl. 264—109 **13 Claims**

1. A process for shaping particulate material into individual shaped articles comprising:

conveying plates containing apertures therethrough on a surface for forming, by reason of the plate apertures and the forming surface, article shaping cells;

feeding particulate material to be shaped to the cells;

conveying the plates containing the material on the forming surface in the cells to a tamping and ejecting means and then conveying the plates and material and the tamping and ejecting means in a downstream direction in synchronization;

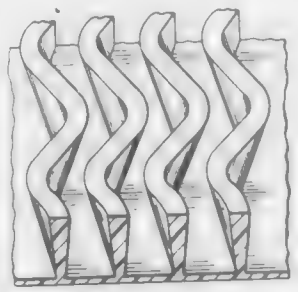
tamping the material in the cells with the tamping and ejecting means while conveying the plates and the material and the tamping and ejecting means for obtaining tamped material in the cells on the forming surface;

displacing the plates away from the forming surface while conveying the plates and tamped material and the tamping and ejecting means and while maintaining the tamped material in contact with the forming surface with the tamping and ejecting means thereby ejecting the tamped material from the plates and providing individual shaped articles of material on the forming surface; and then

disengaging the tamping and ejecting means from the plates and returning the tamping and ejecting means upstream to be conveyed downstream again in synchronization with the plates and material for tamping and ejecting material.

5,011,642

METHOD OF MAKING EXTRUDED ARTICLE



Dennis G. Welygan; Ronald O. Zemke, and Walter W. Pawlikowski, Jr., all of St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Continuation of Ser. No. 210,745, Jun. 23, 1988, abandoned, which is a division of Ser. No. 58,565, Jun. 5, 1987, Pat. No. 4,828,902. This application Nov. 13, 1989, Ser. No. 434,583
Int. Cl.[5] B29C *47/14*
U.S. Cl. 264—167 **8 Claims**

1. A process for making an extruded article comprising:

(a) extruding an extrudable plastic mass having a conformable state and being convertible to a cured state to form an elongate extruded structure having a base element and a plurality of elongate rib elements, said rib elements each having an attachment end and a free end with the attachment end in contact with said base element along its entire length, said rib elements being thicker at said free ends than at said attachment ends, the extrusion rate of said

base element and said attachment ends of said rib elements being the same but being sufficiently slower than the extrusion rate of said free ends of said rib elements so that said free ends of said rib elements will undulate as said extruded structure is extruded;

(b) permitting said free ends of said rib elements to undulate without distortion of said base element while said plastic mass is in said conformable state; and

(c) converting said plastic mass from said conformable state to said cured state while maintaining the undulations in said free ends of said rib elements.

5,011,643

PROCESS FOR MAKING ORIENTED, SHAPED ARTICLES OF PARA-ARAMID/THERMALLY-CONSOLIDATABLE POLYMER BLENDS

Hung H. Yang, Richmond, Va., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Apr. 13, 1989, Ser. No. 337,507

Int. Cl.[5] D01D *5/28*

U.S. Cl. 264—171 **13 Claims**

1. A process for making thermally-consolidatable oriented, shaped articles containing a substantially continuous phase of para-aramid polymer in the direction of orientation comprising the steps of:

forming under agitation a liquid solution of said para-aramid polymer having an inherent viscosity of at least about 3 dl/g and a thermoplastic polymer in a common solvent, said solution having a total article-forming polymer concentration sufficient that the solution is bi-phasic and comprises an anisotropic phase and an isotropic phase, at least, about 55% and less than about 80% by weight said article-forming polymers being said para-aramid polymer and at least about 20% and less than about 45% by weight of said article forming polymers being said thermoplastic polymer, said anisotropic and isotropic phases being interdispersed and said anisotropic phase being present in domains with the size of the domains being on the average less than about 300 microns;

orienting the anisotropic phase of said bi-phasic liquid solution; and

removing said solvent to produce oriented shaped articles.

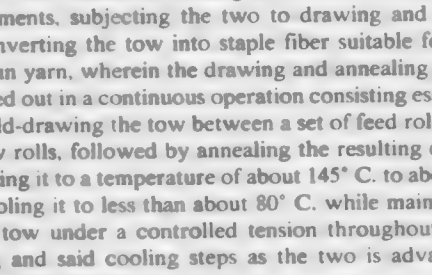
PROCESS FOR PRODUCING GEL FIBER



Masahiro Haruta, Tokyo; Hirohide Munakata; Satoshi Yuasa, both of Yokohama, and Yoko Yoshinaga, Machida, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 938,283, Dec. 5, 1986, abandoned. This application Apr. 24, 1989, Ser. No. 342,665

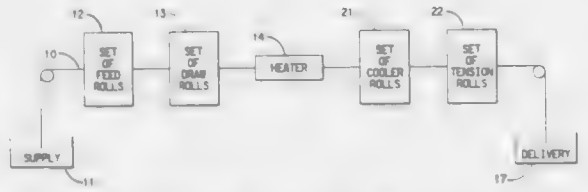
Claims priority, application Japan, Dec. 11, 1985, 60-277032

Int. Cl.[5] D01F *6/26*

U.S. Cl. 264—184 **8 Claims**

1. A process for producing a gel fiber, comprising a step (N) of spinning a solution containing as a constituent component for a gel at least one polymer having at least one monomer unit selected from the group consisting of N-n-propylacrylamide, N-n-propylmethacrylamide, N-iso-propylacrylamide, N-iso-propylmethacrylamide, N-cyclopropylacrylamide, N-cyclopropylmethacrylamide, N,N-ethylmethylacrylamide, N,N-diethylacrylamide, N-acrylpyrrolidine, N-acrylpiperidine, to solidify the solution into a fiber, and the step (M) of effecting crosslinking of the fiber to form a gel which can be swelled or shrunk reversibly by a thermal action in the presence of a liquid.

5,011,645



PROCESS FOR PREPARING NYLON STAPLE FIBER

Alfred H. Thompson, Jr., Seaford, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

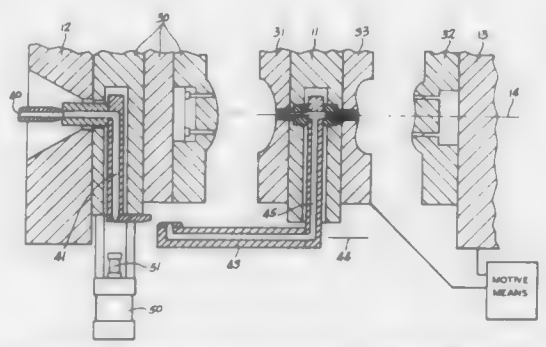
Filed May 4, 1989, Ser. No. 347,052

Int. Cl.[5] D01D *5/16;* **D01F** *6/60*

U.S. Cl. 264—210.7 **5 Claims**

1. Process for preparing nylon staple fibers having high load bearing tenacity, including the steps of melt-spinning nylon polymer into filaments, forming a tow from a multiplicity of the filaments, subjecting the two to drawing and annealing, and converting the tow into staple fiber suitable for forming into spun yarn, wherein the drawing and annealing of the tow is carried out in a continuous operation consisting essentially of first cold-drawing the tow between a set of feed rolls and a set of draw rolls, followed by annealing the resulting drawn tow by heating it to a temperature of about 145° C. to about 200° C. and cooling it to less than about 80° C. while maintaining the drawn tow under a controlled tension throughout both said heating and said cooling steps as the two is advanced by a further set of rolls.

5,011,646



METHOD AND APPARATUS FOR INJECTION MOLDING USING A MOVABLE SPRUE BAR

Rene Bertschi, Toronto, Canada, assignor to Husky Injection Molding Systems Ltd., Bolton, Canada

Filed Feb. 24, 1989, Ser. No. 314,894

Int. Cl.[5] B29C *45/12*

U.S. Cl. 264—297.2 **15 Claims**

1. A method for injection molding a plastic material which comprises: providing a stationary first machine platen and a movable second machine platen; providing a stack mold having a horizontal central axis, a movable center section, at least one first mold cavity between the first platen and the center section, and at least one second mold cavity between the second platen and the center section; opening and closing said stack mold in a direction parallel to the horizontal central axis; injecting plastic material into said mold cavities via an injection nozzle, a first runner system communicating with the injection nozzle, a sprue bar communicating with the first runner system and a second runner system communicating with the sprue bar and located in the center section; and relatively moving said sprue bar and at least one of the first and second runner systems to engage and disengage the sprue bar and said at least one of the first and second runner systems by relative movement in a direction perpendicular to the horizontal central axis of the stack mold, wherein the engagement is sufficient to insure a tight seal between the sprue bar and said at least one of the first and second runner systems; and moving the sprue bar and stack mold relative to each other in a direction parallel to the horizontal central axis upon opening and closing the stack mold.

5,011,647

INTERNAL MOLD RELEASE COMPOSITIONS

Louis W. Meyer, Livingston; Robert Carswell, Lake Jackson, both of Tex., and J. Alan Vanderhider, Fruthwilen, Switzerland, assignors to The Dow Chemical Company, Midland, Mich.

Continuation-in-part of Ser. No. 466,826, Feb. 16, 1983, abandoned, and a continuation-in-part of Ser. No. 570,141, Jan. 12, 1984, Pat. No. 4,876,019. This application Jun. 21, 1989, Ser. No. 369,581

Int. Cl.[5] B29C *33/60, 45/00*

U.S. Cl. 264—300 **63 Claims**

1. A process comprising reacting a polyisocyanate in a closed mold with an active hydrogen-containing composition comprising

(A) a material having an average of at least about 2 active hydrogen-containing groups per molecule and a weight from about 500 to about 5000 per active hydrogen-containing group, said composition having dissolved therein

(B) from about 0.5 to about 10 parts by weight per 100 parts by weight of component (A) of a metal salt of an organic material containing at least one carboxylic acid group and a saturated or unsaturated aliphatic hydrocarbon chain having at least about 7 carbon atoms wherein, said metal is selected from Groups I-B, II-B, IV-B, V-B, VI-B, VII-B or VIII of the Periodic Table of the Elements;

said composition containing a sufficient quantity of at least one aliphatic primary and/or secondary amine-containing material such that component (B) is soluble in said composition, wherein

said composition is devoid of an organic material containing at least one carboxylic acid group, phosphorus-containing acid group or boron-containing acid group or mixture of such materials wherein said organic material contains a siloxane chain or contains at least one terminal or pendant saturated or unsaturated aliphatic hydrocarbon chain containing at least about 7 carbon atoms.

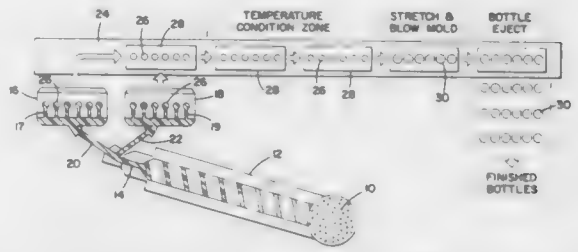
2. The process of claim 1 wherein component (B) is represented by the structure

$$M^{n+}(^{-}OCR)_n$$

wherein M represents the metal, R represents an organic group containing a terminal or pendant saturated or unsaturated aliphatic hydrocarbon chain containing at least about 7 carbon atoms, and n is equal to the valance of the metal.

3. The process of claim 2 which is a reaction injection molding process.

5,011,681



SYSTEM, METHOD AND APPARATUS FOR HOT FILL PET CONTAINER

Lawrence E. Garver, and Gregory L. Kimbrough, both of Columbia, S.C., assignors to Van Dorn Company, Cleveland, Ohio

Continuation-in-part of Ser. No. 310,779, Feb. 14, 1989, abandoned, which is a continuation-in-part of Ser. No. 269,881, Nov. 10, 1988, abandoned, which is a continuation of Ser. No. 2,165, Jan. 12, 1987, abandoned. This application Nov. 13, 1989, Ser. No. 435,688

Int. Cl.[5] B29C *49/04, 49/06, 49/64*

U.S. Cl. 264—521 **20 Claims**

1. A one stage process for forming from PET material and in the absence of a heat set step, a PET container for use in hot fill applications comprising the sequential steps of:

(a) drying said PET material to a moisture content of less than about 0.02% by weight and maintaining said PET material such that its dew point is less than about minus 35° F. in an enclosed space;

(b) plasticizing said PET material while said PET material is maintained at said moisture content less than about 0.02% by weight.

(c) injecting or extruding at an initial temperature of about 520° F. to 550° F., said PET material in the dried plasticized form into a preform mold to form a preform of a hollow, generally cylindrical configuration with a closed end and having wall sections between interior and exterior surfaces of predetermined wall thicknesses along the length thereof, and rapidly cooling said PET material in said preform mold at a rate sufficiently fast to prevent spherulite growth but sufficiently long in duration to permit adding additional PET material to said mold to compensate for volumetric contraction of said PET material;

(d) transferring said preform from said preform mold to a

conditioning station when the surface temperature of said preform has been cooled in said preform mold to about 230° F. to 260° F.;

(e) equilibriating the temperature through the wall sections of said preform in said conditioning station to a substantially uniform temperature between about 210° F. to 230° F. over a time period sufficient to develop a crystallite formation; and

(f) stretching and blow molding said preform in a blow mold into a desired container shape, said stretching and blowing commencing when said preform is at said temperature of about 210° F. to 230° F. and completed when the temperature of said container is about 50° F. to 150° F. whereby a thermally stable container with a haze transmission of less than about 5% throughout and a crystallite formation of at least about 30% is produced; said container having a shrinkage of no greater than 2 to 5% in any dimension when hot filled with products at about 195° F. in a hot fill process where said container is sealed within about 5 to about 15 seconds from the time it is hot filled.

HIGH TEMPERATURE REACTOR UTILIZING A GRAPHITE REFLECTOR

Winfried Wachholz, Gorxheimertal, Fed. Rep. of Germany, assignor to Hochtemperatur-Reaktorbau GmbH, Mannheim, Fed. Rep. of Germany

Filed Feb. 14, 1989, Ser. No. 310,663

Claims priority, application Fed. Rep. of Germany, Feb. 15, 1988, 3804643

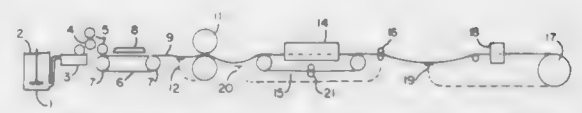
Int. Cl.[5] G21C *19/42*

U.S. Cl. 376—313 **15 Claims**

1. A high temperature reactor comprising a cylindrical core cavity defined by a graphite reflector exhibiting a roof reflector, a side reflector and a bottom reflector, wherein suitable metal atoms or molecules capable of bonding volatile iodine and cesium iodide are incorporated individually by compounds of said metals into an upper part of said roof reflector said suitable metals are highly diluted and dissolved in a cracked binder material of said roof reflector graphite, wherein said metal atoms or molecules are alkaline earth metals or rare earths.

5,011,654

PRODUCTION OF FLAT PRODUCTS



Roy Mathers, 29 Hawarden Road, Hope, Wrexham, Clwyd, Wales, Great Britain

Filed Jul. 25, 1990, Ser. No. 557,961

Claims priority, application United Kingdom, Jul. 29, 1989, 8917402

Int. Cl.[5] G22F *5/00*

U.S. Cl. 419—3 **3 Claims**

1. A continuous process for producing strip products which comprises forming an aqueous slurry of a powder mixture which exhibit a tendency to expand during sintering and a film-forming cellulose derivative, producing from this slurry a self-supporting strip, feeding this self-supporting strip onto an endless moving belt by which the strip is transported into and through a sinter furnace, and controlling the speeds at which the strip enters and leaves the furnace in a sense to impose in the strip as it passes through the furnace a tensile force in its direction of travel, the tensile force imposed being related to the expected or actual increase in strip length occasioned by expansion of the strip during the sintering process and being such as to prevent ridging of the strip which would otherwise be caused by such expansion.

5,011,655

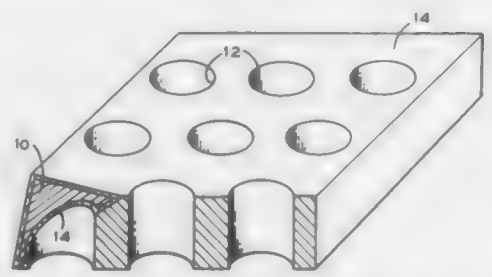
PROCESS OF FORMING A COMPOSITE STRUCTURE

William L. Mankins, Huntington, W. Va., assignor to INCO Alloys International, Inc., Huntington, W. Va.

Filed Dec. 22, 1989, Ser. No. 455,498

Int. Cl.[5] B22F *3/00*

U.S. Cl. 419—8 **20 Claims**



1. A process of manufacturing a thin metallic body composite structure comprising:

cleaning an inner layer of a first metal to remove oxides and promote metallurgical bonding, said inner layer having a

plurality of penetrating holes piercing the thickness of said inner layer,

filling said penetrating holes with metal powder of a second metal,

placing two outer layers of said second metal on opposite sides of said cleaned and filled inner layer to form a sandwich structure.

heating said sandwich structure in a non-oxidizing atmosphere to a temperature at which recrystalization will occur in said sandwich structure, and

hot working said sandwich structure by reducing thickness of said sandwich structure to form said composite structure.

COPPER DOPED LOW MELT SOLDER FOR COMPONENT ASSEMBLY AND REWORK

Daniel S. Niedrich, Apalachin, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed May 31, 1989, Ser. No. 359,315

Int. Cl.[5] C22C *13/00*

U.S. Cl. 420—558 3 Claims

1. A low melting temperature solder composition, wherein the solder is nominally comprised of about 54 wt. % tin/26 wt. % lead/20 wt. % indium, and doped with about 0.12 to about 0.20 wt. % copper.

5,011,659

CASTABLE CORROSION RESISTANT ALLOY

John H. Culling, St. Louis, Mo., assignor to Carondelet Foundry Company, St. Louis, Mo.

Filed Mar. 22, 1990, Ser. No. 497,584

Int. Cl.[5] C22C *30/00*

U.S. Cl. 420—582 10 Claims

1. A castable corrosion resistant alloy having improved weldability and high tensile elongation consisting essentially of:

Nickel	28–34% by weight
Chromium	22–26%
Molybdenum	3.3–4.4%
Tungsten	2–3%
Copper	1–3%
Silicon	0.2–0.9%
Manganese	0.3–1.3%
Carbon	up to about 0.05%
Thiobium	up to about 0.3%
Aluminum	up to about 0.25%
Vanadium	up to about 0.25%

-continued

Titanium	up to about 0.2%
Iron	essentially the balance.

METHOD OF STERILIZING MEDICAL GRADE FILM

Arthur A. Arena, Trenton, N.J., assignor to Huls America Inc., Piscataway, N.J.

Continuation of Ser. No. 37,043, Apr. 10, 1987, Pat. No. 4,839,233. This application Nov. 28, 1988, Ser. No. 276,645

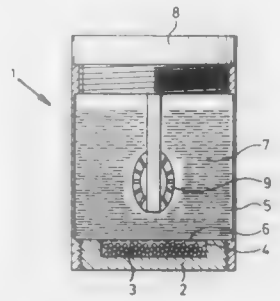
Int. Cl.[5] A61L *2/08*

U.S. Cl. 422—22 14 Claims

1. A method of sterilizing a medical grade film comprising exposing the film to high energy radiation, wherein the film comprises a vinyl chloride resin containing sufficient barium sulfate to prevent discoloration of said film when exposed to said radiation.

5,011,661

CONTACT LENS CARE SET



Horst Schäfer, Aschaffenburg-Obernau; Gerhard Ludwig, Stromberg, and Rainer Sunderdiek, Aschaffenburg-Schweinheim, all of Fed. Rep. of Germany, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

Continuation-in-part of Ser. No. 140,950, Dec. 29, 1987, abandoned, which is a continuation of Ser. No. 883,964, Jul. 10, 1986, abandoned. This application Oct. 18, 1989, Ser. No. 423,654

Claims priority, application Fed. Rep. of Germany, Jul. 10, 1985, 3524659; Sep. 11, 1985, 3532433

Int. Cl.[5] A61K *9/24, 9/58;* A61L *2/18*

U.S. Cl. 422—30 11 Claims

1. A method for disinfecting a contact lens which comprises immersing the lens in an aqueous solution of H_2O_2, the H_2O_2 being present in sufficient concentration to substantially sterilize the lens, and adding to the solution, before the H_2O_2 has substantially sterilized the lens, a tablet comprising catalase and a polymeric coating which dissolves gradually in the aqueous solution of H_2O_2, said polymeric coating effecting release of the catalase which is retarded for at least 30 minutes after the addition of said tablet to the aqueous H_2O_2 solution, wherein the polymeric coating contains a polymer selected from the group consisting of hydroxypropylmethylcellulose phthalate polymer, a polymer from methacrylic acid or methacrylate esters, a copolymer from methacrylic acid and methacrylate esters and a copolymer from methyl vinyl ether and maleic anhydride, wherein the polymeric coating additionally contains triacetin for further control of the release of the catalase, whereby the lens so treated is suitable for application to the eye of a human without diluting the solution obtained after the catalase has decomposed any residual H_2O_2, or without rinsing the lens.

11. A contact lens care set comprising an aqueous solution containing a sterilizing effective amount of H_2O_2 and a neutralizing agent in the form of a tablet, said tablet comprising catalase and a polymeric coating comprising a polymer selected from the group consisting of hydroxypropylmethylcellulose phthalate polymer, a polymer from methacrylic acid or methacrylate esters, a copolymer from methacrylic acid and methacrylate esters and a copolymer from methyl vinyl ether and maleic anhydride, wherein the polymeric coating additionally contains triacetin, the polymeric coating effecting release of the catalase which is retarded for at least 30 minutes after the addition of said tablet to the aqueous solution.

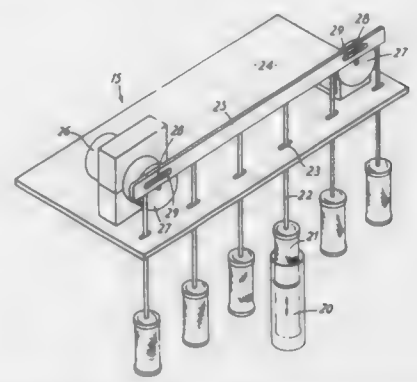
DISSOLUTION TESTING MACHINE



Akbar Noormohammadi, 153 Earlifield Road, London SW18; Robert E. Dodd, 40 Fir Tree Ave., Wallingford Oxon OX10 OPD, both of England; Arnold H. Beckett, 16 Crestbrook Ave., Palmers Green, London 13, United Kingdom, and Grahame K. J. Geeves, The Cobbles St. Marys Rd., Ascot, Berks, England

Continuation of Ser. No. 585,394, Mar. 2, 1984, abandoned. This application Jul. 2, 1987, Ser. No. 70,145

Claims priority, application United Kingdom, Mar. 4, 1983, 83 06055

Int. Cl.[5] G01N *31/00*

U.S. Cl. 422—68.1 9 Claims

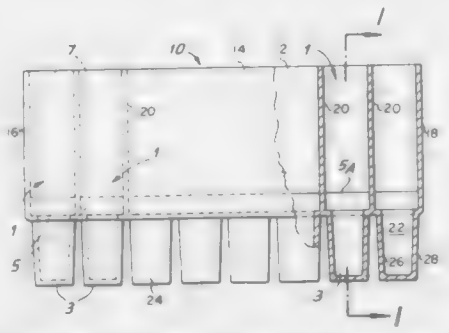
1. In a dissolution testing machine consisting essentially of a container for a liquid, a fluid passable holder for a sample, support means for supporting said holder within said container, and drive means for said holder and said support means;

the improvement wherein the fluid passable holder comprises resilient gauze fabric at a bottom portion thereof to prevent abrasion of a sample when it is contacted therewith, and wherein the drive means is for moving said support means in such a manner that said holder is vertically reciprocated within said container without rotation about an axis so that liquid in said container flushes into and out of the holder, thereby causing a sample in the holder to move up and down in response to liquid flushing into and out of said holder.

5,011,663

MULTITEST-TUBE FOR CLINICAL CHEMISTRY ANALYSIS FOR SEVERAL SIMULTANEOUS TESTS

Alberto Innocenti, Florence, Italy, assignor to S [illegible] A C s.r.l., Florence, Italy



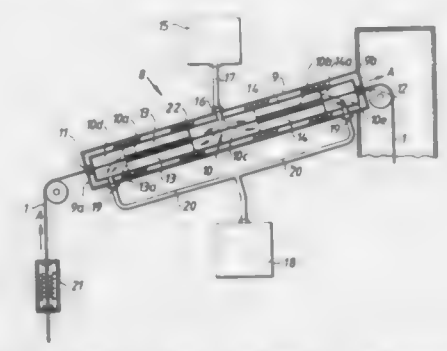
Continuation of Ser. No. 76,541, Jul. 22, 1987, abandoned. This application Aug. 13, 1990, Ser. No. 567,688

Int. Cl.[5] B01L *3/00*

U.S. Cl. 422—102 3 Claims

1. A multi test-tube construction for clinical test tube analysis comprising: a planar front wall; a planar rear wall substantially parallel to said front wall: first and second planar side walls, substantially perpendicular to said front and rear walls, each side wall being connected to said front and rear walls; a plurality of intermediate side wall members, substantially parallel to said side walls, positioned between and connected to said front and rear walls forming a plurality of cells with said front and rear walls, the outermost of said plurality of interme-

diate side wall members forming outermost cells with said first and second planar side walls and said front and rear walls; a plurality of lower portions, each lower portion being associated with each cell, each said lower portion having a bottom wall, a lower portion planar front wall connected to said front wall, a lower portion planar rear wall, a first lower portion planar side wall and a second lower portion planar side wall, said lower portion planar side walls being each connected to one of said first side wall, second side wall or intermediate side wall; a plurality of side portions associated with each cell, each side portion being connected to said rear wall and said lower portion rear wall, each of said side portions forming a cavity



region between said rear wall and corresponding said lower rear wall portion with an edge separating each of said side portions from said lower portion in a horizontal direction for storage of a sample to be tested, each of said walls being transparent so as to allow optical sensing and visual inspection, reagents positioned in respective cavities of said side portions overflowing into said lower portion, holding a sample or the like, upon oscillation about a horizontal longitudinal axis, of the multi test-tube construction, of suitable amplitude and frequency allowing investigation of a plurality of samples or reagents in the corresponding plurality of cells under uniform conditions.

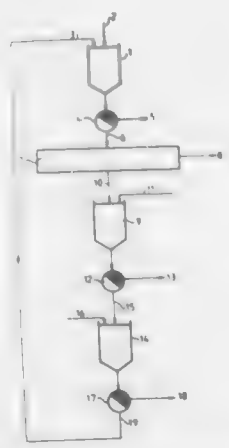
ARRANGEMENT FOR THE STERIILIZATION OF A TRAVELLING MATERIAL WEB

Pär Olanders, Lund, Sweden, assignor to Roby Teknik AB, Lund, Sweden

Filed Sep. 28, 1988, Ser. No. 250,269
Claims priority, application Sweden, Oct. 9, 1987, 8703903
Int. Cl.[5] A61L *2/20*
U.S. Cl. 422—292 **8 Claims**

1. Apparatus for gas-phase sterilizing a travelling material web comprising:



an elongated chamber having an inlet at one end and an outlet at the opposite end, said inlet and outlet being aligned to allow a material web to extend along a predetermined path into the chamber through the inlet and out of the chamber through the outlet, said chamber having interior walls spaced apart on opposite sides of said path, first conduit means for introducing a sterilizing gas into said chamber and second conduit means for withdrawing gas from said chamber, said first and second conduit means being spaced apart longitudinally of said chamber, said chamber including constriction means for accelerating the sterilizing gas along the path and for forcing the sterilizing gas to flow in close contact with the material web at very high speed as the gas flows from the first conduit means to the second conduit means to ensure that the sterilizing gas contacts and is uniformly distributed over the whole width of the material web so that effective sterilization of the entire material web takes place, said constriction means including a pair of plates extending outwardly from said interior walls toward said path, said plates being positioned between said first and second conduit means, and a heating device positioned in front of the inlet to the chamber so that the material web will be subjected to heat from the heating device prior to entering the chamber.

5,011,665

NONPOLLUTING RECOVERY OF RARE EARTH VALUES FROM RARE EARTH MINERALS/ORES

Francinet Cailly, Paris, and Yves Mottot, Tremblay/Les Gonesse, both of France, assignors to Rhone-Poulenc Chimie, Courbevoie, France

Filed Mar. 5, 1990, Ser. No. 487,926
Claims priority, application France, Mar. 3, 1989, 89 02757
Int. Cl.[5] C01F *17/00*
U.S. Cl. 423—21.5 **33 Claims**

1. A process for the recovery of rare earth values from a rare earth mineral, comprising (a)

leaching/decomposing such rare earth mineral with a solution of nitric acid to solubilize the rare earth values contained therein, (b) optionally separating insoluble residue from the resulting leach solution, (c) separating the rare earth values from said leach solution, (d) treating the leach solution thus stripped of rare earth values with a hydroxide of a metallic cation M to precipitate solubilized impurities and separating the thus precipitated impurities therefrom, (e) treating the resulting purified solution with sulfuric acid to precipitate metal sulfates and separating the thus precipitated sulfates therefrom to regenerate said nitric acid solution, and (f) optionally recycling such regenerated solution of nitric acid to said leaching-/decomposition step (a).

5,011,666

METHOD FOR PURIFYING TiO_2 ORE

Tze Chao, Newark, and George H. Senkler, Jr., Hockessin, both of Del., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Jul. 28, 1988, Ser. No. 225,431
Int. Cl.[5] C22B *34/10*
U.S. Cl. 423—82 **26 Claims**

1. Process for purifying TiO_2 ore containing impurities of iron, alkali metal, alkaline earth metal, rare earth metal, aluminum, phosphorus, thorium, uranium, chromium, manganese, silicon, vanadium, and yttrium, said process consisting essentially of subjecting the ore to two or more leaching treatments, said leaching treatment:

(a) alternating between use of an aqueous solution of a mineral acid and an aqueous solution of an alkali metal compound selected from the group consisting essentially of alkali metal carbonates, hydroxides or mixtures thereof, and wherein the treatment with a mineral acid occurs first, and

(b) being conducted at a temperature, pressure, and time, and with an amount and concentration of an aqueous solution of a mineral acid and an aqueous solution of an alkali metal compound, which are sufficient to solubilize substantially the iron, alkali metal, alkaline earth metal, rare earth metal, aluminum, phosphorus, thorium, uranium, chromium, manganese, silicon, vanadium, and yttrium impurities present to form a leachate, and wherein the leachate formed is removed prior to the next leaching treatment.

5,011,667

SELF-BOUND SODIUM CHABAZITE AGGREGATES AND METHODS FOR PREPARATION THEREOF

Steven M. Kuznicki, Easton, Pa., and John R. Whyte, Jr., New York, N.Y., assignors to Engelhard Corporation, Iselin, N.J.

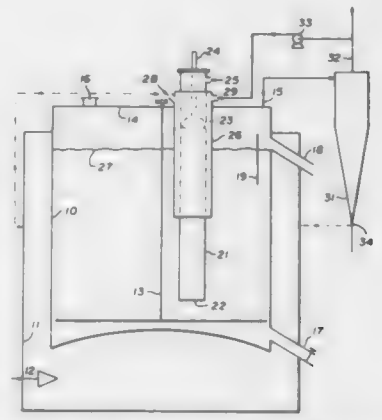
Filed Sep. 8, 1988, Ser. No. 242,014
Int. Cl.[5] C01B *33/34*
U.S. Cl. 423—118 **3 Claims**

1. A process for making monolithic bodies of finely divided particles of naturally-occurring chabazite bonded with crystals of synthetic chabazite including the steps of:

(a) forming a mixture comprising finely divided chabazite ore and a sodium aluminum silicate gel into monolithic bodies, the get having a composition such that the molar ratio of silicon to aluminum is between 1.0 and 1.5 and the ratio of sodium to silicon ranges from 0.35 to 0.55;

(b) recovering the resulting monolithic bodies;

(c) and heating said bodies in the presence of water to a temperature above 80° C. for a period of time of sufficient duration to convert said gel to additional chabazite, thereby producing monolithic bodies of finely divided particles of naturally-occurring chabazite bonded with crystals of synthetic chabazite.



5,011,668

CALCINATION APPARATUS

David J. Ball, and Edward Varney, both of Nottingham, Great Britain, assignors to United States Gypsum Company, Chicago, Ill.

Continuation of Ser. No. 144,693, Jan. 13, 1988, abandoned, which is a continuation of Ser. No. 507, Jan. 5, 1987, abandoned. This application Mar. 2, 1989, Ser. No. 318,498
Claims priority, application United Kingdom, Jan. 7, 1986, 8600275
Int. Cl.[5] F27B *15/00;* **C04B** *11/00, 11/02*
U.S. Cl. 423—171 **7 Claims**

1. A method for calcining calcium sulphate dihydrate by heating material in a bed by the direct introduction of a hot as through a tube extending downwardly into the bed, in which the temperature of the hot gas is reduced before it directly contacts the material in the bed by indirect heat exchange through the wall of the tube with at least one relatively cool substance compatible with the material of the bed, said substance or substances themselves being separate from the material of the bed during the initial heat exchange but contacting said material before the latter is contacted by the hot gas and at a higher level of the bed than does the hot gas.

5,011,669

PROCESS FOR PRODUCING A ROD-FORM SILICA

Katsuyoshi Tsuchiya, Minamata, and Kaneo Noake, Yokohama, both of Japan, assignors to Chisso Corporation, Japan

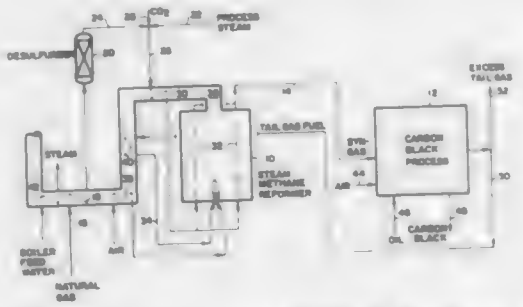
Filed Jan. 24, 1990, Ser. No. 469,314
Claims priority, application Japan, Jan. 25, 1989, 1-15472
Int. Cl.[5] C01B *33/146*
U.S. Cl. 423—338 **9 Claims**

1. A process for producing a rod-shaped silica, which comprises adding 45 to 200 parts by weight of water to 100 parts by weight of a silicic acid ester and agitating at 40° C. or lower to form a sol of the resulting hydrolyzate of silicic acid ester, adding 35 to 150 parts by weight of the sol and a surfactant to 100 parts by weight of a hydrophobic medium to form an emulsion, and subjecting the emulsion to a temperature increase at two stages, the first temperature increase being by 5° to 30° C. at a rate of 10° to 200° C./min. or less and the second temperature increase being by 3° to 20° C. at a rate of 0.5° to 10° C./min., to form a rod-shaped silica.

5,011,670

INTEGRATED REFORMER PROCESS FOR THE PRODUCTION OF CARBON BLACK

Ruth A. Davis, Allentown; David M. Nicholas, New Tripoli; Dale D. Smith; Shoou-I Wang, both of Allentown, and Richard A. Wright, Macungie, all of Pa., assignors to Air Products and Chemicals, Inc., Allentown, Pa.



Filed Mar. 7, 1989, Ser. No. 320,206
Int. Cl.[5] C01B *31/62;* **C09C** *1/48*
U.S. Cl. 423—450 **2 Claims**

1. A process for the production of carbon black from a hydrocarbon feedstock comprising:

(a) reforming a hydrocarbon fuel into a predominantly hy-

drogen and carbon monoxide containing synthesis gas with steam in a catalytic elevated temperature reformation reaction.

(b) pyrolyzing and partially oxidizing said hydrocarbon feedstock in the presence of the combustion of said synthesis gas and an oxidant gas to produce a carbon black containing tailgas wherein the heat of pyrolysis is provided by the combustion of said synthesis gas.

(c) quenching said tailgas and recovering said carbon black from said tailgas;

(d) utilizing tailgas after carbon black recovery to provide said elevated temperature for the reforming of said hydrocarbon fuel wherein at least a portion of said tailgas after carbon black recovery is combusted with a second oxidant gas to produce said elevated temperature

5,011,671

CERIC OXIDE WITH NEW MORPHOLOGICAL CHARACTERISTICS AND METHOD FOR OBTAINING SAME

Jean-Luc Le Loarer, La Rochelle, France, assignor to Rhone-Poulenc Chimie, Courbevoie, France

Filed Jun. 29, 1988, Ser. No. 213,189

Claims priority, application France, Jun. 29, 1987, 87 09122

Int. Cl.[5] C01F *17/00*

U.S. Cl. 423—592 **27 Claims**

1. A method for obtaining a ceric oxide having a specific surface of at least 15 m^2/g, measured after calcination at a temperature of between 800° and 900° C., said method comprising preparing a ceric hydroxide precipitate by reacting a solution of cerium salt, a base, and optionally, an oxidizing agent, the amount of base being selected such that the pH of the resulting reaction medium is greater than 7; (ii) separating the ceric hydroxide precipitate; optionally (iii) washing the ceric hydroxide precipitate; (iv) placing the ceric hydroxide in suspension in water or in an aqueous solution of a decomposable base; (v) heating the suspension or solution in a closed chamber to a temperature and pressure lower than the critical temperature and critical pressure thereof; (vi) cooling the suspension or solution and returning it to about atmospheric pressure; (vii) separating the resulting ceric hydroxide; and (viii) calcining the separated ceric hydroxide.

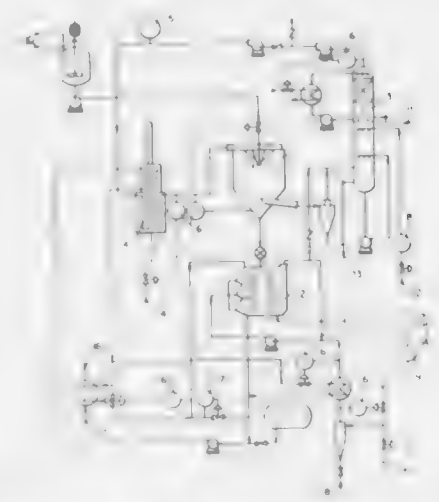
5,011,672

PROCESS FOR PRODUCING POTASSIUM MANGANATE

D. Manuel O. G. Garcia, Oviedo, Spain, assignor to Industrial Quimica Del Nalon, S.A., Oviedo, Spain

Continuation of Ser. No. 49,696, May 14, 1987, abandoned. This application May 1, 1989, Ser. No. 353,145

Claims priority, application Spain, May 16, 1986, 555072



Int. Cl.[5] C01G *45/12*

U.S. Cl. 423—599 **32 Claims**

1. A process for preparing potassium manganate (K_2MnO_4) comprising the steps of:

(a) mixing a starting material containing a manganese ore having manganese in the form of manganese dioxide or manganese with a valency lower than or equal to 4 + with a first solution of potassium hydroxide in water to form a second solution having a mole ratio of potassium hydroxide to manganese in the approximate range of 2 to 3; and

(b) atomizing said second solution into drops into a heated oxidizing gas stream in a first reactor vessel having a wall, said drops of said atomized second solution being of a

sufficiently small size and the temperature of said oxidizing gas stream being sufficiently high that said drops lose water and solidify to a powder prior to contacting said wall, whereby said manganese is oxidized so said powder comprises potassium hypomanganate and potassium manganate

METHOD OF PRODUCING TITANIUM OXIDES

Masafumi Yoshimoto, Sakai; Tadao Nakatsuji, Kashibacho, and Kazuhiko Nagano, Sakai, all of Japan, assignors to Sakai Chemical Industry Co., Ltd., Osaka, Japan

Division of Ser. No. 357,599, May 26, 1989. This application Nov. 20, 1989, Ser. No. 438,001

Claims priority, application Japan, May 28, 1988, 63-131076

Int. Cl.[5] C01G *23/047*

U.S. Cl. 423—610 **4 Claims**

1. A method for producing titanium oxides for use as a catalyst carrier or a molded catalyst which comprises: adding a solution of an alkali at a rate of not more than about 0.05 moles/l per mole of titanium tetrachloride to an aqueous solution of titanium tetrachloride having a concentration of not more than 0.8 mole/l at a temperature of 50°-70° C., to thereby substantially thermally hydrolyze the titanium tetrachloride to produce titanium hydroxide; and then drying and calcining the titanium hydroxide at a temperature of 300°-700° C.

5,011,675

CONVERSION EFFICIENCY IN TRICKLE BED REACTORS

Patricia Haure; Peter L. Silveston; Robert R. Hudgins, all of Waterloo, Canada, and Maxime Bellut, Nancy Cedex, France, assignors to University of Waterloo, Waterloo, Canada

Filed Mar. 15, 1988, Ser. No. 168,239

Claims priority, application United Kingdom, Mar. 16, 1987, 8706203

Int. Cl.[5] C10G *47/02*

U.S. Cl. 423—659 **18 Claims**

1. A method of effecting a chemical reaction in a trickle bed reactor by flowing liquid and gaseous streams over a bed of solids which comprises:

first flowing said liquid stream downwardly over said bed of solids at a flow rate which is less than that necessary to maintain said bed of solids completely wetted to cause the formation of stagnant liquid pockets in said bed and exposure of dry solids to said flowing gas stream for a period of time which permits said chemical reaction to continue,

then flowing said liquid stream downwadly over said bed of solids at a higher flow rate than that necessary to maintain said bed of solids completely wetted and for a period of time sufficient to rewet the solids completely, quench any hot spots which have developed in said bed and to flush out stagnant regions of the bed, and

subsequently repeating said steps of lesser flow rate flow of said liquid stream over said bed of particles and higher flow rate of said liquid stream over said bed of particles, whereby said chemical reaction is effected more efficiently than flowing said liquid stream over said bed of particles at a constant flow rate which is at least that necessary to maintain said bed of particles completely wetted.

METHOD TO DIRECTLY RADIOLABEL ANTIBODIES FOR DIAGNOSTIC IMAGING AND THERAPY

Mathew L. Thakur, Cherry Hill, N.J., assignor to Thomas Jefferson University, Philadelphia, Pa.

Filed Mar. 27, 1990, Ser. No. 499,790

Int. Cl.[5] A61K *39/395*

U.S. Cl. 424—1.1 **20 Claims**

1. A method for directly labeling proteins with radionuclides for use in diagnostic imaging and therapy comprising the steps of incubating a protein-containing solution with a solution of sodium ascorbate; adding a required quantity of reduced radionuclide to said incubated protein-containing solution and incubating.

5,011,677

RADIOACTIVE GLASS MICROSPHERES

Delbert E. Day, Rolla, and Gary J. Ehrhardt, Columbia, both of Mo., assignors to The Curators of the University of Missouri, Columbia, Mo.

Division of Ser. No. 673,123, Nov. 19, 1984, Pat. No. 4,789,501. This application Aug. 18, 1988, Ser. No. 234,017

Int. Cl.[5] A61K *43/00;* **A61N** *5/00;* **C03C** *12/00*

U.S. Cl. 424—1.1 **45 Claims**

1. A radioactive microsphere for radiation therapy of a mammal comprising a biologically compatible glass material containing at least one beta or gamma radiation emitting isotope distributed substantially throughout the glass which emits a therapeutic intensity and amount of beta or gamma radiation, and a balance of elements selected from the group consisting of elements that do not become radioactive upon neutron irradiation and elements that have a half-like that is sufficiently short so that the elements do not emit a significant amount of beta or gamma radiation at the time of administration, the microsphere having a chemical durability such that subsequent to administration of the microsphere to the mammal, the microsphere will not release a significant amount of the radiation emitting radioisotope into the mammal's system.

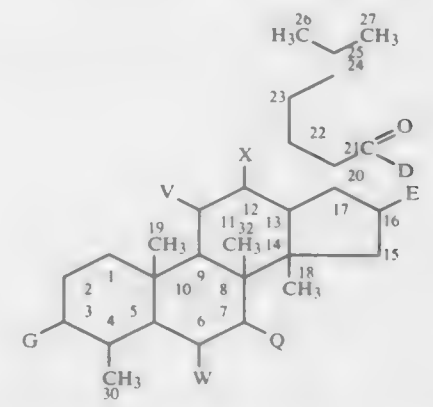
COMPOSITION AND METHOD FOR ADMINISTRATION OF PHARMACEUTICALLY ACTIVE SUBSTANCES

Yu-chang J. Wang; William A. Lee, both of Los Altos, and Blair Narog, Palo Alto, all of Calif., assignors to California Biotechnology Inc., Mountain View, Calif.

Filed Feb. 1, 1989, Ser. No. 305,520



Int. Cl.[5] A61K *9/12, 9/14, 37/02*

U.S. Cl. 424—45 **43 Claims**

1. A nonaqueous, dry powder composition for the transmucosal administration of pharmaceutically active substance, comprising a particular suspension of:

(a) a medically effective amount of a polypeptide drug and

(b) a biocompatible steroid of the formula

wherein a dashed line represents a single or double bond;

D represents a group having a molecular weight below 600 daltons which renders an effective amount of said steroid water soluble within the range of about pH 2 to about pH 12;

E represents OAc, OH, a lower alkyl group or a lower heteroalkyl group;

G represents OAc, OH, a lower alkyl group or a lower heteroalkyl group;

W represents OAc or H; and

Q, V, and X, each individually, represent OH or H, said steroid (i) containing two to three polar functions, exclusive of the function represented by D; and (ii) being capable of increasing the permeation of a human or animal mucosal surface by a pharmaceutically active substance, in an amount effective to increase the permeability of said body surface to a pharmaceutically active substance; and

wherein said particulate suspension is suspended in a biocompatible (hydro/fluoro) carbon propellant.

5,011,679

RAW HIDE HAVING A COATING CONTAINING AN INORGANIC PYROPHOSPHATE

Henry C. Spanier, West Milford, and Ilassey O. Ekpo, Newark, both of N.J., assignors to Nabisco Brands, Inc., East Hanover, N.J.

Filed May 30, 1989, Ser. No. 358,149

Int. Cl.[5] A61K *7/20*

U.S. Cl. 424—57 **5 Claims**

1. Process for the prevention of tartar accumulation on the teeth of a dog, comprising chewing or eating by the dog of a tartar inhibiting amount of raw hide which contains an edible coating comprising an effective antitartar amount of at least one alkali metal inorganic pyrophosphate, the amount of said at least one alkali metal inorganic pyrophosphate being sufficient to deliver from about 0.2 to about 5 weight percent, based

on the total weight of the raw hide containing at least one alkali metal inorganic pyrophosphate, of P_2O_7, said at least one alkali metal inorganic pyrophosphate being water soluble, the raw hide containing an edible coating containing at least one alkali metal inorganic pyrophosphate being slightly acid to near neutral, and the raw hide containing an edible coating containing at least one alkali metal inorganic pyrophosphate being chewable, tough and flexible.

5,011,680

SOLID COSMETIC PREPARATION

Toshiyuki Suzuki, Ichikawa; Masahide Nohta, Sakura; Akira Shigeta, Tokyo; Yoshimitsu Ina, Funabashi, and Manami Nozawa, Chiba, all of Japan, assignors to Kao Corporation, Tokyo, Japan

Continuation of Ser. No. 837,615, Mar. 7, 1986, abandoned. This application Jun. 15, 1988, Ser. No. 208,792

Claims priority, application Japan, Mar. 13, 1985, 60-50124; Sep. 6, 1985, 60-196973; Sep. 6, 1985, 60-196974

Int. Cl.[5] A61K *7/025, 31/21, 31/08*

U.S. Cl. 424—64 18 Claims

1. A solid cosmetic preparation comprising a blend of (A) from 99.9 to 90 percent by weight of at least one cosmetic component and (B) from 0.1 to 10 percent by weight of a mixture of triglycerides, said mixture of triglycerides comprising mixed acid triglycerides having as fatty acid residues in the same molecule,

(a) at least one straight chain, saturated C_{20}–C_{26} fatty acid group and

(b) at least one unsaturated C_{16}–C_{22} fatty acid group,

said fatty acid residues of said mixture of triglycerides comprising 15 to 70 percent by weight of straight chain, saturated C_{20}–C_{26} fatty acid groups and 20 to 60 percent by weight of unsaturated C_{16}–C_{22} fatty acid groups, said cosmetic component (A) being different from said mixture of triglycerides (B) and the saturated fatty acid residues of said mixed acid triglycerides not having a branched chain.

5,011,681

FACIAL CLEANSING COMPOSITIONS

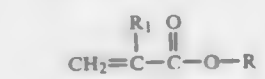
Susan L. Ciotti, Derby; Eric G. Spengler, Cheshire, and George E. Deckner, Trumbull, all of Conn., assignors to Richardson-Vicks, Inc., Shelton, Conn.

Filed Oct. 11, 1989, Ser. No. 419,895

Int. Cl.[5] A61K *7/02*

U.S. Cl. 424—81 10 Claims

1. A cleansing composition for removing make-up in the form of an oil-in-water emulsion comprising:



a. from about 0.5% to about 10% of a surfactant with an HLB greater than about 10 selected from the group consisting of anionic, nonionic, zwitterionic, amphoteric and ampholytic surfactants and mixtures thereof;

b. from about 2% to 30% of polyalphaolefin of the formula:

$R_1—C{=}C—R_2$

wherein R_1 and R_2 are independently from about C_{20} to about C_{30} alkyl, wherein said polyalphaolefin has a viscosity of from about 2 to about 4 centistokes at 100° C.; and

c. from about 0.025% to about 0.75% of a carboxylic copolymer comprising polymers of a monomeric mixture containing 95.9 to 98.8 weight percent of an olefinically unsaturated carboxylic monomer selected from the group consisting of acrylic, methacrylic and ethacrylic acids, about 1 to about 3.5 weight percent of an acrylate ester of the formula:

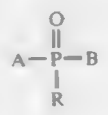
wherein R is an alkyl radical containing 10 to 30 carbon atoms and R_1 is hydrogen, methyl or ethyl, and 0.1 to 0.6 weight percent of a polymerizable cross-linking polyalkenyl polyether of a polyhydric alcohol containing more than one alkenyl ether group per molecule wherein the parent polyhydric alcohol contains at least 3 carbon atoms and at least 3 hydroxyl groups.

5,011,682

HYPOPHOSPHITE-CONTAINING COTELOMERS AS ANTITARTAR AGENTS

David L. Elliott, Hawthorne; Catherine L. Howie, Parsippany, both of N.J., and Peter G. Montague, Rugby, England, assignors to Conopco, Inc., New York, N.Y.

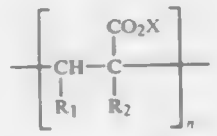
Filed Apr. 18, 1990, Ser. No. 510,651



Int. Cl.[5] A61K *7/16, 7/18*

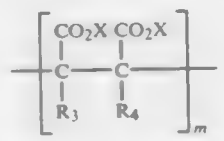
U.S. Cl. 424—52 17 Claims

1. An oral composition comprising:



(i) a fluoride source present in an effective amount to reduce caries; and

(ii) a polymer present in an effective amount to control build-up of tartar, said polymer having the formula I:



(I)

wherein A is a random polymeric residue comprising at least one unit of structure II,

(II)

and at least one unit of structure III, different from a unit of structure II,

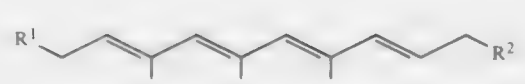
(III)

and B is hydrogen or a residue A; m and n are integers sufficient to provide polymer of weight averaged molecular weight ranging from about 400 to about 5000; m and n in residue A may each be the same or different from respective m and n in residue B; R is an—OX, where X is selected from the group consisting of hydrogen, alkali metal, alkaline earth metal, transition metal, ammonium, alkyl amine, alkanolammonium residues and mixtures thereof; R_1, R_2, R_3 and R_4 are hydrogen, methyl, ethyl radicals or combinations thereof.

5,011,683

AGGREGATION PHEROMONES OF THE DRIEDFRUIT BEETLE, *CARPOPHILUS HEMIPTERUS*

Robert J. Bartelt, East Peoria, and Patrick F. Dowd, Peoria, both of Ill., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.



Filed Nov. 25, 1988, Ser. No. 275,863

The portion of the term of this patent subsequent to Apr. 16, 2008, has been disclaimed.

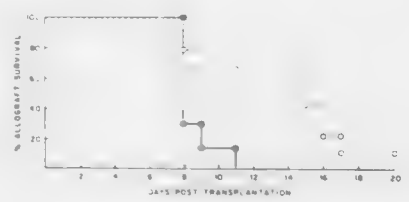
Int. Cl.[5] A07N *25/00, 27/00;* C07C *9/00*

U.S. Cl. 424—84 7 Claims

1. A substantially pure compound having the structure:

wherein R^1 and R^2 are independently selected from the group consisting of hydrogen and lower alkyl.

5,011,684



LYSING OR BLOCKING UNWANTED CELLS WITH IL-2 RECEPTOR-SPECIFIC BINDING SUBSTANCE

Terry B. Strom, Brookline, Mass., assignor to Beth Israel Hospital Association, Boston, Mass.

Filed Sep. 5, 1985, Ser. No. 772,893

Int. Cl.[5] A61K *39/395*

U.S. Cl. 424—85.2 6 Claims

1. A method of treating a mammal suffering from a nonmalignant, disease state-producing immune response characterized by a proliferative burst of lymphocytes having on their surfaces IL-2 receptors, said method comprising administering to said mammal, during said proliferative burst, a cell-lysing or IL-2 blocking amount of a monoclonal antibody to the IL-2 receptor, whereby said IL-2 receptor-bearing lymphocytes are lysed or blocked and memory T-lymphocytes and resting T-lymphocytes of said mammal are spared.

5,011,685

BACULOVIRUS PROTEINS AND VIRAL PESTICIDES CONTAINING SAME

Robert R. Granados, Ithaca, N.Y., assignor to Boyce Thompson Institute for Plant Research, Inc., Ithaca, N.Y.

Division of Ser. No. 426,795, Oct. 25, 1989, Pat. No. 4,973,667, which is a continuation of Ser. No. 178,259, Apr. 6, 1988, abandoned. This application Sep. 10, 1990, Ser. No. 580,083

Int. Cl.[5] A61K *35/76;* A01N *63/00*

U.S. Cl. 424—93 7 Claims

1. A viral pesticide comprising a nuclear polyhedrosis virus and a viral factor which enhances infectivity, said factor comprising a baculovirus protein free of occlusion bodies which protein breaks down the physical structure of the peritrophic membrane of lepidopterous larvae through the degration of structural glycoproteins.

5,011,686

THROMBUS SPECIFIC CONJUGATES

Roy H. L. Pang, Medway, Mass., assignor to Creative Biomolecules, Inc., Hopkinton, Mass.

Continuation of Ser. No. 99,242, Sep. 21, 1987, abandoned. This application Nov. 15, 1989, Ser. No. 437,769

Int. Cl.[5] A61K *37/02, 37/48, 37/547*

U.S. Cl. 424—94.1 11 Claims

1. A method for imparting to an injectable reagent an affinity for an intravascular thrombus, said method comprising the step of linking to said injectable reagent a fibrin binding domain comprising a protein having an affinity for fibrin and a sequence identical or homologous to the FA, FB, FC, FD, or FE fragments of protein A or portion thereof, a protein analog thereof having at least about 5% to 50% of the fibrin affinity of fragment B of Protein A, or an oligomer of the protein or the protein analog.

5,011,687

PURIFIED MULLERIAN INHIBITING SUBSTANCE AND PROCESS FOR TREATING HUMAN OVARIAN CANCER CELLS

Patricia K. Donahoe, Weston, and David A. Swann, Lexington, both of Mass., assignors to The General Hospital Corporation, Boston, Mass.

Continuation of Ser. No. 620,546, Jun. 18, 1984, abandoned, which is a continuation of Ser. No. 303,516, Sep. 18, 1981, abandoned, which is a continuation of Ser. No. 71,316, Aug. 30, 1979, abandoned. This application Oct. 29, 1985, Ser. No. 792,233

Int. Cl.[5] A61K *35/48*

U.S. Cl. 424—559 2 Claims

1. A purified form of Mullerian Inhibiting Substance (MIS) which, when isolated from testicular tissue comprises a glycoprotein having the following characteristics:

(a) an activity of at least 1 as measured by the Mullerian regression organ culture assay, which is substantially free of testicular tissue and of proteinaceous material capable of degrading said MIS;

(b) a cytotoxicity index of greater than 0.25 towards synchronously growing cells in a cell culture of a human ovarian papillary serous cystadenocarcinoma, when said cell culture is populated at a density between 50 and 100 cells per well, but showing no statistically significant cytotoxicity towards non-Mullerian human gliobastomas or against human fibroblasts;

(c) molecular weight about 70,000 daltons;

(d) carbohydrate fraction: mannose, galactose, glucasamine, and N-acetylneuraminic acid; and

(e) peptide fraction: 80–90 weight percent amino acids.

5,011,688

LIQUID COMPOSITION FOR THE RELIEF OF PREMENSTRUAL AND MENSTRUAL DISCOMFORTS

Henry D. Calam, 251 Furnace Dock Rd., Peekskill, N.Y. 10566, and Hans A. Schaeffer, 14 Pallant Ave., Linden, N.J. 07036

Continuation-in-part of Ser. No. 309,078, Feb. 2, 1989, abandoned, which is a continuation of Ser. No. 74,548, Jul. 17, 1987, abandoned. This application May 8, 1990, Ser. No. 523,036

Int. Cl.[5] A61K *9/08, 47/00*

U.S. Cl. 424—195.1 12 Claims

1. A liquid composition for the relief of premenstrual and menstrual discomfort comprising, as active pharmaceutical agents, an effective amount of an analgesic, an antihistamine, and a diuretic, said active agents being unpleasant in taste, and dissolved in a liquid vehicle, said composition containing 5–25 percent by volume alcohol and being flavored with active flavoring elements of citrus, vanilla, and mint, said active flavoring ingredients being present in an amount sufficient to mask the unpleasant taste of the pharmaceutically active agents.

5,011,689

COMPOSITION OF MATTER AND METHOD FOR TREATING POISON IVY

T. Paul Misenko, 1093 Barbd La., Bristolville, Ohio 44402, assignor to T. Paul Misenko, Bristolville, Ohio

Continuation of Ser. No. 169,305, Mar. 17, 1988, abandoned. This application Dec. 11, 1989, Ser. No. 449,471

Int. Cl.[5] A61K *35/78*

U.S. Cl. 424—195.1 6 Claims

1. A method for reducing rash formation and itching of skin caused by poison ivy comprising breaking up a plant of the genus Plantago to release the sap therein and to form a fibrous pulp containing sap and applying an effective amount of said sap-containing pulp to the affected area of skin.

5,011,690

SPHEROIDAL SILICA

Michael J. Garvey, Wirral; Ian C. Griffiths, Merseyside, and John H. S. Rennie, Cheshire, all of England, assignors to Unilever Patent Holdings B.V., Rotterdam, Netherlands

Continuation of Ser. No. 937,112, Dec. 2, 1986, Pat. No. 4,778,667. This application Jun. 6, 1988, Ser. No. 202,563

Claims priority, application United Kingdom, Jun. 5, 1987, 8713263

Int. Cl.[5] A61K *9/08, 9/50, 7/46;* **B32B** *5/16*

U.S. Cl. 424—401 **13 Claims**

1. Process for the preparation of porous silica spheroids having a particle size in the range 1 to 400 microns and axial ratios of 1:1 to 1:12 and containing included material selected from the group consisting of perfumes, flavouring materials, pigments, germicides, bactericides, fungicides, bleaching agents, skin benefit agents, therapeutic agents and mixtures thereof, said process comprising the steps of

(i) mixing together (a) an aqueous, stabilized silica sol containing dispersed therein said included material in an amount of 0.02 to 50% by weight of the silica and (b) an aqueous solution of a polymer which is not adsorbed by the silica, so as to form a phase separated system comprising silica droplets containing said included material in a polymer-rich continuous phase, and

(ii) condensing the silica sol to aggregate the droplets to form said porous silica spheroids containing the included material.

5,011,691

OSTEOGENIC DEVICES

Hermann Oppermann; Thangavel Kuberasampath, both of Medway; David C. Rueger, West Roxbury, and Engin Ozkaynak, Milford, all of Mass., assignors to Stryker Corporation, Kalamazoo, Mich.

Continuation-in-part of Ser. No. 232,630, Aug. 15, 1988, which is a continuation-in-part of Ser. No. 179,406, Apr. 8, 1988, Pat. No. 4,968,590. This application Feb. 23, 1989, Ser. No. 315,342

Int. Cl.[5] C07K *13/00, 15/00;* **A61K** *37/00;* **C12P** *21/00*

U.S. Cl. 424—423 **37 Claims**

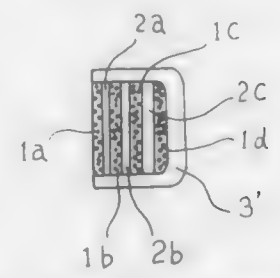
1. An osteogenic device for implantation in a mammal comprising osteogenic protein dispersed within a biocompatible, in vivo biodegradable matrix defining pores of a dimension sufficient to permit influx, proliferation and differentiation of migratory progenitor cells from the body of said mammal,

the improvement wherein said osteogenic protein is produced by expression of recombinant DNA in a host cell, and comprises a pair of polypeptide chains, each of which has an amino acid sequence sufficiently duplicative of the sequence of COP-5 or COP-7 such that said pair of polypeptide chains, when disulfide bonded to produce a dimeric species, has a conformation capable of inducing endochondral bone formation in association with said matrix when implanted in a mammal.

5,011,692

SUSTAINED PULSEWISE RELEASE PHARMACEUTICAL PREPARATION

Keiji Fujioka; Shigeji Sato; Yoshihiro Takada; Yoshio Sasaki, and Nobuhiko Tamura, all of Ibaraki, Japan, assignors to Sumitomo Pharmaceuticals Company, Limited, Osaka, Japan



Filed Dec. 23, 1986, Ser. No. 946,158

Claims priority, application Japan, Dec. 28, 1985, 60-297550; Nov. 14, 1986, 61-272542

Int. Cl.[5] A61F *2/00*

U.S. Cl. 424—426 **20 Claims**

1. A sustained pulsewise-release pharmaceutical dosage form means for embedding beneath skin which embedded administration comprises (a) drug-containing polymeric material layers (layers A) and polymeric material layers free from the drug in question or containing only a slight and significantly smaller amount of the same (layers B) disposed alternatingly, and (b) a surface extending in a direction perpendicular to the layers and

coated in its entirety with a polymeric material which is insoluble or scarcely soluble in water and in body fluids.

5,011,693

HAEMOSTATIC AGENTS

Martin Whitefield, London, England, assignor to Diomed Developments Limited, Hitchin, England

Continuation-in-part of Ser. No. 264,073, Oct. 28, 1988, abandoned. This application Oct. 24, 1989, Ser. No. 425,874

Claims priority, application United Kingdom, Oct. 24, 1988, 8824850

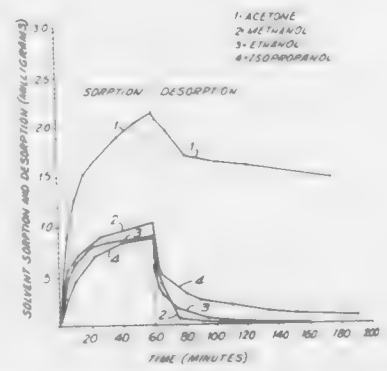
Int. Cl.[5] A61R *9/66*

U.S. Cl. 424—455 **12 Claims**

1. A gel for topical application as a hemostatic agent consisting essentially of a solution in water of basic ferric sulphate at a concentration within the range 6 to 20% w/v Fe(III) and sufficient for hemostatic activity, the said solution containing sufficient sulphate and colloidal silicon dioxide to gel the solution.

5,011,694

PHARMACEUTICAL DOSAGE UNIT FORMS WITH DELAYED RELEASE



Eberhard Nuernberg, Uttenreuth-Weiher, and Josef Pfeuffer, Bad Koenigshofen, both of Fed. Rep. of Germany, assignors to Röhm GmbH, Darmstadt, Fed. Rep. of Germany

Filed Aug. 1, 1989, Ser. No. 388,120

Claims priority, application Fed. Rep. of Germany, Aug. 11, 1988, 3827214

Int. Cl.[5] A61K *9/20*

U.S. Cl. 424—464 **6 Claims**

1. A method for making a delayed release pharmaceutical dosage unit form which comprises contacting, at a temperature from 18° C. to 50° C. and for a time between 5 minutes and 24 hours, a gas phase comprising the vapor of a lower alcohol having 1 to 4 carbon atoms with a matrix which comprises a compressed mixture of a powdered active pharmaceutical and a powdered polymer selected from the group consisting of polymers of acrylate esters, polymers of methacrylate esters, and vinyl ester polymers.

5,011,695

STERILIZATION OF BLOOD AND ITS DERIVATIVES WITH VITAMINS

Herbert Dichtelmuller, Sulzbach/Ts., and Wolfgang Stephan, Dreieich, both of German Democratic Rep., assignors to Biotest Pharma GmbH, Dreieich, Fed. Rep. of Germany

Filed Feb. 16, 1989, Ser. No. 311,483

Claims priority, application Fed. Rep. of Germany, Feb. 22, 1988, 3805459

Int. Cl.[5] A61K *35/14, 35/16;* **C12N** *7/06*

U.S. Cl. 424—529 **21 Claims**

1. A method for sterilizing a lipid-coated-virus-containing member selected from the group consisting of blood, a blood derivative, plasma or a plasma derivative consisting essentially of treating said member with an agent selected from the group consisting of vitamin A, vitamin E, vitamin B_6, vitamin B_{12} and vitamin C or a mixture thereof.

5,011,696

MALT FLAVOR MATERIAL AND PREPARATION THEREOF

Gerhard J. Haas, Woodcliff Lake, and Karen G. Heller, Livingston, both of N.J., assignors to Kraft General Foods, Inc., Glenview, Ill.

Filed Mar. 12, 1990, Ser. No. 491,794

Int. Cl.[5] A23L *1/22*

U.S. Cl. 426—28 **14 Claims**

1. A process for producing a heat-stable, low volatile, yeast fermented malt flavorant comprising:

(a) preparing a mixture containing distillers malt flour with 0 to 25% gelatin, by weight;

(b) adding water to the mixture of step (a) to produce a slurry containing 20% to 50% by weight solids;

(c) heating the slurry to a first temperature of from about 40° C. to about 55° C. for a first time period of about 15 minutes to about 180 minutes;

(d) diluting the slurry to about 10% to about 35% solids;

(e) heating the slurry to a second temperature of from about 50° C. to about 65° C.;

(f) holding the slurry at the second temperature for a second time period of from about 15 minutes to about 120 minutes;

(g) fermenting the slurry with yeast at a fermenting temperature of from about 25° C. to about 40° C. for a fermenting time period of from about 24 hours to about 120 hours; and

(h) heating the slurry at a temperature and for a period of time sufficient to inactivate the yeast.

5,011,697

INHIBITING DEVELOPMENT OF MUTAGENS AND CARCINOGENS

Ronald C. Jones, Briafcliff Manor, and John H. Weisburger, White Plains, both of N.Y., assignors to American Health Foundation, Dana Road, N.Y.

Continuation-in-part of Ser. No. 659, Jan. 6, 1987, Pat. No. 4,777,052. This application Aug. 6, 1988, Ser. No. 227,628

Int. Cl.[5] A23L *1/305, 1/314, 3/34*

U.S. Cl. 426—92 **20 Claims**

1. A method of inhibiting the development of mutagens/carcinogens during the cooking of a protein containing foodstuff comprising applying L-proline to the foodstuff in an amount sufficient to inhibit the development of mutagens/carcinogens during the cooking of the foodstuff, and cooking the foodstuff with the L-proline thereon.

5,011,698

BREATHABLE MICROPOROUS FILM AND METHODS FOR MAKING IT

Mitchell K. Antoon, Jr., and David J. Hill, both of Wilmington, Del., assignors to Hercules Incorporated, Wilmington, Del.

Division of Ser. No. 500,975, Mar. 9, 1990, which is a division of Ser. No. 224,632, Jul. 28, 1988, Pat. No. 4,923,650. This application Nov. 5, 1990, Ser. No. 608,785

Int. Cl.[5] B65B *25/04*

U.S. Cl. 426—395 **2 Claims**

1. A container capable of creating within it substantially no loss of water vapor yet substantially free flow of O_2 and CO_2 gases to the atmosphere in the presence of respiring fresh fruit, vegetable, or flowers, that is constructed of a substantially gas-impermeable material having a gas-permeable panel in one or more of its walls to provide the flow of O_2 and CO_2 gases but yet a substantial barrier to water vapor through its walls, where the panel is composed of a breathable microporous film comprising 20 to 37% by weight of a polymer or copolymer of an alpha-olefin having 1-8 carbons or mixtures thereof, 60 to 75% by weight of calcium carbonate or glass beads having particle sizes of 10 to 25 micrometers, 0.1 to 3.0% by weight of calcium stearate, and 0 to 2% by weight of a UV light-oxygen, and heat stabilizer, said breathable film composition having been produced by preparing a melt blend containing said ingredients and maintaining the moisture level of the blend below 700 ppm prior to forming a casting therefrom, forming a casting from said melt blend and then, based on the polymer or copolymer used, stretching the casting to produce oriented film in two directions from about 1.5 to 7 times in each direction in a temperature range of from about 20° to 160° C., each oriented film having a Gurley porosity (method B, ASTM D-726) of 0.1 second to 85 seconds so that the film has good air and water vapor transmission rate but is substantially impenetrable by liquid water.

5,011,699

PROCESS FOR STERILIZING FOOD STUFFS

Hisateru Mitsuda, Kyoto; Hiroshi Ohminami, Nara, and Haruko Nagasawa, Kyoto, all of Japan, assignors to Japan Food Industry Association Inc., Kyoto, Japan

Filed Sep. 7, 1989, Ser. No. 404,334

Int. Cl.[5] A23B *4/16, 5/10, 7/144*

SYRUP DELIVERY SYSTEM FOR CARBONATED BEVERAGES

Keith W. Gustafson, Station 1101, Lake Arrowhead, Waleska, Ga. 30183; George W. Kalet, 2892 Wynfair Dr., Marietta, Ga. 30062, and Martin S. Taylor, Station 1083, Lake Arrowhead, Waleska, Ga. 30183

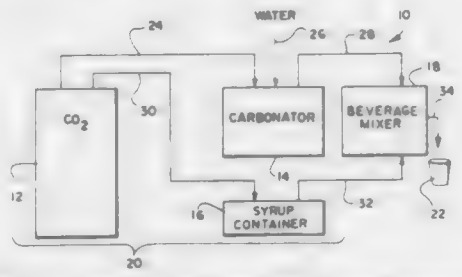
Filed Aug. 11, 1989, Ser. No. 392,779

Int. Cl.[5] B01F *3/04*

U.S. Cl. 426—477 **9 Claims**

6. A method for mixing a carbonate beverage comprising the steps of:

(a) carbonating water with a source of CO_2 gas;



(b) delivering the carbonated water to a beverage mixer through a carbonated water inlet line;

(c) delivering beverage syrup to the beverage mixer through a syrup inlet line by:

i. connecting the syrup inlet line of the beverage mixer to

a syrup container comprising a collapsible bag containing the syrup which bag is located inside a rigid drum and which bag has connector means for connection to the syrup inlet line; and

ii. connecting an outlet line from a source of pressurizing

fluid to a fitting on the rigid drum which fitting communicates with a space between the rigid drum and the collapsible bag so that the source of pressurizing fluid collapses the bag and forces the syrup out of the bag, through the connector means, through the syrup inlet line, and into the beverage mixer.

LOW CALORIE FOOD PRODUCTS HAVING SMOOTH, CREAMY, ORGANOLEPTIC CHARACTERISTICS

Cynthia C. Baer, Arlington Heights; Gregory S. Buliga, Mt. Prospect; Gerard L. Hassenheutti, Highland Park; George A. Henry, Wilmette; Alice A. Heth, Evanston; Linda K. Jackson, Lincolnshire; Jill M. Kennedy-Tolstedt, DesPlaine; Phillip J. Kerwin, Wilmette; Mark S. Miller, Arlington Heights; Elizabeth M. Parker, DesPlaines; Neela K. Paul, Clarendon Hills; David G. Pechak, Glen Ellyn; Gary F. Smith, Highland Park, and Vernon C. Witte, Naperville, all of Ill., assignors to Kraft General Foods, Inc., Glenview, Ill.

Continuation-in-part of Ser. No. 292,568, Dec. 30, 1988, and Ser. No. 81,115, Aug. 3, 1987, abandoned, which is a continuation-in-part of Ser. No. 658,618, Oct. 9, 1984, Pat. No. 4,684,533, said Ser. No. 292,568, is a continuation-in-part of Ser. No. 188,283, Apr. 29, 1988, abandoned, Ser. No. 177,184, Apr. 4, 1988, abandoned, and Ser. No. 24,507, Mar. 1, 1987, Pat. No. 4,762,726, which is a continuation-in-part of Ser. No. 567,096, Dec. 30, 1983, Pat. No. 4,563,360, and Ser. No. 567,277, Dec. 30, 1983, Pat. No. 4,559,233. This application Aug. 18, 1989, Ser. No. 395,800

Int. Cl.[5] A23L *1/0534, 1/24, 1/308*

U.S. Cl. 426—573 **5 Claims**

1. A method for preparing a low fat or substantially fat-free food product comprising the steps of heating and repeatedly shearing at least two times an aqueous dispersion consisting of from about 3 to about 10 weight percent of microcrystalline cellulose and from about 90 to about 97 weight percent water in a high shear zone having a pressure drop of at least 12,000 psi to fragment the microcrystalline cellulose to submicron sized microcrystalline cellulose fragments and reagglomerating the crystalline cellulose fragments under high shear conditions to produce an aqueous dispersion of porous microreticulated microcrystalline particles having a void volume at least about 25 volume percent, a mean particle size in the range of from about 5 to about 20 microns, and a particle size distribution such that at least about 75 weight percent of the particles have a maximum dimension of less than about 25 microns,

combining said microreticulated microcrystalline cellulose dispersion with from about 2 to about 33 weight percent of xanthan gum, based on the dry weight of said microreticulated microcrystalline cellulose dispersion, and

blending said xanthan stabilized microreticulated microcrystalline cellulose dispersion with additional food components to provide a low fat or fat-free food product comprising from about 0.25 to about 4 weight percent of dispersed microreticulated microcrystalline cellulose, from about 50 to about 99 weight percent of water, from about 1 to about 35 weight percent of carbohydrates, from about 0 to about 10 weight percent protein, and less than about 7 weight percent triglycerides.

5,011,702

PROCESS FOR PRODUCING TEXTURED PROTEIN FOOD MATERIALS

Kimie Tamaki, Tokyo; Tsuguaki Nishiya, Sayama, and Kiyoshi Tatsumi, Iruma, all of Japan, assignors to Snow Brand Milk Products Co., Ltd., Sapporo, Japan

Filed Jan. 17, 1990, Ser. No. 466,641

Int. Cl.[5] A23C *21/00*

U.S. Cl. 426—583 **5 Claims**

1. A process for producing textured protein food materials consisting essentially of the steps heating a solution containing whey protein as the major component, and freezing the solution in a stationary state to obtain textured protein food materials.

5,011,703

LOW FAT, LOW CHOLESTEROL RAW MEAT PRODUCT

Dallas V. Chapman, 200 Union Street, The Junction, Newcastle, N.S.W. 2300, Australia

Continuation of Ser. No. 257,570, Oct. 14, 1988, abandoned, which is a division of Ser. No. 46,886, Feb. 25, 1987, Pat. No. 4,778,682. This application Feb. 23, 1990, Ser. No. 483,651

Claims priority, application Australia, Jun. 28, 1985, PHO1263; Sep. 30, 1985, PHO2677

Int. Cl.[5] A23L *1/317*

U.S. Cl. 426—646 **26 Claims**

1. A comminuted, self-binding, raw meat product having reduced fat and cholesterol content, as compared with naturally occurring meat of food animals, prepared by a process comprising:

(a.) arranging raw meat from a slaughtered food animal, containing naturally-occurring fat and cholesterol, in a thin layer;

(b.) exposing said thin meat layer to ultraviolet light;

(c.) comminuting said exposed raw meat in contact with a chilled surface in the presence of iced water, edible acid, sodium chloride, and food phosphates for a period of time whereby a portion of said fat and cholesterol are separated from said comminuted meat and adhere to said chilled surface, and then

(d.) removing said comminuted meat from the fat and cholesterol adhering to said chilled surface.

5,011,704

FUDGE SAUCE AND FROZEN CONFECTION

Michael S. Smagula, Plainsboro, N.J., and Michael R. Tancredi, New Milford, Conn., assignors to Kraft General Foods, Inc., Glenview, Ill.

Filed Jan. 31, 1990, Ser. No. 473,269

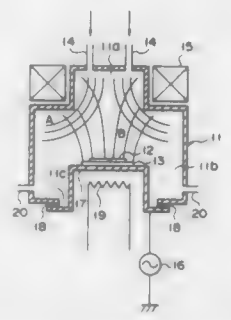
Int. Cl.[5] A23G *3/00*

U.S. Cl. 426—660 **19 Claims**

1. A ready-to-eat dessert comprising a frozen confection and a fudge sauce flowable at freezer temperature, the fudge sauce being an aqueous mixture comprising mixed saccharides, modified food starch, fat and hydrophilic colloids, wherein the dynamic viscosity of the sauce is less than 5×10^4 poise at $-12°$ C. and is relatively stable in viscosity over a temperature range of from $-10°$ C. to $+10°$ C., the slope of the plot of temperature versus the logarithm to the base 10 of dynamic viscosity being within the range of from $-0.1/°$ C. to $-0.001/°$ C.

5,011,705

PLASMA PROCESSING METHOD



Susumu Tanaka, Hachioji, Japan, assignor to Tel Sagami Limited, Kanagawa, Japan

Filed Apr. 25, 1989, Ser. No. 342,900

Claims priority, application Japan, Apr. 28, 1988, 63-105924

Int. Cl.[5] B05D *3/06*

U.S. Cl. 427—39 **11 Claims**

1. A plasma processing method employed in a plasma processing apparatus wherein said apparatus comprises a susceptor with a surface for mounting an object to be treated within a treatment container, and means for forming an electric field within said treatment container such that said electric field creates lines of electric force which cross the mounting surface of the susceptor, said method comprising the steps of:

arranging an annular coil for forming a magnetic field wherein said magnetic field has magnetic lines of force within said treatment container, wherein said coil is positioned so the axis of said coil substantially crosses said mounting surface of said susceptor; and the magnetic lines of force are generated at a place remote from said susceptor;

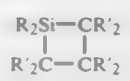
introducing a cleaning gas into said treatment container; and

forming said electric field and said magnetic field within said treatment container so as to generate plasma from said cleaning gas for cleaning the inner space of said treatment container with said plasman.

5,011,706

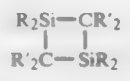
METHOD OF FORMING COATINGS CONTAINING AMORPHOUS SILICON CARBIDE

Leo Tarhay, Sanford, and Kenneth G. Sharp, Midland, both of Mich., assignors to Dow Corning Corporation, Midland, Mich.



Filed Apr. 12, 1989, Ser. No. 336,927

Int. Cl.[5] B05D *3/06;* **C23C** *16/32, 16/50*



U.S. Cl. 427—39 **14 Claims**

1. A method of forming a continuous coating on a structure, the method comprising:

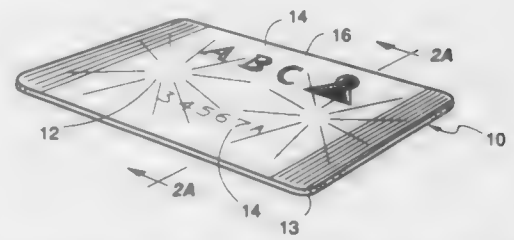
introducing sufficient quantity of a vapor into an evacuated chamber containing the structure to provide a vapor pressure in the chamber of 0.001 to 300 Torr, the vapor comprising a silicon-containing cyclobutane selected from the group consisting of silacyclobutanes represented by the formula

and 1,3-disilacyclobutanes represented by the formula

where, in both formulas, each R is independently selected from the group consisting of hydrogen, fluorine, and hydrocarbon radicals having 1 to 4 carbon atoms and each R' is independently selected from the group consisting of hydrogen and hydrocarbon radicals having 1 to 4 carbon atoms;

inducing decomposition of the silicon-containing cyclobutane in the chamber by effecting a plasma discharge within the chamber containing the structure.

5,011,707



METHOD FOR APPLYING ADHESIVE TO A HOLOGRAM FILM

Russell W. Schell, 4612 Gregory St., McHenry, Ill. 60050, and Anthony R. Losacco, 1025 E. Maple St., Lombard, Ill. 60148

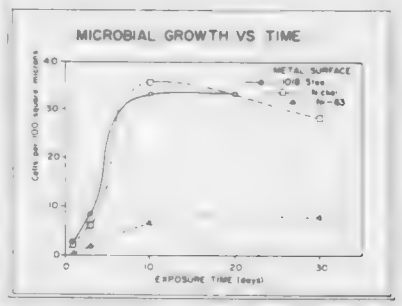
Division of Ser. No. 326,889, Mar. 21, 1989, Pat. No. 4,971,646. This application Oct. 2, 1990, Ser. No. 591,747

Int. Cl.[5] B05D *3/00*

U.S. Cl. 427—39 **11 Claims**

1. A method for applying an adhesive to a hologram film including the steps of: passing the hologram film between electrical corona treatment rollers; passing the hologram film past a primer or sizing station; and then applying melted adhesive to the hologram film.

5,011,708



USE OF RADIOACTIVE NICKEL-63 TO INHIBIT MICROBIALLY INDUCED CORROSION

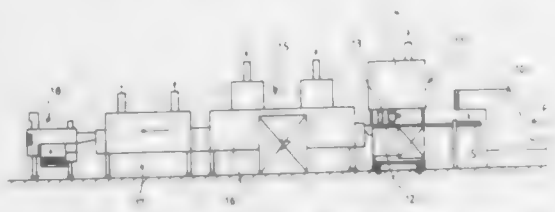
James L. Kelly, and Ralph J. Reda, both of Charlottesville, Va., assignors to University of Virginia Alumni Patents Foundation, Charlottesville, Va.

Filed Jun. 6, 1989, Ser. No. 362,000

Int. Cl.[5] C23C *14/00, 10/00, 26/00*

U.S. Cl. 427—443.1 **12 Claims**

1. A method for the prevention of microbially induced corrosion or fouling of a substrate, comprising the step of:



including in or coating on the substrate, prior to its exposure to an environment, an amount of nickel-63 effective to prevent the growth of microorganisms on the substrate; and thereafter exposing the substrate to the environment which contains sufficient microorganisms, and for a period of time which would be expected to cause corrosion or fouling of the substrate if not treated.

5,011,709

METHOD FOR MODIFYING THE SURFACE STATE OF MATERIALS, IN PARTICULAR OF THE PAPER AND/OR CARD TYPE

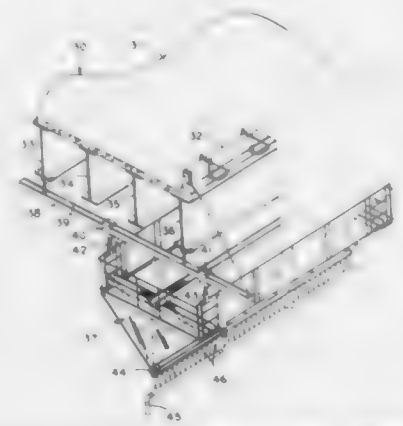
Romain Arbogast, Nevers, and Albert Gervie, Lozanne, both of France, assignors to Oris, Lyons, France

Filed Oct. 4, 1988, Ser. No. 253,431
Claims priority, application France, Oct. 5, 1987, 87 13733
Int. Cl.[5] B05D 3/06
U.S. Cl. 427—56.1 7 Claims

1. A method of modifying the surface state of a print medium, the method comprising the steps of:

simultaneously applying a plurality of printing fluids on the surface of the print medium in such a manner as to provide dusting zones on the medium suitable for retaining dusting powder particles which adhere exclusively on said zones, dusting a dusting powder onto said medium including said dusting zones;

removing excess dusting powder by means of a flow of air, and heating the medium to fix the printing fluids and the dusting powder particles retained thereby, said heating being equivalent to the use of radiation at a wavelength of 2.5-3.8 μ;



wherein said dusting powder is constituted by a substance which melts on heating and which is set after subsequent cooling, and wherein said heating step is performed in an atmosphere of hot air at a temperature of at least about 115° C. sufficient to melt said dusting powder and having a degree of humidity not less than 85% and sufficient to counter a large drop in the humidity of the medium under the effect of the heating, the temperature of the surface of said print medium not exceeding about 90° C. during said heating.

5,011,710

BRIDGE MAINTENANCE METHOD AND EQUIPMENT

John F. Harrison, 2579 Prairie Ave., Holland, Mich. 49424

Filed Nov. 10, 1988, Ser. No. 269,470
Int. Cl.[5] E04G 1/18, 1/00; B24C 9/00
U.S. Cl. 427—142 7 Claims

1. A method of removing and then applying surface material on structural components, comprising

supporting an enclosure adjacent certain of said components to include a surface of at least one of said components in an at least partially enclosed space,

suspending walkway means in said enclosed space, and processing said surface from said walkway means; and

establishing a conveyor conduit at the lower extremity of said enclosure, and applying a vacuum to said conduit to remove gaseous and particulate material from said enclosure and maintain reduced pressure within said enclosure.

5,011,711

METHOD FOR POST-TREATMENT OF ELECTROPLATED STEEL SHEETS FOR SOLDERING

Katsumi Kanda; Junichi Fujimoto; Masashi Ichishima; Takao Nishimura, and Yoshikazu Kondo, all of Yamaguchi, Japan, assignors to Toyo Kohan Co., Ltd., Chiyoda, Japan

Filed Jul. 13, 1989, Ser. No. 379,172
Int. Cl.[5] B05D 3/04, 3/10
U.S. Cl. 427—334 25 Claims

1. A method for post-treating plated steel sheet for soldering which comprises the steps of (1) coating said sheet with an aqueous post-treatment solution having a pH of from 3 to 10 and comprising at least one water-soluble or water-dispersible material selected from the group consisting of

a. condensates of fatty higher alcohols, alkylphenols or fatty acids with ethylene oxides,

b. polyethylene glycol-alkylamines,

c. esters of sorbitan and fatty acids,

d. surfactants prepared from polypropylene glycol and polyethylene glycol,

e. amides of fatty acid and diethanol amine,

f. esters of sucrose and fatty acids,

g. saponificates of lanolin alcohol or lanolin fatty acid,

h. abietic acid,

i. benzoic acid,

j. saturated fatty acids having 12 to 24 carbon atoms,

k. unsaturated fatty acids having 12 to 24 carbon atoms,

l. alcohols having 2 to 400 carbon atoms,

m. esters of fatty acids,

n. derivatives of benzotriazoles,

o. metalates, ammonium salts and amine salts of material h. through n.,

p. paraffin waxes, and

q. phosphoric esters,

said solution containing from 2 to 100 g/liter of any of said materials other than phosphoric esters, and/or from 5 to 200 g/liter of phosphoric esters, and further comprising from 2 to 100 g/liter of at least one water-soluble or water-dispersed organic fluoro compound of the formula

$$C_nF_{2n+1}R_1R_2$$

where

R_1 is methylene, ethylene or a direct bond;

R_2 (which is introduced to increase the water-solubility or water-dispersibility) is a radical of acrylic esters, methacrylic esters, phosphoric esters, or carboxylic esters, or an ethylene oxide adduct, and

n is an integer from 2 to 30,

in which up to one-third of the fluorine atoms can optionally be replaced by hydrogen atoms, and (2) drying said solution to obtain a coating thickness in the range of from 0.01 to 2 μm.

5,011,712

FORMALDEHYDE-FREE HEAT RESISTANT BINDERS FOR NONWOVENS

Ronald Pangrazi, Flemington, and James L. Walker, Whitehouse Station, both of N.J., assignors to National Starch and Chemical Investment Holding Corporation, Wilmington, Del.

Filed Mar. 16, 1989, Ser. No. 324,071
Int. Cl.[5] B05D 3/02
U.S. Cl. 427—389.9 16 Claims

1. In a process for preparing a heat resistant nonwoven product comprising the steps of:

(a) impregnating a nonwoven web with an aqueous binder;

(b) removing excess binder;

(c) drying and curing the mat;

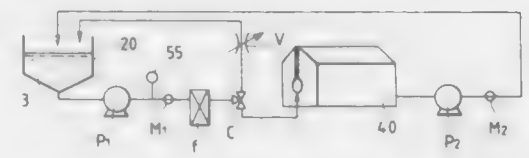
the improvement which comprises utilizing as the binder an emulsion polymer having a glass transition temperature (Tg) of +10° to +50° C., said polymer consisting essentially of 100 parts by weight of C_1-C_4 alkyl acrylate or methacrylate ester monomers or mixtures thereof or styrene/acrylate monomers, 0.5 to 5 parts of a hydroxyalkyl acrylate or methacrylate, 3 to 6 parts of methyl acrylamido glycolate methyl ether; and 0.1 to 3 parts of a multifunctional comonomer.

5,011,713

USE OF PERFLUOROPOLYETHER DERIVATIVES IN THE FORM OF AN AQUEOUS EMULSION FOR PROTECTING STONY MATERIALS FROM ATMOSPHERIC AGENTS

Daria Lenti, and Mario Visca, both of Alessandria, Italy, assignors to Ausimont S.R.L., Milan, Italy

Filed Apr. 7, 1989, Ser. No. 334,521
Claims priority, application Italy, Apr. 8, 1988, 20127 A/88
Int. Cl.[5] B05D 3/02
U.S. Cl. 427—393.6 12 Claims



1. A process for protecting marble, stone, tiles, cement, gypsum, or wood and other analogous materials utilized in particular in the building industry from the deteriorating action of atmospheric agents and pollutants, by applying onto said materials a protective agent comprising a microemulsion of perfluoropolyethers containing functionalized groups and, optionally, peroxide bridges in the chain.

5,011,714

METHOD OF APPLYING A LIQUID TO A MOVING WEB

Shinsuke Takahashi; Norio Shibata, and Tsunehiko Sato, all of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Division of Ser. No. 491,991, Mar. 12, 1990. This application Jun. 21, 1990, Ser. No. 541,674
Claims priority, application Japan, Mar. 16, 1989, 1-62274
Int. Cl.[5] H01F 10/02; B05D 1/18
U.S. Cl. 427—434.3 3 Claims

1. A method for applying a liquid to a moving web with an extruder apparatus including an extruder, a first pump for pumping coating liquid from a storage tank to an inlet of said extruder, and a second pump for returning excess coating liquid from said extruder to said tank, comprising:

a first step of simultaneously pumping a first quantity of coating liquid from said tank with a first pump, returning a second quantity of coating solution from said first pump to said tank, and passing a third quantity of coating liquid from said first pump to said second pump, bypassing said extruder, thence returning said third quantity to said tank; and

a subsequent second step of simultaneously pumping said first quantity of coating liquid from said tank to said inlet of said extruder, coating said second quantity of coating liquid with said extruder on said moving web, and returning said third quantity of coating liquid from said extruder to said liquid storage tank with said second pump.

5,011,715

TWO STAGE METHOD FOR OPERATING AUTODEPOSITION BATH

Ronald W. Broadbent, Horsham, Pa., assignor to Henkel Corporation, Ambler, Pa.

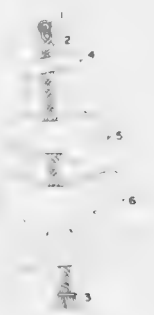
Continuation of Ser. No. 287,197, Dec. 20, 1988, abandoned. This application Jun. 22, 1990, Ser. No. 542,674
Int. Cl.[5] C23C 26/00
U.S. Cl. 427—443.1 20 Claims

1. A method of operating an autodeposition bath, comprising the steps of:

(a) providing a bath comprising (i) stable, autodepositable polymer, (ii) acid in sufficient quantity to maintain the pH of the bath at not more than about 4, (iii) a soluble oxidant in sufficient quantity to maintain the redox potential of the bath at least about 425 mv more oxidizing than a silver-saturated silver chloride electrode, and (iv) a concentration of soluble iron less than a specific value;

(b) contacting the bath provided in step (a) with ferriferous active metal surface, so as to cause autodeposition of polymer thereon and to cause the concentration of soluble iron in the bath to increase, while simultaneously maintaining the redox potential of the bath at least about 425 mv more oxidizing than a silver-saturated silver chloride electrode by supplying additional soluble oxidant to the bath as needed, until the concentration of soluble iron in the bath exceeds said specific value; and

(c) contacting the bath, after completion of step (b), with additional amounts of ferriferous active metal surface, so as to cause autodeposition of polymer on the active metal surface from the bath while simultaneously maintaining the redox potential of the bath at a value not less than about 272 mv and not more than about 375 mv more oxidizing than a silver-saturated silver chloride electrode by supplying additional soluble oxidant to the bath as needed,



wherein the average rate of increase of soluble iron in the bath, per unit area of active metal coated, during step (c) of the process is less than during step (b).

5,011,716

HOLDER FOR BARRETTES

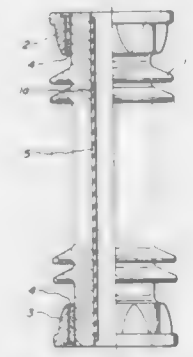
Diane Allen, 373 Coolidge Ave., Oceanside, N.Y. 11572

Filed Apr. 30, 1990, Ser. No. 516,475
Int. Cl.[5] A45D 8/34
U.S. Cl. 428—4 2 Claims

1. A holder for barrettes, comprising a mounting ring, adapted to be mounted on a wall,

a length of braided hair looped through the mounting ring and

an elastic band, mounted on the end of said braided hair, to



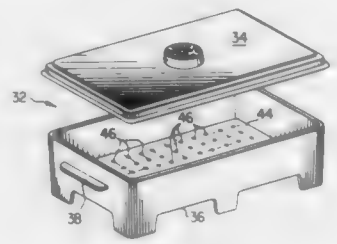
hold the loose ends together wherein a number of barrettes are mounted on the length of braided hair for easy inspection and selection.

5,011,717

EXPLOSION PREVENTING PORCELAIN HOLLOW INSULATOR

Tsutomu Moriya, Chita; Yasunori Matsuura, Kasugai, and Takao Nakamura, Iwakura, all of Japan, assignors to NGK Insulators, Ltd., Japan

Filed Jul. 5, 1989, Ser. No. 375,478
Claims priority, application Japan, Jul. 7, 1988, 63-170291
Int. Cl.[5] H01B *17/00*
U.S. Cl. 428—34.4 3 Claims



1. A hollow porcelain insulator comprising an elastic insulating layer adhered to the inner wall surface thereof, said elastic insulating layer having a tensile strength of at least 150 kg/cm^2 at room temperature and a thickness of at least 2 mm.

5,011,718

METHOD AND APPARATUS FOR REDUCING RESIDUAL LEVELS OF ETHYLENE OXIDE IN REPEATEDLY STERILIZED POLYMERIC DEVICES

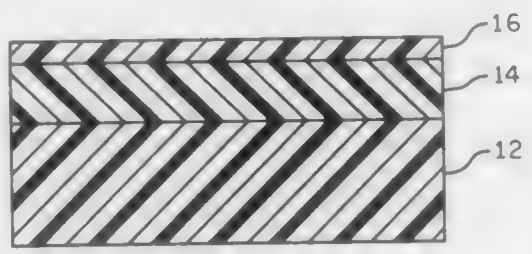
William H. Patterson, Jacksonville, Tex., assignor to Monarch Products, Inc., Jacksonville, Tex.

Filed May 4, 1988, Ser. No. 189,972
Int. Cl.[5] A61L *2/00*
U.S. Cl. 428—35.7 7 Claims

1. A medical device capable of being repeatedly sterilized with ethylene oxide without warping or melting and without build-up of residual levels of ethylene oxide therein, comprising:

a polymeric base having generally rigid sides dimensioned for receiving medical instruments and apertures for allowing ethylene oxide to pass through said polymeric base;

a polymeric lid for covering said polymeric base to define a polymeric container for medical instruments; said lid having an aperture therein to allow passage of ethylene oxide, wherein ethylene oxide comes in contact with both the exterior and interior surfaces of said container; and



a coating of dense material formed over the interior and exterior surfaces of said polymeric base and said polymeric lid, said coating having the characteristic of inhibiting penetration of the interior and exterior surfaces of said polymeric base and said polymeric lid by the ethylene oxide, thereby reducing build-up of residual levels of the ethylene oxide on the interior and exterior surfaces of said polymeric base and said polymeric lid.

5,011,719

POLYMERIC COMPOSITIONS AND FILMS

Russell P. Gehrke, Neenah; Richard E. Johnson, Jr., Appleton, and Yong J. Kim, Neenah, all of Wis., assignors to American National Can Company, Chicago, Ill.

Continuation-in-part of Ser. No. 802,910, Nov. 29, 1985, Pat. No. 4,764,404. This application Jul. 27, 1987, Ser. No. 78,122
Int. Cl.[5] B29D *22/00*
U.S. Cl. 428—35.7 82 Claims

1. A multiple layer film, comprising:

(a) a first layer, the composition of said first layer being a blend of (i) as a first component, 40% to 80% by weight of a first polypropylene, as a copolymer containing 1 to 8 weight percent random moieties of ethylene, (ii) as a second component, 5% to 50% by weight of a first ethylene butene-1 copolymer containing 85 to 95 mole percent ethylene, and (iii) a third component providing elastomeric properties and being selected from the group consisting of ethylene propylene copolymer, polybutylene, polyisobutylene, ethylene propylene diene monomer terpolymer, styrene butadiene styrene copolymer, styrene ethylene butylene styrene copolymer, styrene isoprene styrene copolymer, polybutene-1, and isobutylene isoprene copolymer; and

(b) a second layer, the composition of said second layer being a blend of (i) a second polypropylene polymer containing up to 7 weight percent random moieties of ethylene and (ii) 5% to 50% by weight of a second ethylene butene-1 copolymer containing 85 to 95 mole percent ethylene,

wherein the random moiety ethylene content in said polypropylene in said second layer is at least 1 weight percent less than the random moiety ethylene content in said polypropylene in said first layer

MULTILAYER CONTAINERS AND METHOD OF MAKING SAME

Saleh A. Jabarin, Holland, Ohio, assignor to Owens-Illinois Plastic Products Inc., Toledo, Ohio

Filed Jul. 10, 1989, Ser. No. 377,392
Int. Cl.[5] B65D *25/00*
U.S. Cl. 428—36.6 10 Claims

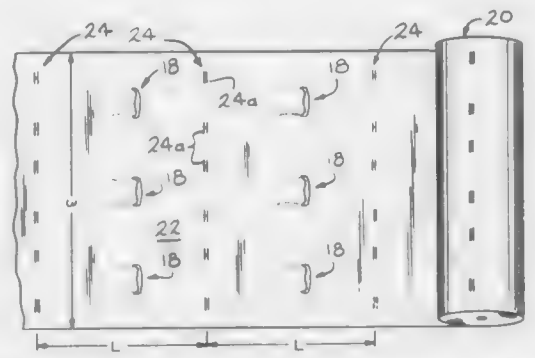
1. A container having a wall with at least two layers bonded together without a separate adhesive layer, one layer being a support layer that is a blend of a polyolefin and a polymer having a polar group that is a maleic anhydride functionalized block copolymer of styrene and ethylene/butylene, and the other layer being a barrier layer that is a polyamide or an ethylene/vinyl alcohol copolymer.

5,011,721

CHEMORHEOLOGICALLY TAILORED MATRIX RESIN FORMULATIONS AND THEIR USE IN MAKING PRE-IMPREGNATED FIBERS AND IN FABRICATING COMPOSITE PARTS

Owen H. Decker, Okesa, Okla., and Neal A. Mumford, Brigham, Utah, assignors to Thiokol Corporation, Ogden, Utah

Filed Oct. 16, 1989, Ser. No. 422,989
Int. Cl.[5] C08J *5/24*; C08L *63/00*
U.S. Cl. 428—36.9 36 Claims



1. A chemorheologically viscosity tailored matrix resin formulation for use in forming prepregs and filament wound composite articles and having a specified viscosity profile comprising a curable epoxy matrix resin and an effective amount of a reactive resin curing agent reactive at room temperature and a latent resin curing agent substantially non-reactive at room temperature but activated upon heating or radiation such that the matrix resin formulation is adapted upon formulation to have a viscosity sufficiently low enough to enable the matrix resin to impregnate a filament or fiber at room temperature without the necessity for the application of heat or solvent and which, upon standing at room temperature after impregnation into the fiber or filament to form a prepreg composition, rises in viscosity to a viscosity level sufficiently high to prevent excessive bleed of the matrix resin from winding tension upon spooling of the prepreg yet of sufficiently low enough viscosity to allow the prepreg to tack and drape in order to nestle and set during winding of a filament wound composite article from said prepreg after room temperature storage of the spooled prepreg material, and which matrix resin in the prepreg experiences a reduction in viscosity upon heating the prepreg composition, to a viscosity minimum sufficient low to allow the matrix resin in the heated prepreg to flow and substantially eliminate the formation of voids in the winding of a composite article from said prepreg yet not so low as to permit bleeding of the matrix resin from the prepreg and with the continued application of heat to the filament wound composite article to permit the matrix resin in the filament wound composite article to cure to a hardened or gelled state.

5,011,722

RECTANGULAR PAPERBOARD PACKAGE AND METHOD OF MAKING SAME

Yun H. Chung, Toledo, and Dennis E. Chung, Sylvania, both of Ohio, assignors to Chung Packaging Company, Perrysburg, Ohio

Continuation-in-part of Ser. No. 195,367, May 13, 1988, Pat. No. 4,813,545, which is a continuation of Ser. No. 887,562, Jul. 17, 1986, abandoned. This application Mar. 21, 1989, Ser. No. 326,380
Int. Cl.[5] B32B *3/10*
U.S. Cl. 428—43 29 Claims

1. A longitudinally extending sheet of paperboard material for use in constructing a plurality of generally rectangular paperboard packages, said sheet comprising:

a plurality of uniformly longitudinally spaced indexing means;

each indexing means including at least one precut peg receiving portion;

a plurality of longitudinally spaced apart tear line means, with a separate tear line means located between each longitudinally successive pair of indexing means, each tear line means defining an openable portion of said sheet and being spaced from each of said indexing means.

OPTICAL INFORMATION RECORDING MEDIUM

Makoto Harigaya, Hiratsuka; Yukio Ide, Mishima; Katsuyuki Yamada, Yokohama, and Hiroko Iwasaki, Tokyo, all of Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

Filed Jul. 20, 1989, Ser. No. 382,186
Claims priority, application Japan, Jul. 20, 1988, 63-179186; Mar. 24, 1989, 1-70585; Jun. 6, 1989, 1-142086
Int. Cl.[5] B32B *3/02*
U.S. Cl. 428—64 9 Claims

7. The phase-change type optical information recording medium comprising a substrate and a recording layer formed thereon, which recording layer comprises a phase-transition type compound consisting of 6 elements, having a chalcopyrite structure, represented by the following formula (I):

$$X \cdot Y \cdot Z_2 \quad (I)$$

wherein X represents one or two elements selected from the group consisting of elements belonging to the groups Ib and IIb in a periodic table; Y represents one or two elements selected from the group consisting of elements belonging to the groups IIIb, IVb, and Vb in a periodic table; and Z represents one or two elements selected from the group consisting of elements belonging to the groups Vb and VIb in a periodic table, which combination is selected from the group consisting of:

$(I_{1-x}I'_x)\text{-}(III_{1-y}III'_y)\text{-}(VI_{1-z}VI'_z)_2$,
$(I_{1-x}I'_x)\text{-}(III_{1-y}V_y)\text{-}(VI_{1-z}VI'_z)_2$,
$(II_{1-x}II'_x)\text{-}(IV_{1-y}IV'_y)\text{-}(V_{1-z}V'_z)_2$,
$(II_{1-x}II_x)\text{-}(III_{1-y}III'_y)\text{-}(VI_{1-z}VI'_z)_2$,
$(I_{1-x}II_x)\text{-}(IV_{1-y}IV'_y)\text{-}(V_{1-z}V'_z)_2$,
$(I_{1-x}I_x)\text{-}(III_{1-y}IV_y)\text{-}(VI_{1-z}VI'_z)_2$,
$(II_{1-x}I'_x)\text{-}(III_{1-y}III'_y)\text{-}(V_{1-z}VI_z)_2$,
$(II_{1-x}II'_x)\text{-}(III_{1-y}IV_y)\text{-}(V_{1-z}VI_z)_2$,
$(II_{1-x}II'_x)\text{-}(IV_{1-y}IV_y)\text{-}(V_{1-z}VI_z)_2$,
$(II_{1-x}II'_x)\text{-}(III_{1-y}IV_y)\text{-}(V_{1-z}VI_2)_2$, and
$(I_{1-x}II_x)\text{-}(III_{1-y}IV_y)\text{-}(V_{1-z}VI_z)_2$;

wherein I, II, III, VI, V and VI each represents an element of the group Ib, IIb, IIIb, VIb, Vb and VIb, respectively in the periodic table; I', II', III', IV', V' and VI' each represents a different element from the I, II, III, IV, V and VI in the same group; and $0<x<1$, $0<y<1$, and $0<z<1$.

U.S. Cl. 428—156 4 Claims

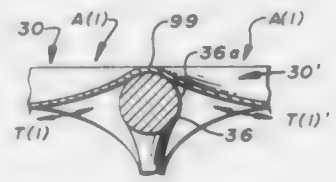
1. A resin molded part comprising:

a base;

one or more flexible and movable push-button-shaped thick projections formed integrally with said base; and

thin wall portions continued from the peripheral edges of the button-shaped thick projections to said base, said thin wall portions being 0.1 to 0.2 mm in thickness and having an inclination of 40–60°.

5,011,729



VACUUM INSULATED PANELS WITH CONCAVE SURFACES ON THE SURFACE LAYERS

Ian R. McAllister, 2040 West 12th Avenue, Vancouver, B.C., Canada V6J-2G2

Filed Nov. 15, 1989, Ser. No. 436,824

Int. Cl.[5] B32B *1/04;* B65D *90/06*

U.S. Cl. 428—167 21 Claims

2. An insulating panel, comprising:

(a) an outer, continuous membrane forming a top surface and a bottom surface on said panel;

(b) an internal rigid frame enclosed within said continuous membrane, said rigid frame supporting said top surface and said bottom surface of said panel;

(c) a vacuum space enclosed within said continuous membrane;

(d) a plurality of biaxially curved, concave surfaces formed on said continuous membrane and located on said top surface and said bottom surface of said panel, each said biaxially curved, concave surface being freely supported by said rigid frame and being loaded in tension when exposed to ambient atmospheric pressure, each said biaxially curved, concave surface having selected dimensions, and transverse and longitudinal curvatures such that the developed tensile stresses on adjacent said biaxially curved, concave surfaces are substantially equal, and;

(e) a plurality of arcuate paths formed on said continuous membrane between adjacent said biaxially curved, concave surfaces, whereby differential tensile stresses on adjacent said biaxially curved concave surfaces may be offset.

BULK POLYMERIZED CYCLOOLEFIN CIRCUIT BOARDS

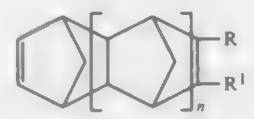
Lindwood P. Tenney, Birmingham, Ala.; David J. Smith, Sheffield Lake, Ohio; Dennis J. Janda, Parma, Ohio, and Dennis A. Barnes, Medina, Ohio, assignors to B. F. Goodrich, Akron, Ohio

Continuation of Ser. No. 85,489, Aug. 14, 1987, abandoned. This application Apr. 11, 1989, Ser. No. 336,373

Int. Cl.[5] B32B *9/00*

U.S. Cl. 428—209 38 Claims

1. A dielectric support for electronic components comprising a crosslinked copolymer having a Tg (Hdt) above about 100° C. and a dielectric constant value in the range from 2.3 MHz to 3.2 MHz, wherein said crosslinked copolymer is made by the bulk polymerization of polymerizable monomer,



wherein from about 80 weight percent to about 100 weight percent of said polymerizable monomer is composed of a first monomer and other monomer,

wherein said other monomer is different from said first monomer,

wherein said first monomer and said other monomer are selected from monomers which conform to Formulas II and III:

II

III

where n is 1-10, R and R^1 are (1) independently selected from hydrogen, alkyl groups of 1 to 12 carbon atoms, alkylene groups of 2 to 12 carbon atoms, cycloalkyl groups of 6 to 20 carbon atoms and aryl groups of 6 to 20 carbon atoms or (2) are combined together to form saturated and unsaturated cyclic groups containing 4–7 carbon atoms with the two ring carbon atoms connected thereto and

wherein from at least about 5 weight percent of said polymerizable monomer is of Formulas II and III wherein (1) R or R^1 provide mono-unsaturated alkylene groups having 2 to 4 carbon atoms and cycloalkylene groups having 6–20 carbon atoms or (2) R and R^1 together form mono-unsaturated cyclic groups of 4 to 7 carbon atoms with the two ring carbon atoms connected thereto.

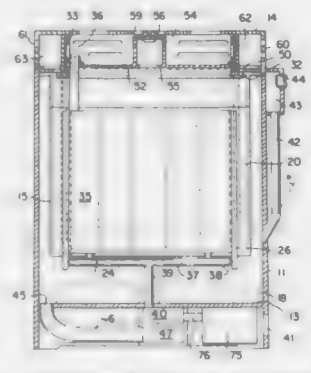
GLAZING HAVING CONTACT STRIPS ON A SUBSTRATE
Anton Dietrich, Wiesenfelden; Klaus Hartig, Ronneburg; Hans-Christian Schaefer, Langenselbold, and Joachim Szczyrbowski, Regensburg, all of Fed. Rep. of Germany, assignors to Leybold Aktiengesellschaft, Hanau I, Fed. Rep. of Germany
Division of Ser. No. 881,712, Jul. 3, 1986, Pat. No. 4,830,876. This application Jan. 24, 1989, Ser. No. 301,199
Claims priority, application Fed. Rep. of Germany, Dec. 11, 1985, 35436948
Int. Cl.[5] B32B 17/06
U.S. Cl. 428—630 17 Claims



1. Transparent sheet with an electrically conductive surface coating, said sheet comprising
a glass substrate,
a silver layer,
a metal coating comprising nickel on said silver layer,
a surface layer of dielectric oxide on said metal coating on said silver layer,
at least one contact strip on said surface layer, said contact strip comprising a metal which is diffused from said contact strip through said surface layer to establish electrical contact between said contact strip and said silver layer

Patent Not Issued For This Number

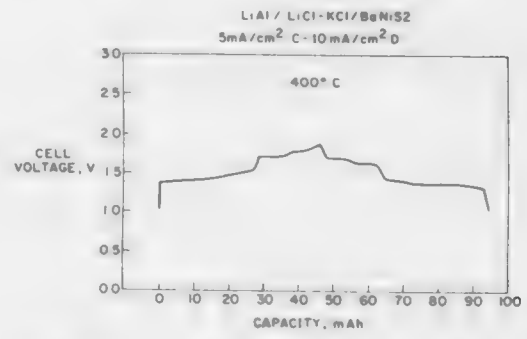
5,011,747
METAL/AIR BATTERY WITH PULSED GAS BUBBLING
David S. Strong, Battersea, and John A. Dawson, Amherstview, both of Canada, assignors to Alcan International Limited, Montreal, Canada
Continuation of Ser. No. 269,062, Nov. 9, 1988, abandoned. This application May 4, 1990, Ser. No. 518,286
Int. Cl.[5] H01M 12/04
U.S. Cl. 429—27 5 Claims

1. A metal-air battery comprising:
(a) a tank defining a reservoir for liquid electrolyte;
(b) one or more metal-air cells disposed for immersion in electrolyte, each cell including at least one air cathode having a first surface disposed for contact with electrolyte and a second surface exposed to air and a metal anode disposed for immersion in electrolyte in facing spaced relation to the first cathode surface to constitute therewith an anode-cathode pair electrically coupled by electrolyte;

(c) a bubbler tube extending horizontally in the electrolyte reservoir beneath each cell and serving to inject gas bubbles into electrolyte between the anode and cathode of each cell, and

(d) means for providing a flow of gas only to the bubbler tube(s), said gas being substantially free of any said electrolyte, and
(e) means for pulsating the flow of gas passing through the bubbler tube.

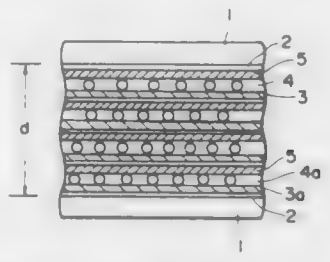
5,011,748
RECHARGEABLE BATTERY CATHODE FROM P2-PHASE SODIUM COBALT DIOXIDE
Lawrence W. Shacklette, Maplewood; Linda B. Townsend, Sparta, and Taiguang R. Jow, Morris, all of N.J., assignors to Allied-Signal, Morris Township, Morris County, N.J.
Continuation-in-part of Ser. No. 112,847, Oct. 23, 1987, abandoned. This application May 12, 1989, Ser. No. 350,967
Int. Cl.[5] H07M 4/52
U.S. Cl. 429—50 37 Claims



1. An improved battery of the type which includes a cathode means, an anode means and an electrolyte, the improvement comprising a cathode means comprising Na_xCoO_2 in the P2 phase characterized in that the change in x during a charge/-discharge cycle, Δx, is greater than about 0.37.

5,011,749
THIN RIBBONLIKE FLEXIBLE RECHARGEABLE ZINC/HALIDE CELL
Joost Manassen, Rehovot, Israel, and Israel Cabasso, Syracuse, N.Y., assignors to Yeda Research and Development Co., Ltd., Rehovot, Israel
Filed Jul. 10, 1989, Ser. No. 377,443
Int. Cl.[5] H01M 10/36
U.S. Cl. 429—101 26 Claims

1. A rechargeable zinc halide electrolyte electrochemical cell comprising a laminate of the sequence:
a. an electrically conducting chemically inert material;
b. a membrane matrix formed of an hydrophilic polymer matrix in which is immobilized a zinc halide electrolyte; and
c. an electrically conducting layer adapted to absorb and absorb halogen.



5,011,750
HIGH TEMPERATURE RECHARGEABLE MOLTEN SALT CELL
Edward J. Plichta, Howell, and Wishvender K. Behl, Ocean, both of N.J., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.
Filed Jul. 5, 1990, Ser. No. 549,176
Int. Cl.[5] H01M 10/39
U.S. Cl. 429—112 6 Claims

1. A high temperature rechargeable molten salt cell comprising a member of the group consisting of lithium, lithium aluminum alloy, lithium silicon alloy, sodium, potassium, calcium, magnesium, an alkali metal, a group II A element, a group II A alloy and composite mixtures thereof, as the anode, a chemical compound of the composition XYS_2 wherein X is an element selected from the group consisting of Be, Mg, Ca, Sr, Ba and

Ra and Y is an element selected from the group consisting of Fe, Co, and Ni as the cathode active material and a member of the group consisting of a molten salt, and a eutectic mixture of metal halides, carbonates, nitrates and oxalates as the electrolyte.

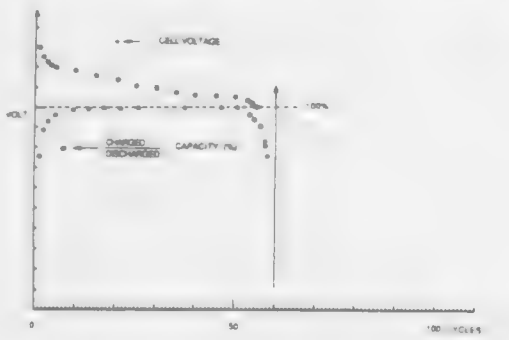
ELECTROCHEMICAL DEVICE
Sachiko Yoneyama, Yokohama; Toshiyuki Ohsawa, Kawasaki; Okitoshi Kimura, Tokyo, and Toshiyuki Kabata, Yokohama, all of Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan
Filed Jun. 21, 1989, Ser. No. 369,122
Claims priority, application Japan, Jun. 21, 1988, 63-151110; Aug. 9, 1988, 63-197173
Int. Cl.[5] H01M 6/18, 2/16
U.S. Cl. 429—192 15 Claims



1. An electrochemical device comprising:
at least a pair of electrodes; and
a solid or solid-like composite electrolyte interposed therebetween, comprising uniformly spherical particles having a flatness ratio of 0–5% which are dispersed in said solid or solid-like composite electrolyte.

5,011,752
RECHARGEABLE ALKALINE MANGANESE DIOXIDE-ZINC CELL HAVING IMPROVED CUMULATIVE CAPACITY
Karl Kordesch, Lakewood, Ohio; Josef Gsellmann, Graz, Austria, and Klaus Tomantschger, Mississauga, Canada, assignors to Battery Technologies Inc., Mississauga, Canada
Filed Aug. 30, 1989, Ser. No. 400,712
Claims priority, application Hungary, Aug. 31, 1988, 4507/88
Int. Cl.[5] H01M 4/50
U.S. Cl. 429—206 29 Claims

1. A rechargeable alkaline electrochemical cell having an anode, an alkaline electrolyte, and a manganese dioxide cathode, in which cell the cathode has been preconditioned before the cell is finally assembled and sealed;

wherein said manganese dioxide material of said cathode is a preconditioned MnOx material having an oxidation state

at the time when said cell is finally assembled and sealed such that x is between 1.70 and 1.90.

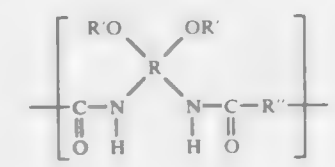
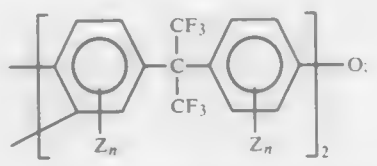
PHOTORESIST COMPOSITIONS CONTAINING POLYAMIDES POLYBENZOXA FROM BIS((AMINOHYDROXYPHENYL)HEXAFLUOROISOPROPYL)DIPHENYL ETHERS



Werner H. Mueller, Greenwich, and Dinesh N. Khanna, W. Warwick, both of R.I., assignors to Hoechst Celanese Corporation, Somerville, N.J.

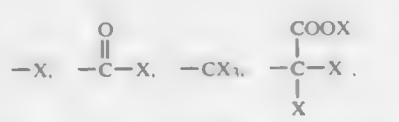
Division of Ser. No.327,761, Mar. 23, 1989, Pat. No. 4,939,215. This application Feb. 7, 1990, Ser. No. 476,332

Int. Cl.[5] **G03F** *9/00;* **G03C** *1/52*



U.S. Cl. 430—4 **11 Claims**

1. A positive photoresist composition comprising a polyamide comprising the following recurring structure in the polymer chain:



wherein:

(1) R is a tetravalent aromatic moiety of the formula:

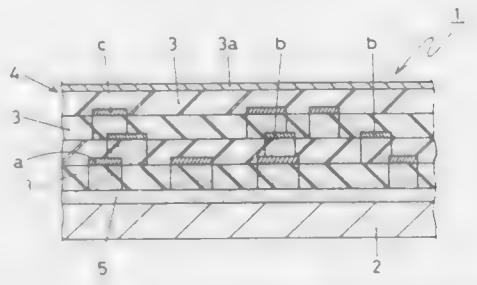
(2) R′ is a monovalent moiety independently selected from:

X is hydrogen or a substituent independently selected from: substituted or unsubstituted lower alkyl of 1 to 8 carbons and substituted or unsubstituted phenyl; Z is independently selected from chloro, bromo, fluoro, iodo and lower alkyl of 1 to 6 carbons; n is independently 0 or 1; and

(3) R″ is selected from a substituted or unsubstituted alkylene, alicyclic or arylene moiety, said composition further containing a radiation sensitizer.

5,011,754

PIGMENT-TRANSFER SHEETS AND METHOD FOR DECORATING HEAT-RESISTANT ARTICLES



Masayuki Ono, Tokai, Japan, assignor to INAX Corporation, Aichi, Japan

Filed Apr. 24, 1990, Ser. No. 513,776

Claims priority, application Japan, Apr. 26, 1989, 1-106818

Int. Cl.[5] **G03C** *1/90, 11/12, 11/20*

U.S. Cl. 430—15 **20 Claims**

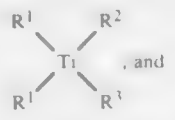
1. A decorating pigment-transfer sheet for decorating heatresistant articles, which comprises a water-absorbing substrate sheet, a water-soluble paste layer placed on the substrate sheet, at least one photosensitive resin layer placed on the paste layer and having adhesive dot photoimages, and a glaze-containing pigment layer deposited on the adhesive dot images of each photosensitive layer, whereby the pigment layer having good gradation and high resolution in compliance with the photo-images.

5,011,755

PHOTOINITIATOR MIXTURES CONTAINING A TITANOCENE AND A 3-KETOCOUMARIN

Ottmar Rohde, Basel; Armin Schaffner, Cudrefin; Martin Riediker, Riehen, and Kurt Meier, Binningen, all of Switzerland, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

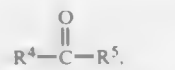
Continuation of Ser. No. 145,431, Jan. 19, 1988, abandoned. This application Jan. 30, 1990, Ser. No. 473,135



Claims priority, application Switzerland, Feb. 2, 1[illegible]7, 360/87

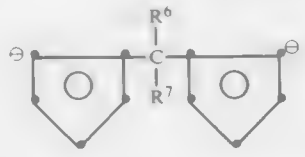
Int. Cl.[5] **G03F** *7/038, 7/30, 7/38, 7/40*

U.S. Cl. 430—18 **18 Claims**



1. A composition comprising

(a) a titanocene photoinitiator of the formula I

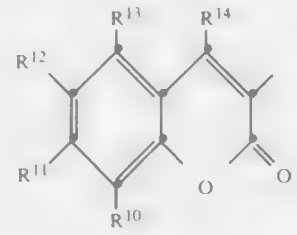


(I)

(b) a 3-ketocoumarin of the formula II

(II)

in which both R^1 independently of one another are unsubstituted or C_1-C_6alkyl- or C_1-C_6alkoxy-substituted cyclopentadienyl$^{\ominus}$, indenyl$^{\ominus}$ or 4,5,6,7-tetrahydroindenyl$^{\ominus}$ or together are a radical of the formula III

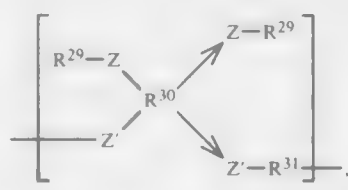


(III)

R^6 and R^7 independently of one another being hydrogen or methyl, R^2 is a 6-membered carbocyclic aromatic ring or a 5-membered or 6-membered heterocyclic aromatic ring, which in at least one of the two ortho-positions relative to the metal-carbon bond is substituted by a fluorine atom or by a $-CF_2R$ group, R being a fluorine atom or methyl. R^3 is as defined for R^2 or, additionally, can be halogen, cyanate, thiocyanate, azide or cyanide, $-OR^8$ or $-SR^9$, R^8 being hydrogen, C_1-C_6alkyl, phenyl, acetyl or trifluoroacetyl and R^9 being C_1-C_6alkyl or phenyl, or R^2 and R^3 together form a radical of the formula IV

$$-Q-Y-Q- \qquad (IV),$$

in which Q is a 6-membered carbocyclic aromatic radical or a 5-membered or 6-membered heterocyclic aromatic radical, the two bonds each being in the ortho-position relative to the bridge Y and each meta-position relative to the bridge Y being substituted by a fluorine atom or a $-CF_2R$ group, and Y is a direct bond, $-O-$, $-S-$, $-SO_2-$, $-CO-$, $-CH_2-$ or $-C(CH_3)_2-$, R^4 is a radical of the formula V



(V)

R^5 is C_1-C_{20}alkyl, cycloalkyl having 5-7 ring carbon atoms, phenyl or naphthyl which are unsubstituted or substituted by one to three C_1-C_6-alkyl groups, C_1-C_6alkoxy groups or halogen atoms or by one diphenylamino or C_1-C_6dialkylamino group, or is C_7-C_9aralkyl, a radical $-(CH=CH)_a-C_6H_5$ or a radical of the formula V, a is 1 or 2, and R^{10}, R^{11}, R^{12}, R^{13} and R^{14} independently of one another are hydrogen, C_1-C_6alkyl, C_1-C_6alkoxy, phenyl, tolyl, xylyl or benzyl and R^{11} can additionally also be a group $-NR^{15}R^{16}$ or $-OR^{15}$, wherein R^{15} and R^{16} independently of one another are hydrogen or C_1-C_6alkyl, it also being possible for two or three of the radicals R^{10}, R^{11}, R^{12} and R^{13} together with the ring carbon atoms, to which they are attached, to form a fused ring having 5 or 6 ring atoms or a fused ring system having 5-membered or 6-membered rings.

8. A composition comprising the components (a) and (b) according to claim 1 and, as a component (c), ethylenically unsaturated monomers or prepolymers.

9. A composition according to claim 8, containing, as component (c), a polymer precursor which has identical or different recurring structural units of the formula VIII

(VIII)

and reacts on heating to give a thermally stable ring structure, in which formula R^{29} is a radical having a photopolymerizable olefinic double bond, R^{30} is a tetravalent aromatic radical after removal of the four functional groups, two functional groups in each case being adjacent and the arrows representing structural isomerism, R^{31} is a divalent aliphatic, cycloaliphatic or mononuclear or polynuclear aromatic radical, it being possible for aromatic radicals R^{31} to carry one of the groups $-CONH_2$ or $-COOH$ in the ortho-position relative to the bond Z′, the Z are a covalent or ionic bond element and the Z′ are a covalent bond element, with the proviso that, on heating of the photopolymerizable composition, Z and Z′ alone, or together with $-CONH_2$ or $-COOH$ groups contained in R^{31}, give a thermally stable ring structure, with elimination of R^{29}.

14. A composition according to claim 9, additionally containing, as a component (d), an acrylic acid ester, methacrylic acid ester, allyl ether or allyl ester or partial esters of these acids with a polyol.

15. A process for producing images or protective layers, comprising the steps of

(i) applying a layer of a composition according to claim 14 to a substrate,

(ii) imagewise exposure of the system,

(iii) with or without a thermal pretreatment, in order to pre-harden the exposed areas,

(iv) developing the system and

(v) thermally cyclizing the component (c).

5,011,756

STORAGE OF OPTICAL INFORMATION USING PHOTOCHIROPTICAL EFFECT

David E. Nikles, Middlesex, N.J., assignor to Hoechst Celanese Corp., Somerville, N.J.

Filed Feb. 27, 1990, Ser. No. 486,031

Int. Cl.[5] **G03L** *11/00, 1/00;* **C09K** *19/00;* **B32B** *3/02*

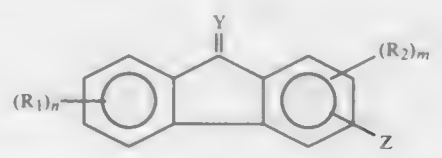
U.S. Cl. 430—19 **10 Claims**

1. An optical information medium comprised of an optical information layer, wherein the optical information layer is comprised of a material at least a portion of which is treated with and selectively interacts with circularly polarized light to form a distinguishable product and which new product is distinguishable from said material on the basis of optical activity.

5,011,757

ELECTROPHOTOGRAPHIC PHOTORECEPTOR CONTAINING A FLUORENE DERIVATIVE

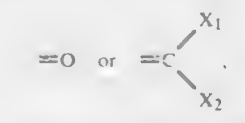
Yutaka Akasaki; Katsumi Nukada, and Katsuhiro Sato, all of Kanagawa, Japan, assignors to Fuji Xerox Co., Ltd., Tokyo, Japan



Filed Nov. 15, 1989, Ser. No. 436,875

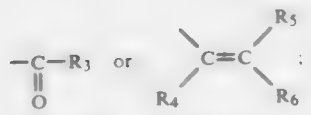
Claims priority, application Japan, Nov. 16, 1988, 63-287613; Nov. 16, 1988, 63-287618; Nov. 16, 1988, 63-287620; Nov. 16, 1988, 63-287621

Int. Cl.[5] **G03G** *5/06, 5/14*

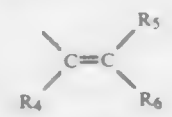


U.S. Cl. 430—58 **15 Claims**

1. An electrophotographic photoreceptor comprising a conductive substrate and a photosensitive layer on the conductive substrate, wherein the photosensitive layer comprises a charge generating agent and a compound of formula (I):



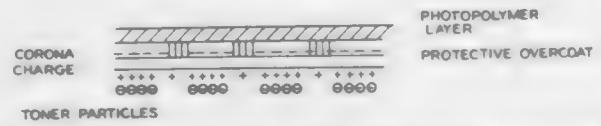
(I)



wherein R_1 and R_2 each represents a hydrogen atom, an alkyl group, an aryl group, an alkoxycarbonyl group, an aryloxycarbonyl group, a nitro group, a halogen atom, an alkylcarbonyl group or an arylcarbonyl group; Y represents

X_1 and X_2 may be the same or different groups and are selected from a cyano group or an alkoxycarbonyl group; Z represents

R_3 represents a substituted or unsubstituted aryl or nitrogen-containing heterocyclic group; R_4, R_5 and R_6 each represents a hydrogen atom, an alkyl group, an aralkyl group, an aryl group or a heterocyclic group; when Z is the



group, R_1 and R_2 are other than the alkylcarbonyl group; m is 0 or 1; n is 0 to 2; and when n is 2, the R_1 groups may be the same or different.

5,011,758

USE OF A LIQUID ELECTROPHOTOGRAPHIC TONER WITH AN OVERCOATED PERMANENT MASTER IN ELECTROSTATIC TRANSFER

Robert H. Detig, Berkeley Heights, and David P. Bujese, Butler, both of N.J., assignors to Olin Hunt Specialty Products Inc., West Paterson, N.J.

Continuation-in-part of Ser. No. 160,254, Feb. 25, 1988, Pat. No. 4,859,557. This application Jul. 31, 1989, Ser. No. 387,044
The portion of the term of this patent subsequent to Aug. 22, 2006, has been disclaimed.
Int. Cl.[5] **G03G** *13/22*
U.S. Cl. 430—100 **28 Claims**

1. A method of fabricating a toned pattern on an electrically isolated receiving surface, comprising the steps of:

(a) coating a conductive substrate with a photopolymer material that will undergo an increase in resistivity upon exposure to a source of actinic radiation;

(b) forming a permanent latent image on the photopolymer material by exposing to an actinic radiation source to form electrostatically contrasted non-imaged areas and an exposed latent image;

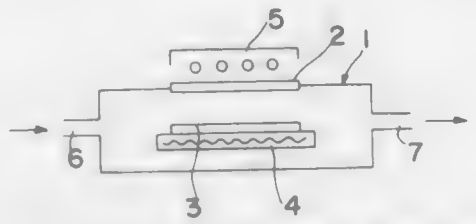
(c) coating the photopolymer material with a low friction protective overcoated material;

(d) charging the protective overcoated material so that a charge is retained above the unexposed areas of the photopolymer material;

(e) developing the electrostatic latent image area by applying charged liquid electrophotographic toner particles to the protective overcoated material, the charged liquid electrophotographic toner particles being directed to the protective transparent overcoat material above the unexposed areas of the photopolymer material to form a developed image;

(f) establishing an electric field between the photopolymer material and the receiving surface;

(g) placing the receiving surface adjacent to the photopolymer material; and



(h) transferring the developed image from the protective overcoated material at a point of transfer to the receiving surface to form non-imaged areas and a transferred toner particle image in an imaged area.

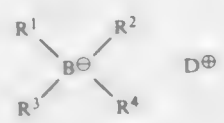
5,011,759

SEMICONDUCTOR ELEMENT AND METHOD OF FORMING SAME AND ARTICLE IN WHICH SAID ELEMENT IS USED

Hajime Hitotsuyanagi; Nobuhiko Fujita; Hideo Itozaki; Syoji Nakagama; Saburo Tanaka, and Kazuhiko Fukushima, all of Itami, Japan, assignors to Sumitomo Electric Industries, Ltd., Osaka, Japan

Division of Ser. No. 177,904, Apr. 1, 1988, abandoned, which is a continuation of Ser. No. 844,027, Mar. 25, 1986, abandoned. This application Aug. 8, 1989, Ser. No. 391,734
Claims priority, application Japan, Mar. 28, 1985, 60-65513; Mar. 28, 1985, 60-65514; Mar. 28, 1985, 60-65515; Jun. 3, 1985, 60-120176
Int. Cl.[5] **G03G** *5/082;* **B05D** *3/06*
U.S. Cl. 430—128 **4 Claims**

1. A method of forming an a-SiGe:H film, which can be used in semiconductor elements, which comprises forming a film by a mercury-sensitized photochemical gas phase vapor deposition method with ultraviolet rays having wavelengths of 0.3 μm or less as a light source, wherein a member selected from the group consisting of SiH_4, Si_2H_6 and SiF_4, together with GeH_4 or GeF_4, are used as raw material gases and are introduced with hydrogen as a diluent gas into a film-forming chamber so that a volume ratio of the hydrogen gas to the total gas volume is within the range of 0.25 to 0.60, and the film being formed under the conditions of a film-forming pressure of 0.1 to 20 Torr, an intensity of the ultraviolet rays of 10 to 500 mW/cm^2, and a substrate temperature of 150° to 250° C.



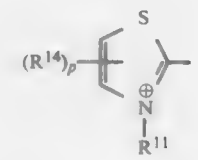
5,011,760

PHOTOPOLYMERIZABLE COMPOSITION

Jun Yamaguchi, Shizuoka; Masaki Okazaki, and Yoshio Inagaki, both of Kanagawa, all of Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

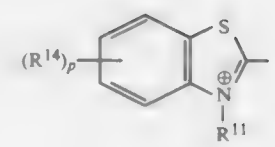
Continuation of Ser. No. 250,191, Sep. 28, 1988, abandoned. This application May 11, 1990, Ser. No. 522,406
Claims priority, application Japan, Sep. 28, 1987, 62-243464
Int. Cl.[5] **G03F** *7/029*
U.S. Cl. 430—281 **3 Claims**

1. A photopolymerizable composition which consists essentially of (a) a polymerizable compound having at least one ethylenic unsaturated bond, and (b) a salt formed by an organic cationic dye compound and an organic boron compound anion, wherein the salt is represented by the following formula (I), with the organic cationic dye compound ($D\oplus$) being represented by the following formula (II):



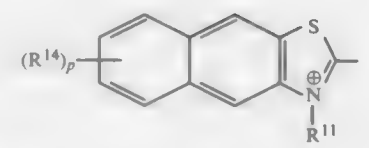
(I)

wherein $D\oplus$ represents a cationic dye; and R^1, R^2, R^3 and R^4, which may be the same or different, each represents an alkyl group, an aryl group, an aralkyl group, an alkaryl group, an alkenyl group, an alkynyl group, an alicyclic group, a heterocyclic group, an allyl group, or a group derived therefrom, and two or more of the substituent groups R^1 to R^4 can combine to form a cyclic structure.

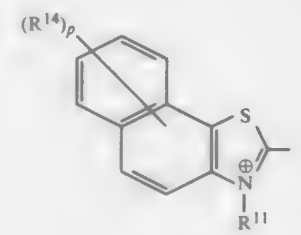


$$\phi\oplus - L = \Psi \quad \text{(II)}$$

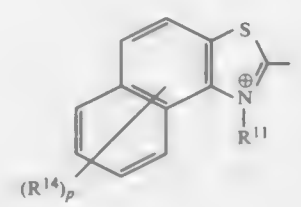
wherein ϕ and Ψ, which may be the same or different, each represents a heterocyclic ring containing at least one nitrogen atom, and L represents a methine group, or a tri-, penta-, hepta- or nona-methine group formed by linking methine groups one after another by conjugated double bonds, each of which may be substituted, provided that L combines with at least either ϕ or Ψ to form a ring, wherein the heterocyclic ring represented by ϕ and Ψ is represented by the following formula ϕI to ϕXVI wherein each formula is represented by its corresponding structure bearing the positive charge



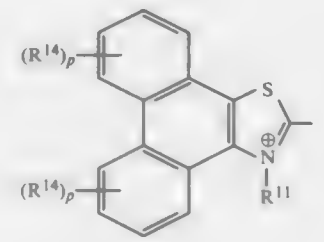
ϕI



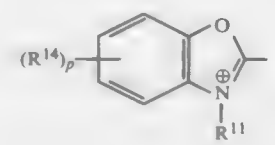
ϕII



ϕIII

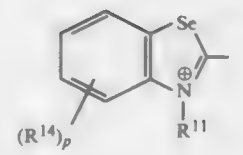


ϕIV

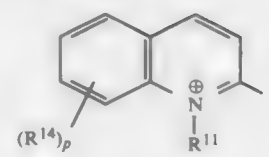


ϕV

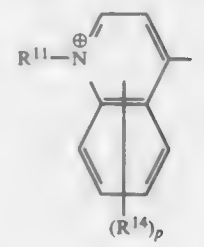
ϕVI



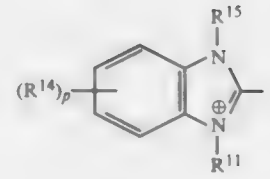
ϕVII



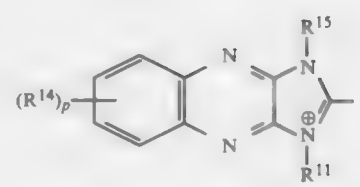
-continued



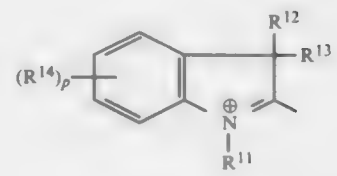
ϕVIII



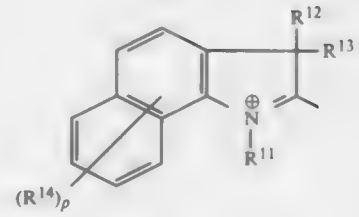
ϕIX



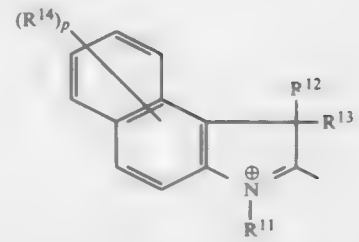
ϕX



ϕXI

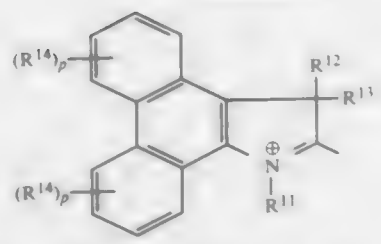


ϕXII



ϕXIII

ϕXIV



ϕXV

-continued

φXVI

wherein the group represented by R^{11} or R^{15} in the heterocyclic ring of formula φI to φXVI is a substituted or unsubstituted alkyl, aryl or alkenyl group, provided that when R^{11} or R^{15} combines with L to form a ring, it corresponds to a divalent linking group represented by Z, wherein Z is a divalent linking group for completing a ring by combining with φ or Ψ,

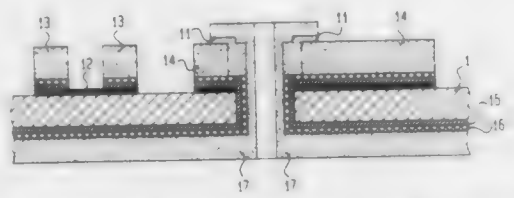
R^{12} or R^{13} is a unsubstituted or substituted alkyl group or unsubstituted or substituted aryl group,

R^{14} is an alkyl group, an aryl group, a heterocyclic ring residual group, a halogen atom, an alkoxy group, an aryloxy group, an alkylthio group, an arylthio group, an alkylcarbonyl group, an arylcarbonyl group, an alkyloxycarbonyl group, an aryloxycarbonyl group, an alkylcarbonyloxy group, an arylcarbonyloxy group, an alkylamido group, an arylamido group, an alkylcarbamoyl group, an arylamino group, an alkylsulfonyl group, an arylsulfonyl group, an alkylsulfonamido group, an arylsulfonamido group, an alkylsulfamoyl group, an arylsulfamoyl group, a cyano group or a nitro group,

and p is an integer of 0 to 4, and when p is 2 or more, plural R^{14}'s may be the same or different from each other.

5,011,761

PROCESS FOR MAKING METALLIZED HOLES IN A DIELECTRIC SUBSTRATE BY VACUUM DEPOSITION OF METALS AND THE PRODUCT OBTAINED THEREBY



Tarcisio Cagnin, Milan, and Giampiero Ferraris, Como, both of Italy, assignors to Siemens Telecommunicazioni S.p.A., Milan, Italy

Filed Feb. 27, 1989, Ser. No. 316,365

Claims priority, application Italy, Mar. 18, 1988, 19830 A/88

Int. Cl.[5] G03C *5/00*; **C25D** *5/02*

U.S. Cl. 430—312 **14 Claims**

1. A process for forming metallized holes in a dielectric substrate having conductive and/or resistive paths on one side, hereinafter called the front, the other side being called hereinafter the back, comprising the following steps in succession:

(a) electrogalvanic growth of the conductive and/or resistive paths delimited by a first photosensitive lacquer on said front,

(b) drilling of the substrate and forming of holes,

(c) covering of the front with a second negative photosensitive lacquer and exposing said second negative photosensitive lacquer with a mask and developing it to form uncovered rings of said conductive and/or resistive paths coinciding with the holes,

(d) electrogalvanic growth of metal on the front and forming of metal rivets protruding inside the holes as extensions of said conductive and/or resistive paths,

(e) removal of said second photosensitive lacquer and completing of conductive and/or resistive paths,

(f) deposition on the back of metals which also spread over the side walls of said holes until they unite electrically with the protrusions of said metal rivets,

(g) covering of the front with said second photosensitive lacquer and development with said mask, and

(h) electrogalvanic growth of metal on the back, side walls of the holes and the front in the zones not covered by said second photosensitive lacquer.

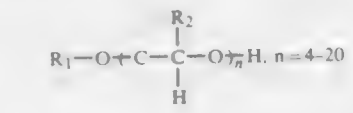
5,011,762

PHOTOSENSITIVE COMPOSITIONS HAVING ENHANCED PHOTOPOLYMERIZATION RATE

Rong-Jer Lee, Yun-Lin; Chein-Dhau Lee, Hsinchu, and Wen-Shin Shen, Hwa-Lien, all of Taiwan, assignors to Industrial Technology Research Institute, Hsinchu, China

Filed Aug. 14, 1990, Ser. No. 567,136

Int. Cl.[5] G03C *1/725*



U.S. Cl. 430—281 **6 Claims**

1. A photosensitive composition which utilizes ultraviolet light to initiate a free radical addition reaction, comprising at least:

(a) a material having unsaturated carbon-carbon double bonds which undergoes free radical polymerization;

(b) a photoinitiator which produces free radicals when irradiated with ultraviolet light; and

(c) a photosensitivity accelerator of the formula

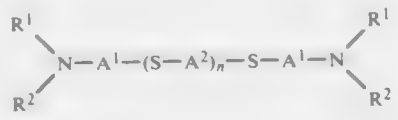
wherein R_1 is hydrogen, linear alkyl or acyl groups having 1 to 20 carbon atoms, R_2 is hydrogen or methyl, and added in a quantity of from 0.1 to 5% of the whole photosensitive material mixture.

5,011,763

METHOD FOR PROCESSING A SILVER HALIDE COLOR PHOTOGRAPHIC MATERIAL

Kiyoshi Morimoto, and Yoshihiro Fujita, both of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Oct. 27, 1988, Ser. No. 263,228



Claims priority, application Japan, Oct. 29, 1987, 62-274095; Nov. 2, 1987, 62-277580

Int. Cl.[5] G03C *7/00, 7/42*

U.S. Cl. 430—393 **14 Claims**

1. A method for processing a silver halide color photographic material comprising developing, followed by either bleaching in a bleaching solution or bleach-fixing in a bleach-fixing solution an imagewise exposed silver halide color photographic material, wherein at least one bleach-accelerating agent represented by formula (I) is contained in said bleaching solution, bleach-fixing solution or prebath thereof after color development in an amount of from 1×10^{-5} to 1×10^{-1} mol per liter of the processing solution, or is contained in said color photographic material:

(I)

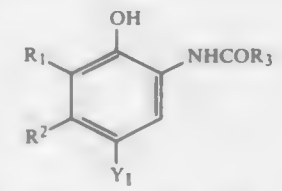
wherein R^1 and R^2, which may be the same or different, each represents a hydrogen atom or an unsubstituted alkyl group, or R^1 and R^2 may combine with each other to form a heterocyclic ring; A^1 and A^2, which may be the same or different, each represents an alkylene group having from 2 to 5 carbon atoms which may be substituted; and n represents an integer from 2 to 6.

5,011,764

SILVER HALIDE COLOR PHOTOGRAPHIC MATERIAL WHICH FORMS A COLOR PHOTOGRAPHIC IMAGE WITH IMPROVED PRESERVABILITY

Nobuo Sakai, and Minoru Sakai, both of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

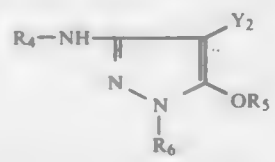
Filed Apr. 7, 1988, Ser. No. 178,937



Claims priority, application Japan, Apr. 7, 1987, 62-85449

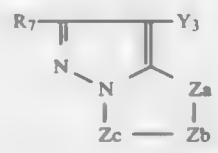
Int. Cl.[5] G03C *1/46, 1/38*

U.S. Cl. 430—505 **26 Claims**



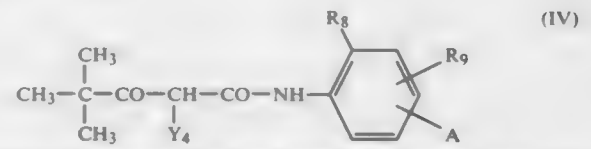
1. A silver halide color photographic material comprising a support having thereon at least one red-sensitive silver halide emulsion layer, at least one green-sensitive silver halide emulsion layer and at least one blue-sensitive silver halide emulsion layer, where the red-sensitive halide emulsion layer contains a disperson of oleophilic fine particles which is obtained by emulsifying or dispersing a solution containing at least one cyan coupler represented by the general formula (I) and at least one water-insoluble and organic solvent-soluble homopolymer or copolymer composed of at least one recurring unit having no acid group in the main chain or side chain thereof, the green-sensitive silver halide emulsion layer contains at least one magenta coupler represented by the general formula (II) or (III), the blue-sensitive silver halide emulsion layer contains at least one yellow coupler represented by the general formula (IV), and the silver halide color photographic material contains at least one compound represented by the eh general formula (B) incorporated in a red-sensitive silver halide emulsion layer:

(I)



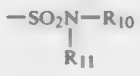
where R_1 represents a hydrogen atom or a halogen atom; R_2 represents an alkyl group; R_3 represents a ballast group; and Y_1 represents a hydrogen atom or a group released at the time of coupling reaction with an oxidation product of a developing agent (hereafter simply referred to as a releasing group),

(II)



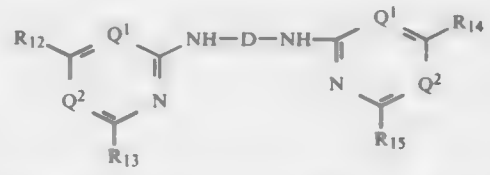
where R_4 represents an aryl group; R_5 represents a hydrogen atom, an aliphatic or aromatic acyl group or an aliphatic or aromatic sulfonyl group; R_6 represents an aryl group; and Y_2 represents a hydrogen atom or a releasing group,

(III)

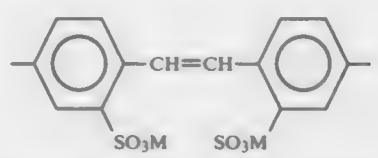


wherein R_7 represents a hydrogen atom or a substitutent; Y_3 represents a hydrogen atom or a releasing group; Za, Zb and Zc each represents a methine group, a substituted methine group, =N—or —NH—, one of the Za—Zb bond and the Zb—Zc bond being a double bond and the other being a single bond; when the Zb—Zc bond is a carbon-carbon double bond, the Zb—Zc bond may be a part of a condensed aromatic ring; R_7 or Y_3 may also form a polymer including a dimer or more; and when Za, Zb or Zc is a substituted methine group, the substituted methine group may form a polymer including a dimert or more,

(IV)



where R_8 represents a halogen atom or an alkoxy group; R_8 represents a hydrogen atom, a halogen atom or an alkoxy group; A represents $-NHCOR_{10}$, $-NHSO_2R_{10}$, $-SO_2NHR_{10}$, $-COOR_{10}$ or



(wherein R_{10} and R_{11} each represents an alkyl group); and Y_4 represents a hydrogen atom or a releasing agent,

(B)

where D represents a divalent aromatic group represented by the following formula:

wherein M represents a hydrogen atom or a cation capable of imparting water solubility; R_{12}, R_{13}, R_{14} and R_{15}, which may be the same or different, each represents a hydrogen atom, a hydroxy group, an alkoxy group, an aryloxy group, a halogen atom, a heterocyclic group, a mercapto group, an alkylthio group, an arylthio group, a heterocyclic thio group, an amino group, an alkylamine group, a cyclohexylamino group, an arylamino group, a heterocyclic amino group, an aralkylamino group or an aryl group; and Q^1 and Q^2 each represents —N= or —CH= and at least one of Q^1 and Q^2 is —N=.

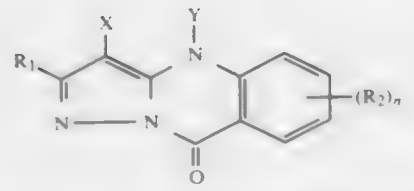
DYE FORMING COUPLER FOR PHOTOGRAPHIC USE

Kimie Tachibana, Hino, and Yutaka Kaneko, Sagamihara, both of Japan, assignors to Konica Corporation, Tokyo, Japan



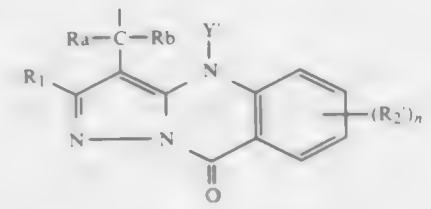
Division of Ser. No. 284,522, Dec. 15, 1988, abandoned. This application Jun. 22, 1990, Ser. No. 541,463

Claims priority, application Japan, Feb. 15, 1988, 63-32094

Int. Cl.[5] G03C *7/38*

U.S. Cl. 430—548 **4 Claims**

1. A silver halide photographic light-sensitive material comprising a support having thereon a silver halide emulsion layer containing a dye-forming coupler represented by Formula I:



wherein R_1 and R_2 individually represent a hydrogen atom or a substituent selected from the group consisting of an alkyl group, an aryl group, an anilino group, an acylamino group, a sulfonamido group, an alkylthio group, an arylthio group, an alkenyl group, a cycloalky group, a halogen atom, a cycloalkenyl group, an alkinyl group, a heterocyclic group, a sulfonyl group, a sulfinyl group, a phosphonyl group, an acyl group, a carbamoyl group, a sulfamoyl group, a cyano group, an alkoxy group, a sulfonyloxy group, an aryloxy group, a heterocyclic-oxy group, a siloxy group, an acyloxy group, a carbamoyloxy group, an amino group, an alkylamino group, an imido group, a ureido group, a sulfamoylamino group, an alkoxycarbonylamino group, an aryloxycarbonylamino group, an alkoxtcarbonyl group, an aryloxycarbonyl group, a heterocyclic thio group, a thioureido group, a carboxyl group, a hydroxy group, a mercapto group, a nitro group, a sulfonic acid group, a spiro compound residue and a bridged hydrocarbon compound residue;

wherein Y is hydrogen or a group capable of splitting off after said coupler is coupled with the oxidized product of the color developing agent;

n is an integer of zero to 4, provided that the R_2s may be the same or different from each other when n is 2, 3 or 4;

X represents an atom or a group selected from the group consisting of a halogen atom, an alkoxy group, an aryloxy group, a heterocyclic-oxy group, an acyloxy group, a sulfonyloxy group, an alkylcarbonyloxy group, an aryloxycarbonyloxy group, an alkyloxalyloxy group, an alkoxyoxalyloxy group, an alkylthio group, an arylthio group, a heterocyclic-thio group, an alkyloxythiocarbonylthio group, an acylamino group, a nitrogen-containing heterocyclic group linked on a nitrogen atom, an alkyloxycarbonylamino group, a carboxyl group and a group represented by the formula:

wherein R_1', R_2' and Y' are selected from the same group from which said R_1, R_2 and Y are selected; and Ra and Rb individually represent a hydrogen atom, an aryl group, an alkyl group or a heterocylic group, with the proviso that said atom or group represented by X is capable of being split off upon reaction with the oxidized product of a color developing agent.

5,011,766

SILVER HALIDE COLOR PHOTOGRAPHIC LIGHT-SENSITIVE MATERIAL

Shuji Kida, Hino; Hiroshi Kita; Shigeto Hirabayashi, both of Hachioji, and Yutaka Kaneko, Sagamihara, all of Japan, assignors to Konica Corporation, Tokyo, Japan

Filed Jan. 4, 1990, Ser. No. 460,803

Claims priority, application Japan, Jan. 18, 1989, 1-9272

Int. Cl.[5] G03C *1/08*

U.S. Cl. 430—558 **7 Claims**

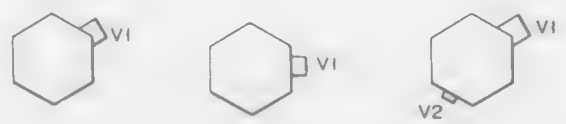
1. A silver halide color photographic light-sensitive material comprising a red light sensitive silver halide emulsion layer containing a pyrazoloazole type cyan coupler having a group represented by Formula 1 which is directly bonded to the azole ring of said pyrazoloazole coupler:

$$-(X=Y)n-R_1 \qquad (1)$$

wherein X and Y each is a substituted or unsubstituted methine group or a nitrogen atom; R_1 is a hydrogen atom or a substituent; and n is an integer of 1 or 2, provided that two of Xs and two of Ys may be the same or different from each other when n is 2, and two of either X, Y and R_1 are allowed to be bonded to each other to form a ring other than a benzene ring.

5,011,767

SILVER HALIDE PHOTOGRAPHIC EMULSION



Seiji Yamashita, and Shunji Takada, both of Minami-ashigara, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed May 17, 1989, Ser. No. 352,960

Claims priority, application Japan, May 18, 1988, 63-121443

Int. Cl.[5] G03C *1/02*

U.S. Cl. 430—567 **6 Claims**

1. A silver halide emulsion comprising junctioned grains having substantially one junction per grain that occupy 70% or more of a total projected area of all grains, each of said junction grains comprises a substrate grain and substantially one epitaxially grown portion junctioned on the substrate grain, and crystal structures of the substrate grain and the epitaxially grown portion of the junctioned grain have a rock-salt type structure, wherein said rock-salt type structure comprises silver bromide, silver chloride, silver bromoiodide, silver bromochloride or silver chlorobromoiodide, which are prepared by the following steps:

adding a spectral sensitizing dye selected from the group consisting of cyanine, merocyanine, complex cyanine, complex merocyanine, oxol, hemioxonol, styryl, merostyryl and streptocyanine, or an adsorptive photographic additive, in an amount of 150% or more of the saturated adsorption quantity of silver halide crystals used as substrate grains, and

adding soluble silver salt and soluble halide or fine silver halide grains to perform physical ripening and epitaxial growth of silver halide.

METHODS FOR DETECTING NUCLEIC ACID SEQUENCES

Peter Duck, and Robert Bender, both of Ottawa, Canada, assignors to Meiogenics U.S. Limited Partnership, Columbia, Md.

Continuation-in-part of Ser. No. 805,279, Dec. 5, 1985, Pat. No. 4,876,187. This application Apr. 29, 1988, Ser. No. 187,814

The portion of the term of this patent subsequent to Oct. 24, 2006, has been disclaimed.

Int. Cl.[5] C12Q *1/68, 1/42;* G01N *33/566;* C07H *15/12*

U.S. Cl. 435—6 **12 Claims**

1. A method for detecting a single-stranded target nucleic acid which comprises:

(a) obtaining the single-stranded target nucleic acid;

(b) forming a reaction mixture which includes the target nucleic acid and a complementary single-stranded nucleic acid probe under conditions which allow the target nucleic acid and the probe to hybridize to each other and form a double-stranded, target-probe complex, the probe being present in molar excess relative to the target and having the structure

$$[NA_1\text{- R - }NA_2]_n$$

wherein NA_1 and NA_2 are DNA sequences, wherein R is a scissile nucleic acid linkage, and wherein n is an integer from 1 to 10;

(c) treating the double-stranded, target-probe complex from step (b) so as to cleave the probe within a predetermined sequence of the scissile nucleic acid linkage and thereby form at least one intact DNA-containing oligonucleotide fragment from the probe, such fragment being, or being treated so as to be, no longer capable of remaining hybridized to the target nucleic acid;

(d) repeating steps (b) and (c); and

(e) detecting the intact DNA-containing fragments so formed and thereby detecting the single-stranded target nucleic acid.

MULTIEPITOPIC IMMUNOMETRIC ASSAY

Dominique Bellet, Paris, France, and Jack R. Wands, Waban, Mass., assignors to The General Hospital Corporation, Boston, Mass.

Continuation-in-part of Ser. No. 599,560, Apr. 12, 1984, abandoned. This application Sep. 24, 1987, Ser. No. 102,766

Int. Cl.[5] C12N *5/00;* G01N *33/53, 33/545;* C12Q *1/00*

U.S. Cl. 435—7.94 **12 Claims**

1. An immunometric assay for a multivalent antigen in a sample, comprising:

(a) forming a mixture of said sample with multiple immobilized monoclonal antibodies against different epitopes on said antigen, and incubating said mixture for a time and under conditions sufficient to allow said antigen in said sample to bind to said multiple immobilized monoclonal antibodies;

(b) adding to said mixture after said incubation of step (a) a detectably labeled monoclonal soluble antibody which is identical to one of said multiple immobilized monoclonal antibodies, and incubating the new resulting mixture for a time and under conditions sufficient to allow said detectably labeled monoclonal soluble antibody to bind to said antigen;

(c) separating detectably labeled monoclonal antibody bound to said antigen from detectably labeled monoclonal soluble antibody; and

(d) detecting either said detectably labeled monoclonal antibody bound to said antigen, or detecting detectably labeled monoclonal soluble antibody not bound to said antigen;

wherein any one of said multiple immobilized monoclonal antibodies shows, by itself, substantially less binding towards said antigen in said immunometric assay, when used with itself

or another monoclonal antibody in soluble labeled form, than when used with multiple immobilized monoclonal antibodies in combination.

SHUTTLE VECTOR, UTILIZING THE *E. COLI* ASPARAGINE SYNTHETASE GENE, AND CAPABLE OF DOMINANT TRANSFECTION AND AMPLIFICATION IN ANIMAL CELLS

Clifford P. Stanners, Baie d'Urfé , and Mireille Cartier, Pierrefonds, both of Canada, assignors to The Royal Institution for the Advancement of Learning (McGill University), Montreal, Canada

Filed Feb. 11, 1988, Ser. No. 154,912
Int. Cl.[5] C12N *15/64, 15/85, 15/69, 5/10*
U.S. Cl. 435—172.3 1 Claim

1. A method for dominant selection and amplification of a vector in animal cells which are asparagine independent for growth, said method comprising,

(1) transforming an animal cell with a shuttle vector comprising,

(a) DNA sequences which render said vector capable of selection and growth in bacterial cells and expression of inserted nucleotide sequences in animal cells, and

(b) the *E.Coli* gene AsnA coding for asparagine synthetase, and

(c) an optional heterologous gene for which high level expression is desired,

(2) selecting transformed cells containing said shuttle vector by growing the cells in a culture medium lacking asparagine and containing albizziin, wherein cells expressing the *E.Coli* AsnA gene are resistant to albizziin,

(3) selecting transformed cells containing multiple copies of said shuttle vector by growing said transformed cells in a culture medium containing increasing concentrations of β-aspartyl hydroxamate.

1. A method of autofluorography comprising the steps of

a. preparing a separation medium containing radiolabelled materials to be identified;

b. enhancing said prepared separation medium by soaking said separation medium in an excess of an enhancer solution, said enhancer solution being reuseable and comprising

1. about 5-95% by weight of an acid anhydride of the formula

where R_1 and R_2 are selected from a group consisting of straight chain, branch chain, and substituted alkyl groups;

2. about 0.01-25% by weight of a water miscible acid; and

3. about 0.01-25% by weight of a scintillation fluor;

c. decanting said excess of said enhancer solution from said separation medium wherein said excess is available for reuse;

d. drying said separation medium; and

e. exposing a photographic emulsion to said enhanced separation medium, thereby forming an autofluorograph.

5,011,782

METHOD OF MAKING PASSIVATED ANTIREFLECTIVE COATING FOR PHOTOVOLTAIC CELL

Walter R. Lamb, Sunnyvale, and Darrell Griffin, Stratford, both of Calif., assignors to Electric Power Research Institute, Palo Alto, Calif.

Filed Mar. 31, 1989, Ser. No. 332,287

Int. Cl.[5] H01L *31/18*

U.S. Cl. 437—2 9 Claims

1. A method of fabricating a point contact photovoltaic cell comprising the steps of

(a) providing a semicondcutor substrate,

(b) oxidizing the surfaces of said semiconductor substrate,

(c) forming a plurality of doped regions of p-conductivity type and n-conductivity type in a first major surface of said substrate;

(d) forming first and second metallization layers for interconnecting said plurality of doped regions,

(e) depositing silicon nitride on said first and second metallization layers as an etchant protection layer,

(f) thinning said substrate by etching a second major surface opposite from said first major surface, and

(g) forming a layer of antireflective material on said second major surface.

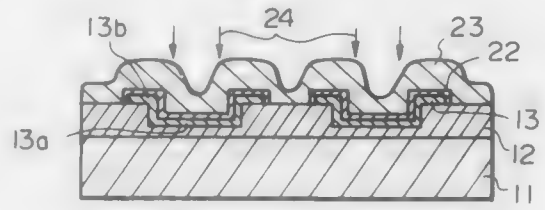
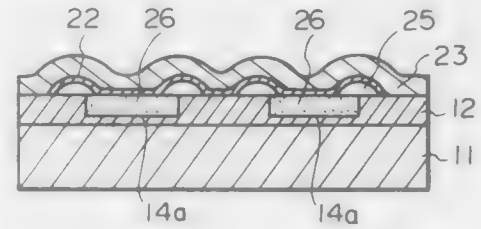
1. A method for producing a semiconductor device having a substrate, comprising the steps of:

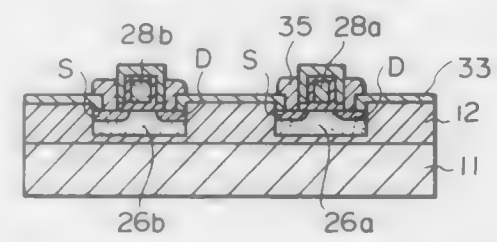
(a) forming a first insulating layer on the substrate, the insulating layer having a plurality of concave portions;



(b) forming a non-single crystalline silicon layer on the surface of the first insulating layer, the non-single crystalline silicon layer having a first portion and second portion, the first portion extending from the bottom and along the sides of the concave portions and terminating at the second portion located at the surface of the first insulating layer and located between the concave portions, the thickness of the first portion being greater than the thickness of the second portion;



(c) patterning the non-single crystalline silicon layer at the surface of the first insulating layer;



(d) covering the patterned non-single crystalline silicon layer with a second insulating layer;

(e) irradiating the patterned non-single crystalline silicon layer and the second insulating layer with an energy ray in a substantially vertical direction to melt the patterned non-single crystalline silicon layer such that the first portion of the non-single crystalline silicon layer having higher energy abosorptivity than that of the second portion and flows into the concave portions and then the second portion of the non-crystalline silicon layer melts and flows, and at the same time, the molten silicon layer of the first portion being solidified, thereby forming single crystalline regions in the concave portions, the volume of the patterned non-single crystalline silicon layer being substantially equal to that of the concave portions, the single crystalline regions being level with the top surface of the first insulating layer; and

(f) forming semiconductor elements in the single crystalline regions.

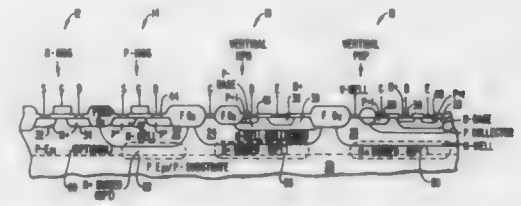
METHOD OF MAKING A COMPLEMENTARY BICMOS PROCESS WITH ISOLATED VERTICAL PNP TRANSISTORS

Kola N. Ratnakumar, San Jose, Calif., assignor to Exar Corporation, San Jose, Calif.

Division of Ser. No. 146,934, Jan. 21, 1988. This application Jul. 20, 1990, Ser. No. 556,231



Int. Cl.[5] H01L *21/265*

U.S. Cl. 437—34 10 Claims

1. In a method for forming CMOS transistors and NPN transistors on a single wafer, said method including the step of forming an N well as the collector of an NPN vertical transistor, an improvement for forming at least one isolated, vertical PNP transistor comprising the steps of:

forming an N-well to contain said PNP transistor during said step of forming an NPN vertical transistor collector;

implanting N type material to form an N base of said PNP transistor;

implanting a P type material at an energy greater than 300 keV for singly ionized material or greater than 150 kV for doubly ionized material to form a collector of said PNP transistor; and

forming a P region as an emitter of said PNP transistor.

INSULATOR ASSISTED SELF-ALIGNED GATE JUNCTION

Richard Nguyen, San Diego, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Oct. 30, 1990, Ser. No. 605,623

Int. Cl.[5] H01L *21/04*

U.S. Cl. 437—41 11 Claims

1. An improved process for fabricating a junction field effect transistor having a high transconductance, low capacitance and low leakage comprising:

providing a semi-insulating substrate having an n channel thereon;

placing a photoresist layer in a predetermine pattern on said n channel to function as a mask;

etching away of the masked n channel layer to a desired depth to define a wedge-shaped n region extending thereabove;

depositing a layer of insulator over the entire substrate including insulator regions of the deposited insulator that completely abut the sides of said wedge-shaped region; removing the photoresist layer, said insulator regions entirely covering the sides of said wedge-shaped region;

creating a p^+n junction system by p^+ diffusion in said wedge-shaped n region which is the gate region of the JFET, said insulator regions entirely covering the sides of said $p+n$ junction system to distinguish from the open-junction of the conventional self-aligned gate JFET;

depositing a gate patterned metal layer on top of the wedge-shaped p^+n junction system area which partially extends over said insulator regions of said deposited insulator;

removing said deposited insulator down to said n channel with the exception of said insulator regions; and

evaporating source and drain metal electrodes on said n channel layer and gate metal electrodes on said wedge-shaped p^+n junction system area to create a self-aligned gate JFET without an opened-junction region.

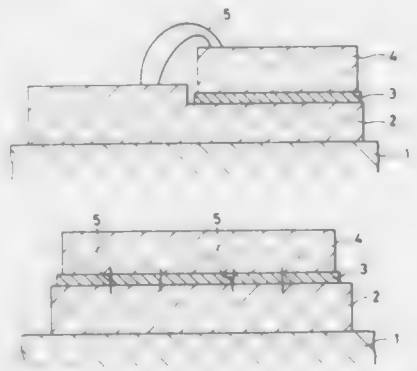
METHOD OF MANUFACTURING A HYBRID CIRCUIT KLEMENT



Satoru Isoda; Osamu Tomisawa, and Hiroaki Kawakubo, all of Hyogo, Japan, assignors to Mitsubishi Denki K.K., Tokyo, Japan

Division of Ser. No. 72,305, Jul. 13, 1987, Pat. No. 4,902,555. This application Jun. 23, 1989, Ser. No. 370,940

Claims priority, application Japan, Jul. 11, 1986, 61-164191; Jul. 11, 1986, 61-164198

Int. Cl.[5] H01L *21/70. 29/28*

U.S. Cl. 437—51 7 Claims

1. A method of manufacturing a hybrid circuit element, said method of manufacturing being a type using electrical conductors, said method comprising the steps of:

forming an insulating layer on a silicon layer to thereby form a semiconductor element;

forming a redox electrical element on said insulating layer by using redox materials;

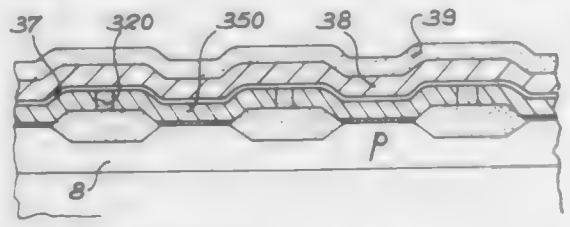
forming a metal wiring pattern on said redox electrical element to create electrodes by using a mask which is formed through energy beam exposure;

juxtaposing said redox electrical element and said semiconductor element together; and

electrically connecting said two elements to each other with said electrical conductors.

5,011,787

PRODUCTION OF AN INTEGRATED MEMORY CELL



Pierre Jeuch, Seyssins, France, assignor to Commissariat a L'Energie Atomique, Paris, France

Filed Jul. 7, 1989, Ser. No. 376,626

Claims priority, application France, Jul. 13, 1988, 88 09559

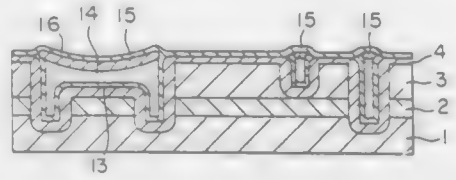
Int. Cl.[5] H01L *21/70*

U.S. Cl. 437—52 10 Claims

1. Method to produce an EPROM or EEPROM type integrated memory cell on a semi-conductive substrate comprising a matrix of memory points electrically insulated from each other, each memory point comprising a source, a drain, a floating gate, a control grid and a channel situated under the floating gate, the source and the drain being situated on both sides of the floating gate, the floating gate of each memory point being laterally distant and insulated along a first direction from one or two other floating gates, said method comprising a stage for forming lateral insulations of the floating gates along the first direction by insulating relief patterns followed by a stage for forming the actual floating gates by depositing and etching.

5,011,788

PROCESS OF MANUFACTURING SEMICONDUCTOR INTEGRATED CIRCUIT DEVICE AND PRODUCT FORMED THEREBY



Mikinori Kawaji, Hino; Toshihiko Takakura; Akihisa Uchida, both of Koganei; Shigeo Kuroda, Ome; Yoichi Tamaki, Kokubunji; Takeo Shiba, Kodaira; Kazuhiko Sagara, Tokyo, and Masao Kawamura, Fuchu, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Division of Ser. No. 11,932, Feb. 6, 1987, Pat. No. 4,819,054, which is a continuation-in-part of Ser. No. 824,929, Jan. 31, 1986, abandoned, which is a continuation of Ser. No. 536,519, Sep. 28, 1983, abandoned, which is a continuation-in-part of Ser. No. 670,976, Nov. 13, 1984, abandoned. This application Dec. 15, 1988, Ser. No. 284,557

Claims priority, application Japan, Sep. 29, 1982, 57-168355; Nov. 11, 1983, 58-210834

Int. Cl.[5] H01L *21/70*

U.S. Cl. 437—67 21 Claims

1. A process of manufacturing a semiconductor integrated circuit device comprising the steps of:

(a) grooving a Si substrate at a portion to be used as an inactive wiring region of said integrated circuit device to form a pair of isolation grooves;

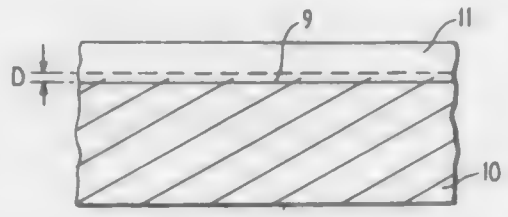
(b) grooving said pair of isolation grooves and an area therebetween, simultaneously so as to form two first grooves and a second groove, shallower than said first grooves, between the first grooves;

(c) forming a first insulating film extending on a surface of said first and second grooves; and

(d) forming wirings over said first insulating film extending on a surface of the first and second grooves, so that said first insulating film and said first and second grooves minimize parasitic capacitance between said wirings and said substrate.

5,011,789

METHOD OF MANUFACTURING A SEMICONDUCTOR DEVICE



Gordon P. Burns, Southampton, England, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Sep. 4, 1986, Ser. No. 904,090

Claims priority, application United Kingdom, Sep. 6, 1985, 8522195; Dec. 6, 1985, 8530053

Int. Cl.[5] H01L *21/20, 21/324*

U.S. Cl. 437—81 17 Claims

1. A method of manufacturing a semiconductor device comprising the steps of

passing a stream of hydrogen gas over a silicon body, said silicon body being at a first temperature below 900 degrees Celsius to prevent at least one of diffusion and outgassing from said silicon body,

applying a heat pulse to said silicon body to heat said silicon body form said first temperature to a second temperature above 1000 degrees Celsius, said heat pulse cleaning surfaces of said silicon body at said second temperature,

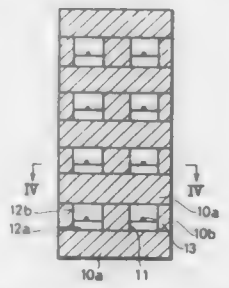
maintaining said heat pulse at said second temperature for time ranging from 15 to 120 seconds,

passing a silicon carrier gas over said silicon body during said heat pulse to deposit an epitaxial silicon layer on said silicon body at said second temperature, and

reducing temperature below a minimum temperature for depositing silicon at the end of said heat pulse.

5,011,790

METHOD OF MANUFACTURING CUBIC BORON NITRIDE P-N JUNCTION BODY



Junji Degawa, and Kazuwo Tsuji, both of Hyogo, Japan, assignors to Sumitomo Electric Industries, Ltd., Osaka, Japan

Filed Mar. 2, 1989, Ser. No. 317,946

Claims priority, application Japan, Mar. 3, 1988, 63-51009

Int. Cl.[5] H01L *21/22;* C30B *29/38*

U.S. Cl. 437—134 11 Claims

1. A method of manufacturing a cubic boron nitride p-n junction body, comprising the following steps:

(a) providing a boron nitride source material,

(b) preparing cubic boron nitride seed crystals (1) having a certain conductivity type semiconductor property,

(c) preparing a solvent material containing 0.1 to 5.0 wt. % of a doping material for causing a conductivity type opposite to that of said seed crystals and being capable of dissolving boron nitride,

(d) enclosing each of said seed crystals individually and uniformly on all sides in a body of said solvent material,

(e) enclosing on all sides each of said bodies of solvent material having a seed crystal enclosed therein, in said boron nitride source material

(f) growing cubic boron nitride having a conductivity type semiconductor property opposite to that of said seed crystals, on said seed crystals under thermodynamically stable conditions for cubic boron nitride at a temperature exceeding the melting point of said solvent material, whereby a spontaneous nucleation outside said seed crystals is avoided to cause a uniform rapid growth all around each seed crystal.

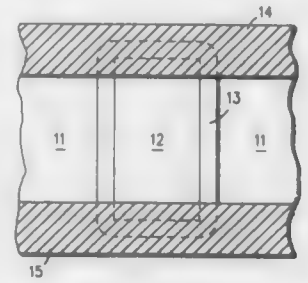
FUSIBLE LINK WITH BUILT-IN REDUNDANCY

Sal T. Mastroianni, Tempe, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Feb. 3, 1989, Ser. No. 305,575

Int. Cl.[5] H01L *21/441, 21/44*

U.S. Cl. 437—180 6 Claims



1. A method of making a fusible sidewall spacer, comprising the steps of:

providing a semiconductor substrate;

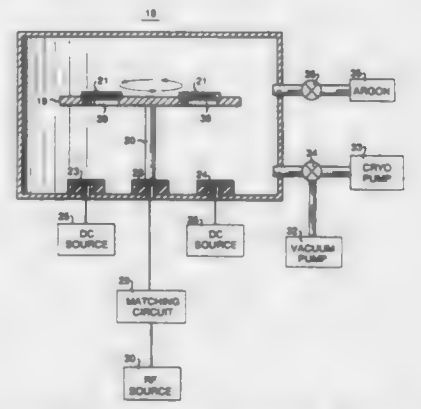
forming a dielectric layer on the substrate;

patterning a transition having four sides in the dielectric layer;

forming a fusible material on the dielectric layer; and

partially removing the fusible material to form the fusible sidewall spacer along the transition in the dielectric layer.

5,011,792



METHOD OF MAKING OHMIC LOW RESISTANCE WSB CONTACTS TO III-V SEMICONDUCTOR MATERIALS

Ranjan Dutta, Lawrenceville, N.J., assignor to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Feb. 12, 1990, Ser. No. 478,875

Int. Cl.[5] H01L *21/283*

U.S. Cl. 437—184 7 Claims

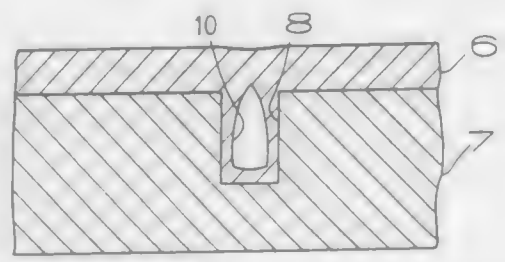
1. The method of making an electronic device comprising the steps of applying a metal film to a substrate of III-V material so as to make a substantially ohmic contact thereto characterized in that:

tungsten and antimony are deposited by sputtering onto the substrate so as to form the metal film.

5,011,793

VACUUM DEPOSITION USING PRESSURIZED REFLOW PROCESS

Hisaharu Obinata, Hatano, Japan, assignor to Nihon Shinku Gijutsu Kabushiki Kaisha, Kanagawa, Japan



Filed Jun. 19, 1990, Ser. No. 540,163

Int. Cl.[5] H01L *21/90*

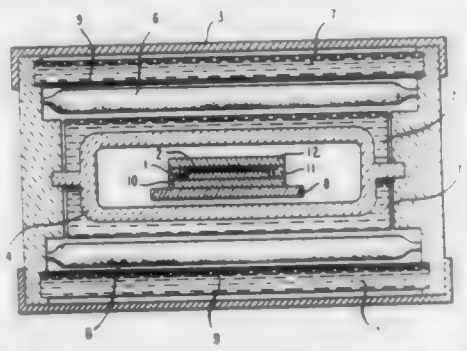
U.S. Cl. 437—203 9 Claims

1. A method of forming a thin film on a substrate having one or more recesses without void being generated in each recess, comprising the steps of forming the thin film on the substrate in a vacuum atmosphere, heating the thin film formed on the substrate to cause it to be melted and to close the entrance of

each recess by the melted material, and exposing the melted material of the thin film to a pressurized gas so that the melted

material is filled into each recess of the substrate thereby removing voids in each recess.

5,011,794



PROCEDURE FOR RAPID THERMAL ANNEALING OF IMPLANTED SEMICONDUCTORS

Karen A. Grim, Reading, Pa.; Shobha Singh, Summit, N.J.; LeGrand G. Van Uitert, Morristown, N.J., and George J. Zydzik, Columbia, N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed May 1, 1989, Ser. No. 345,923

Int. Cl.[5] H01L *21/00, 21/02, 21/18, 21/20*

U.S. Cl. 437—247 **56 Claims**

1. A process for fabricating a semiconductor device, which comprises

subjecting to a Rapid Thermal Anneal (RTA) a wafer of semiconductor material having dopant ions implanted into at least one selected area of at least one surface thereof and a layer of an encapsulating material over the said surface, the said RTA including in succession, a pre-anneal step, a main annealing step and a post-anneal step, the pre-anneal step being conducted at a temperature and for a period sufficient to reduce any thermal shock to the semiconductor material which may result from the main-annealing step, the said pre-anneal temperature being lower than a peak temperature of the main annealing step, the main annealing step being conducted at a temperature and for a period sufficient to remove damage caused to the said surface by the ion implantation and to activate dopant ions in said at least one selected area of the said surface of the wafer, and a post-anneal step being conducted at a temperature and for a period sufficient to relieve stresses which may result from the main-annealing step,

wherein prior to said RTA, enclosing the wafer within a cavity of a container (hereinafter referred to as a "black-box") comprising a base, an annular guard ring and a lid, said base, guard ring and lid comprising black-body material stable under annealing conditions.

HUMAN TPA PRODUCTION USING VECTORS CODING FOR DHFR PROTEIN

Arthur D. Levinson, Hillsborough; Diane Pennica, Burlingame; William J. Kohr, San Mateo; Gordon A. Vehar, San Carlos; David V. Goeddel, Hillsborough, all of Calif.; Elizabeth M. Yelverton, Seattle, Wash., and Christian C. Simonsen, Saratoga, Calif., assignors to Genentech, Inc., San Francisco, Calif.

Continuation of Ser. No. 149,032, Jan. 27, 1988, abandoned, which is a continuation of Ser. No. 149,990, Jan. 27, 1988, abandoned, which is a continuation of Ser. No. 459,153, Jan. 19, 1983, abandoned. This application Mar. 22, 1990, Ser. No. 499,201

Int. Cl.[5] C12P *21/00, 19/34*; **C12N** *15/00, 5/00*

U.S. Cl. 435—69.2 **10 Claims**

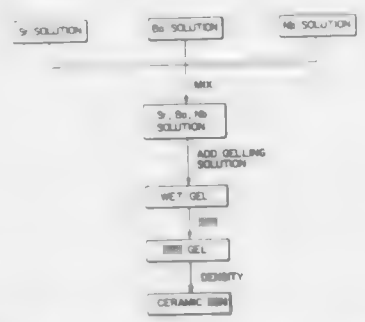
1. A method for preparing tPA in host cells which method comprises:

(a) transfecting said host cells with a plasmid effective in expressing DNA sequences encoding a DHFR protein and tPA protein contained therein;

(b) growing the host cells under conditions such that said tPA protein is produced in amounts of at least 0.1 pg of tPA per cell per day; and

(c) recovering said tPA from said cells.

5,011,796



SOL-GEL PREPARATION OF POLYCRYSTALLINE STRONTIUM BARIUM NIOBATE (SBN)

Keith Bridger, Washington, D.C.; Lorianne Jones, Cockeysville, and Stephen R. Winzer, Ellicott City, both of Md., assignors to Martin Marietta Corporation, Bethesda, Md.

Filed Oct. 23, 1989, Ser. No. 425,666

Int. Cl.[5] C03C *3/00*

U.S. Cl. 501—12 **40 Claims**

1. A method for the production of polycrystalline strontium barium niobate materials having a substantially 100 percent tungsten bronze structure, the method comprising forming a solution of Sr, Ba and Nb alkoxides in an alcoholic solvent, gelling the solution, drying the gelled solution, and densifying the dried gel.

5,011,797

COMPOSITION AND METHOD FOR RADIATION SYNOVECTOMY OF ARTHRITIC JOINTS

Delbert E. Day, Rolla, and Gary J. Ehrhardt, Columbia, both of Mo., assignors to The Curators of the University of Missouri, Columbia, Mo.

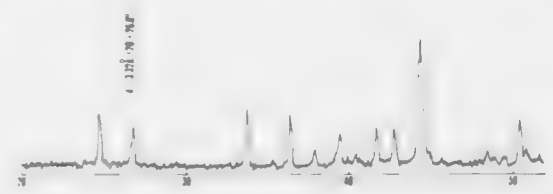
Division of Ser. No. 150,154, Jan. 29, 1988, Pat. No. 4,889,707. This application Sep. 15, 1989, Ser. No. 408,115

Int. Cl.[5] C03C *12/00, 3/095*

U.S. Cl. 501—33 **19 Claims**

1. A nonradioactive microsphere adapted for radiation synovectomy on arthritic joints in a mammal comprising a biologically compatible glass material selected from the group consisting of magnesium aluminosilicate and aluminosilicate and containing an isotope selected from the group consisting of samarium, holmium, erbium, dysprosium, and rhenium chemically dissolved in and distributed substantially uniformly throughout said glass material and which, upon being subjected to an effective amount of neutron irradiation, will produce a beta emitting radioisotope selected from the group consisting of samarium-153, holmium-166, erbium-169, dysprosium-165, rhenium-186 and rhenium-188.

5,011,798



CHROMIUM ADDITIVE AND METHOD FOR PRODUCING CHROMIUM ALLOY USING THE SAME

Minoru Sasabe, Chiba; Masao Imamura, Yamagata; Yasunobu Yoshida, Yamagata; Shinya Andoh, Yamagata, and Hiroshi Miyake, Yamagata, all of Japan, assignors to Tosoh Corporation, Shinnanyo, Japan

Filed Sep. 28, 1989, Ser. No. 413,501

Int. Cl.[5] C22C *1/02, 1/03*

U.S. Cl. 501—87 **8 Claims**

1. A chromium additive of the formula $Cr_xC_yO_z$, wherein $0.04 \leqq y \leqq 0.35$, and $0.03 \leqq z \leqq 0.30$ for $x=1$, said additive having an X ray diffraction peak at $d=3.32$ Å ($2\theta=26.8°$).

5,011,799

IN SITU PRODUCTION OF SILICON CARBIDE REINFORCED CERAMIC COMPOSITES

Asoke C. Das Chaklander, 1788 Acadia Road, Vancouver, British Columbia, Canada V6T 1B3, and Sankar Das Gupta, 29 Sullivan Street, Toronto, Ontario, Canada M5T 1B8

Continuation-in-part of Ser. No. 409,054, Sep. 19, 1989, abandoned. This application Sep. 14, 1990, Ser. No. 582,388

Int. Cl.[5] C04B *35/10, 35/14, 35/56*

U.S. Cl. 501—89 **18 Claims**

1. A process for making alumina-SiC composite ceramic powder comprising forming a mixture of alumino-silicates and carbon particles as precursor material, reacting said mixture at a temperature of above 1500° C. to transform said mixture into said composite ceramic powder having Al_2O_3 and SiC as major phases.

5,011,800

PROCESS FOR MAKING MOLYBDENUM DISILICIDE OR MOLYBDENUM DISILICIDE/ALUMINA COMPOSITIONS

Rudolf Abramovici, Depew, and George T. Hida, North Tonawanda, both of N.Y., assignors to Benchmrk Structural Ceramics Corporation, Amherst, N.Y.

Filed Mar. 26, 1990, Ser. No. 499,038

Int. Cl.[5] C04B *35/58*

U.S. Cl. 501—96 **20 Claims**

1. A process for preparing a molybdenum disilicide composition, comprising the steps of sequentially:

(a) providing a composition comprised of from about 12 to about 34 weight percent of molybdenum oxide, from about 10 to about 29 weight percent of silica, from about 12 to about 36 weight percent of metallic component, and from about 15 to about 60 weight percent of inorganic diluent, wherein:

1. at least about 90 weight percent of said composition consists of a mixture of said molybdenum oxide, said silica, said metallic component, and said inorganic diluent;
2. said composition contains less than about 2.0 weight of liquid;
3. said metal component is selected from the group consisting of aluminum, magnesium, and mixtures of of aluminum and magnesium;
4. said inorganic diluent is a salt of a metallic compound which has a solubility in cold water of at least 20 grams per 100 cubic centimeters of said cold water;
5. said inorganic diluent does not decompose at a temperature of from about 1,500 to about 2,000 degrees centigrade; and
6. at a temperature of from about 1,500 to about 2,000 degrees centrigrade, said inorganic diluent is nonreactive with material selected from the group consisting of molybdenum oxide, molybdenum dislicide, silica, silicon, aluminum, alumina, magnesium, magnesia, molybdenum, and mixtures thereof;

(b) igniting said composition, thereby causing a self-propagating, metallothermic, exothermic combustion reaction to occur and producing a combusted composition;

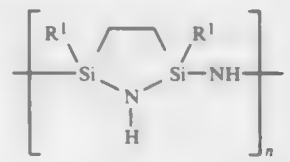
(c) cooling the combusted composition; and

(d) washing the cooled, combusted composition with water.

5,011,801

POLYMERIC ETHYLENE-BRIDGED CHLOROSILAZANES, PROCESS FOR THEIR PREPARATION, CERAMIC MATERIALS WHICH CAN BE PREPARED FROM THEM CONTAINING SILICON NITRIDE, AND THEIR PREPARATION

Tilo Vaahs; Marcellus Peuckert, and Martin Brück, all of P.O. Box 80 03 20, D-6230 Frankfurt am Main 80, Fed. Rep. of Germany



Filed Nov. 30, 1989, Ser. No. 444,816

Claims priority, application Fed. Rep. of Germany, Dec. 3, 1988, 3840770

Int. Cl.[5] C04B *35/46, 35/48*

U.S. Cl. 501—97 **14 Claims**

1. A process for the preparation of polymeric ethylene-bridged chlorosilazanes, which comprises reacting an oligosilazane of the general formula (I)

(I)

in which n is about 2 to about 12, with at least one of the chlorosilanes $Cl_2R^2Si—CH_2CH_2—SiR^2Cl_2$, $Cl_3Si—CH_2—CH_2—SiR^3Cl_2$, R^4SiCl_3 or R^5SiHCl_2 at 30° C. to 300° C., where R^1 to R^5 are C_1–C_6-alkyl or C_2–C_6-alkenyl groups, which may be identical or different.

5,011,802

COKING TAR IMPREGNATED REFRACTORY PRODUCTS

Orville Hunter, Jr., Columbia; James L. Hill, and David E. Potts, both of Mexico, all of Mo., assignors to A.P. Green Industries, Inc., Mexico, Mo.

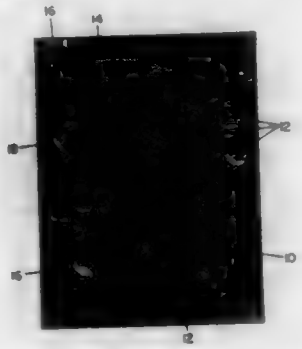
Filed Jan. 22, 1990, Ser. No. 468,167

Int. Cl.[5] C04B *35/04*

U.S. Cl. 501—100 **7 Claims**

1. In a process for coking tar impregnated refractory products wherein said products are heated in a furnace to a temperature sufficient to cause emission of volatile constituents from the tar and for a time sufficient to remove substantially all of the volatile constituents from the products, the improvement comprising,

heating the refractory products in a muffle within the furnace while maintaining a positive pressure within the muffle during emission of the volatile constituents, and



thereafter cooling the refractory products in a substantially non-oxidizing atmosphere.

5,011,803

LEAD MAGNESIUM NIOBATE CERAMIC DIELECTRICS HAVING LOW SINTERING TEMPERATURES

Hyun D. Park, Chelmsford, Mass., and Joseph D. Nance, Honea Path, S.C., assignors to Kemet Electronics Corporation, Greenville, S.C.

Filed Jan. 10, 1990, Ser. No. 463,308
Int. Cl.[5] C04B *35/46*
U.S. Cl. 501—136 **12 Claims**

1. A lead magnesium niobate perovskite-rich dielectric material which is capable of being formed from a mixture of oxide powders which is sintered at relatively low temperatures, comprising:

(a) lead-containing oxide component (expressed in terms of oxides) consisting essentially of 2 to 5 weight percent MgO, 15 to 30 weight percent Nb_2O_5, 0.5 to 7 weight percent Fe_2O_3, 0.5 to 5 weight percent WO_3 and PbO wherein the amount of lead (based on the total lead in the dielectric material) is between about 85 to 110 atomic percent of that required on a stoichiometric basis to satisfy the relationship:

$$xPb(Mg_{\frac{1}{3}}Nb_{\frac{2}{3}})O_3\text{-}yPb(Fe_{\frac{1}{2}}Nb_{\frac{1}{2}})O_3\text{-}zPb(Fe_{\frac{2}{3}}W_{\frac{1}{3}})O_3$$

(based on the total iron and niobium in the dielectric material) wherein x is between about 0.8 and 0.92, y is between about 0.005 and 0.165 and z is between about 0.035 and 0.075; wherein the atomic ratio of tungsten to iron (based on the total tungsten and iron in the dielectric material) is less than about 0.49:1; and wherein the atomic ratio of magnesium to niobium (based on the total magnesium and niobium in the dielectric material) is between about 0.55:1 and 0.42:1,

(b) cadmium component (expressed in terms of CdO) in an amount of about 1 to 5 weight percent based on the dielectric material,

(c) transition metal component (expressed in terms of oxides) of at least one of TiO_2, ZrO_2 and HfO_2, said transition metal component being in an amount sufficient to increase the insulation resistance of an otherwise identical material but not containing the transition metal component, and

(d) sintering aid residue (expressed in terms of oxides) in an amount of about 0.2 to 2 weight percent based on the total weight of the material, said sintering aid residue comprising one or more of GeO_2, SiO_2, Bi_2O_3, ZnO, Al_2O_3, CuO and B_2O_3, which as the sintering aid are provided in combination with PbO such that the sintering aid has a melting point of between about 650° and 900° C.

5,011,804

CERAMIC DIELECTRIC COMPOSITIONS AND METHOD FOR IMPROVING SINTERABILITY

Horacio E. Bergna, Wilmington, and Ian Burn, Hockessin, both of Del., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Feb. 28, 1990, Ser. No. 506,964
Int. Cl.[5] C04B *35/46*
U.S. Cl. 501—138 **13 Claims**

1. A method for enhancing the sinterability of ceramic dielectric composition comprising uniform coated particles of ceramic powder according to the steps of:

(a) mixing sintering flux component precursors with the ceramic powder whereby the flux component precursors form a uniform coating comprising primarily zinc borate on each particle wherein said coating comprises less than about 50% by weight of the coated particle; and

(b) drying and optionally calcining the coated particles.

5,011,805

DEHYDROGENATION, DEHYDROCYCLIZATION AND REFORMING CATALYST

Ralph M. Dessau, Edison, N.J., assignor to Mobil Oil Corporation, Fairfax, Va.

Division of Ser. No. 389,214, Aug. 3, 1989, Pat. No. 4,929,792, which is a division of Ser. No. 283,779, Dec. 13, 1988, Pat. No. 4,867,864. This application Mar. 7, 1990, Ser. No. 489,993
Int. Cl.[5] B01J *29/30*
U.S. Cl. 502—66 **39 Claims**

1. A non-acidic calcined catalyst composition comprising 0.01 to 30 weight percent of a reforming dehydrogenation/hydrogenation metal and zeolite beta in a non-acidic form, wherein zeolite beta is characterized by a framework silica:alumina ratio of 10 to 200.

2. The catalyst of claim 1, wherein the metal is a Group VIII metal.

4. The catalyst of claim 1, wherein said zeolite beta contains boron and wherein said boron ranges from 0.1 to 5 weight percent.

5. The catalyst of claim 1, wherein the non-acidic form includes an element selected from the group consisting of Group IA and Group IIA of the Periodic Table.

5,011,806

CATALYST COMPOSITION FOR THE HYDROGENATION OF CARBOXYLIC ACID ESTERS

Gether Irick, Jr., Gray; Patricia N. Mercer, Kingsport, and Kenneth E. Simmons, Blountville, all of Tenn., assignors to Eastman Kodak Company, Rochester, N.Y.

Division of Ser. No. 309,641, Feb. 13, 1989, Pat. No. 4,929,777. This application Feb. 5, 1990, Ser. No. 474,920
Int. Cl.[5] B01J *21/06, 23/06, 23/10, 23/72*
U.S. Cl. 502—202 **5 Claims**

3. A catalyst composition comprising as the essential ingredients chemically-mixed, copper-titanium oxide of the formula

$$Cu_xTi_yO_z$$

wherein x, y, and z represent atomic ratios and x is about 0.01 to 0.75, y is about 0.99 to 0.25, and z is about 1.99 to 1.25 and an oxide of lanthanum or zinc.

5,011,807

CATALYSTS FOR THE PRODUCTION OF ETHYLENE OXIDE

Percy Hayden, Guisbrough, and Harry Pinnegar, Stockton-on-Tees, both of England, assignors to Imperial Chemical Industries plc, London, England

Filed Aug. 29, 1989, Ser. No. 400,133
Claims priority, application United Kingdom, Aug. 30, 1988, 8820500; Sep. 7, 1988, 8820975; Oct. 12, 1988, 8823919; Dec. 16, 1988, 8829343
Int. Cl.[5] B01J *27/055, 27/051, 27/047;* **C07D** *301/10*
U.S. Cl. 502—218 **7 Claims**

1. A catalyst for the production of ethylene oxide by the oxidation of ethylene with oxygen which consists essentially of silver supported on a porous heat resisting support, a group VI A transition metal selected from the group consisting of chromium, molybdenum and tungsten, an alkali metal selected from potassium, rubidium and cesium, and sulphur, said catalyst including 3 to 50% by weight of silver and 0.1 to 5 gram atoms of the transition metal, 0.1 to 10 gram atoms of sulphur and 0.1 to 15 gram atoms of the alkali metal per million grams of catalyst.

5,011,808

OXYCHLORINATION CATALYST COMPOSITION AND AN OXYCHLORINATION PROCESS USING IT

John D. Scott, Nr. Northwich, Great Britain, assignor to Imperial Chemical Industries PLC, England

Filed Dec. 13, 1989, Ser. No. 449,771
Claims priority, application United Kingdom, Dec. 20, 1988, 8829706
Int. Cl.[5] B01J *27/122*
U.S. Cl. 502—225 **3 Claims**

1. Oxychlorination catalyst composition comprising a mixture of metallic chlorides carried on a support therefor, wherein said mixture of metallic chlorides consists essentially of a mixture of copper chloride, magnesium chloride, and potassium chloride in which the level of copper is within the range of from 3 to 9% by weight based on the weight of said catalyst composition, the level of magnesium is within the range of from 0.2 to 3% by weight based on the weight of said catalyst composition, and the level of potassium within the range of from 0.2 to 3% by weight based on the weight of said catalyst composition, and wherein said catalyst composition provides a Cu:Mg:K atomic ratio of 1:0.1 to 1.0:0.1 to 1.0.

PREPARATION OF A SILVER CATALYST

Klaus Herzog, Ludwigshafen; Karl-Heinz Boehning, Darmstadt; Heinrich Aichinger, Mannheim; Juergen Plueckhan; Wolf D. Mross, both of Frankenthal, and Matthias Schwarzmann, Limburgerhof, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Jan. 29, 1990, Ser. No. 471,544
Claims priority, application Fed. Rep. of Germany, Feb. 23, 1989, 3905578
Int. Cl.[5] B01J *21/04, 23/04, 23/50*
U.S. Cl. 502—348 **5 Claims**

1. In a two-stage process for preparing a carrier supported catalyst which contains silver and an alkali metal wherein the initial carrier supported catalyst is prepared in a first stage to contain metallic silver and may also contain the light alkali metal lithium, and this initial catalyst is then doped in a second stage with an impregnating solution containing a heavy alkali metal cation selected from the group consisting of sodium, potassium, rubidium and cesium, the improvement which comprises:

using in said second stage an impregnating solution which contains said heavy alkali metal and one or more nitrates of the formula

$$R^+NO_3^-$$

where R^+ is an ammonium, hydrazinium, C_1-C_{12}-monoalkylammonium, C_2-C_{12}-dialkylammonium, C_3-C_{12}-trialkylammonium or C_4-C_{12}-tetraalkylammonium cation.

PLATE-SHAPED CATALYST AND METHOD OF PRODUCING SAME

Takashi Michimoto; Yukinari Nakamoto; Kazuhiko Kuwada, and Nobuyoshi Ishida, all of Hiroshima, Japan, assignors to Babcock Hitachi Kabushiki Kaisha, Tokyo, Japan

Filed Apr. 10, 1989, Ser. No. 335,422
Claims priority, application Japan, Oct. 7, 1988, 63-253037
Int. Cl.[5] B01J *32/00, 35/04*
U.S. Cl. 502—439 **13 Claims**

1. A plate-shaped catalyst, comprising:

an expanded metal strip having roughened surfaces;

said surface roughened expanded metal strip having a catalytic layer coated on each entire surface thereof;

said expanded metal strip having the catalytic layer formed thereon further having convex and concave portions adjoining one another and separated by a predetermined distance; and

the surfaces of said catalytic layer being formed with waveshapes having a predetermined pitch.

IN SITU DYE GENERATION FOR THERMAL TRANSFER PRINTING

Leslie Shuttleworth, Webster, N.Y., and Michael J. McManus, Peabody, Mass., assignors to Eastman Kodak Company, Rochester, N.Y.

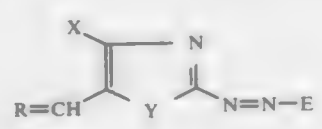
Filed Mar. 7, 1990, Ser. No. 490,116
Int. Cl.[5] B41M *5/035, 5/18, 5/22, 5/26*
U.S. Cl. 503—201 **28 Claims**

14. A process for forming a dye image comprising imagewise transferring an electrophile from a donor element comprising a support bearing said electrophile to a receiver element comprising a support bearing a coupler compound capable of reacting with said electrophile to form an arylidene dye, and reacting said electrophile with said coupler compound to form said dye image, wherein said electrophile has the following structure:

wherein

X is halogen, substituted or unsubstituted alkylsulfonyloxy, substituted or unsubstituted arylsulfonyloxy, or substituted or unsubstituted acyloxy,

E^1, E^2, E^3, and E^4 are each independently hydrogen, substituted or unsubstituted alkyl or alkenyl having up to about six carbon atoms, substituted or unsubstituted aryl having up to about ten carbon atoms, halogen, cyano, benzoxazolyl, nitro, —CO_2R, —COR, —$CONH_2$, —CONHR, —CONRR, or —SO_2R, wherein each R is independently substituted or unsubstituted alkyl or alkenyl having up to about six carbon atoms, or substituted or unsubstituted aryl having up to about ten carbon atoms, with the proviso that at least two of the E groups are other than hydrogen, alkyl, alkenyl, aryl or halogen;



B^1 and B^2 represent the atoms necessary to complete optional five- or six-member rings formed with carbonyl moieties of E^1, E^2 or E^3;

B^3 represents hydrogen or the atoms necessary to complete

an optional five- or six-member ring with a carbonyl moiety of E^1;
and n is zero or one.

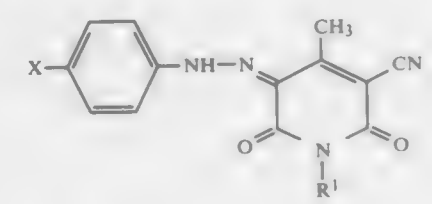
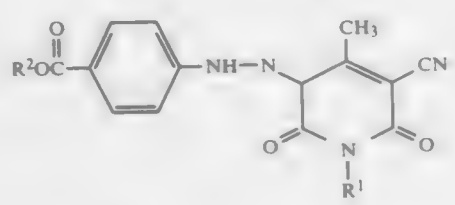
THERMAL TRANSFER PRINTING
Roy Bradbury, Cheshire, England, assignor to Imperial Chemical Industries, London, England
Filed Jul. 18, 1989, Ser. No. 381,260
Claims priority, application United Kingdom, Jul. 20, 1988, 8817220
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 **17 Claims**

1. A thermal transfer printing sheet comprising a substrate having a coating comprising a binder and at least one azo dye of Formula I:



I



wherein;
R is the residue of an active methylene compound;
X is hydrogen; halogen; optionally substituted alkyl; optionally substituted aryl or optionally substituted heteroaryl;
Y is -S- or a group of the formula $>N-R^1$ wherein R^1 represents hydrogen or an optionally substituted C_{1-4}-alkyl; and
E is the residue of a coupling component.

5,011,813
THERMAL TRANSFER PRINTING
Roy Bradbury, St. Helens; Peter A. Gemmell, and Richard A. Hann, both of Ipswich, all of England, assignors to Imperial Chemical Industries PLC, London, United Kingdom
Filed Mar. 19, 1990, Ser. No. 495,414
Claims priority, application United Kingdom, Mar. 23, 1989, 8906821
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 **7 Claims**

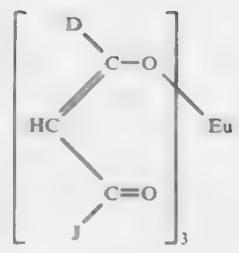
1. A thermal transfer printing sheet comprising a substrate having a coating comprising a mixture of dyes of 20–50% of Formula I and of 80–50% of Formula II.

I

II

wherein:
R^1 is C_{1-12}-alkyl;
X is halogen; and
R^2 is aryl or C_{1-4}-alkyl unsubstituted or substituted by C_{1-4}-alkoxy, C_{1-4}-alkoxy-C_{1-4}-alkoxy or aryl.

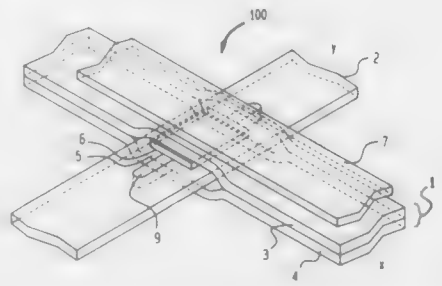
5,011,814
THERMAL DYE TRANSFER RECEIVING ELEMENT WITH POLYETHYLENE OXIDE BACKING LAYER
Daniel J. Harrison, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.
Filed Feb. 27, 1990, Ser. No. 485,676
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 **17 Claims**



10. In a process of forming a dye transfer image in a dye-receiving element comprising:
(a) removing an individual dye-receiving element comprising a support having on one side thereof a polymeric dye image-receiving layer and on the other side thereof a backing layer from a stack of dye-receiving elements;
(b) moving said individual dye-receiving element to a thermal printer printing station and into superposed relationship with a dye-donor element comprising a support having thereon a dye-containing layer so that the dye-containing layer of the donor element faces the dye image-receiving layer of the receiving element; and
(c) imagewise-heating said dye-donor element and thereby transferring a dye image to said individual dye-receiving element;
the improvement wherein said backing layer comprises a mixture of polyethylene oxide and submicron colloidal inorganic particles, said mixture not containing more than about 20 wt. % polyethylene oxide.

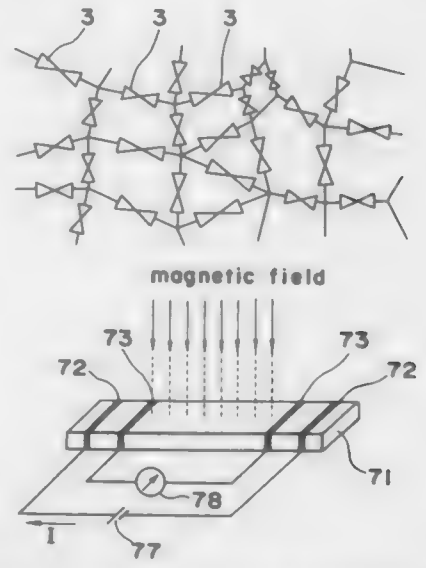
5,011,815
THERMAL TRANSFER DYESHEET
Nicholas C. Beck, Manningtree; Peter A. Gemmell, and Richard A. Hann, both of Ipswich, all of Great Britain, assignors to Imperial Chemical Industries plc, London, England
Filed Nov. 9, 1989, Ser. No. 433,785
Claims priority, application United Kingdom, Nov. 11, 1988, 8826456
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 **6 Claims**

4. A method for improving the stability of a colour print formed by dye-diffusion thermal transfer printing, which comprises placing against the print, a panel of transfer coat supported on a substrate, the panel comprising a dye-absorbent binder which is substantially free from any thermally transferable materials, and heating at least those areas of the print to which one or more dyes have been transferred, thereby to cause absorption by said panel of dye molecules at the surface of the print.



5,011,816
RECEIVER FOR THERMALLY-TRANSFERABLE FLUORESCENT EUROPIUM COMPLEXES
Gary W. Byers, and Derek D. Chapman, both of Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.
Filed Mar. 13, 1990, Ser. No. 493,077
Int. Cl.[5] B41M *5/035, 5/26*
U.S. Cl. 503—227 **12 Claims**

5. In a process of forming a transfer image comprising:
(a) imagewise-heating a donor element comprising a support having on one side thereof a layer comprising a material dispersed in a polymeric binder, and
(b) transferring an image to a receiving element comprising a support having thereon an image-receiving layer to form said transfer image,
the improvement wherein said material is a 6-coordinate europium(III) complex and said image-receiving layer also contains a monodentate or bidentate ligand capable of reacting with said 6-coordinate europium(III) complex to form a higher coordinate complex, said 6-coordinate europium(III) complex having the formula:



wherein:
D is a substituted or unsubstituted, aromatic, 5-or 6-membered carbocyclic or heterocyclic moiety; and
J is $-CF_3$, $-CH_3$, $-CH_2F$ or $-CHF_2$.

5,011,817
MAGNETIC MEMORY USING SUPERCONDUCTOR RING
Yasuharu Hidaka, and Takashi Inoue, both of Tokyo, Japan, assignors to NEC Corporation, Tokyo, Japan
Filed Jan. 27, 1989, Ser. No. 302,673
Claims priority, application Japan, Jan. 29, 1988, 63-20606; Jan. 29, 1988, 63-20607
Int. Cl.[5] G11C *11/44*
U.S. Cl. 505—1 **4 Claims**

1. A magnetic memory element using a superconductive ring comprising:
a first wire of superconductive material extending in a first direction;
a second wire of superconductive material extending in a second direction so as to form a cross-over area between said first and second wires;
a ferromagnetic film disposed between said first and second wires at said cross-over area and having a uniaxial anisotrophy along said second direction;
a third wire of superconductive material extending in said first direction and sandwiching said ferromagnetic film and said second wire at said cross-over area, said third wire being contacted with said first wire so as to form a ring portion at said cross-over area;
a fourth wire of conductive material extending in a first direction on said first wire;
a first means for reversing a magnetized direction of said ferromagnetic film by applying first and second currents to said second and fourth wires, respectively;
a second means for tilting said magnetized direction of said ferromagnetic film by applying a pulse current to said second wire so as to cause a diamagnetic current in said ring portion of said first and third wires;
a third means for detecting a direction of said diamagnetic current by applying a bias current to said first and third wires from the same direction, a critical current of said third wire being larger than that of said first wire but smaller than said bias current so as to switch a superconductive state of said ring portion into a normal conductive state when the sum of said diamagnetic current and a partial current of said bias current passing through said first wire at said ring portion exceeds a critical current of said first wire at said ring portion.

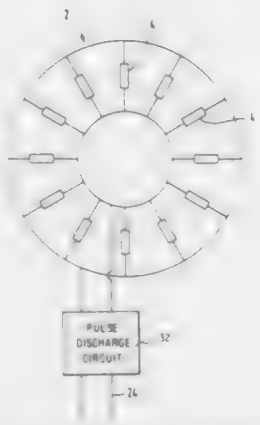
PROCESS USING SUPERCRITICAL CONDITIONS FOR PRODUCING HIGHLY ACCURATE AND HOMOGENEOUS POWDER MIXTURE USEFUL IN FABRICATION OF HIGH QUALITY CERAMIC SUPERCONDUCTORS
Jacques Leibovitz, San Jose, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif.
Filed Jun. 2, 1988, Ser. No. 201,706
Int. Cl.[5] B01D *3/06;* **H01L** *39/12*
U.S. Cl. 505—1 **11 Claims**

1. A process for forming a uniform and homogeneous mixture of a plurality of ceramic precursor compounds in a desired stoichiometric ratio as a precipitate from a fluid under supercritical processing conditions, the process comprising:

(a) dissolving a stoichiometric mixture of compounds in a fluid confined in a fixed first volume at a first density and supercritical temperature, the mixture of compounds containing from 1 to 25 weight per cent less than the saturation amount of the least soluble compound in the fluid at said first density and supercritical temperature; and
(b) rapidly expanding the volume in which said fluid is confined to a second fixed volume without changing the phase of the fluid, thereby lowering the density of the



fluid and causing said stoichiometric mixture of compounds to precipitate as a uniform and stoichiometrically accurate mixture of said compounds;
wherein said stoichiometric mixture of compounds, when subsequently heated in the presence of oxygen, will form a high quality superconductor material because of the uniform and homogeneous distribution of the precipitated components in a stoichiometrically accurate ratio throughout the mixture.

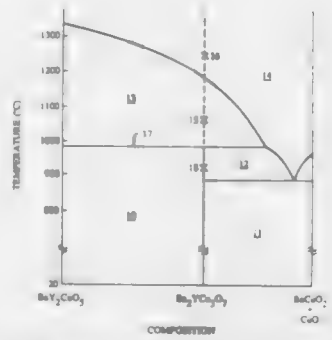
PREPARATION OF A UNIFORM MIXED METAL OXIDE AND SUPERCONDUCTIVE OXIDES

Timothy J. Barder, Addison, Ill., assignor to Allied-Signal Inc., Morris Township, Morris County, N.J.

Filed Jan. 10, 1989, Ser. No. 296,267
Int. Cl.[5] C01F *1/00, 17/00;* **C01G** *1/00*
U.S. Cl. 505—1 **10 Claims**



1. A method for producing a uniform mixed metal oxide comprising:
(a) dissolving metals as their salts of a carboxylic acid in an aliphatic alcohol in the substantial absence of water, said metals are in the same proportions as in the corresponding mixed metal oxide produced in step(c);
(b) co-precipitating said metals as their oxalates by mixing the alcohol solution of (a) with oxalic acid; (c) separating the co-precipitated metal oxalates of (b) and calcining said oxalates in air or oxygen above about 500° C. to convert said oxalates to the corresponding metal oxides.

5,011,823
FABRICATION OF OXIDE SUPERCONDUCTORS BY MELT GROWTH METHOD

Sungho Jin, Millington; Richard C. Sherwood, New Providence, and Thomas H. Tiefel, Piscataway, all of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Continuation-in-part of Ser. No. 62,529, Jun. 12, 1979, abandoned. This application Nov. 27, 1987, Ser. No. 126,083
Int. Cl.[5] B05D *5/12*
U.S. Cl. 505—1 **18 Claims**

1. A method of fabricating a body that comprises a superconductive oxide of nominal composition $Ba_{2-x}M_{1-y}X_{x+y}Cu_3O_{7\pm\delta}$, where M is selected from the group consisting of Y, Eu, La, and combinations thereof, the optional X is different from Ba and M and is selected from the group consisting of the elements of atomic number 57–71, Sc, Ca and Sr, with $0 \leqq x+y \leqq 1$ and $0 \leqq \delta < 0.5$, and with Ba and M being at least 50% unsubstituted, wherein the method comprises
a) providing a quantity of precursor material comprising an oxide of one or more of Ba, Cu, M and X, associated with the precursor material is a phase diagram comprising a solid-liquid region and a liquid regions, and a solidus temperature;
b) heating the precursor material such that at least a portion thereof is at a temperture above the solidus temperature and is a liquid;
c) cooling at least a part of the liquid precursor material to a temperature below the solidus temperature such that re-solidified precursor material results, the rate of cooling selected such that at least a substantial portion of the re-solidified precursor material comprises elongate grains, associated with a given elongate grain being a long axis and an aspect ratio, at least a substantial fraction of the elongate grains measuring at least about 10 μm along the long axis and having an aspect ratio of at least 10:1; and
d) heat treating the re-solidified precursor material in an oxygen-containing atmosphere such that the superconductive oxide is produced from the re-solidified precursor material.

U.S. Cl. 514—18 **13 Claims**

1. A compound of formula I

$$R^N—L—N—B^3—R^C \quad (I)$$

in which
R^N represents a radical of the formula II;

(II)

R^2 represents hydrogen or a radical of the formula R—[A]$_n$—NH—;
R^3 denotes amino, guanidino, (C_1–C_3)-alkylamino or di-(C_1–C_3)-alkylamino;
m denotes an integer from 1 to 6;
A represents a radical of the formula —NH—CR^4R^5—CO—;
R denotes hydrogen, (C_1–C_6)-alkanoyl, (C_7–C_{11})-aroyl, in which the aromatic moiety is unsubstituted or mono- or disubstituted by (C_1–C_4)-alkyl, (C_1–C_4)-alkoxy, (C_1–C_4)-alkylthio, halogen, carbamoyl, (C_1–C_4)-alkoxycarbonyl and/or sulfamoyl, or is monosubstituted by methylenedioxy, or denotes (C_5–C_7)-cycloalkyl-(C_1–C_3)-alkanoyl or (C_6–C_{14})-aryl-(C_1–C_3)-alkanoyl, where a —CH_2 group in the radicals where R is not a hydrogen can be replaced by —O— or —S—;
n is 0 or, if p=1, n represents 1;
R^4 and R^5 are identical or different and denote hydrogen, (C_1–C_6)-alkyl or (C_7–C_{11})-aralkanoyl;
L represents Pro, D-Pro or a radical of the formula —N-H—$CH(R^6)$—CO—;
R^6 denotes (C_1–C_6)-alkyl which is unsubstituted or monosubstituted by hydroxyl, (C_1–C_6)-alkoxy, (C_1–C_6)-alkoxycarbonyl, carbamoyl or R-NH, R being as defined above but cannot be hydrogen, or denotes (C_7–C_{11})-aralkyl which is unsubstituted or monosubstituted on the aromatic ring by (C_1–C_6)-alkoxy, or denotes 3-indolymethyl;

N represents Pro, D-Pro or a radical of the formula —N-H—CH(R^7)—CO—;
R^7 denotes (C_1–C_6)-alkyl which is unsubstituted or monosubstituted by hydroxyl, (C_1–C_6)-alkoxy, (C_1–C_6)-alkoxycarbonyl, carbamoyl or R-NH, R being as defined above but cannot be hydrogen, or denotes (C_7–C_{11})-aralkyl which is unsubstituted or monosubstituted on the aromatic ring by (C_1–C_6)-alkoxy, or denotes 3-indolymethyl;
B^2 represents Arg, D-Arg, Lys or D-Lys;
R^C represents a radical of the formula $-NR^9-CH(R^8)-(CO)_p-R^1$;
R^8 is defined as R^7, with CH, CH_2 or CH_3 radicals which are present in the β-position with respect to —NH— optionally being monohydroxylated, and
R^9 denotes hydrogen; or
R^8 and R^9 together denote $-[CH_2]_3-$ or $[CH_2]_4$;
p is 0 or 1
R^1 represents hydrogen, hydroxyl or (C_1–C_6)-alkoxy in the case of p = 0;
R^1 represents OR^{10} or $NR^{10}R^{11}$ in the case of p = 1; and
R^{10} and R^{11} are identical or different and denote hydrogen, (C_1–C_6)-alkyl or (C_7–C_{11})-aralkyl; or $NR^{10}R^{11}$ represents pyrrolidino, piperidino or morpholino; or
p is 1, or if n = 0, p represents 0;
R and R^1 together denote a bond, and the other radicals are as defined above,
and its physiologically tolerated salts.

AQUEOUS DIALYSIS AND RINSING SOLUTION FOR INTRAPERITONEAL ADMINISTRATION

Volker Steudle, and Volker Bartz, both of Giessen, Fed. Rep. of Germany, assignors to Fresenius AG, Bad Homburg, Fed. Rep. of Germany

Filed Apr. 10, 1989, Ser. No. 335,921
Claims priority, application Fed. Rep. of Germany, Apr. 15, 1988, 3812525
Int. Cl.[5] A61K *9/08, 31/70, 33/06, 33/14*
U.S. Cl. 514—23 **13 Claims**

1. Aqueous dialysis and rinsing solution for intraperitoneal administration containing electrolytes, an osmotically active substance and optional additives, characterized in that galactose is the sole osmotically active substance and is present in a concentration of 1–70 g/l.

9. Aqueous dialysis and rinsing solution for intraperitoneal administration containing electrolytes, osmotically active substances and optional additives, characterized in that galactose and glucose are the sole osmotically active substances and are present in a total concentration of 1–70 g/l.

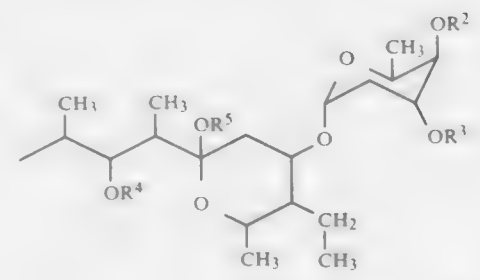
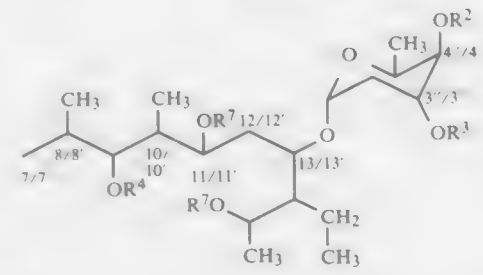
ELAIOPHYLINE DERIVATIVES, COMPOSITIONS CONTAINING THEM AND THE USE THEREOF AS ANTHELMINTIC AGENTS

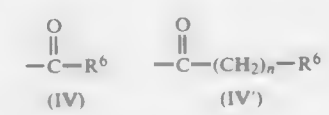


Gerhard Kretzschmar, Bad Soden am Taunus; Dieter Düwel, Hofheim am Taunus; Susanne Grabley, Königstein/Taunus; Peter Hammann, Kelkheim; Gerhard Seibert, Darmstadt; Hartmut Voelskow, Hattersheim am Main, and Carlo Giani, Frankfurt am Main, all of Fed. Rep. of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany



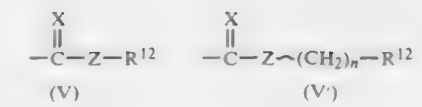
Filed Oct. 28, 1988, Ser. No. 263,753
Claims priority, application Fed. Rep. of Germany, Oct. 31, 1987, 3736960
Int. Cl.[5] A61K *31/70;* **C07H** *17/08*
U.S. Cl. 514—32 **9 Claims**

1. An elaiophyline derivative of the formula I



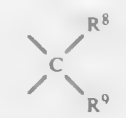
(I)

where the C-13 C double bonds in the macrodielide ring of the compound of the formula I can also be hydrogenated and in which
R^1 is a radical of the formula II or III



(II)

(III)

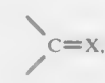


in which
R^2 and r^3 are identical or different and denote hydrogen or a radical of the formula IV or IV'

(IV) (IV')

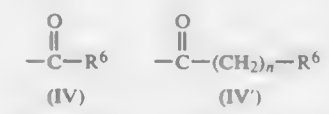
in which
n denotes 1 to 3 and
R^6 denotes C_1–C_{15}-alkyl, C_2–C_{15}-alkenyl, C_2–C_{15}-alkynyl, C_3–C_9-cycloalkyl, a radical selected from the group consisting of phenyl, naphthyl, thiophene, furan, pyridine, pyrimidine and pyrazine, where said radical can be substituted by halogen, nitro, cyano, hydroxyl, C_1–C_4-alkyl or C_1–C_4-alkoxy and where for the case in which R^3 is hydrogen, R^2 is also hydrogen,
or in which
R^2 and R^3 are identical and denote C_1–C_4-alkyl, benzyl, allyl, methoxyethoxymethyl, methoxymethyl, β-trimethylsilylethoxymethyl, trimethylsilyl, triethylsilyl, dimethylphenylsilyl, dimethylcyclohexylsilyl or dimethyl tertiary butylsilyl
or
R^2 and R^3 denote sulfonates of the formula SO_2R
in which
R^{10} denotes C_1–C_{10}-aklyl, phenyl or p-tolyl
or
R^2 and R^3 represent a radical of the formula V or V'

(V) (V')



in which
n denotes 1 to 3
X denotes oxygen or sulfur
R^{12} denotes C_1–C_{15}-alkyl, C_3–C_9-cycloalkyl, phenyl, napthyl, pyridyl, pyrimidyl or pyrazinyl, where the phenyl, napthyl, pyridyl, pyrimidyl or pyrazinyl radicals can be substituted by halogen, nitro, cyano or C_1–C_4-alkoxy and
Z denotes oxygen, —N—H or a radical —N—R^{12} or —N—$(CH_2)_n$— R^{12}, where n and R^{12} have the above-mentioned meanings
or in which
R^2 and R^3 together represent a radical of the formula VI

(VI)



in which
R^8 and R^9 are identical or different and denote hydrogen or unbranched C_1–C_{10}-alkyl or where
R^8 and R^9 represent an alkylene chain, which together with the carbon atom carrying it, forms a 5-, 6- or 7-membered ring
or in which
R^2 and R^3, for the case in which R^1 is a radical of the formula II, are identical and represent a radical of the formula VIII

(VIII)

in which
X denotes oxygen or sulfur
or
R^2 and R^3, for the case in which R^1 is a radical of the formula II, together represent a radical of the formula

wherein
X denotes oxygen or sulfur
and in which
R^4, provided that R^2 and R^3 are hydrogen, denotes hydrogen or, for the case in which R^2 and R^3 do not denote hydrogen, is hydrogen or a radical of the formula IV or IV'

(IV) (IV')

n and R^6 have the above-mentioned meanings
and
R^5 is hydrogen or a radical of the formula $-(CH_2)_n-R^6$
where
n and R^6 have the above-mentioned meanings
and in which
R^7 denotes hydrogen or—provided that R^2, R^3 and R^4 do not simultaneously denote hydrogen—forms a radical of the formula IV or IV'—as defined above—
and in which
$R^{1'}$ has the same meaning as R^1, where the two radicals R^1 and $R^{1'}$ can be substituted both by identical—except for the radicals R^4 and R^5 and for the case in which R^2 and R^3 together form a radical of the formula VI—and different substituents, with the exception that when R^1 is a radical of the formula II in which R^2 and R^3 form a radical of the formula VIII or in which R^2 and R^3 together form a radical of the formula >C=X, for $R^{1'}$ the radicals R^2 and R^3 in the radical of the formula II or III are not simultaneously hydrogen,
excluding elaiophyline itself, elaiophyline having a hydrogenated macrodiolide ring, and also compounds of the formula I, wherein the macrodiolide ring is hydrogenated or unhydrogenated and in which R^1 and $R^{1'}$ are identical or different and represent a radical of the formula II or III, wherein R^2 and R^3 denote hydrogen or acetyl and R^4 and R^5 or R^7 denote hydrogen and likewise also excluding the compounds of the formula I in which the macrodiolide ring is unhydrogenated and wherein R^1 and $R^{1'}$ simultaneously represent a radical of the formula II, wherein R^2, R^3 and R^4 denote hydrogen and wherein
R^5 denotes a radical of the formula $-(CH_2)_n-R^6$ where n and R^6 have the above-mentioned meanings.

4. A pharmaceutical composition for use in the treatment of anthelmintic disorders comprising a therapeutically effective amount of at least one of the elaiophyline derivatives of the formula I as claimed in claim 1, wherein the C—C double bonds in the macrodiolide ring of the compound of the formula (I) can also be hydrogenated and in which
R^1 is a radical of the formula II or III, in which R^2 and R^3 are identical or different and denote hydrogen, or a radical of the formula IV or IV' in which
n denotes 1 to 3 and
R^6 denotes C_1–C_{15}-alkenyl, C_2–C_{15}-alkynyl, C_3–C_9-cycloalkyl, aryl or heteroaryl radical selected from the group consisting of phenyl, naphthyl, thiophene, furan, pyridine, pyrimidine or pyrazine, wherein said aryl and heteroaryl radicals can be substituted by halogen, nitro, cyano, hydroxyl, C_1–C_4-alkyl or C_1–C_4-alkoxy and where for the case in
which R^3 is hydrogen, R^2 is also hydrogen,
or in which
R^2 and R^3 are identical and denote C_1–C_4-alkyl, benzyl, allyl, methoxyethoxymethyl, methoxymethyl, β-trimethylsilylethoxymethyl, trimethylsilyl, triethylsilyl, dimethylphenylsilyl, dimethylcyclohexylsilyl or dimethyl tertiary butylsilyl
or
R^2 and R^3 denote sulfonates of the formula SO_2R^{10}
in which
R^{10} denotes C_1–C_{10}-alkyl, phenyl or p-tolyl
or
R^2 and R^3 represent a radical of the formula V or V'
in which
n denotes 1 to 3
X denotes oxygen or sulfur
R^{12} denotes C_1–C_{15}-alkyl, C_3–C_9-cycloalkyl, phenyl, napthyl, pyridyl, pyrimidyl or pyrazinyl, where the phenyl, napthyl, pyridyl, pyrimidyl or pyrazinyl radicals can be substituted by halogen, nitro, cyano or C_1–C_4-alkoxy and
denotes oxygen, —N—H or a radical —N—R^{12} or —N—(CH_2)—
R^{12}, where n and R^{12} have the above-mentioned meanings
or in which
R^2 and R^3 together represent a radical of the formula VI
in which
R^8 and R^9 are identical or different and denote hydrogen or unbranched C_1–C_{10}-alkyl or where
R^8 and R^9 represent an alkylene chain, which together with the carbon atom carrying it, forms a 5-, 6- or 7-membered ring

or in which

R^2 and R^3, for the case in which R^1 is a radical of the formula II, are identical and represent a radical of the formula VIII

in which

X denotes oxygen or sulfur

or

R^2 and R^3, for the case in which R^1 is a radical of the formula II, together represent a radical of the formula

$$\geqq C=X,$$

wherein

X denotes oxygen or sulfur

and in which

R^4, provided that R^2 and R^3 are hydrogen, denotes hydrogen or, for the case in which R^2 and R^3 do not denote hydrogen, is hydrogen or a radical of the formula IV or IV'

n and R^6 have the above-mentioned meanings

and

R^5 is hydrogen or a radical of the formula $-(CH_2)_n-R^6$

where

n and R^6 have the above-mentioned meanings

and in which

R^7 denotes hydrogen or—provided that R^2, R^3 and R^4 do not simultaneously denote hydrogen—forms a radical of the formula IV or IV' as defined above—

and in which

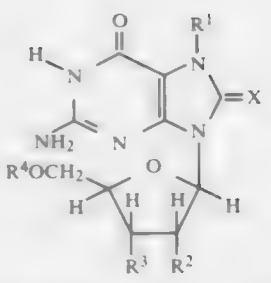
$R^{1'}$, has the same meaning as R^1, where the two radicals R^1 and $R^{1'}$ can be substituted both by identical-13 except for the radicals R^4 and R^5 and for the case in which R^2 and R^3 together form a radical of the formula VI—and different substituents, with the exception that when R^1 is a radical of the formula II in which R^2 and R^3 form a radical of the formula VIII or in which R^2 and R^3 together form a radical of the formula $>C=X$, for $R^{1'}$ the radicals R^2 and R^3 in the radical of the formula II or III are note simultaneously hydrogen,

excluding elaiophyline, together with an inert carrier.

7. A method for treating a patient suffering from an anthelmintic disease which comprises administering to said patient a therapeutic amount of a pharmaceutical composition as claimed in claim 4.

5,011,828

IMMUNOSTIMULATING GUANINE DERIVATIVES, COMPOSITIONS AND METHODS



Michael Goodman, 6455 Calle de Lagrima, Rancho Santa Fe, Calif. 92067; William Weigle, 13750 Ruette Le Parc, Apt. C, Del Mar, Calif. 92014; Stanley Bell, 732 Braeburn La., Narberth, Pa. 19072; Robert Chen, 39 Beverly Dr., Belle Mead, N.J. 08502; Roland K. Robins, 3 Titan, Irvine, Calif. 92715, and William J. Hennen, 2306 Long Dr., Bryan, Tex. 77802

Continuation-in-part of Ser. No. 798,629, Nov. 15, 1985, Pat. No. 4,746,651, which is a continuation-in-part of Ser. No. 546,679, Nov. 1, 1983, Pat. No. 4,643,992. This application May 5, 1988, Ser. No. 190,697

Int. Cl.[5] A61K *31/70;* **C08B** *31/00*

U.S. Cl. 514—45 **29 Claims**

1. A substituted guanine nucleoside derivative that corresponds to the formula

wherein X is O, S, Se or NCN;

R^1 is a straight, cyclic or branch chained hydrocarbyl radical having a length greater than an ethyl group and less than a decyl group;

R^2 and R^3 are the same or different radicals selected from the group consisting of hydrogen, hydroxyl, lower alkoxy, lower alkanoyloxy, and benzoxy or R^2 and R^3 together constitute a lower alkylidenedioxy radical;

R^4 is a radical selected from the group consisting of hydrogen, lower alkanoyl, and benzoyl; and

the pharmaceutically acceptable, non-toxic base addition salts thereof.

5,011,829

PHARMACEUTICAL COMPOSITION AND METHOD OF INHIBITING VIRUS

Martin S. Hirsch, Newton, and Victoria A. Johnson, Boston, both of Mass., assignors to G. D. Searle & Co., Skokie, Ill.

Filed Jun. 2, 1989, Ser. No. 360,439

Int. Cl.[5] A61K *31/70, 31/445*

U.S. Cl. 514—50 **21 Claims**

1. A method of treating an HIV infected patient which comprises administering to said patient a combination of 3'-azido-3'-deoxythymidine and N-butyl deoxynojirimycin, or their pharmaceutically acceptable salts, in an amount which achieves antiviral efficacy and which yields a dose level which produces a combination index less than 1.

5,011,830

ORAL COMPOSITIONS HAVING IMPROVED ANTICALCULUS PROPERTIES CONTAINING PYROPHOSPHATE AND AN ACRYLIC ACID POLYMER

Giles J. Leonard, Oxford, and Michael L. Marberry, Cincinnati, both of Ohio, assignors to The Proctor & Gamble Company, Cincinnati, Ohio

Continuation of Ser. No. 375,211, Jul. 3, 1989, abandoned, which is a continuation of Ser. No. 129,268, Dec. 7, 1987, abandoned. This application Jul. 16, 1990, Ser. No. 554,936

Int. Cl.[5] A61K *7/18, 7/16*

U.S. Cl. 424—57 **13 Claims**

1. An anticalculus oral composition comprising:

(a) a safe and effective amount of a pyrophosphate salt or a mixture of said salts;

(b) a safe and effective amount of polyacrylic acid or copolymers of acrylic acid and another monomer or mixtures thereof;

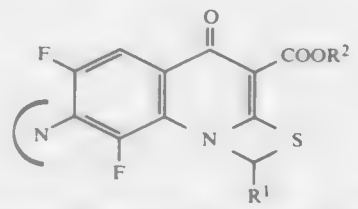
(c) a safe and effective amount of a water soluble fluoride ion source; and

(d) a pharmaceutically acceptable carrier.

5,011,831

DERIVATIVES OF QUINOLINECARBOXYLIC ACID

Masahiro Kise; Masahiko Kitano, both of Kyoto; Masakuni Ozaki, Joyo; Kenji Kazuno, Rittocho; Masahito Matsuda, Otsu; Ichiro Shirahase, Kyoto, and Yoshifumi Tomii, Katano, all of Japan, assignors to Nippon Shinyaku Co. Ltd., Japan



Filed Nov. 7, 1988, Ser. No. 267,938

Claims priority, application Japan, Nov. 7, 1987, 62-281551

Int. Cl.[5] A61K *31/395;* **C07D** *513/04*

U.S. Cl. 514—210 **21 Claims**

1. A compound of the formula (I)

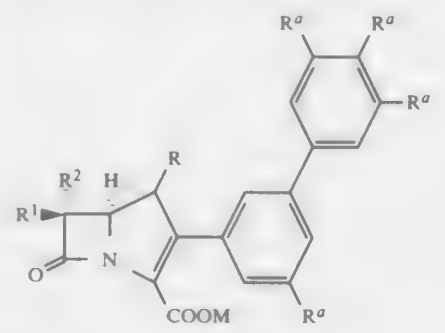
[I]

or a pharmaceutically acceptable salt thereof wherein R^1 is hydrogen, straight or branch chain lower alkyl of phenyl unsubstituted or substituted by one or more halo moieties; R^2 is hydrogen or straight or branch chain lower alkyl; and

is pyrrolidino, piperidino, piperazino, morpholino or thiomorpholino unsubstituted or substituted by straight or branch chain alkyl of 1 to 4 carbon atoms, amino or mono- or dialkylamino wherein the alkyl moiety is straight or branch chain of 1 to 4 carbon atoms.

5,011,832

2-BIPHENYL-CARBAPENEM ANTIBACTERIAL AGENTS



Frank P. Dininno, Old Bridge, and Thomas N. Salzmann, North Plainfield, both of N.J., assignors to Merck & Co., Inc., Rahway, N.J.

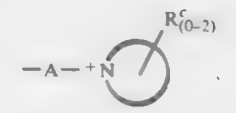
Filed Jun. 26, 1990, Ser. No. 544,281

Int. Cl.[5] C07D *487/01;* **A61K** *31/40*

U.S. Cl. 514—210 **28 Claims**

1. Carbapenem compounds of the formula:

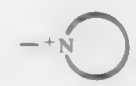
(I)



wherein:

R is H or CH_3,

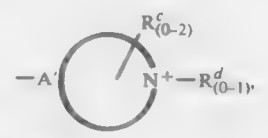
R^1 and R^2 are independently H, CH_3—, CH_3CH_2—, $(CH_3)_2CH$—, $HOCH_2$—, $CH_3CH(OH)$—, $(CH_3)_2C(OH)$—, $FCH_2CH(OH)$—, $F_2CHCH(OH)$—, $F_3CCH(OH)$—, $CH_3CH(F)$—, CH_3CF_2—, or $(CH_3)_2C(F)$—;



R^a are independently selected from the group consisting of hydrogen and the radicals set out below, provided that one but not more than one R^a is selected from type I substituents and not more than four R^a radicals are other than hydrogen:

(a)

where



is $(CH_2)_m$—Q—$(CH_2)_n$, where m is 0 to 6 and n is 1 to 6 and Q is a covalent bond, O, S, SO, SO_2, NH, $-SO_2NH-$, $-NHSO_2-$, —CONH—, —NHCO—, $-SO_2N(C_1-C_4alkyl)-$, $-N(C_1-C_4alkyl)SO_2-$, $-CON(C_1-C_4alkyl)-$, $-N(C_1-C_4alkyl)CO-$, —CH=CH—, —CO—, —OC(O)—, —C(O)O— or $N(C_1-C_4alkyl)$ and $(CH_2)_m$ is attached to the biphenyl moiety;

is a 5- or 6-membered monocyclic heterocycle or an 8-, 9- or 10-membered bicyclic heterocycle, the heterocycle containing a first nitrogen in an aromatic 5- or 6-membered first ring, with attachment of the heterocycle to A by way of said first nitrogen and said first nitrogen is quaternary by virtue of the attachment and ring bonds, with the first ring containing 0 or 1 of either O or S, with the first ring containing 0 to 3 additional nitrogen atoms, with the first ring optionally fused to a 3- or 4-membered moiety to form the optional second ring, with the the moiety containing at least one carbon atom, with the moiety containing 0 or 1 of either O or S, with the moiety containing 0 to 2 nitrogen atoms, and with the moiety being saturated or unsaturated and the second ring aromatic or non-aromatic;

is R^a as defined under II below, hydrogen, or $-NR^yR^z$ (where R^y and R^z are defined in II below), but independently selected from R^a and from each other if more than one R^c is present, and is attached to a carbon ring atom or a nitrogen heteroatom the valency of which is not satisfied by the ring bonds;

(b)

where

is a 5 or 6-membered monocyclic heterocycle or an 8-, 9- or 10-membered bicyclic heterocycle, the heterocycle containing a first nitrogen in an aromatic 5- or 6-membered first ring, with said first nitrogen quaternary by virtue of a substituent R^d in addition to the ring bonds thereto, with said first nitrogen neutral in the absence of a substituent R^d, with attachment of the heterocycle to A' by way of a carbon atom of a ring, with the first ring containing 0 or 1 of either O or S, with the first ring containing 0 to 2 additional nitrogen atoms, with the first ring optionally fused to a 3- or 4-membered moiety to form the optional second ring, with the moiety containing at least one carbon atom, with the moiety containing 0 or 1 of either O or S, with the moiety containing 0 to 2 nitrogen atoms, and with the moiety being saturated or

unsaturated and the second ring aromatic or non-aromatic;

R^c is defined above;

R^d is hydrogen, NH_2, 0 or C_1–C_4alkyl (where the alkyl group is optionally mono-substituted with R^q as defined under IIc below);

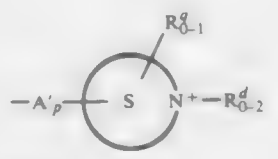
A′ is $(CH_2)_m$—Q—$(CH_2)_n$, where m is 0 to 6 and n is 0 to 6, Q is given above, and when m and n are 0 then Q is not a covalent bond;

(c) $—A_p—N^+R^yR^z(R^w)_{(0-1)}(R^z)$

where

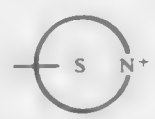
R^y and R^z are as defined under II below.

R^y and R^z may further be together a C_2–C_4 alkylidene radical to form a ring (optionally mono-substituted with R^q as defined below) interrupted by $N(O)R^e$ or $N^+(R^q)_2$ (where R^e is hydrogen, C_1–C_4alkyl or C_1–C_4alkyl mono-substituted with R^q as defined below),



R^w is hydrogen, C_{1-4} alkyl, O^-, NH_2 or absent in which case the N+ is neutral,

R^w, R^y and R^z may further together form a C_5–C_{10} tertiary alkylidene radical which with N^+ forms a bicyclic ring, where the tertiary alkylidene radical is optionally mono-substituted with R^q as defined below and where the tertiary carbon of the tertiary alkylidene radical is optionally replaced with nitrogen, N^+R^e (where R^e is defined above), or $N^+—O^-$,



p is 0 or 1, and

A is as defined above;

(d)

where

is a 5- or 6-membered monocyclic heterocycle or an 8-, 9- or 10-membered bicyclic heterocycle, the heterocycle containing a first nitrogen in a first ring, with the first ring saturated or unsaturated and non-aromatic, with the first nitrogen quaternary by virtue of one or two substituents R^d in addition to the ring bonds thereto, with the first nitrogen alternatively neutral by virtue of zero or one substituents R^d in addition to the ring bonds thereto, with attachment of the heterocycle to A′ by way of a carbon atom or non-quaternary nitrogen atom of a ring, with the first ring containing in addition to carbon and the first nitrogen 0 to 1 of a member selected from the group consisting of the non-quaternary nitrogen of attachment, O, S, S(O), $S(O)_2$ and NR^e where R^e is defined above, with the first ring optionally fused to a 2-, 3- or 4-membered moiety to form the optional second ring, with the moiety optionally containing in addition to carbon the non-quaternary nitrogen of attachment, and with the moiety saturated or unsaturated and the second ring non-aromatic;

R^d is defined above and where more than one R^d is present on a nitrogen, at least one R^d is hydrogen or C_1-C_4alkyl;

A′ is defined above; and

p is defined above;

R^q is defined below;

II.

(a) a trifluoromethyl group: $—CF_3$;

(b) a halogen atom: —Br, —Cl, —F, or —I;

(c) C_1–C_4 alkoxy radical: $—OC_{1-4}$ alkyl, wherein the alkyl is optionally mono-substituted by R^q, where

R^q is a member selected from the group consisting of —OH, $—OCH_3$, —CN, $C(O)NH_2$, $OC(O)NH_2$, CHO, $—OC(O)N(CH_3)_2$, $—SO_2NH_2$, $—SO_2N(CH_3)_2$, $—SOCH_3$, $—SO_2CH_3$, —F, $—CF_3$, $—COOM^a$ (where M^a is hydrogen, alkali metal, methyl or phenyl), tetrazolyl (where the point of attachment is the carbon atom of the tetrazole ring and one of the nitrogen atoms is mono-substituted by Ma as defined above) and $—SO_3M^b$ (where M^b is hydrogen or an alkali metal);

(d) a hydroxy group: —OH;

(e) a carbonyloxy radical: $—O(C═O)R^s$, where

R^s is C_{1-4} alkyl or phenyl, each of which is optionally mono-substituted by R^q as defined above;

(f) a carbamoyloxy radical: $—O(C═O)N(R^y)R^z$ where

R^y and R^z are independently H, C_{1-4} alkyl (optionally mono-substituted by R^q as defined above), together a 3- to 5-membered alkylidene radical to form a ring (optionally substituted with R^q as defined above) or together a 2- to 4-membered alkylidene radical, interrupted by —O—, —S—, —S(O)— or $—S(O)_2—$, to form a ring (where the ring is optionally mono-substituted with Rq as defined above);

(g) a sulfur radical: $—S(O)_n—R^s$ where n=0–2, and R^s is defined above.

(h) a sulfamoyl group: $—SO_2N(R^y)R^z$ where R^y and R^z are as defined above ,

(i) azido: N_3

(j) a formamido group: $—N(R^t)(C═O)H$,

where

R^t is is H or C_{1-4} alkyl, and the alkyl thereof is optionally mono-substituted by R^q as defined above;

(k) a (C_1–C_4 alkyl)carbonylamino radical: $—N(R^t)(C═O)C_{1-4}$ alkyl, where R^t is as defined above, and the alkyl group is also optionally mono-substituted by R^q as defined above;

(l) a (C_1–C_4 alkoxy) carbonylamino radical: $—N(R^t)(C═O)OC_{1-4}$ alkyl, where R^t is as defined above, and the alkyl group is also optionally mono-substituted by R^q as defined above;

(m) a ureido group: $—N(R^t)(C═O)N(R^y)R^z$ where R^t, R^y and R^z are as defined above;

(n) a sulfonamido group: $—N(R^t)SO_2R^s$, where R^s and R^t are as defined above;

(o) a cyano group: —CN;

(p) a formyl or acetalized formyl radical: $—(C═O)H$ or $—CH(OCH_3)_2$;

(q) (C_1–C_4 alkyl)carbonyl radical wherein the carbonyl is acetalized: $—C(OCH_3)_2C_{1-4}$ alkyl, where the alkyl is optionally mono-substituted by R^q as defined above;

(r) carbonyl radical: $—(C═O)R^s$, where R^s is as defined above;

(s) a hydroximinomethyl radical in which the oxygen or carbon atom is optionally substituted by a C_1–C_4 alkyl group: $—(C═NOR^z)R^y$ where R^y and R^z are as defined above, except they may not be joined together to form a ring;

(t) a (C_1–C_4 alkoxy)carbonyl radical: $—(C═O)OC_{1-4}$ alkyl, where the alkyl is optionally mono-substituted by R^q as defined above;

(u) a carbamoyl radical: $—(C═O)N(R^y)R^z$ where R^y and R^z are as defined above;

(v) an N-hydroxycarbamoyl or N(C_1–C_4 alkoxy)carbamoyl radical in which the nitrogen atom may be additionally substituted by a C_1–C_4 alkyl group: $—(C═O)—N(OR^y)R^z$ where R^y and R^z are as defined above, except they may not be joined together to form a ring;

(w) a thiocarbamoyl group: $—(C═S)N(R^y)(R^z)$ where R^y and R^z are as defined above;

(x) carboxyl: $—COOM^b$, where M^b is as defined above;

(y) thiocyanate: —SCN;

(z) trifluoromethylthio: $—SCF_3$;

(aa) tetrazolyl, where the point of attachment is the carbon atom of the tetrazole ring and one of the nitrogen atoms is mono-substituted by hydrogen, an alkali metal or a C_1–C_4 alkyl optionally substituted by R^q as defined above;

(ab) an anionic function selected from the group consisting of: phosphono $[P═O(OM^b)_2]$; alkylphosphono $\{P═O(OM^b)—[O(C_1$-C_4 alkyl)]$\}$; alkylphosphinyl $[P═O(OM^b)—(C_1$-C_4alkyl)]; phosphoramido $[P═O(OM^b)N(R^y)R^z$ and $P═O(OM^b)NHR^x]$; sulfino (SO_2M^b); sulfo (SO_3M^b); acylsulfonamides selected from the structures $CONM^bSO_2R^x$, $CONM^bSO_2N(R^y)R^z$, $SO_2NM^bCON(R^y)R^z$; and SO_2NM^bCN, where

R^x is phenyl or heteroaryl, where heteroaryl is a monocyclic aromatic hydrocarbon group having 5 or 6 ring atoms, in which a carbon atom is the point of attachment, in which one of the carbon atoms has been replaced by a nitrogen atom, in which one additional carbon atom is optionally replaced by a heteroatom selected from O or S, and in which from 1 to 2 additional carbon atoms are optionally replaced by a nitrogen heteroatom, and where the phenyl and heteroaryl are optionally mono-substituted by R^q, as defined above; M^b is as defined above; and R^y and R^z are as defined above;

(ac) C_5–C_7 cycloalkyl group in which one of the carbon atoms in the ring is replaced by a heteroatom selected from O, S, NH or N(C_1–C_4 alkyl) and in which one additional carbon atom may be replaced by NH or N(C_1–C_4 alkyl), and in which at least one carbon atom adJacent to each nitrogen heteroatom has both of its attached hydrogen atoms replaced by one oxygen thus forming a carbonyl moiety and there are one or two carbonyl moieties present in the ring;

(ad) C_2–C_4 alkenyl radical, optionally mono-substituted by one of the substituents (a) to (ac) above and phenyl which is optionally substituted by R^q as defined above;

(ae) C_2–C_4 alkynyl radical, optionally mono-substituted by one of the substituents (a) to (ac) above;

(af) C_1–C_4 alkyl radical;

(ag) C_1–C_4 alkyl mono-substituted by one of the substituents (a) - (ac) above;

(ah) a 2-oxazolidinonyl moiety in which the point of attachment is the nitrogen atom of the oxazolidinone ring, the ring oxygen atom is optionally replaced by a heteroatom selected from —S— and $>NR^t$ (where R^t is as defined above) and one of the saturated carbon atoms of the oxazolidinone ring is optionally mono-substituted by one of the substituents (a) to (ag) above;

M is selected from:

(i) hydrogen;

(ii) a pharmaceutically acceptable esterifying group or removable carboxyl protecting group;

(iii) an alkali metal or other pharmaceutically acceptable cation; or

(iv) a negative charge which is balanced by a positively charged group.

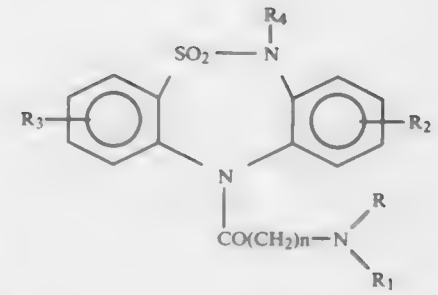
NOVEL DERIVATIVES OF 6,11-DIHYDRO-DIBENZO(C,F)(1,2,5)-THIADIAZEPINE 5,5-DIOXIDE, SALTS THEREOF AND APPROPRIATE PROCESSES FOR THE PREPARATION THEREOF

Franco Borsini; Alberto Meli; Giovanna Volterra, all of Firenze; Danilo Giannotti, Lucca, and Vittorio Pestellini, Firenze, all of Italy, assignors to A. Menarini Industrie Farmaceutiche Riunite, Florence, Italy



Filed Aug. 11, 1989, Ser. No. 393,517

Claims priority, application Italy, Aug. 12, 1988, 9466 A/88

Int. Cl.[5] **C07D** *285/36;* **A61K** *31/55*

U.S. Cl. 511—211 **9 Claims**

1. A novel derivative of 11-carbonyl-6,11-dihydrodibenzo[c,f][1,2,5]thiadiazepine 5,5-dioxide of the general formula

wherein

R and R_1, which can be different, represent a hydrogen atom or a (C_1–C_5)alkyl or (C_1–C_4)hydroxyalkyl group, or R and R_1 together can form a 5-membered and/or 6-membered heterocyclic ring which may contain a further heteroatom,

R_2 and R_3, which can be different, represent a hydrogen atom, a (C_1–C_3)alkoxy, (C_1–C_3)alkyl, nitro, amino or (C_1–C_3)alkylamino, halogen, halogenoalkyl or hydroxyl group,

R_4 represents a hydrogen atom or a (C_1–C_4)alkyl, alkylaryl or (C_1–C_6)alkylamino group, and n assumes values of 0, 1 or 2.

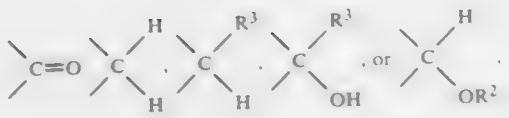
U.S. Cl. 514—212 **26 Claims**

1. A method of treating or preventing neuronal loss, comprising administering to an animal in need of such treatment a compound of the formula:



wherein:

R is hydrogen, C_2–C_6 acyl, C_1–C_6 alkyl, aryl, C_1–C_6 alkoxycarbonyl, C_7–C_{10} aralkyl, C_2–C_6 alkenyl, C_3–C_{15} dialkylaminoalkyl, C_1–C_6 hydroxyalkyl, C_2–C_6 alkynyl, C_3–C_{15} trialkylsilyl, C_4–C_{10} alkylcycloalkyl, or C_3–C_6 cycloalkyl;

R^1 is hydrogen, C_1–C_6 alkyl, C_2C_6 alkenyl, C_{7-C10} aralkyl, C_1–C_6 alkoxy or C_3–C_{15} dialkylaminoalkyl;

X and Y are independently selected from the group consisting of chloro, fluoro, bromo, iodo, C_1–C_6 alkoxy, C_2–C_6-dialkoxymethyl, C_1–C_6 alkyl, cyano, C_3–C_{15} dialkylaminoalkyl, carboxy, carboxamido, C_1–C_6 haloalkyl, C_1–C_6 haloalkylthio, allyl, aralkyl, C_3–C_6 cycloalkyl, aroyl, aralkoxy, C_2–C_6 acyl, aryl, substituted aryl, C_1–C_6 alkylthio, C_1–C_6 alkylsulfonyl, C_1–C_6 haloalkylsulfonyl, C_1–C_6 alkylsulfinyl, C_1–C_6 haloalkylsulfinyl, arylthio, C_1–C_6 haloalkoxy, amino, C_1–C_6 alkylamino, C_2–C_{15} dialkylamino, hydroxy, carbamoyl, C_1–C_6 N-alkIcarbamoyl, C_2–C_{15} N,N-dialkylcarbamoyl, nitro and C_2–C_{15} dialkylsulfamoyl;

Z represents a group selected from

wherein R^2 is hydrogen, C_1–C_6 alkyl, C_2–C_6 alkenyl, aralkyl, C_4–C_{15} dialkylaminoalkyl, C_2–C_6 acyl, aroyl, or aralkanoyl, and R^3 is C_1–C_6 alkyl, C_2–C_6 alkenyl, phenyl, aralkyl or C_3–C_{15} dialkylaminoalkyl; and

n is an integer selected from 0 (X or Y is hydrogen, respectively), 1, 2, 3, or 4;

or a pharmaceutically acceptable salt thereof;

wherein said compound exhibits a high binding activity with respect to the PCP receptor in mammalian nerve cells, and wherein said compound is administered in an amount effective to treat or prevent said neuronal loss.

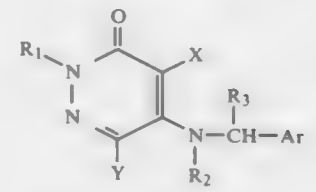
1. A 2-substituted 3-(2-ethoxyethyl)imidazo [4,5-b] pyridine compound of the formula

wherein n is an integer of from 1 to 5 inclusive, and R_1 and R_2 each represents a saturated or unsaturated alkyl radical containing from 1 to 4 carbon atoms or they may form, together with the adjacent nitrogen atom, a heterocyclic ring selected from the group consisting of pyrrolidine, morpholine and piperidine, wherein said heterocyclic ring may be substituted by a C_1–C_3 alkyl group, or a non-toxic pharmaceutically acceptable acid addition salt thereof.

5,011,839

3(2H)PYRIDAZINONES FOR ANTAGONISTIC AGENT AGAINST SRS-A

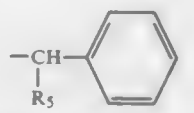
Keizo Tanikawa; Ryozo Saloda, both of Funabashi; Sakuya Tanaka, Minamisaitama, and Kenichi Shikada, Saitama, all of Japan, assignors to Nissan Chemical Industries Ltd., Tokyo, Japan



Filed Dec. 4, 1989, Ser. No. 444,953

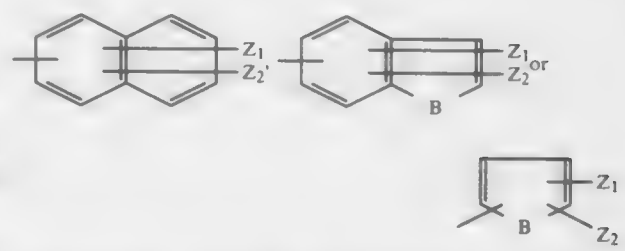
Claims priority, application Japan, Dec. 20, 1988, 63-321476; Oct. 20, 1989, 1-274661

Int. Cl.[5] **A61K** *31/50;* **C07D** *401/00*



U.S. Cl. 514—247 **8 Claims**

1. A 3(2H)pyridazinone of the formula:



(I)

wherein R_1 is hydrogen, 2-propenyl, or straight chained or branched C_1–C_4 alkyl; each of R_2 and R_3 which may be the same or different, is hydrogen, or straight chained or branched C_1–C_3 alkyl; X is chlorine, or bromine; Y is hydrogen, halogen, nitro, amino, or —AR_4 wherein A is oxygen, or sulfur, and R_4 is hydrogen, straight chained, branched or cyclic C_1–C_8 alkyl, or

wherein R_5 is hydrogen, or straight chained or branched C_1–C_4 alkyl; and Ar is

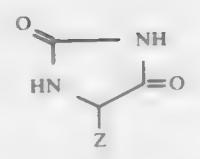
wherein each of Z_1 and Z_2 which may be the same or different, is hydrogen, halogen, straight or branched C_1–C_4 alkyl, or —OR_6 wherein R_6 is straight or branched C_1–C_4 alkyl, and B is oxygen, sulfur, or —N=C— (to form a quinoline or pyridine ring); or a pharmaceutically acceptable salt thereof.

8. An antagonistic agent against SRS-A comprising an effective amount of a 3(2H)pyridazinone of the formula I as defined in claim 1 or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier.

5,011,840

IMIDAZOLIDINEDIONE DERIVATIVES IN DIABETES TREATMENT

Reinhard Sarges, Mystic, Conn., assignor to Pfizer Inc., New York, N.Y.



PCT No. PCT/US86/02514, § 371 Date May 5, 1989, § 102(e) Date May 5, 1989

PCT Filed Nov. 24, 1986, Ser. No. 435,529

U.S. Cl. 514—253 **20 Claims**

1. A method of treating allergic diseases in warm-blooded animals suffering from the same, which method comprises the systemic administration to warm blooded animals of an effective anti-allergic amount of compound of the formula:

(I)

a pharmaceutically acceptable acid addition salt or a stereochemically isomeric form thereof, wherein:

$-A^1=A^2-A^3=A^4-$ represents a bivalent radical of the formula:

—N=CH—CH=CH— (a-1);

—CH=N—CH=CH— (a-2);

—CH=CH—N=CH— (a-3) or;

—CH=CH—CH=N— (a-4).

wherein one or two hydrogen atoms in said radicals (a-1)–(a-4) may, each independently from each other, be replaced by halo, C_{1-6}alkyl, C_{1-6}alkyloxy, trifluoromethyl, or hydroxy;

R represents hydrogen or C_{1-6}alkyl;

R^1 represents hydrogen, C_{1-10}alkyl, C_{3-6}cycloalkyl, Ar^1, C_{1-6}alkyl substituted with one or two Ar^1 radicals, or a radical of the formula —Alk—G—R^2,

wherein:

Ar^1 represents phenyl; phenyl substituted with 1, 2, or 3 substituents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl)amino, carboxyl, C_{1-6}alkyloxycarbonyl, and C_{1-6}alkylcarbonyl; thienyl; halothienyl; furanyl; C_{1-6}alkyl substituted furanyl; pyridinyl; pyrimidinyl; pyrazinyl; thiazolyl; imidazolyl; or imidazolyl substituted with C_{1-6}alkyl;

Alk represents C_{1-6}alkanediyl;

G represents O, S, or NR^3, wherein R^3 represents hydrogen, C_{1-6}alkylcarbonyl, C_{1-6}alkyloxycarbonyl, or Ar^2—C_{1-6}alkyl;

Ar^2 represents phenyl or phenyl substituted with 1, 2, or 3 substitutents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl)amino, carboxyl, C_{1-6}alkyloxycarbonyl and C_{1-6}alkylcarbonyl; and

R^2 represents hydrogen; C_{2-6}alkenyl; C_{2-6}alkenyl substituted with Ar^2; C_{3-6}alkynyl; Ar^1; C_{1-6}alkyl; or C_{1-6}alkyl substituted with Ar^1, hydroxy, C_{1-6}alkyloxy, carboxyl, C_{1-6}alkyloxycarbonyl, Ar^2-oxycarbonyl, or Ar^2—C_{1-6}alkyloxycarbonyl, wherein $Ar^1$and Ar^2 are as defined above;

m represents a number having a value of from 1 to 4;

n represents a number having value of from 1 to 2; and

L represents a radical of the formula:

—Alk—R^4 (b-1);

—Alk—Y—R^5 (b-2); or

—*Alk*—Z^1—(C=*X*)—Z^2—R^6 (b-3)

wherein:

Alk is as defined above;

Y represents O, S, NR^8, wherein R^8 represents hydrogen, C_{1-6}alkyl, C_{1-6}alkylcarbonyl, or Ar^1-carbonyl, wherein Ar^1 is as defined above;

$Z^1$and Z^2 each independently represent O, S, NR^9, or a direct bond, wherein R^9 represents hydrogen or C_{1-6}alkyl;

X represents O, S, or NR^{10}, wherein R^{10} represents hydrogen, C_{1-6}alkyl, or cyano; and

R^4, R^5, and R^6 represent Het,

wherein Het represents:

(i) an optionally substituted five- or six-membered heterocyclic ring containinged 1, 2, 3, or 4 heteroatoms selected from the group consisting of oxygen, sulfur, and nitrogen, provided that no more than two oxygens or sulfurs are present; or

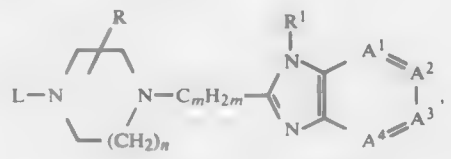
(ii) an optionally substituted five- or six-membered heterocyclic ring containing 1 2 heteroatoms selected from the group consisting of oxygen, sulfur, and nitrogen, being fused with an optionally substituted five- or six-membered ring through two ring carbon atoms or one ring carbon and one ring nitrogen atom, containing ion the remainder of the fused ring only carbon atoms; or

(iii) an optionally substituted five- or six-membered heterocyclic ring containing 1 or 2 heteroatoms selected from the group consisting of oxygen, sulfur, and nitrogen, being fused with an optionally substituted five- or six membered heterocyclic ring through two ring carbon atoms or one ring carbon and one ring nitrogen atom, containing in the remainder of the fused ring 1 or 2 heteroatoms selected from the group consisting of oxygen, sulfur and nitrogen;

wherein:

Het may optionally be substituted with up to 4 substituents when Het is a monocyclic ring system, and wherein Het may optionally be substituted with up to 5 substituents when Het is a bicyclic ring system, said substituents of Het being selected from the group consisting of a bivalent radical =X; halo; isocyanato; isothiocyanato; nitro; cyano; trifluoromethyl; a radical of formula —A; a radical of formula —Y—A; or a radical of formula $-A^1-C(=X)-Z^2-A$;

wherein:



=X is as defined above;

A represents hydrogen, Ar^2, or C_{1-6}alkyl being optionally substituted with Ar^2, C_{1-6}alkyloxy, Ar^2—O, hydroxy, or C_{1-6}alkyloxycarbonyl; and

Y, Z^1, and Z^2 each have the meaning as defined above;

provided that (i) when in the radical —Y—A, A is hydrogen, then Y is other than a direct bond, or (ii) when in the radical $-Z^1-C(=X)-Z^2-A$, A is hydrogen and Z^1 is NR^9, O, or S, then Z^2 is other than O or S.

8. A compound of the formula:

(I)

a pharmaceutically acceptable acid addition salt or a stereochemically isomeric form thereof, wherein:

$-A^1=A^2-A^3=A^4-$ represents a bivalent radial of the formula:

—N=CH—CH=CH— (a-1);

—CH=N—CH=CH— (a-2);

—CH=CH—N=CH— (a-3); or

—CH=CH—CH=N— (a-4),

wherein one or two hydrogen atoms in said radicals (a-1)–(a-4) may, each independently from each other, be replaced by halo, C_{1-6}alkyl, C_{1-6}alkyloxy, trifluoromethyl, or hydroxy;

R represents hydrogen or C_{1-6}alkyl;

R^1represents hydrogen, C_{1-10}alkyl, C_{3-6}cycloalkyl, Ar^1, C_{1-6}alkyl substituted with one or two Ar^1 radicals, or a radical of the formula —Alk—G—R^2,

wherein:

Ar^1 represents phenyl; phenyl substituted with 1, 2, or 3 substitutents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl)amino, carboxyl, C_{1-6}alkyloxycarbonyl, and C_{1-6}alkylcarbonyl; thienyl; halothienyl; furanyl; C_{1-6}alkyl substituted furanyl; pyridinyl; pyrimidinyl; pyrazinyl; thiazolyl; imidazolyl; or imidazolyl substituted with C_{1-6}alkyl;

Alk represents C_{1-6}alkanediyl;

G represents O, S, or NR^3, wherein R^3 represents hydrogen, C_{1-6}alkylcarbonyl, C_{1-6}alkyloxycarbonyl, or Ar^2—C_{1-6}alkyl;

Ar^2 represents phenyl or phenyl substituted with 1, 2, or 3 substitutents each independently selected from halo, hydroxy, nitro, cyano, trifluoromethyl, C_{1-6}alkyl, C_{1-6}alkyloxy, C_{1-6}alkylthio, mercapto, amino, mono- and di(C_{1-6}alkyl)amino, carboxyl, C_{1-6}alkyloxycarbonyl and C_{1-6}alkylcarbonyl; and

R^2 represents hydrogen; C_{2-6}alkynyl; C_{2-6}alkenyl substituted with Ar^2; C_{3-6}alkynyl; Ar^1; C_{1-6}alkyl; or C_{1-6}alkyl substituted with Ar^1, hydroxy, C_{1-6}alkyloxy, carboxyl, C_{1-6}alkyloxycarbonyl, Ar^2-oxycarbonyl, or Ar^2—C_{1-6}alkyloxycarbonyl, wherein Ar^1 and Ar^2 are as defined above;

m represents a number having a value of from 1 to 4;

n represents a number having a value of from 1 to 2; and

L represents a radical of the formula:

—Alk—R^4 (b-1);

—Alk—Y—R^5 (b-2); or

—Alk—Z^1—(C=X)—Z^2—R^6 (b-3),

wherein:

Alk is as defined above;

Y represents O, S, NR^8, wherein R^8 represents hydrogen, C_{1-6}alkyl, C_{1-6}alkylcarbonyl, or Ar^1-carbonyl, wherein Ar^1 is as defined above;

Z^1 and Z^2 each independently represent O, S, NR^9, or a direct bond, wherein R^9 represents hydrogen or C_{1-6}alkyl;

X represents O, S, or NR^{10}, wherein R^{10} represents hydrogen, C_{1-6}alkyl, or cyano; and

R^4, R^5, and R^6 represent Het,

wherein Het represents:

(i) an optionally substituted five- or six-membered heterocyclic ring containinged 1, 2, 3, or 4 heteroatoms selected from the group consisting of oxygen, sulfur, and nitrogen, provided that no more than two oxygens or sulfurs are present; or

(ii) an optionally substituted five- or six-membered heterocyclic ring containing 1 or 2 heteroatoms selected from the group consisting of oxygen, sulfur, and nitrogen, being fused with an optionally substituted five- or six-membered ring through two ring carbon atoms or one ring carbon and one ring nitrogen atom, containing in the remainder of the fused ring only carbon atoms; or

(iii) an optionally substituted five- or six-membered heterocyclic ring containing 1 or 2 heteroatoms selected

from the group consisting of oxygen, sulfur, and nitrogen, being fused with an optionally substituted five- or six-membered heterocyclic ring through two ring carbon atoms or one ring carbon and one ring nitrogen atom, containing in the remainder of the fused ring 1 or 2 heteroatoms selected from the group consisting of oxygen, sulfur and nitrogen;

wherein:

Het may optionally be substituted with up to 4 substituents when Het is a monocyclic ring system, and wherein Het may optionally be substituted with up to 5 substituents when Het is a bicyclic ring system, said substituents of Het being selected from the group consisting of a bivalent radical =X; halo; isocyanato; isothiocyanato; nitro; cyano; trifluoromethyl; a radical of formula —A; a radical of formula —Y—A; or a radical of formula $—Z^1—C(=X)—Z^2—A$;

wherein:

=X is as defined above;

A represents hydrogen, Ar^2, or C_{1-6}alkyl being optionally substituted with Ar^2, C_{1-6}alkyloxy, $Ar^2—O$, hydroxy, or C_{1-6}alkyloxycarbonyl; and

Y, Z^1, and Z^2 each have the meaning as defined above;

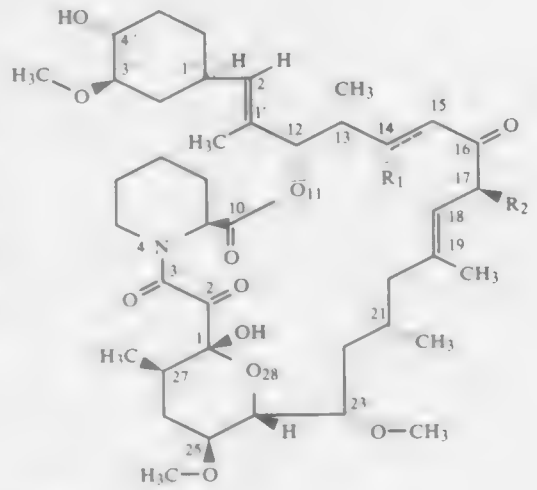
provided that (i) when in the radical —Y—A, A is hydrogen, then Y is other than a direct bond, or (ii) when in the radical $—Z^1—C(=X)—Z^2—A$, A is hydrogen and Z^1 is NR^9, O, or S, then Z^2 is other than O or S.

5,011,844

SUBSTITUTED 4-AZATRICYCLO(22.3.1.0^{4,9})OCTACOS-18-ENE DERIVATIVES, THEIR PREPARATION AND PHARMACEUTICAL COMPOSITIONS CONTAINING THEM

Theodor Fehr, Dornach, Switzerland, assignor to Sandoz Ltd., Basel, Switzerland

Filed Aug. 25, 1989, Ser. No. 399,673



Claims priority, application United Kingdom, Aug. 26, 1988, 8820348; May 31, 1989, 8912432

Int. Cl.^{5} A61K *31/395;* **C07D** *498/16;* **C12P** *17/18*

U.S. Cl. 514—291 **9 Claims**

1. A compound of formula I

I

wherein

either

R_1 is hydroxy,

R_2 is allyl or n-propyl and

there is a single bond between the carbon atoms numbered 14 and 15

or

R_1 is missing,

R_2 is allyl and

there is a double bond between the carbon atoms numbered 14 and 15.

6. A method for the prevention or treatment of conditions requiring immunosuppression or of inflammatory conditions, such as

(a) the prevention and treatment of

resistance in situations of organ or tissue transplantation e.g. of heart, kidney, liver, bone marrow and skin,

graft-versus-host disease, such as following bone marrow grafts,

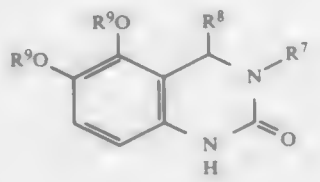
autoimmune diseases such as rheumatoid arthritis, systemic Lupus erythematosus, Hashimoto's thyroidis, multiple sclerosis, Myasthenia gravis, diabetes type I and uveitis,

cutaneous manifestations of immunologically-mediated illnesses, such as Alopecia areata, and

(b) the treatment of inflammatory and hyperproliferative skin diseases, such as psoriasis, atopical dermatitis, contact dermatitis and further eczematous dermatitises, seborrhoeic dermatitis, Lichen planus, Pemphigus, bullous Pemphigoid, Epidermolysis bullosa, urticaria, angioedemas, vasculitides, erythemas, cutaneous eosinophilias, Lupus erythematosus and acne, comprising administering a therapeutically effective amount of a compound according to claim 1 together with a pharmaceutically acceptable carrier or diluent to a subject in need of such treatment.

5,011,843

TREATMENT OF GLAUCOMA USING PHOSPHODIESTERASE INHIBITORS



John W. Sbell, Hillsborough, Calif., assignor to Iolab Corporation, Claremont, Calif.

Division of Ser. No. 200,809, May 31, 1988, Pat. No. 4,975,428. This application Jun. 1, 1990, Ser. No. 531,729

Int. Cl.^{5} A61K *31/505*

U.S. Cl. 514—259 **2 Claims**

1. A method of lowering intraocular pressure in a mammal which comprises administering to the eye of said mammal a pharmaceutical composition comprising a therapeutically effective amount of a phosphodiesterase inhibitor of the following formula:

wherein

R^7 is hydrogen provided that R^7 is hydrogen only when the dotted line linkage represents a saturated bond;

R^8 is hydrogen, lower alkyl, cycloalkyl having 4–8 carbon atoms, cycloalkylalkyl wherein the cycloalkyl group has 4–8 carbon atoms and the alkyl group has 1–3 carbon atoms, haloalkyl having 1–3 halogen atoms and 1–4 carbon atoms, norbornyl and norbornylmethyl;

R^9 is lower alkyl,

and the dotted line linkage represents a saturated bond or a double bond.

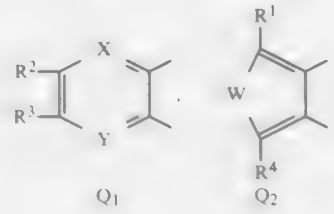
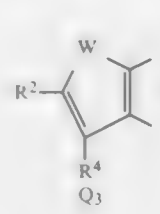
U.S. Cl. 514—291 **18 Claims**



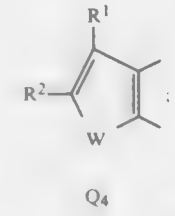
1. A compound of the formula

I



wherein

R^5 represents C_1 to C_6-alkyl or the group $—(CH_2)_n—Z—(CH_2)_m—Ar$ wherein Z represents O, S or $—CH_2—$ and Ar is phenyl, optionally substituted by one or two groups selected from the group consisting of hydrogen, C_1 to C_6-alkyl, C_1 to $C_{6\text{-}alkoxy}$, *Cl, F, Br, I,* NO_2, CF_3, CN, $R^6—S(O)_x$, $R^7—CO—$, $(R^8R^9)NCO—$ and phenyl, wherein x is 0, 1 or 2, and each R^6, R^7, R^8 and R^9 is independently C_1 to C_6 alkyl or two adjacent groups on Ar may form together an additional fused benzenoid ring; n and m independently represent integers of from 1 to 8; and ring Q represents one of the rings Q_1, Q_2, Q_3 or Q_4 below:



Q_1

Q_2

or

Q_3 Q_4

X is N or C—R^1;

Y is N or C—R^4;

W represents O or S;

each of R^1, R^2, R^3 and R^4 is independently selected from hydrogen, C_1 to C_6-alkyl, C_1 to C_6-alkoxy Cl, F, Br, I NO_2, CF_3, CN, $R^{10}—S(O)_y—$, $R^{11}—CO—$, $(R^{12}R^{13})N—CO—$ or phenyl, wherein y is 0, 1 or 2 and each of R^{10}, R^{11}, R^{12} and R^{13} is independently C_1 to C_6-alkyl, or, in the ring Q_1, two adjacent groups, i.e. R^1R^2, R^2R^3 or R^3R^4, may form together an additional fused benzenoid ring; or a pharmaceutically acceptable acid addition salt thereof.

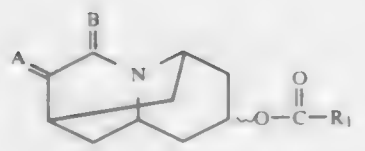
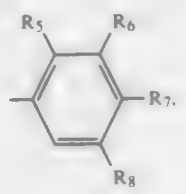
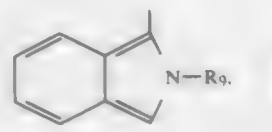
U.S. Cl. 514—294 **15 Claims**

1. A pharmaceutical composition suitable for use in the treatment of anxiety, psychosis, glaucoma, and for stimulating gastric motility comprising a pharmaceutically acceptable carrier in admixture with a compound of the formula

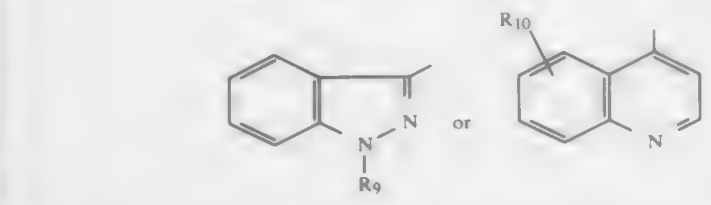


wherein A is H_2, O, (H)(OH), $(OH)_2$ or N—OH; B is H_2, (H)(CH_3), (H)($CH_2NR_3R_4$) or CH_2 wherein R_3 and R_4 are C_{2-4} alkyl or are combined to give tetramethylene, pentamethylene or $—CH_2CH_2—O—CH_2CH_2$; R_1 is



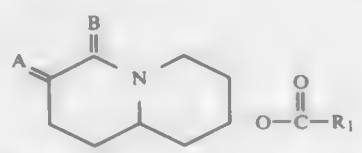


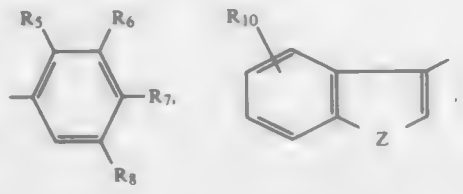
wherein Z is NR_9, O or S; R_5, R_6 and R_8 are each hydrogen, halogen, C_{1-3} alkyl or C_{1-3} alkoxy; R_7 is hydrogen, amino, (C_{1-4} alkyl)amino, (C_{1-4} alkyl)$_2$amino, alkoxy, or nitro; R_9 is hydrogen, C_{1-4} alkyl or phenyl (C_{1-2} alkyl); R_{10} is hydrogen, halogen, C_{1-4} alkyl, C_{1-4} alkoxy, hydroxyl, cyano or $—CONH_2$; R_{11} is hydrogen, halogen, C_{1-4} alkyl or phenyl; the wavy line indicates that the configuration of the oxygen substituent on the ring can be endo or exo; and the pharmaceutically acceptable acid addition and quarternary ammonium salts of the aforesaid compounds.



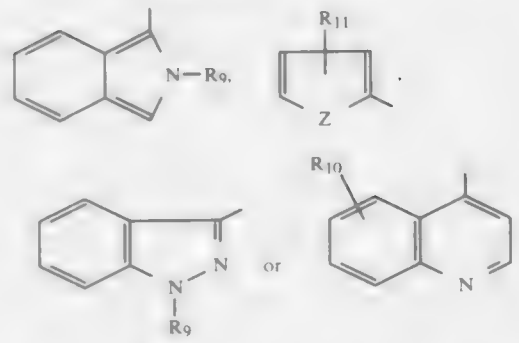
3. A method for the treatment of anxiety comprising administering to a patient in need thereof of an effective amount of a compound of the formula

wherein A is H_2, O, (H)(OH), $(OH)_2$ or N—OH; B is H_2, $(H)(CH_3)$, $(H)(CH_2NR_3R_4)$ or CH_2 wherein R_3 and R_4 are C_{2-4} alkyl or are combined to give tetramethylene, pentamethylene or $—CH_2CH_2—O—CH_2CH_2—$; R_1 is



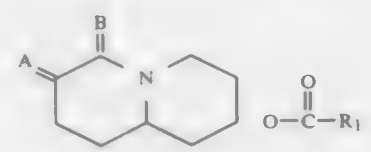


wherein Z is NR_9, O or S; R_5, R_6 and R_8 are each hydrogen, halogen, C_{1-3} alkyl or C_{1-3} alkoxy; R_7 is hydrogen, amino, $(C_{1-4}$ alkyl)amino, $(C_{1-4}$ alkyl)$_2$amino, alkoxy or nitro; R_9 is hydrogen, C_{1-4} alkyl or phenyl (C_{1-2} alkyl); R_{10} is hydrogen, halogen, C_{1-4} alkyl, C_{1-4} alkoxy, hydroxy, cyano or $—CONH_2$; R_{11} is hydrogen, halogen, C_{1-4} alkyl or phenyl; the wavy line indicates that the configuration of the oxygen substituent on the ring can be endo or exo; and the pharmaceutically acceptable acid addition and quarternary ammonium salts of the aforesaid compounds.

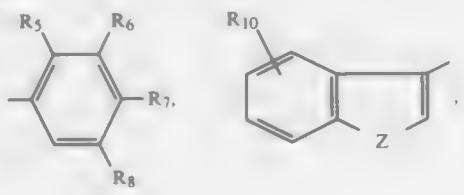


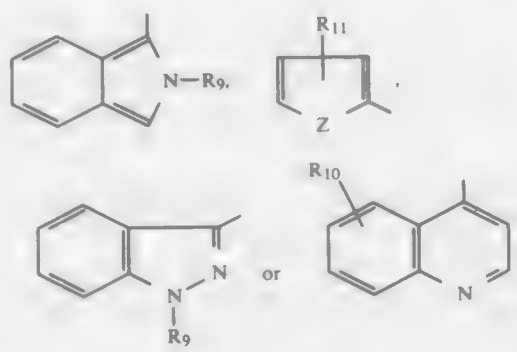
5. A method for the treatment of psychosis comprising administering to a patient in need thereof an effective amount of a compound of the formula

wherein A is H_2, O, (H)(OH), $(OH)_2$ or N—OH; B is H_2, $(H)(CH_3)$, $(H)(CH_2NR_3R_4)$ or CH_2 wherein R_3 and R_4 are C_{2-4} alkyl or are combined to give tetramethylene, pentamethylene or $—CH_2CH_2—O—CH_2CH_2—$; R_1 is



-continued





wherein Z is NR_9, O or S; R_5, R_6 and R_8 are each hydrogen, halogen, C_{1-3} alkyl or C_{1-3} alkoxy; R_7 is hydrogen, amino, $(C_{1-4}$ alkyl)amino, $(C_{1-4}$ alkyl)$_2$amino, alkoxy or nitro; R_9 is hydrogen, C_{1-4} alkyl or phenyl (C_{1-2} alkyl); R_{10} is hydrogen, halogen, C_{1-4} alkyl, C_{1-4} alkoxy, hydroxy, cyano or $—CONH_2$; R_{11} is hydrogen, halogen, C_{1-4} alkyl or phenyl; the wavy line indicates that the configuration of the oxygen substituent on the ring can be endo or exo; and the pharmaceutically acceptable acid addition and quarternary ammonium salts of the aforesaid compounds.

7. A method for stimulating gastric motility comprising administering to a patient in need thereof an effective amount of a compound of the formula:

wherein A is H_2, O, (H)(OH), $(OH)_2$ or N—OH; B is H_2, $(H)(CH_3)$, $(H)(CH_2NH_3R_4)$ or CH_2 wherein R_3 and R_4 are C_{2-4} alkyl or are combined to give tetramethylene, pentamethylene or $—CH_2CH_2—O—CH_2CH_2—$; R_1 is

wherein Z is NR_9, O or S; R_5, R_6 and R_8 are each hydrogen, halogen, C_{1-3} alkyl or C_{1-3} alkoxy; R_7 is hydrogen, amino, $(C_{1-4}$ alkyl)amino, $(C_{1-4}$ alkyl)$_2$amino, alkoxy or nitro; R_9 is hydrogen, C_{1-4} alkyl or phenyl (C_{1-2} alkyl); R_{10} is hydrogen, halogen, C_{1-4} alkyl, C_{1-4} alkoxy, hydroxy, cyano or $—CONH_2$; R_{11} is hydrogen, halogen, C_{1-4} alkyl or phenyl; the wavy line indicates that the configuration of the oxygen substituent on the ring can be endo or exo; and the pharmaceutically acceptable acid addition and quarternary ammonium salts of the aforesaid compounds.

U.S. Cl. 514—336 **11 Claims**

1. A compound of the following structural formula

or a pharmaceutically acceptable salt thereof wherein;

Ar is selected from the group consisting of pyridyl, and 2,3-dimethoxypyridyl;

R^4 is $S(O)_n R^2$, in which n is 0, 1 or 2, and

R^2 is selected from the group consisting of

(a) C_{2-6}alkyl,

(b) Substituted C_{1-6}alkyl wherein the substituent is selected from the group consisting of hydroxy, amino, N-C_{1-4}alkylamino, and N,N-di-C_{1-4}alkylamino, and

(c) C_{1-6}alkylcarbonyl-C_{1-6}alkyl;

Y is selected from the group consisting of

(a) C_{1-12}alkyl,

(b) C_{1-6}hydroxyalkyl,

(c) C_{1-6}alkoxy-C_{1-6}alkyl,

(d) amino-C_{1-6}alkyl, and

(e) N-substituted or N,N-disubstituted amino-C_{1-6}alkyl wherein the substituents are each individually C_{1-6}alkyl;

R^6 is substituted C_{1-6}alkyl wherein the substituent is selected from the group consisting of hydroxy, amino, N-C_{1-4}alkylamino, and N,N-di-C_{1-4}alkyamino, wherein the relationship of the substituents at positions 2 and 5 of the tetrahydrofuran includes all stereoisomers.

9. A method of antagonizing the effects of PAF in a subject in need thereof which comprises administering to said subject a nontoxic therapeutically effective amount of a compound according to claim 1.

1. A compound having the structural formula

and pharmaceutically acceptable salts thereof, wherein

X represents CH or N;

A represents O or S;

m is an integer of from 0 to 2;

n is an integer of from 0 to 2;

R^1 and R^2 are the same or different and each is independently selected from H or alkyl containing 1 to 6 carbon atoms;

W represents $—N(R^4)—$, —NH—, $—N(COR^4)—$, or $—N(-SO_2R^4)—$ {wherein R^4 is alkyl containing 1 to 6 carbon atoms};

B represents alkylene having from 2 to 8 carbon atoms, which alkylene may be optionally substituted with a group selected from —OH, —F, alkyl having from 1 to 4 carbon atoms, $—CH_2OH$, —CHO, $—CO_2H$, $—COR^3$ {wherein R^3 is selected from $—NHR^4$, $—N(R^4)_2$ or $—OR^4$ and R^4 is as defined above}, or —CN, with the proviso that OH or F is not on the carbon adjacent to W;

Q represents an aryl group containing from 6 to 15 carbon atoms or an aromatic heterocyclic group containing from 3 to 14 carbon atoms and having at least one O, S, or N in the ring, which aryl or aromatic heterocyclic group can optionally be substituted with up to 3 substituents Y as defined below; and each Y substituent is independently selected from —OH, hydroxymethyl, alkyl containing from 1 to 6 carbon atoms, halo, $—NO_2$, alkoxy containing 1 to 6 carbon atoms, $—CF_3$, —CN, cycloalkyl containing 3 to 7 carbon atoms, alkenyloxy containing from 3 to 6 carbon atoms, alkynyloxy containing from 3 to 6 carbon atoms, $—S(O)_p—R^4$ {wherein R^4 is as defined above and p is an integer of from 0 to 2}, $—CO—R^5$ {wherein R^5 represents —OH, $—NH_2$, $—NHR^4$, $—N(R^4)_2$ or $—OR^4$ in which R^4 is as defined above}, $—O—D—COR^5$ wherein D represents alkylene having from 1 to 4 carbon atoms and R^5 is as defined above, $—NH_2$, $—NHR^4$, $—N(R^4)_2$ wherein R^4 is as defined above or —NHCOH.

2. A pharmaceutical composition comprising a compound according to claim 1 and a pharmaceutically acceptable carrier.

5,011,861

MEMBRANES FOR SOLID PHASE PROTEIN SEQUENCING

James M. Coull, Acton; Darryl J. Rappin, North Billerica; Hubert Koester, Concord; Malcolm G. Pluskal, Bedford; Michael J. Steuck, North Reading, and Alex G. Bonner, Lexington, all of Mass., assignors to Millipore Corporation, Bedford, Mass.

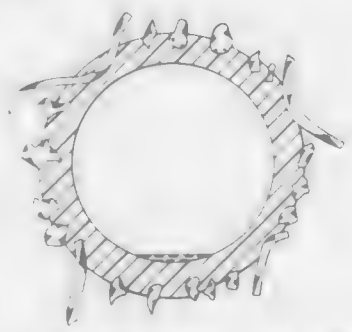
Filed Jun. 28, 1988, Ser. No. 212,430

Int. Cl.[5] C08G *18/14*

U.S. Cl. 521—53 16 Claims

1. A flexible, polymeric, porous membrane suitable for use with solid phase protein sequencing processes, said membrane having functional groups that covalently link peptides and proteins to the membrane surface.

5,011,862



COATING MEDIA CONTAINING LOW DENSITY COMPOSITE OPACIFIERS

George E. Melber, Depew, and Leon Wolinski, Checktowago, both of N.Y., assignors to Pierce & Stevens Corporation, Buffalo, N.Y.

Division of Ser. No. 225,755, Jul. 29, 1988, which is a continuation-in-part of Ser. No. 28,119, Mar. 19, 1987, Pat. No. 4,722,943, which is a continuation-in-part of Ser. No. 103,203, Oct. 1, 1987, Pat. No. 4,829,094, which is a continuation-in-part of Ser. No. 103,204, Oct. 1, 1987, Pat. No. 4,843,104, which is a division of Ser. No. 28,119, Mar. 19, 1987, Pat. No. 4,772,943. This application Jun. 6, 1989, Ser. No. 362,312

Int. Cl.[5] C08J *9/22, 9/32*

U.S. Cl. 521—54 7 Claims

1. A coating medium for application to a substrate comprising a film forming binder and a composite opacifier, said composite opacifier comprising expanded thermoplastic resin microspheres having an inorganic opacifying constituent adhered to and embedded in the surface thereof.

5,011,863

PROCESS FOR THE PREPARATION OF EXPANDABLE POLYMER BEADS AND MATERIALS DERIVED THEREFROM

Hugues Godfrin, Vimy, France, assignor to Atochem, Paris La Defense, France

Filed Jul. 19, 1990, Ser. No. 553,815

Claims priority, application France, Jul. 19, 1989, 89 09704

Int. Cl.[5] C08J *9/20*

U.S. Cl. 521—56 12 Claims

1. In a process for the preparation of expandable polymer beads comprising (a) the polymerization in aqueous suspension, at a temperature of between 80° C. and 150° C., at a pressure of between 1 and 20 bars, for a period of between 6 and 20 hours, of at least one vinylaromatic monomer in the presence of an effective quantity of at least one polymerization initiator and of an effective quantity of at least one suspension stabilizer, and (b) the addition of an effective quantity of at least one blowing agent, the improvement which comprises performing the polymerization in the presence, in relation to the vinylaromatic monomer(s), of 0.01% to 0.6% by weight of at least one polyethylene wax and of 0.005% to 0.1% by weight of at least one nonionic surface-active agent having an HLB (hydrophile-lipophile balance) value of between 7 and 16.

5,011,864

WATER ABSORBENT LATEX POLYMER FOAMS CONTAINING CHITOSAN (CHITIN)

Steven F. Nielsen, Charlotte, N.C., and Dai W. Kim, Chatham, N.J., assignors to Hoechst Celanese Corp., Somerville, N.J.

Continuation-in-part of Ser. No. 434,376, Nov. 9, 1989. This application Jun. 4, 1990, Ser. No. 533,243

The portion of the term of this patent subsequent to Feb. 5, 2008, has been disclaimed.

Int. Cl.[5] C08J *9/28*

U.S. Cl. 521—70 25 Claims

1. A water absorbent latex polymer foam containing chitin prepared by the process of:

a. preparing a foamable latex polymer material;

b. foaming said latex polymer material to form a latex foam material;

c. blending both water absorbent polymer products and chitin products with the latex foam material; and

d. drying the latex foam material containing the water absorbent polymer and chitin within its structure to form a water absorbent latex polymer foam containing chitin.

5,011,865

REDUCTION OF SILICONE FOAM DENSITY USING BUFFERS

Donald S. Johnson, Scotia, N.Y., assignor to General Electric Company, Waterford, N.Y.

Filed Apr. 2, 1990, Ser. No. 503,355

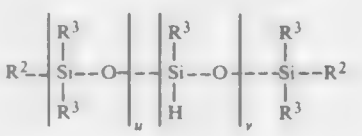
Int. Cl.[5] C08J *9/00*

U.S. Cl. 521—82 11 Claims

1. A method for preparing a silicone foam having a reduced density of about 5 to about 6 pounds per cubic foot, comprising the step of agitating a mixture of ingredients comprising by weight:

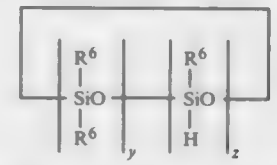
(A) a silicone composition, comprising by weight:

(1) 100 parts of a vinyl-terminated polydiorganosiloxane of the formula:



wherein R and R^1 are selected from the group consisting of substituted or unsubstituted hydrocarbon radicals of from 1 to 20 carbon atoms, such that the polymer contains from 0.0002 to 3% by weight vinyl and x varies such that the viscosity of the polymer varies from 100 to 1,000,000 centipoise at 25° C.;

(2) about 0.5 to about 5 parts by weight of an aqueous buffer solution having a pH in the range of about 9 to about 10; and



(3) about 25 to about 140 parts per million of a platinum catalyst;

(B) about 2.5 to about 20 parts of a substantially linear hydride polysiloxane having the formula

wherein R^2 is selected independently from the group consisting of hydrogen, alkyl radicals of from 1 to 8 carbon atoms, halo substituted alkyl radicals of from from 1 to 8 carbon atoms, aryl radicals of from 6 to 14 carbon atoms, and halo substituted aryl radicals of from 6 to 14 carbon atoms; and R^3 is selected from the group consisting of alkyl radicals of from 1 to 8 carbon atoms, aryl radicals of from 6 to 14 carbon atoms, halo aryl radicals of from 6 to 14 carbon atoms, and haloalkyl radicals of from 3 to 8 carbon atoms; u and v are integers which can vary sufficiently to provide a hydride polysiloxane having a viscosity of from about 5 to about 10,000 centipoise at 25° C.;

(C) about 0.1 to about 15 parts of a cyclic hydride polysiloxane having the general formula:

wherein R^6 may be independently hydrogen, an alkyl radical of from 1 to 8 carbon atoms, an aryl radical from 6 to 14 carbon atoms, or a haloalkyl radical of 3 to 8 carbon atoms; y is an integer having a value of 0 to 5 inclusive, z is an integer having a value of from 1 to 8 inclusive, and the sum of y and z has a value of 3 to 8 inclusive; and

(D) about 0.1 about 5 parts of a hydroxyl source selected from the group consisting of water, organic alcohol, or a mixture of the foregoing.

5,011,866

INSULATING ALKENYL AROMATIC POLYMER FOAM

Kyung W. Suh, Granville, Ohio, assignor to The Dow Chemical Company, Midland, Mich.

Filed Nov. 8, 1989, Ser. No. 433,644

Int. Cl.[5] C08J *9/08*

U.S. Cl. 521—97 10 Claims

1. An alkenyl aromatic thermoplastic synthetic resinous elongate foam body comprising the body having a machine direction and a transverse direction and defining a plurality of closed noninterconnecting gas-containing cells therein, the cells having an average cell size of from about 0.01 to about 0.3 millimeters when measured across a minimum cross-sectional dimension of the body, the body being of a generally uniform cellular structure without substantial discontinuities, the body having a cross-sectional area of at least 8 square inches (51.6 square centimeters) with a minimum cross-sectional dimension of at least about 0.25 inch (6.35 millimeters), a water vapor permeability not greater than about 1.8 perm inch (3.02 metric perm centimeters) a density of from about 1.0 to about 6.0 pounds per cubic foot (16 to 96 kilograms/cubic meter) with the further limitations that the cells contain, as gas, at least 70 percent by weight of a compound selected from the group consisting of 1,1,1-trifluoroethane and 1,1,1,2-tetrafluoroethane and that any change in dimension in any direction be about four percent or less when measured by the test designated ASTM D2126/C578.

5,011,867

ELECTRON-BEAM CURED EMULSION PRESSURE-SENSITIVE ADHESIVES

Prakash Mallya; Sebastian S. Plamthottam, both of Pasadena, and Yehuda Ozari, Arcadia, all of Calif., assignors to Avery International Corporation, Pasadena, Calif.

Continuation of Ser. No. 101,943, Sep. 28, 1987, abandoned. This application Dec. 28, 1988, Ser. No. 292,654

Int. Cl.[5] C09J *133/08, 133/02;* C08F *265/06*

U.S. Cl. 522—109 33 Claims

1. A cured pressure-sensitive adhesive composition having increased elevated temperature shear properties as compared to the uncured adhesive, said adhesive comprising an electron-beam cured linear emulsion polymer having a glass transition temperature of at least 20° C. below the use temperature, said linear emulsion polymer formed at a temperature less than

about 20° C. and of at least one first monomer which, when homopolymerized, has a glass transition temperature less than about −25° C. and at least one second monomer which, when homopolymerized, has a glass transition temperature greater than about −25° C., said linear emulsion polymer cured by exposure to electron-beam radiation at a dosage of up to abut 100 kGy and sufficient to increase the 70° C. shear of the emulsion polymer to at least about 10 kiloseconds while maintaining a 180° peel at least about 250 N/m and loop tack of at least about 200 N/m at an adhesive coat weight of from about 40 to about 60 g/m^2.

5,011,868

DENTURE STABILIZER

James J. Keegan, Bloomfield, N.J., assignor to Warner-Lambert Company, Morris Plains, N.J.

Filed Dec. 1, 1989, Ser. No. 444,473

Int. Cl.^{5} A61K *6/00*; C08L *1/00*; A61C *13/23*

U.S. Cl. 523—120 **30 Claims**

1. A denture adhesive base composition comprising a substantially anhydrous mixture of from about 20 to about 25 percent by weight of a cationic acrylamide polymer, from about 50 to about 60 percent by weight of sodium carboxymethylcellulose and from about 20 to about 25 percent by weight of ethylene oxide polymer.

5,011,869

SELF-LEVELING SILICONE SEALANT COMPOSITIONS AND METHODS FOR MAKING SAME

John W. Dean, Guilderland, N.Y., and Melvin D. Beers, Hudson, Ohio, assignors to General Electric Company, Waterford, N.Y.

Continuation of Ser. No. 154,479, Feb. 8, 1988, abandoned, which is a continuation of Ser. No. 716,073, Mar. 26, 1985, abandoned. This application Aug. 29, 1989, Ser. No. 401,527

Int. Cl.^{5} C08K *5/17*

U.S. Cl. 523—213 **33 Claims**

1. A self-leveling, curable composition, consisting essentially of:

(a) an acyloxy-terminated polydiorganosiloxane,

(b) an effective amount of metal-containing condensation catalyst,

(c) from about 25 parts per million to about 200 parts per million of dihexylamine, and

(d) sufficient fumed silica treated with cyclopolysiloxanes or silazanes to provide reinforcement.

5,011,870

THERMALLY CONDUCTIVE ORGANOSILOXANE COMPOSITIONS

Adam L. Peterson, Midland, Mich., assignor to Dow Corning Corporation, Midland, Mich.

Filed Feb. 8, 1989, Ser. No. 308,151

Int. Cl.^{5} C08K *3/28*

U.S. Cl. 523—220 **3 Claims**

1. In an organosiloxane composition comprising a polyorganosiloxane and a finely divided solid thermally conductive filler, the improvement comprising the presence in said composition of a mixture of thermally conductive fillers comprising (1) from 20 to 60 weight percent, based on the weight of said mixture, of a first filler consisting essentially of aluminum nitride having an average particle size no larger than one micron and (2) at least one additional thermally conductive filler having an average particle size of from 10 to 100 microns. where said mixture constitutes from 40 to 85 percent of the total weight of said composition.

5,011,871

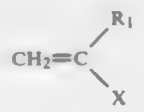
IMPACT RESISTANT THERMOPLASTIC MOLDING COMPOSITION AND USE THEREOF

Rainer Bueschl, Roedersheim-Gronau; Adolf Echte, Ludwigshafen; Konrad Schulte, Schifferstadt, and Hans Mittnacht, Weinheim, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Mar. 15, 1989, Ser. No. 323,753

Claims priority, application Fed. Rep. of Germany, Mar. 31, 1988, 3811014

Int. Cl.^{5} C08L *51/04*



U.S. Cl. 523—436 **8 Claims**

1. An impact resistant thermoplastic molding composition containing, each percentage being based on A + B,

A: from 80 to 55% by weight of a hard matrix of a copolymer containing at lest 95% by weight of units of aromatic vinyl monomer a_{11} of from 8 to 10 carbon atoms and of at least one comonomer a_{12} of a proportion of 0.1 to 1.95% by weight, based on A, and

B: from 45 to 20% by weight of a soft phase which, uniformly dispersed in the hard matrix, has an average particle diameter d_{50} (volume average) of from 3.5 to 9 μm,

as obtained by solution polymerization, mass polymerization or initial mass polymerization followed by aqueous dispersion polymerization of the mixture of monomers a_{11} and a_{12} in the presence of elastomer (rubber) and subsequent isolation of the useful product, wherein the comonomer a_{12} has the general Formula I

(I)

where

X is -OR^2 or -COOR^2,

R^1 is hydrogen or methyl and

R^2 is substituted alkyl of from 1 or 2 to 10 carbon atoms with at least one OH, epoxy, cyano, furfuryl or morpholino group or wherein a_{12} is selected from the group consisting of acrylamide, methacrylamide, N-methylacrylamide, and N-methylmethacrylamide.

5,011,872

THERMALLY CONDUCTIVE CERAMIC/POLYMER COMPOSITES

Carol A. Latham, Lakewood, and Michael F. McGuiggan, Shaker Heights, both of Ohio, assignors to The Carborudum Company, Niagara Falls, N.Y.

Continuation of Ser. No. 135,785, Dec. 21, 1987. This application Mar. 22, 1989, Ser. No. 327,067

Int. Cl.^{5} C08L *63/00*

U.S. Cl. 523—440 **10 Claims**

1. A thermal conductive polymer composition comprising a mixture of a polymer and a thermally conductive filler material, said filler material having a median particle size of between about 130 to 260 microns and a size distribution characterized by the formula:

$$\frac{\% < (M - 60)}{\% > (M + 60)} > 0.60$$

where % represents the wt. % of the particles below or above the median particle size and M represents the median particle size in microns.

5,011,873

MOLDING POLYAMIDE RESIN COMPOSITION

Isao Nomura, Hiratsuka, and Kazuo Yamamiya, Chigasaki, both of Japan, assignors to Mitsubishi Gas Chemical Company, Inc., Tokyo, Japan

Filed Oct. 24, 1989, Ser. No. 425,980

Int. Cl.^{5} C08K *7/14*

U.S. Cl. 523—466 **8 Claims**

1. A molding polyamide resin composition comprising

(A) 50 to 99 parts by weight of a polyamide resin derived from xylylenediamine as a main diamine component and an alpha,omega-straight chain aliphatic dicarboxylic acid as a main dicarboxylic acid component,

(B) 1 to 50 parts by weight of polyhexamethyleneadipamide resin,

(C) 5 to 85 parts by weight, per 100 parts by weight of components (A) and (B) combined, of a thermosetting resin powder having an average

particle diameter of 1 to 800 micrometers, and

(D) 5 to 200 parts by weight, per 100 parts by weight of components (A) and (B) combined, of glass fibers,

the total amount of the polyamide resin components (A) and (B) being 100 parts by weight.

U.S. Cl. 524—371 **10 Claims**

1. A composition for a cable in which:

the composition is fiber free and comprises in admixture and in parts by weight, 100 parts of amorphous polypropylene, from 10 to 70 parts of aluminum trihydrate or magnesium hydroxide, and an organic halogenated material and antimony trioxide, the organic halogenated material comprising decabromodiphenyloxide, bromated diphenyl ether, tetrabromophthalic anhydride, chlorendic anhydride or hexachlorocyclopentadiene and an aggregate of the halogenated material and antimony trioxide being from 5 to 30

parts, such that the composition is fire retardant and water resistant; and

the amorphous polypropylene provides a continuous phase throughout the composition and has a low molecular weight to provide the composition with grease-like or jelly-like properties at room temperature.

AQUEOUS THERMOPLASTIC COATING COMPOSITION FOR PLASTICS MATERIALS AND COATING METHOD USING SAME

Yasuhiro Fujii, Kanagawa; Masaru Mitsuji, Zama, and Junichi Kajima, Hiratsuka, all of Japan, assignors to Kansai Paint Company, Limited, Hyogo, Japan

Filed Jan. 16, 1990, Ser. No. 465,705

Claims priority, application Japan, Jan. 18, 1989, 1-9433

Int. Cl.[5] **C08L** *75/04*

U.S. Cl. 524—457 **5 Claims**

1. An aqueous thermoplastic coating composition for coating plastics substrates, the composition consisting essentially of:

(A) an aqueous acrylic resin and

(B) a urethane resin emulsion,

the component (B) being a self-emulsifiable urethane emulsion prepared by subjecting a urethane prepolymer to reaction for chain extension by water and emulsification after or during neutralization of the urethane prepolymer with a tertiary amine, the urethane prepolymer consisting essentially of (i) an aliphatic and/or an alicyclic diisocyanate, (ii) a polyether diol and/or polyester diol both having a number-average molecular weight of about 500 to about 5000, (iii) a low-molecular weight polyhydroxyl compound and (iv) a dimethylolalkanoic acid in NCO/OH equivalent ratio of 1.1–1.9:1, the amount of the component (A) being about 1 to about 12% by weight and the amount of the component (B) being about 99 to about 88% by weight, based on the combined weight (calculated as solids) of the two components.

5,011,882

AQUEOUS COATING COMPOSITION

Naohito Shingo, Katano, and Takahito Kishida, Yao, both of Japan, assignors to Nippon Paint Co., Ltd., Osaka, Japan

Filed May 20, 1988, Ser. No. 197,447

Claims priority, application Japan, May 20, 1987, 62-122733

Int. Cl.[5] **C08L** *51/00*

U.S. Cl. 524—504 **5 Claims**

1. An aqueous coating composition comprising

(A) 100 parts by weight of an acrylic resin powder having an acid value of 15 to 200,

(B) 25 to 900 parts by weight of an acrylic graft polymer having an acid value of 20 to 100, which is composed of a polymer portion (1) having an acid value of not more than 15 and an acrylic polymer portion (2) having an acid value of 40 to 200, and

(C) 3 to 900 parts by weight of a curing agent for curing the component (A), the component (B) or both the components (A) and (B).

5,011,883

STABILIZED POLYMER LATEX COMPOSITION

Igor Aksman, Dover, Del., assignor to ICI Americas Inc., Wilmington, Del.

Filed Feb. 7, 1990, Ser. No. 476,192

Int. Cl.[5] **C08L** *67/00, 33/06;* **C08G** *63/49, 63/52*

U.S. Cl. 524—513 **23 Claims**

1. A stabilized aqueous polymer latex composition comprising:

(A) polymeric latex particles:

(B) a protective colloid; and

(C) a poly(oxyalkylene)-containing alkyd resin which is the reaction product of:

(i) at least one poly(oxyalkylene) compound with hydroxyl and groups;

(ii) at least one polyol;

(iii) at least one polycarboxylic acid, chloride or anhydride; and

(iv) at least one monocarboxylic acid.

21. A latex composition in accordance with claim 1 wherein the weight ratio of alkyd resin to protective colloid is between about 4:1 and about 1:12.

22. A latex composition in accordance with claim 21 wherein the weight ratio of alkyd resin to protective colloid is between about 2:1 and about 1:8.

23. A latex composition in accordance with claim 22 wherein the weight ratio of alkyd resin to protective colloid is between about 4:3 and about 1:6.

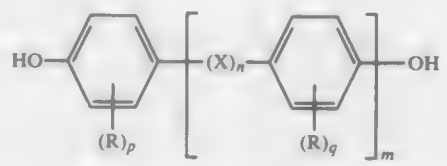
5,011,884

BLENDS OF THERMOTROPIC POLYMERS WITH POLYESTERS AND POLYCARBONATE

Bernhard Rosenau, Neustadt; Bernd Hisgen, Limburgerhof; Gerhard Heinz, Weisenheim; Hans-Georg Braun, Gruenstadt; Dietrich Lausberg, and Hartmut Zeiner, both of Ludwigshafen, all of Fed. Rep. of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany

Filed Aug. 31, 1989, Ser. No. 401,236

Claims priority, application Fed. Rep. of Germany, Sep. 20, 1988, 3831873



Int. Cl.[5] **C08L** *69/00, 67/02, 67/03, 67/04*

U.S. Cl. 524—537 **8 Claims**

1. A polymeric molding composition, containing:

(a) 20–70% by weight of a thermotropic liquid-crystalline polymer,

(b) 10–50% by weight of a polycarbonate which is a polycondensate obtainable by reacting a carbonic acid derivative with an aromatic bisphenol of the formula:

wherein X is alkylene or aralkylene of 1–20 carbon atoms, —SO_2—, —S—, —O— or —CO—, n is 0 or 1, m is 0, 1 or 2, p and q are each 0–4, and R is C_1–C_6-alkyl, C_1–C_4 alkoxy, halogen or phenyl,

(c) 10–50% by weight of a polyester, which is obtained from the polycondensation of one or more alkylene glycols of 2–20 carbon atoms and one or more aromatic dicarboxylic acids or esters thereof, the weight percentages (a), (b) and (c) adding up to 100, and

(d) up to 60% by weight, based on the total amount of proportions (a), (b) and (c), of further polymers, fillers, reinforcing agents, processing aids and other additives.

5,011,885

METHODS FOR THE PRODUCTION OF MICROCAPSULES USING FUNCTIONALIZED ISOCYANATE

Jing-Den Chen, Spring Valley; Kerry Kovacs, Centerville; Margaret T. Thomas, Medway, and Rong-Chang Liang, Centerville, all of Ohio, assignors to The Mead Corporation, Dayton, Ohio

Filed Oct. 27, 1989, Ser. No. 428,098

Int. Cl.[5] **C08L** *75/04*

U.S. Cl. 524—591 **18 Claims**

1. A method for preparing microcapsules which comprises:

preparing an aqueous dispersion or emulsion of a hydrophobic oily core material containing a polyvalent isocyanate, a polyvalent isothiocyanate, or an adduct containing at least one of said polyvalent isocyanate and said polyvalent isothiocyanate, said polyvalent isocyanate and said polyvalent isothiocyanate having an anionic moiety; and

forming capsule walls around the droplets of said oily core material.

5,011,886

PROCESS FOR PRODUCING MODIFIED PHENOLIC RESIN BONDING AGENTS AND USE THEREOF FOR PRODUCING PARTICLE BOARD

Adolf Buschfeld, Alpen; Matthias Lattekamp, Rheinberg; Gerd Ripkens, Kamp-Lintfort, and Hans Schittek, Neukirchen-Vluyn, all of Fed. Rep. of Germany, assignors to Rwe-Dea Aktiengesellschaft fur Mineraloel und Chemie, Hamburg, Fed. Rep. of Germany

Continuation-in-part of Ser. No. 681,538, Dec. 14, 1984, abandoned. This application Feb. 26, 1990, Ser. No. 488,469

Claims priority, application Fed. Rep. of Germany, Dec. 21, 1983, 3346153

Int. Cl.[5] **C08K** *3/20*

U.S. Cl. 524—596 **16 Claims**

1. A process for preparing a product aqueous solution of a high molecular weight phenol-formaldehyde condensation resin of reduced viscosity which comprises:

adding to a charge aqueous solution of a phenol-formaldehyde condensation resin having a viscosity above 300 mPa.s (at 20° C.) with a solids content of 20 to 65 weight percent and containing about 2 to about 16 weight percent alkali, urea in amount of 5 to 50 weight percent, based on said resin solution.

5,011,887

THERMOPLASTIC RESIN COMPOSITION

Isao Sasaki; Naoki Yamamoto, both of Hiroshima, and Akira Yanagase, Otake, all of Japan, assignors to Mitsubishi Rayon Co., Ltd., Tokyo, Japan

Filed Mar. 8, 1989, Ser. No. 320,533

Claims priority, application Japan, Mar. 10, 1988, 63-57039

Int. Cl.[5] **C08L** *51/08*

U.S. Cl. 525—63 **14 Claims**

1. A thermoplastic resin composition comprising:

95–5% by weight of a sulfur-containing thermoplastic polymer (A) selected from the group consisting of polyphenylene sulfide, and polysulfone and

5–95% by weight of a compound-rubber-based graft copolymer (B) which is produced by the graft polymerization of one or more vinyl monomers onto compound rubber particles having an average particle diameter of 0.08–0.6 μm and structures in which 10–90% by weight of a polyorganosiloxane rubber component and 90–10% by weight of a polyalkyl(meth)acrylate rubber component are tangled together so as not to be separable from each other and the total amount of the polyorganosiloxane

rubber component and polyalkyl(meth)acrylate rubber component is 100% by weight.

5,011,888

VULCANIZED RUBBER COMPOSITION

Fumio Tsutsumi, Yokkaichi; Akihiko Morikawa, Tsu; Mitsuhiko Sakakibara, Yokkaichi; Noboru Oshima, Suzuka; Tatsuro Hamada; Tatsuo Fujimaki, both of Higashimurayama, and Masayuki Ohashi, Suginami, all of Japan, assignors to Japan Synthetic Rubber Co. and Bridgestone Corp., both of Tokyo, Japan

Continuation of Ser. No. 291,320, Dec. 28, 1988, abandoned, which is a continuation of Ser. No. 925,048, Oct. 30, 1986, abandoned. This application Dec. 6, 1989, Ser. No. 449,308

Claims priority, application Japan, Oct. 30, 1985, 60-243640

Int. Cl.[5] **C08L** *9/06, 53/02*

U.S. Cl. 525—98 **3 Claims**

1. A vulcanized rubber composition containing not less than 20% by weight, based on the rubber component, of a block copolymer composed of polymer or copolymer block units (A) and random copolymer block units (B), said polymer or copolymer block units (A) being obtained by singly polymerizing a conjugated diolefine or copolymerizing the conjugated diolefine and a monovinyl aromatic hydrocarbon using a lithium initiator and containing not more than 10% by weight of bound monovinyl aromatic hydrocarbon and said random copolymer block (B) being obtained by copolymerizing the conjugated diolefine and the monovinyl aromatic hydrocarbon and containing 15 to 80% by weight of bound monovinyl aromatic hydrocarbon, wherein:

(i) the block copolymer contains not less than 10% by weight of each of the block units (A) and the block units (B);

(ii) the total content of the bound monovinyl aromatic hydrocarbon is from 10 to 40% by weight;

(iii) the average content of the vinyl bonds in the conjugated diolefine portions is from 20 to 70% and

(iv) the polymerizable terminals of the block copolymer are reacted with an isocyanate compound, wherein the isocyanate compound is employed in an amount of 0.2 to 10 equivalents in terms of isocyanate groups per one mole of lithium atom of said lithium initiator.

5,011,889

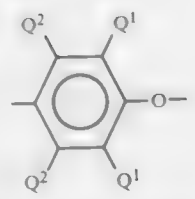
POLYMER, MIXTURE COMPRISING POLYPHENYLENE ETHER, POLYESTER, AND STYRENE POLYMER

Wilhelmus Hamersma, Bergen op Zoom, Netherlands; Roger W. Avakian, Brasschaat, and Christian Bailly, Kalmthout, both of Belgium, assignors to General Electric Co., Selkirk, N.Y.

Filed Nov. 19, 1987, Ser. No. 122,954

Claims priority, application Netherlands, Dec. 8, 1986, 8603112

Int. Cl.[5] **C08F** *8/30, 71/12*



U.S. Cl. 525—133 **7 Claims**

1. A polymer mixture which comprises:

(A) a polyphenylene ether or a mixture thereof with a polystryrene, and

(B) a polyester or a mixture of two or more polyesters, and

(C) a styrene polymer with side chains consisting entirely or partly of cyclic imino ether groups, wherein the polyphenylene ether is a homopolymer or copolymer having the formula

wherein each Q^1 is individually selected from the group consisting of halogen, primary or secondary lower alkyl, phenyl, haloalkyl, amino alkyl, hydrocarbonoxy, and halohydrocarbonoxy, in which at least two carbon atoms separate the halogen and oxygen atoms, and each Q^2 is individually selected from the group consisting of hydrogen, halogen, primary or secondary lower alkyl, phenyl, haloalkyl, hydrocarbonoxy, and halohydrocarbonoxy as defined for Q^1.

5,011,890

POLYACETAL RESINS CONTAINING NON-MELTABLE POLYMER STABILIZERS

Ernest R. Novak, Vienna, W. Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del.

Filed Mar. 17, 1989, Ser. No. 327,664

The portion of the term of this patent subsequent to Mar. 21, 2006, has been disclaimed.

Int. Cl.[5] **C08F** *283/06;* **C08K** *5/47;* **C42L** *61/00*

U.S. Cl. 525—154 **24 Claims**

1. A thermoplastic polyacetal composition consisting essentially of

(a) 0.05–3 weight percent of at least one non-meltable polymer selected from the group consisting of polymers containing formaldehyde reactive hydroxyl groups, polymers containing formaldehyde reactive nitrogen groups, and polymers containing both formaldehyde reactive hydroxyl groups and formaldehyde reactive nitrogen groups, provided that the atoms in the backbone of the polymer to which the formaldehyde reactive groups are attached, directly or indirectly, are separated from each other, on average, by not more than twenty chain atoms, and further provided that the amount of the formaldehyde reactive nitrogen groups attached, directly or indirectly, to the atoms which are in the backbone of the polymer is at least three times as great as the amount of formaldehyde reactive nitrogen groups present in the backbone of the polymer and

(b) 97–99.95 weight percent of at least one polyacetal polymer,

provided that the above-stated percentages are based on the total amount of components (a) and (b) only and further provided that the polymer of component (a) has a number average particle size in the composition of less than 10 microns.

5,011,891

ELASTOMER POLYMER BLENDS

Lawrence Spenadel, Westfield; Joel H. Grosser, Perth Amboy, and Stephen M. Dwyer, Howell, all of N.J., assignors to Exxon Research & Engineering Company, Florham Park, N.J.

Continuation of Ser. No. 321,367, Mar. 9, 1989, abandoned, which is a division of Ser. No. 835,211, Mar. 3, 1986, Pat. No. 4,843,129. This application Aug. 21, 1990, Ser. No. 570,993

Int. Cl.[5] **C08L** *23/16, 23/12, 23/06*

U.S. Cl. 525—211 **9 Claims**

1. A composition comprising:

(a) at least one elastomer copolymer comprising ethylene and at least one other alpha olefin, having a weight average molecular weight of at least 20,000 and having at least one of M_w/M_n less than 2 and M_z/M_w less than 1.8, wherein at least two portions of essentially each copolymer chain of said copolymer, each portion comprising at least 5 wt. % of the chain, differ in composition from one another by at least about 5 wt. % ethylene;

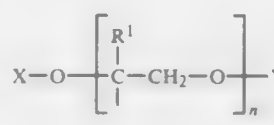
(b) a first plastic composition different from said first plastic composition; and

(c) a second plastic composition.

5,011,892

HYDROPHILIC SWELLABLE GRAFT COPOLYMERS, THEIR PREPARATION AND USE

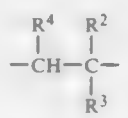
Friedrich Engelhardt, and Ulrich Riegel, both of Frankfurt am Main, Fed. Rep. of Germany, assignors to Cassella AG, Frankfurt am Main, Fed. Rep. of Germany



Filed Mar. 26, 1990, Ser. No. 498,722

Claims priority, application Fed. Rep. of Germany, Apr. 7, 1989, 3911433

Int. Cl.[5] **C08F** *283/06*

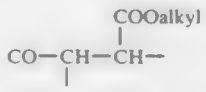


U.S. Cl. 525—404 **14 Claims**

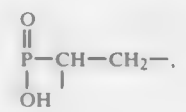
1. Hydrophilic, swellable graft copolymers composed, in random distribution, of 0.5 to 20% by weight of radicals of the general formula I

(I)

79 to 99% by weight of radicals containing at acidic group, of the general formula II



(II)

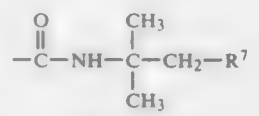


and 0.1 to 2% by weight of radicals of a crosslinking agent which are derived from monomers having at least two olefinically unsaturated double bonds, where

X denotes (C_1–C_{22})-alkyl, aryl, aralkyl or Y

Y denotes $COCH_3$, CH_2COOR^2, $COCH_2CH_2COOH$,

$COOR^2$, $CH_2COCH_2COOR^2$, SO_3H or



n denotes 2 to 300,

R^1 denotes hydrogen or methyl

R^2 independently of one another denotes hydrogen, methyl or ethyl

R^3 denotes the carboxyl group, the sulphonyl group, the phosphonyl group which optionally may be esterified with alkanol having 1 to 4 carbon atoms, or denotes a group of the formula

in which R^7 represents the sulphonyl group or the phosphonyl group, and R^4 denotes hydrogen, methyl, ethyl or the carboxyl group.

5,011,893

METHOD FOR PRODUCING A BLOCK COPOLYAMIDE

Masaaki Miyamoto; Hidemi Nakanishi, and Takayoshi Tanaka, all of Kitakyushu, Japan, assignors to Mitsubishi Kasei Corporation, Tokyo, Japan

Filed Aug. 7, 1989, Ser. No. 390,217

Claims priority, application Japan, Aug. 17, 1988, 63-203195

Int. Cl.[5] **C08L** *77/00*

U.S. Cl. 525—420.5 **5 Claims**

1. A method for producing a block copolyamide, which comprises polycondensing a prepolymer prepared from a dimerized fatty acid and a diamine and having a number average molecular weight of from 1,000 to 50,000, with a polyamide material other than said prepolymer component wherein said polyamide material is an at least three-membered ring lactam, a polymerizable ω-amino acid or a salt obtained by the reaction of a dibasic acid with a diamine or a prepolymer of said polyamide material.

5,011,894

BLENDS OF A POLY(ARYL ETHER KETONE) AND A POLYARYLATE

Lloyd M. Robeson, Whitehouse Station, and James E. Harris, Piscataway, both of N.J., assignors to Amoco Corporation, Chicago, Ill.

Division of Ser. No. 295,114, Jan. 9, 1989, and a continuation of Ser. No. 87,175, Aug. 17, 1987, abandoned, and a continuation of Ser. No. 797,765, Nov. 14, 1985, abandoned, and a continuation of Ser. No. 625,915, Jun. 29, 1984, abandoned. This application Aug. 22, 1989, Ser. No. 396,849

Int. Cl.[5] **C08F** *20/00*

U.S. Cl. 525—437 **15 Claims**

1. A blend comprising a crystalline poly(aryl ether ketone) and a liquid crystalline polyarylate selected from the group consisting of:

(a) a homopolymer of p-hydroxybenzoic acid,

(b) a copolymer of p-hydroxybenzoic acid, terephthalic and isophthalic acids and 4,4′-biphenol,

(c) a copolymer of p-hydroxybenzoic acid and 6-hydroxy-2-naphthoic acid in a 75/25 molar ratio,

(d) a copolyester obtained by polymerizing p-acetoxybenzoic acid in a polyethylene terephthalate matrix and;

(e) a copolymer of p-hydroxybenzoic acid, terephthalic acid and 4,4′-biphenol.

5,011,895

PRECIPITATION POLYMERIZATION OF COPOLYMERS OF A VINYL LACTAM AND A POLYMERIZABLE CARBOXYLIC ACID USING SUB-SURFACE FEEDING

Jenn S. Shih, Paramus; Terry E. Smith, Morristown; John Zamora, Paramus, and Minas Economidis, Passaic, all of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Filed Jun. 4, 1990, Ser. No. 532,843

Int. Cl.[5] **C08F** *2/00, 26/00*

U.S. Cl. 526—88 **10 Claims**

1. A precipitation polymerization process for making fine, white, powdered copolymers of vinyl pyrrolidone and acrylic acid which comprises:

(a) charging a reactor with a solvent in which the copolymer product is substantially insoluble over the entire compositional range of the copolymers, and a polymerization initiator, which is heated to 50° to 150° C., and agitated; and

(b) simultaneously feeding said vinyl pyrrolidone and acrylic acid monomers in the weight ratio of about 3:1 to 10:1, respectively, into said reactor below the surface of the solvent over a period of about 1 to 9 hours while continuing to agitate the reaction mixture to control the exother-

mic heating of the reaction solution and to precipitate the copolymer as a fine, white powder from solution to produce a reaction product having up to about 40% solids.

5,011,896

SYNDIOTACTIC 1,2-POLYBUTADIENE SYNTHESIS IN AN AQUEOUS MEDIUM

Anthony J. Bell, Stow, and Eilert A. Ofstead, Cuyahoga Falls, both of Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio

Filed Sep. 10, 1990, Ser. No. 579,650
Int. Cl.[5] C08F *2/22, 136/06*
U.S. Cl. 526—92 **16 Claims**

1. In the process of synthesizing syndiotactic 1,2-polybutadiene in an aqueous medium by polymerizing 1,3-butadiene with a catalyst system which contains a transition metal compound, an organoaluminum compound, and carbon disulfide: the improvement which comprises reducing the melting point of the syndiotactic 1,2-polybutadiene by conducting said process in the presence of at least one aromatic aldehyde selected from the group consisting of (a) 4-(alkylamino)benzaldehydes, (b) 4-(dialkylamino)benzaldehydes, (c) 2,4-di-(alkoxy)benzaldehydes, (d) 2,6-di-(alkoxy)benzaldehydes, (e) 2,4,6-tri-(alkoxy)-benzaldehydes and (f) 4-(1-azacycloalkyl)benzaldehydes.

5,011,897

PROCESS FOR PREPARING VINYL CHLORIDE POLYMER USING HYDROXYPHENYL MONOMERS

Tadashi Amano, Ibaraki, and Junichi Watanabe, Ageo, both of Japan, assignors to Shin-Etsu Chemical Co., Ltd., Tokyo, Japan

Continuation-in-part of Ser. No. 158,620, Feb. 22, 1988, abandoned. This application May 8, 1989, Ser. No. 348,511
Claims priority, application Japan, Mar. 6, 1987, 62-51641
Int. Cl.[5] C08F *2/20*
U.S. Cl. 526—202 **6 Claims**

1. A process for preparing a vinyl chloride containing polymer, comprising:

suspension polymerizing vinyl chloride or a vinyl monomer mixture containing vinyl chloride in an aqueous medium; and

adding an antioxidant dispersion consisting essentially of from about 5 to 50% by weight of an antioxidant having a melting point of not lower than 30° C. and selected from the group consisting of triethylene glycol-bis[3-(3-t-butyl-5-methyl-4-hydroxyphenyl)-propionate], n-oxtadecyl-3-(4'-hydroxy- 3',5'-di-t-butylphenyl)propionate, t-butylhydroxyanisole, 3,5-di-t-butyl-4-hydroxytolune, and 1,6-hexanediol-bis[3-(3,5-di-t-butyl-4-hydroxyphenyl)propionate] and a suspending agent which is a water-soluble polyvinyl alcohol having a saponification degree of 60 to 98% and a polymerization degree of 600 to 3000 in water to the polymerization system, wherein said antioxidant dispersion has been heated once to a temperature not lower than the melting point of the antioxidant and then cooled, prior to addition of the dispersion to the polymerization system.

5,011,898

ACRYLIC AMPHOTERIC POLYMERS

Robert P. Foss, Hockessin, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Division of Ser. No. 176,806, Apr. 1, 1988, abandoned, which is a division of Ser. No. 377,373, May 12, 1982, Pat. No. 4,943,888
Int. Cl.[5] C08F *2/00*
U.S. Cl. 526—234 **4 Claims**

1. Amphoteric polymer derived from:

(a) 20 to 90 mol percent of acrylic acid units,

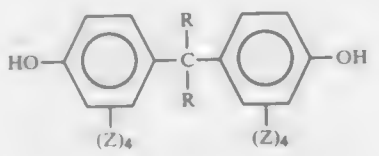
(b) 10 to 30 mol percent of N,N-dimethylaminoethyl methacrylate or N,N-diethylaminoethyl methacrylate units, and

(c) 0 to 70 mole percent of units from one or more members of the group consisting of C_{1-8} alkyl acrylate, C_{1-8} alkyl methacrylate, 2-hydroxyethyl acrylate, 2-hydroxyethyl methacrylate, 2-hydroxypropyl acrylate and 2-hydroxypropyl methacrylate; said polymer prepared by copolymerizing (a), (b) and (c), in solution, in the presence of a strong acid selected from the group consisting of nitric acid, sulfuric acid and hydrochloric acid, in a quantity sufficient to protonate the amine group of (b),

the polymer characterized further by having (i) a molar ratio of (a) to (b) of at least 2 to 1, and (ii) substantially no betaine-type contaminant.

5,011,899

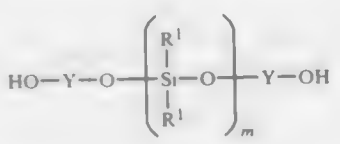
COPOLY(AROMATIC SULFONE CARBONATE - AROMATIC ALKYLCARBONATE) - POLYSILOXANE BLOCK COPOLYMER



Paul D. Sybert, Pittsfield, Mass., assignor to General Electric Company, Pittsfield, Mass.

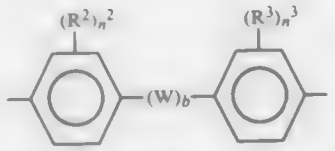
Filed Aug. 15, 1989, Ser. No. 394,710
Int. Cl.[5] C08G *77/04*
U.S. Cl. 528—26 **10 Claims**

1. A polysulfonecarbonate-siloxane block copolymer derived from the reaction products of:

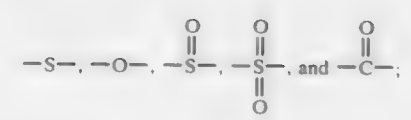


(a) bis-(3,5-dimethyl-4-hydroxyphenyl)sulfone;

(b) a dihydric phenol represented by the formula:



wherein each R is independently selected from the group consisting of hydrogen, monovalent hydrocarbon radicals and halogenated hydrocarbon radicals, each Z being independently selected from the group consisting of hydrogen, lower alkyl radicals and halogen radicals;



(c) a siloxane compound represented by the formula:

wherein m is on average from 5 to 90, each R^1 is independently selected from the group consisting of monovalent hydrocarbon radicals, halogenated hydrocarbon radicals and cyanoalkyl radicals, Y is represented by the formula:

wherein R^2 is independently selected from the group consisting of halogen, monovalent hydrocarbon, and monovalent hydrocarbonoxy radicals; R^3 is independently selected from the group consisting of halogen, monovalent hydrocarbon, and monovalent hydrocarbonoxy radicals; W is selected from the group consisting of divalent hydrocarbon radicals,

n^2 and n^3 are independently selected from the group consisting of integers having a value of from 0 to 4 inclusive; and b is either 0 or 1; and

(d) a carbonate precursor.

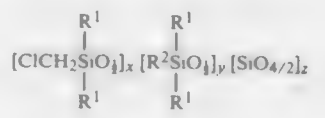
5,011,900

CURABLE COMPOSITION

Sadao Yukimoto; Toshifumi Hirose; Hiroshi Wakabayashi, and Katsuhiko Isayama, all of Hyogo, Japan, assignors to Kanegafuchi Kagaku Kogyo Kabushiki Kaisha, Osaka, Japan

Filed Jun. 7, 1989, Ser. No. 362,714
Claims priority, application Japan, Jun. 10, 1988, 63-144014
Int. Cl.[5] C08F *283/00*
U.S. Cl. 525—477 **10 Claims**

1. A curable composition comprising (A) 100 parts by weight of an oxyalkylene polymer having at least one silicon-containing group in which a hydroxyl group and/or hydrolyzable group is or are bonded to the silicon atom, said polymer being crosslinkable by formation of a siloxane bond, (B) from 0.1 to 20 parts by weight of a compound having one silanol group per molecule and/or a compound capable of forming a compound having one silanol group per molecule on reacting with moisture, and (C) from 0.1 to 20 parts by weight of a compound having an air oxidative curing unsaturated group.



5,011,901

POLYORGANOSILOXANE WITH CHLOROMETHYL GROUPS

Yoshimi Fukutani, Chiba, Japan, assignor to Dow Corning Toray Silicone, Tokyo, Japan

Continuation-in-part of Ser. No. 355,511, May 23, 1989, abandoned. This application Nov. 13, 1989, Ser. No. 434,202
Claims priority, application Japan, May 25, 1988, 63-127284; Nov. 10, 1988, 63-284650
Int. Cl.[5] C08G *77/24*
U.S. Cl. 528—42 **8 Claims**

1. Polyorganosiloxane with a molecular weight of 500 to 500,000 which has the following general formula

in which R^1 is a monovalent hydrocarbon group having 1 to 6 carbon atoms; R^2 is a hydrogen atom or a monovalent hydrocarbon group having 1 to 6 carbon atoms; x and z are positive numbers; y is zero or a positive number; and x, y, and z have values such that their ratios are $0.3 \leqq (x+y)/z \leqq 4$; and $\text{zero} \leqq y/x \leqq 100$.

CO-CATALYST SYSTEM FOR PREPARING POLYURETHANE BASED PLYWOOD-PATCH COMPOSITIONS

Millard E. Foucht, Stone Mountain, Ga., assignor to Georgia-Pacific Resins, Inc., Atlanta, Ga.

Filed Nov. 1, 1989, Ser. No. 430,048
Int. Cl.[5] C08G *18/22*
U.S. Cl. 528—55 **50 Claims**

1. A process for preparing a polyurethane elastomer consisting essentially of the step of reacting a polyol selected from polyether polyols and polyester polyols with an organic polyisocyanate wherein the ratio of NCO groups to hydroxyl groups is greater than about 1.00 to 1 in the presence of a catalytic amount of a co-catalyst system, said co-catalyst system consisting essentially of an organo-bismuth compound and at least one organo-metallic compound, wherein said at least one organo-metallic compound contains a metal selected from the group consisting of zinc, antimony, lithium and combinations thereof and wherein the bismuth contained in said organo-bismuth compound and said metal contained in said organo-metallic compound are present in an effective mole ratio of bismuth to said metal, with the proviso that if said metal is zinc then said effective mole ratio is from about 1:4 to about 1:1, with the proviso that if said metal is antimony then said effective mole ratio is from about 1:1.1 to about 1:0.4, and with the proviso that if said metal is lithium then said effective mole ratio is from about 1:6.6 to less than about 1:1.6.

5,011,903

ENCAPSULATING AND PATCHING ELASTOMER FOR CONCRETE REPAIRS AND METHOD OF MAKING THE SAME

Frank M. Lymburner, Romeo, and Charles M. Peterson, Franklin, both of Mich., assignors to Peterson Elastomers, Inc., Pontiac, Mich.

Continuation of Ser. No. 792,574, Oct. 29, 1985, abandoned. This application Jan. 7, 1988, Ser. No. 145,635
Int. Cl.[5] C08G *18/48, 18/34, 18/32*
U.S. Cl. 528—76 **1 Claim**

1. An encapsulating and patching elastomer for concrete repairs, and protection, said elastomer comprising: a two component urethane system including a polyol reacted with a diisocyanate or a mixture of diisocyanates and a hindered amine, said elastomer having a hardness of over 50 on the Share A scale said polyol being selected from the group including proprylene oxide adducts of diols and triols, caprolactone-based multifunctional polyols, and polytetramethylene ether glycol, said hindered amine being an oligomeric diamine, said oligomeric diamine being polytetramethylene oxide-di-p-aminobenzoate.

5,011,904

EPOXY RESIN COMPOSITIONS BASED ON ALKOXYLATED PHENOLS

Michael B. Cavitt, Lake Jackson; Dennis L. Steele, and David J. Duncan, both of Freeport, all of Tex., assignors to The Dow Chemical Company, Midland, Mich.

Filed Nov. 20, 1989, Ser. No. 439,211
Int. Cl.[5] C08G *59/06, 59/08*
U.S. Cl. 528—103 **13 Claims**

1. An epoxy-containing composition which comprises a mixture of

(I) a product having an average of more than one vicinal epoxide group per molecule which results from dehydrohalogenating the product resulting from reacting

(A) a mixture of

(1) the product resulting from reacting

(a) at least one compound having an average of more than one aromatic hydroxyl group per molecule; with

(b) at least one alkylene oxide having from 2 to about 4 carbon atoms per molecule in an amount which provides a ratio of moles of component (b) to aromatic hydroxyl groups contained in component (a) of from about 1:1 to about 8:1; and

(2) at least one compound having an average of more than one aliphatic hydroxyl group per molecule which compound is free of aromatic rings, wherein components (1) and (2) are present in amounts such that from about 30 to about 70 percent of the hydroxyl groups are contributed by component (1) and from about 70 to about 30 percent of the hydroxyl groups are contributed by component (2) the percentages being based upon the total amount of hydroxyl groups contributed by components (1) and (2); with

(B) at least one epihalohydrin wherein the ratio of moles of

epihalohydrin per hydroxyl group contained in components (1) and)2) is from about 1.08:1 to about 1.7:1; and (II) at least one aromatic or cycloaliphatic epoxy resin having an average of more than one vicinal epoxide group per molecule and having a degree of polymerization of from about 1 to about 14.

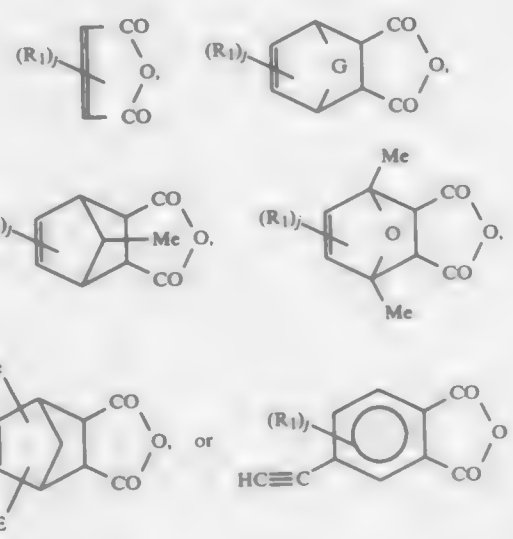
POLYIMIDE OLIGOMERS AND BLENDS

Hyman R. Lubowitz, Rolling Hills Estates, Calif., and Clyde H. Sheppard, Bellevue, Wash., assignors to The Boeing Company, Seattle, Wash.



Continuation of Ser. No. 46,376, May 4, 1987, and a continuation-in-part of Ser. No. 810,818, Dec. 17, 1985, abandoned, said Ser. No. 46,376, is a continuation-in-part of Ser. No. 715,801, Mar. 22, 1985, abandoned, which is a continuation-in-part of Ser. No. 536,264, Sep. 17, 1983, abandoned, said Ser. No. 810,818, is a continuation-in-part of Ser. No. 536,350, Sep. 27, 1983, abandoned, which is a continuation-in-part of Ser. No. 519,394, Aug. 3, 1983, abandoned. This application Aug. 13, 1990, Ser. No. 566,999

Int. Cl.[5] C08G *73/12*

U.S. Cl. 528—170 **30 Claims**

1. A monofunctional crosslinkable, thermoplastic, polyimide oligomer which is the product formed by reacting under an inert gas atmosphere a mixture comprising:

(a) two moles of a crosslinkable monoanhydride selected from the group consisting of:

wherein

Me=methyl;

G=—O—, —SO_2—, —CH_2—, —S—;

E=allyl or methallyl;

R_1=lower alkoxy, aryl, substituted aryl, lower alkyl, substituted alkyl, aryloxy, or halogen; and

j=0, 1, or 2;

(b) n+1 moles of a polyaryl diamine having terminal amino groups, the diamine including alternating aryl radicals (—Ar—) connected together by alternating ether (—O—) and sulfone (—L—) linkages, wherein each sulfone linkage (—L—) is selected from the group consisting of —SO_2—, —S—, —CO—, —$(CF_3)_2C$—, and —$(CH_3)_2C$—, so that the dimaine has a general formula:

$$H_2N—Ar—O—Ar—L—Ar—O]_mAr—NH_2$$

wherein

Ar=an aromatic radial, and

m=a small integer greater than or equal to 1; and

(c) n moles of at least one dianhydride, wherein n=an integer selected so that the oligomer prossesses thermoplastic properties and has an average formula weight of between about 5,000 to 40,000.

PURIFIED CILIARY NEUROTROPHIC FACTOR

Franklin D. Collins, 582 Locust Pl., Boulder, Colo. 80302, and Leu-Fen Lin, 854 Braun Ct., Golden, Colo. 80401

Filed Jan. 5, 1989, Ser. No. 293,851

Int. Cl.[5] C07K *3/14, 3/18, 3/24, 3/28*

U.S. Cl. 530—399 **1 Claim**

1. A method for purifying sciatic nerve ciliary neurotrphic factor and the specific activity of said factor by at least about 25,000 fold from crude sciatic nerve extract comprising:

lowering the pH of the crude nerve extract to form a first precipitate;

removing and discarding said first precipitate from the lowered pH extract;

raising the pH of said extract to about 6.3;

adding ammonium sulfate to the raised pH extract;

chromatofocusing a solution containing a second precipitate obtained from the 30% to 60% ammonium sulfate containing solution;

subjecting fractions obtained by chromatofocusing to sodium dodecyl sulfate polyacrylamide gel electrophoresis; and

performing reversed-phase high-performance liquid chromatography on the sodium dodecyl sulphate polyacrylamide gel electrophoresis eluate.

PROCESS FOR PURIFYING RECOMBINANT HEPATITIS ANTIGENS

Shigeko Yamazaki, Hatfield, Pa., assignor to Merck & Co., Inc., Rahway, N.J.

Filed Oct. 26, 1987, Ser. No. 113,582

Int. Cl.[5] C07K *3/26*

U.S. Cl. 530—414 **15 Claims**

1. A method of substantially purifying recombinant preS1/S2/S hepatitis B antigen, or portion thereof immunochemically reactive with antibodies specific to natural hepatitis surface antigen, comprising the steps of

(a) taking an aliquot of yeast membrane associated antigen extract;

(b) removing the debris of the extract of step (a) by centrifugation;

(c) subjecting the supernatant to diafiltration in the presence of a solution comprising guanidine-HCl of concentrations varying during the diafiltration from between about 7M and 1M, said solution effective to release undesired yeast membrane-bound proteins, and thereafter removing said undesired yeast membrane-bound proteins to yield washed yeast membrane as a retentate product;

(d) subjecting the retentate product of step (c) to a second solution comprising a buffered solution containing octoxynol-9.5 at a concentration of between about 0.1% (w/v) and about 1% (w/v), said second solution effective to release the membrane-bound surface antigen;

(e) subjecting the surface antigen released in step (d) to diafiltration in a third solution to promote passage of said surface antigen across the diafiltration membrane, yielding a filtrate;

(f) treating the filtrate with a quantity of denaturing agent in the presence of a reducing agent effective to solubilize said filtrate; and

(g) removing the denaturing agent and the reducing agent, yielding a substantially purified recombinant pre-S1/S2/S hepatitis B antigen, or portion thereof immunochemically reactive with antibodies specific to natural hepatitis surface antigen.

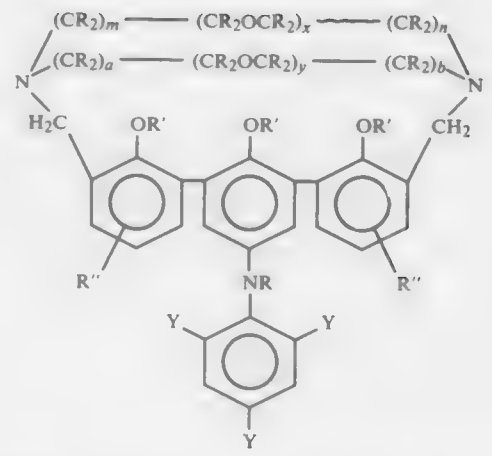
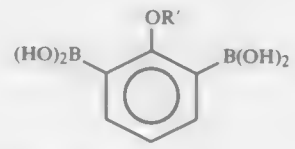
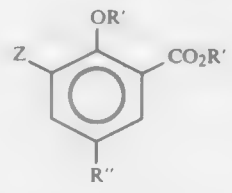
1. A chromogenic cryptahemispherand having the structure



wherein:
R, same or different, is hydrogen, lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
R′, same or different, is lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
R″, same or different, is hydrogen, lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
Q is a chromogenic moiety capable of providing a detectable response upon the complexation of said compound with a test cation in a test sample, and has the structure

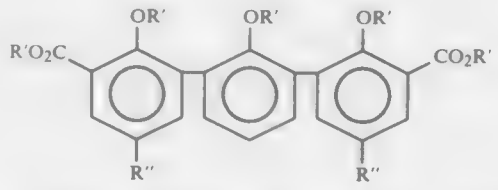


wherein G is 2,4,6-trinitroanilino; 2,6-dinitro-4-trifluoromethylanilino; 2,4-dinitro-6-trifluoromethylanilino; 4-nitroanilino; 4-nitrophenylazo; 4-nitrostyryl; and 4-benzoquinonmonoimino;
a, b, m and n, same or different, are 1 to 3;
x is 1 to 4; and
y is 1 to 4.



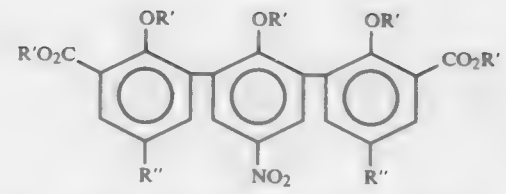
4. A process for the preparation of a chromogenic cryptahemispherand (I) having the formula

(I)



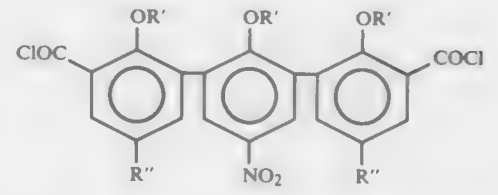
in which:
R, same or different, is hydrogen, lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
R′, same or different, is lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
R″, same or different, is hydrogen, lower alkyl, lower alkylidene, lower alkenyl, allyl or aryl;
Y, same or different, is an electron withdrawing group selected from the group consisting of CN_1, NO_2, CF_3 or COOR;
x is 1 to 4; and
y is 1 to 4;
said process comprising the steps of:
(a) providing a compound (II) having the formula

(II)



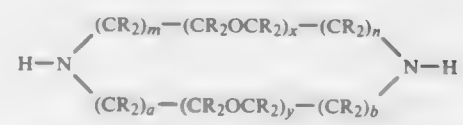
(b) providing a compound (III) having the formula

(III)



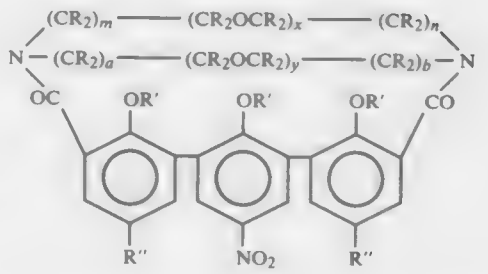
in which Z is halogen;
(c) reacting compounds (II) and (III) in the presence of a catalyst to form a compound (IV) having the formula

(IV)



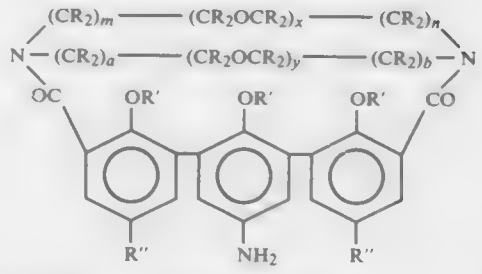
(d) nitrating compound (IV) to obtain a compound (V) having the formula

(V)



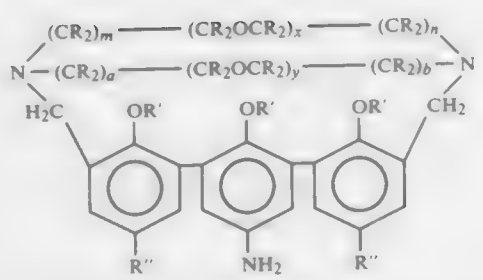
(e) reacting compound (V) with a methylating agent followed by hydrolysis and chlorination to obtain a compound (VI) having the formula

(VI)



(f) reacting compound (VI) with a compound (VII) having the formula

(VII)



to form a compound (VIII) having the formula

(VIII)

(g) reducing compound (VIII) to form a compound (IX) having the formula

(IX)

(h) reducing compound (IX) to form compound (X) having the formula

(X)

(i) reacting compound (X) with an aryl chloride to form compound (I).

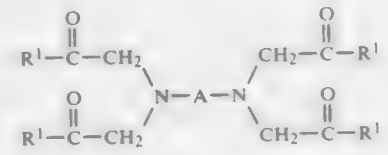
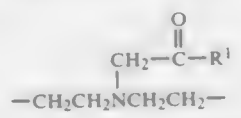
MORPHOLINOAMIDO EDTA DERIVATIVES



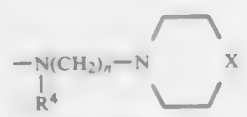
Raghavan Rajagopalan, Maryland Heights, and Muthunadar P. Periasamy, Creve Coeur, both of Mo., assignors to Mallinckrodt, Inc., St. Louis, Mo.

Continuation-in-part of Ser. No. 321,265, Mar. 9, 1989, abandoned. This application Sep. 5, 1989, Ser. No. 402,623

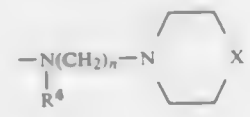


Int. Cl.[5] **C07D** *295/00, 417/00, 413/00, 241/04*

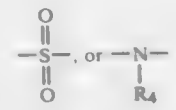
U.S. Cl. 544—58.1 **5 Claims**



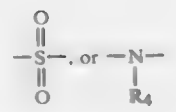
1. A complexing agent of the formula:



wherein A is —CHR^2—CHR^3— or



R^1 groups may be the same or different and are selected from —O^- and



wherein R^4 is hydrogen, alkyl, hydroxyalkyl, alkoxyalkyl, aminoalkyl or acylamino wherein the carbon-containing portions contain from 1 to about 6 carbon atoms, wherein at least one of said R^1 groups is

n is between 1 and 6;

X is —O—, —S—,

and which members are unsubstituted or substituted by hydroxy, alkyl, aryl, hydroxyalkyl, aminoalkyl, aminoaryl, alkylamino, or carbamoyl wherein the substitutents contain from 1 to about 6 carbon atoms; and

R^2 and R^3 may be the same or different and are hydrogen, alkyl having from 1 to about 6 carbon atoms, phenyl or benzyl or $R^2$and R^3 joined together form a ring having 5, 6, or 7 members.

NICKEL-BASED DUAL CATALYST SYSTEMS EFFECTIVE IN SUPPRESSING CARBON DIOXIDE FORMATION DURING DIETHYLENE GIYCOL AMINATION

John F. Knifton, Austin, Tex., assignor to Texaco Chemical Company, White Plains, N.Y.

Filed Jun. 25, 1990, Ser. No. 543,017

Int. Cl.[5] **C07D** *295/023*

U.S. Cl. 544—106 **9 Claims**

1. A process for simultaneously producing morpholine and DIGLYCOLAMINE ® amine while suppressing CO_2 formation comprising the steps of:

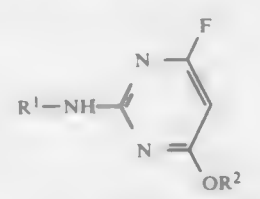
reacting anhydrous diethylene glycol with ammonia in the presence of added hydrogen over a dual nickel-based catalyst system comprising a nickel-chromium oxide catalyst in combination with an oxide-supported nickel catalyst at a temperature of from about 150° C. to about 300° C. and a pressure of about 200 psig to about 5000 psig, and

isolating said morpholine compound and said DIGLYCOLAMINE ® amine from the reaction products.

5,011,927

PREPARATION OF 2-AMINO-4-FLUOROPYRIMIDINE DERIVATIVES

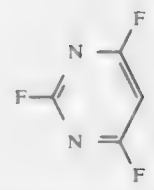
Gerhard Hamprecht, Weinheim, Fed. Rep. of Germany, assignor to BASF Aktiengesellschaft, Ludwigshafen, Fed. Rep. of Germany



Filed Dec. 18, 1989, Ser. No. 452,106

Claims priority, application Fed. Rep. of Germany, Jan. 10, 1989, 3900471

Int. Cl.[5] **C07D** *239/47*

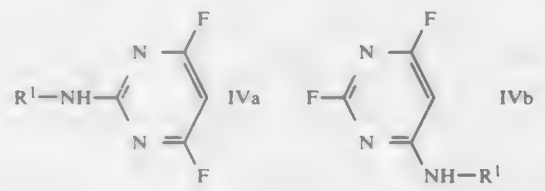


U.S. Cl. 544—320 **12 Claims**

1. A process for the preparation of a 2-amino-4-fluoropyrimidine derivative of the general formula I

I

where R^1 is hydrogen, alkyl, alkenyl, alkynyl, cycloalkyl, phenyl or benzyl, it being possible for the aromatic rings to be substituted once to three times by radicals inert to the reaction conditions, R^2 is one of the R^1 radicals with the exception of hydrogen, by reaction of 2,4,6-trifluoropyrimidine (II)



II

in an aprotic polar organic solvent with an amine of the formula III

$$R^1—NH_2 \qquad \text{III}$$

to give the 2-aminodifluoropyrimidine derivative of the formula IVa mixed with IVb

IVa IVb

separation of IVa out of the resulting reaction mixture and subsequent reaction of IVa with an alcohol of the formula V

$$R^2—OH \qquad \text{V}$$

in the presence of a base at from 0° to 180° C. to give the 2-amino-4-fluoropyrimidine derivative I, which comprises carrying out the reaction of 2,4,6-trifluoropyrimidine II with the amine III at from −80° C. to −15° C., and reacting the 2-aminodifluoropyrimidine derivative IVa with the alcohol V in the presence of an organic base to give the 2-amino-4-fluoropyrimidine derivative I.

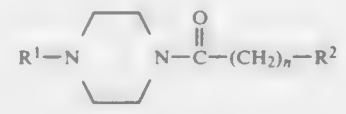
ANALGESIC AND ANTIINFLAMMATORY DERIVATIVES OF 1-ACYL-4-ARYLALKYLPIPERAZINES

Aurelio O. Venero, and Antonio T. Avello, both of Vizcaya, Spain, assignors to Fabrica Espanola de Productos Quimicos Y Farmeceuti Cos S.A. (FAES), Spain



Filed Feb. 28, 1990, Ser. No. 486,098

Claims priority, application European Pat. Off., Feb. 28, 1989, 89500021.4

Int. Cl.[5] **C07D** *403/12, 401/12, 405/12, 409/12*

U.S. Cl. 544—373 **5 Claims**

1. Compounds of structural formula I:

I

wherein

the substituent R^1 is methyl, ethyl, 1-methyl-ethyl or 2-phenylethyl,

n=0, 1 or 2,

R^2 is selected from the group consisting of one of the following radicals:

4-chlorophenyl, 3-chlorophenyl, 2-chlorophenyl, 4-methylphenyl, 3-methylphenyl, 2-methylphenyl, 4-hydroxyphenyl, 3-hydroxyphenyl, 2-hydroxyphenyl, 4-fluorophenyl, 3-fluorophenyl, 2-fluorophenyl, 4-acetoxyphenyl, 3-acetoxyphenyl, 2-acetoxyphenyl, 4-methoxyphenyl, 3-methoxyphenyl, 2-methoxyphenyl, 4-aminophenyl, 3-aminophenyl, 2-aminophenyl, 4-nitrophenyl, 3-nitrophenyl, 2-nitrophenyl, 3-thienyl, 2-furyl, 3-furyl, 2-pyridinyl, 3-pyridinyl, 4-pyridinyl, 2-thiazolyl, 3-methyl-2-thienyl, 5-methyl-2-thienyl, 5-methyl-3-methoxy-2-thienyl, 5-phenyl-3-methoxy-2-thienyl, 2-tetrahydrothienyl, 2-tetrahydrofuryl, 3-tetrahydrothienyl, 1H-2-isoindolyl-1,3(2H)-dioxo, 1-(1H-2-isoindolyl-1,3(2H)-dioxo)-ethyl, 1H-2-isoindolyl-1,3(2H)-dioxo-4,4a,5,6,7,7a-hexahydro, 1H-2-isoindolyl-1,3(2H)-dioxo-4,4a,7,7a-tetrahydro, 1H-2-isoindolyl-1,3(2H)-dioxo-4-nitro, 1H-2-isoindolyl-1,3(2H)-dioxo-4-amino, 1H-pyrrolyl-2,5-dihydro-2,5-dioxo, 1-pyrrolidinyl-2,5-dioxo, 8-azaspiro<4,5>decan-8-yl-7,9-dioxo, 1,2-benzoisothiazol-2-yl-6-carboxy-3(2H)oxo 1,1-dioxide, 1,2-benzoisothiazol-2-yl-3(2H)oxo 1,1-dioxide, 1,2-benzoisothiazol-2-yl-6-nitro-3(2H)oxo 1,1-dioxide, 1,2-benzoisothiazol-2-yl-6-amino-3(2H)oxo 1,1-dioxide, 1,2-benzoisothiazol-2-yl-6-acetylamino-3(2H)oxo 1,1-dioxide, 1-2-benzoisothiazol-2-yl-6-(methylsulfonylamino)-3(2H)oxo 1,1-dioxide, phenoxy, 4-methylphenoxy, 4-chlorophenoxy, 4-fluorophenoxy, 4-chloro-2-methylphenoxy, 4-acetoxyphenoxy, 3-acetoxyphenoxy, 4-hydroxyphenoxy, 3-hydroxyphenoxy, 4-aminophenoxy, 3-aminophenoxy, 4-nitrophenoxy, 3-nitrophenoxy, 3-methoxyphenoxy, amino, acetylamino, methylsulfonylamino, 2-(2-thienyl)-1-ethenyl, 2-(3-thienyl)-1-ethenyl, 2-(3-methyl-2-thienyl)-1-ethenyl, 2-(5-methyl-2-thienyl)-1-ethenyl, 2-(5-methyl-3-methoxy-2-thienyl)-1-ethenyl, 2-(5-phenyl-3-methoxy-2-thienyl)-1-ethenyl, 2-(5-chloro-2-thienyl)-1-ethenyl, 2-(3-chloro-2-thienyl)-1-ethenyl, 2-(3-hydroxy-2-thienyl)-1-ethenyl, 1-amino-ethyl, 1-acetylamino-ethyl and 1-(methylsulfonylamino)-ethyl and the physiologically acceptable salts of such compounds.

5,011,929

SYNTHESIS OF MANNOJIRIMYCIN DERIVATIVES

George W. J. Fleet, and Ian Bruce, both of Oxford, United Kingdom, assignors to Monsanto Company, St. Louis, Mo.

Continuation of Ser. No. 352,068, May 15, 1989, abandoned. This application Oct. 11, 1989, Ser. No. 419,806

Int. Cl.[5] **C07F** *7/02;* **C07D** *211/36*

U.S. Cl. 546—14 **6 Claims**

1. A method for the synthesis of 6-epihomomannojirimycin comprising

a. Reacting 2-azido-7-O-tert-butyl-dimethylsilyl-2-deoxy-b 3,4-O-isopropylidene-D-glycero-D-talo-heptono-1,5-lactone with trifluoromethanesulfonic anhydride to give an azidotriflate,

b. Subjecting the azidotriflate to palladium catalyzed reductive hydrogenation to form a bicyclic lactone,

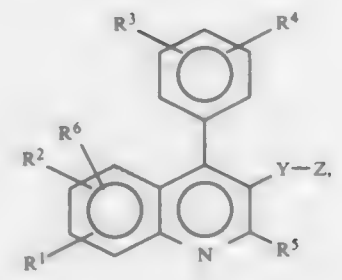
c. Reducing the bicyclic lactone with lithium aluminum hydride to give a protected iminoheptitol, and

d. Removing the protecting groups from the iminoheptitol by acid hydrolysis to give 6-epihomomannojirimycin.

5,011,930

QUINOLINE TYPE MEVALONOLACTONES

Yoshihiro Fujikawa; Mikio Suzuki; Hiroshi Iwasaki, all of Funabashi; Mitsuaki Sakashita, and Masaki Kitahara, both of Shitaoka, all of Japan, assignors to Nissan Chemical Industries Ltd., Tokyo, Japan



Division of Ser. No. 233,752, Aug. 19, 1988. This application Feb. 23, 1990, Ser. No. 483,720

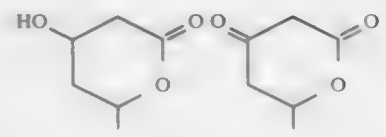
Claims priority, application Japan, Aug. 20, 1987, 62-207224; Jan. 26, 1988, 63-15585

Int. Cl.[5] **C07D** *215/00, 221/06*

U.S. Cl. 546—101 **7 Claims**

1. A compound of the formula

wherein R^1 is hydrogen, 5-fluoro, 6-fluoro, 7-fluoro, 8-fluoro, 5-chloro, 6-chloro, 7-chloro, 8-chloro, 5-bromo, 6-bromo, 7-bromo, 8-bromo, 5-methyl, 6-methyl, 7-methyl, 8-methyl, 5-methoxy, 6-methoxy, 7-methoxy, 8-methoxy, 5-trifluoromethyl, 6-trifluoromethyl, 7-trifluoromethyl, 8-trifluoromethyl, 6-trifluoromethoxy, 6-difluoromethoxy, 8-hydroxyethyl, 5-hydroxy, 6-hydroxy, 7-hydroxy, 8-hydroxy, 6-ethyl, 6-n-butyl or 7-dimethylamino;



R^2, R^3 and R^6 are hydrogen,

R^4 is hydrogen, 4'-chloro or 4'-fluoro,

R^5 is i-propyl or cyclopropyl,

Y is (E) —CH=CH—, and

Z is

—$CH(OH)CH_2CH(OH)CH_2CO_2R^{12}$, —$CH(OH)CH_2C(O)CH_2CO_2R^{12}$ or —$CH(OH)CH_2C(OR^{13})_2CH_2CO_2R^{12}$, wherein R^{12} is hydrogen, physiologically hydrolyzable alkyl, NH_4, sodium, potassium, ½ calcium, or a hydrate of lower alkylamine, di-lower alkylamine or tri-lower alkylamine; two R^{13} are independently primary or secondary C_{1-6} alkyl; or two R^{13} together form —$(CH_2)_2$— or —$CH_2)_3$—.

7. The compound (E)-3,5-dihydroxy-7-[7',8'-(1'',3''-butadienyl)-2'-cyclopropyl-4'-(4''-fluorophenyl)-quinolin-3'-yl]-hept-6-enoic acid, a lactone formed by the condensation of the carboxylic acid with hydroxy at the 5-position, or a sodium salt or C_{1-3} alkyl ester of the carboxylic acid.

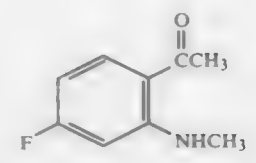
5,011,931

PROCESS FOR THE PREPARATION OF 1-METHYL-3-METHYLTHIO-4-QUINOLONE AND THE SULFINYL, AND SULFONYL ANALOGS THEREOF

Lachlan MacLean; David L. Roberts, both of Nottinghamshire; Kenneth Barron, Tyne and Wear; Kenneth J. Nichol, and Albert E. Harrison, boht of Nottinghamshire, all of Great Britain, assignors to The Boots Company PLC, Nottingham, England

PCT No. PCT/GB88/00952, § 371 Date Jun. 23, 1989, § 102(e) Date Jun. 23, 1989, PCT Pub. No. WO89/04827, PCT Pub. Date Jun. 1, 1989

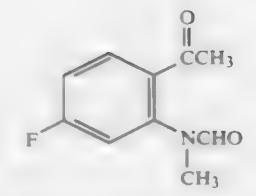
PCT Filed Nov. 7, 1988, Ser. No. 378,216



Claims priority, application United Kingdom, Nov. 18, 1987, 87/26950

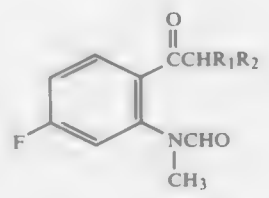
Int. Cl.[5] **C07D** *215/316;* **C07C** *233/15*

U.S. Cl. 546—155 **3 Claims**



1. A process to prepare a compound of formula I in which n is 0 comprising the following stages:

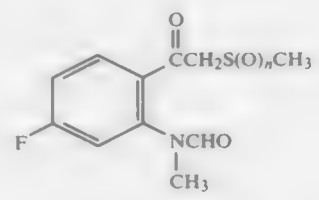
(a) formylating a compound of formula V



V

to give a compound of formula IV

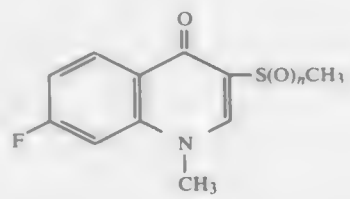
IV



(b) reacting the product of stage (a) with a halogenating agent to give a compound of formula III

III

in which R_1 is halo and R_2 is halo or hydrogen;



(c) reacting the product of stage (b) with a sulphur nucleophile in the form of a methanethiolate anion to give a compound of formula II

II

in which n is 0; and

(d) cyclising the product of stage (c) in the presence of an organic or inorganic base to give the compound of formula I

I

in which n is 0.

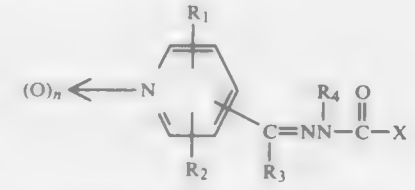
ANTHELMINTIC PYRIDINYL ACYLHYDRAZONES DERIVATIVES

Douglas L. Rector, Kalamazoo; George A. Conder, Richland, and Sylvester D. Folz, Kalamazoo, all of Mich., assignors to Upjohn Company, Kalamazoo, Mich.



PCT No. PCT/US86/00072, § 371 Date Oct. 3, 1986, § 102(e) Date Oct. 3, 1986

Continuation-in-part of Ser. No. 715,425, Mar. 25, 1985, abandoned, which is a continuation-in-part of Ser. No. 700,375, Feb. 11, 1985, abandoned. This PCT application Jan. 23, 1986, Ser. No. 934,575

Int. Cl.[5] **C07D** *405/12, 409/12, 213/76*

U.S. Cl. 546—268 **11 Claims**

1. A compound, hydrate thereof or pharmaceutically acceptable salt thereof of the formula

I

wherein X is selected from (a) hydrogen; (b) C_1–C_{10} alkyl; (c) C_2–C_6 alkenyl; (d) C_2–C_6 alkynyl; (e) cyclo(C_3–C_{10})alkyl optionally substituted with one, 2 or 3 C_1–C_4 alkyl, C_2–C_4 alkenyl, C_1–C_4 alkoxy, trifluoromethyl, or halo; (j) C_2–C_6 alkoxyalkyl; (k) cyclo(C_3–C_{10})alkyl(C_1–C_4)alkyl; (l) phenyl(C_1–C_4)alkyl optionally substituted with one, 2 or 3 C_1–C_4 alkyl, C_1–C_4 alkoxy, halo, or trifluoromethyl; (m) phenoxy(C_1–C_4)alkyl optionally substituted with C_1–C_4 alkyl, C_1–C_4 alkoxy, halo, or trifluoromethyl; (n) naphthyl(C_1–C_3)alkyl optionally substituted with one or 2 C_1–C_4 alkyl, C_1–C_4 alkoxy, halo, or trifluoromethyl; (u) phenyl optionally substituted with one, 2 or 3 C_1–C_4 alkyl, C_1–C_3 alkoxy, halo, trifluoromethyl, C_2–C_6 dialkylamino, C_1–C_3 alkylthio, nitro, or phenoxy optionally substituted with one, 2 or 3 C_1–C_4 alkyl, C_1–C_3 alkoxy, halo, or trifluoromethyl; (v) phenyl optionally substituted with the divalent C_1–C_2 alkylenedioxy; (w) naphthyl optionally substituted with one or 2 C_1–C_4 alkyl, C_1–C_3 alkoxy, halo, trifluoromethyl, C_2–C_6 dialkylamino, C_1–C_3 alkylthio, nitro; (x) bridged polycyclic hydrocarbon substituents of six to 10 nuclear carbons, optionally substituted with one, 2 or 3 (C_1–C_3) alkyl groups; (y) perhalo(C_1–C_7)alkyl;

wherein R_1 and R_2, being the same or different, are hydrogen; hydroxy; C_1–C_4 alkyl; C_1–C_3 alkoxy; C_1–C_3 alkylthio; halo or trifluoromethyl;

wherein R_3 is hydrogen; C_1–C_4 alkyl; cyclo(C_3–C_6)alkyl optionally substituted with one, 2 or 3 C_1–C_3 alkyl; phenyl optionally substituted with one, 2 or 3 C_1–C_4 alkyl, halo, trifluoromethyl, or C_1–C_3 alkoxy; phenyl(C_1–C_3)alkyl optionally substituted with one, 2 or 3 C_1–C_4 alkyl, halo, trifluoromethyl, or C_1–C_3 alkoxy; or 1,3-dioxacyclohexan-5-yl;

wherein R_4 is hydrogen;

wherein n is zero or one;

with the overall proviso that when R_1 and R_2 are both hydrogen, R_3 is hydrogen or alkyl, and n is zero, X is other than (b) C_1–C_{10} alkyl, (e) cyclo(C_1–C_{10})alkyl, (l) phenyl(C_1–C_4)alkyl optionally substituted with halo or C_1–C_4 alkoxy, or (u) phenyl optionally substituted with halo or C_1–C_4 alkoxy;

other than:

benzoic acid [(2-ethyl-4-pyridiny)methylene]hydrazide;

4-dimethylamino benzoic acid (4-pyridinylmethylene)hydrazide;

4-methylbenzoic acid (2-pyridinylmethylene)hydrazide;

4-methylbenzoic acid (2-pyridinylmethylene)hydrazide 1-oxide;

4-methylbenzoic acid (4-pyridinylmethylene)hydrazide;

3,4-dimethoxybenzoic acid [(2-ethyl-4-pyridinyl)methylene]hydrazide;

4-t-butylbenzoic acid(3-pyridinylmethylene)hydrazide;

benzoic acid (α-2-pyridinylbenzylidene)hydrazide;

2-nitrobenzoic acid (4-pyridinylmethylene)hydrazide;

2-nitrobenzoic acid (2-pyridinylmethylene)hydrazide;

2-nitrobenzoic acid (3-pyridinylmethylene)hydrazide;

4-nitrobenzoic acid [(2-ethyl-4-pyridinyl)methylene]hydrazide;

4-nitrobenzoic acid [1-(4-pyridinyl)ethylidene]hydrazide;

2,4,5-trichlorophenoxyacetic acid (4-pyridinylmethylene)-hydrazide;

2,4,5-trichlorophenoxyacetic acid (3-pyridinylmethylene)-hydrazide;

2,4,5-trichlorophenoxyacetic acid (2-pyridinylmethylene)-hydrazide;

2,4-dichlorophenoxyacetic acid (4-pyridinylmethylene)hydrazide;

2,4-dichlorophenoxyacetic acid (3-pyridinylmethylene)hydrazide;

2,4-dichlorophenoxyacetic acid (2-pyridinylmethylene)hydrazide;

4-chlorophenoxyacetic acid (4-pyridinylmethylene)hydrazide;

4-chlorophenoxyacetic acid (3-pyridinylmethylene)hydrazide;

4-chlorophenoxyacetic acid (2-pyridinylmethylene)hydrazide;

1-napthylacetic acid [1-(3-pyridinyl)ethylidene]hydrazide;

1-napthylacetic acid [1-(4-pyridinyl)ethylidene]hydrazide;

1-napthylacetic acid [1-(2-pyridinyl)ethylidene]hydrazide;

1-napthylacetic acid (2-pyridinylmethylene)hydrazide;

1-napthylacetic acid (3-pyridinylmethylene)hydrazide; and

1-napthylacetic acid (4-pyridinylmethylene)hydrazide.

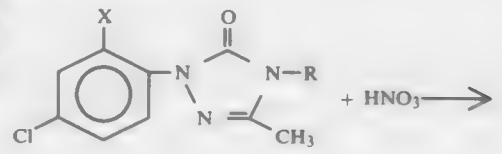
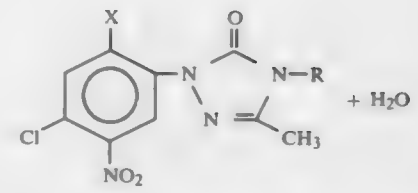
NITRATION OF PHENYL TRIAZOLINONES



John H. Hoare, Hamilton Square, and Marc Halfon, Cranberry, both of N.J., assignors to FMC Corporation, Philadelphia, Pa.

Filed Feb. 26, 1990, Ser. No. 485,106



Int. Cl.[5] **C07D** *249/12*

U.S. Cl. 548—263.2 **7 Claims**

1. Process for the nitration of a compound of formula I below with nitric acid in sulfuric acid, according to the following general equation:

(I)

where X is a Cl or F and R is haloalkyl, in which the improvement comprises carrying out said reaction in fuming sulfuric acid.

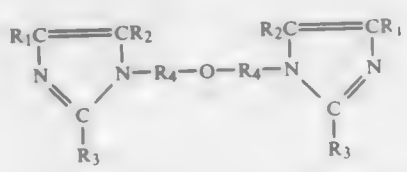
5,011,934

PROCESS FOR PREPARING 1-ALKYLIMIDAZOLES

Heinz-Guenther Schulte; Jeffrey L. Narum, both of Santa Rosa, and Michael R. Johnson, Rohnert Park, all of Calif., assignors to Henkel Research Corporation, Santa Rosa, Calif.

Filed Jun. 19, 1990, Ser. No. 540,037
Int. Cl.[5] C07D *233/58*
U.S. Cl. 548—335 9 Claims

1. A process for preparing a 1-alkylimidazole comprising the steps of: (1) heating a mixture comprised of an imidazole, a base, and a non-reactive aromatic solvent to a temperature of from about 75° C. to about 115° C.; (2) adding to said heated mixture from about 0.8 to about 1.0 moles of an alkyl halide per mole of said imidazole over a period of from about 1 hr to about 5 hours to produce a reaction mixture; (3) maintaining the temperature of said reaction mixture for period of time sufficient to produce a product mixture comprising a solution of said 1-alkylimidazole in said solvent and inorganic material; and, (4) separating said inorganic material from said solution.



5,011,935

IMIDAZOLE ETHER COMPOUNDS

Keiichi Nakatani, and Nobuyasu Nakasugi, both of Kyoto, Japan, assignors to San-Apro Limited, Tokyo, Japan

Filed Jun. 27, 1989, Ser. No. 371,774
Claims priority, application Japan, Jun. 27, 1988, 63-158919
Int. Cl.[5] C07D *403/12*
U.S. Cl. 548—336 2 Claims

1. An imidazole ether compound of the formula (1):

(1)

wherein R_1, R_2 and R_3 are each hydrogen, methyl or ethyl group, and R_4 is ethylene, n-propylene or isopropylene group.

5,011,936

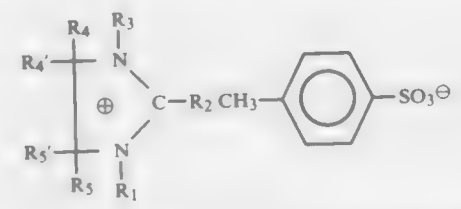
PROCESS FOR REFINING 1,3-DIMETHYL-2-IMIDAZOLIDINONE

Tadashi Kobayashi; Mitsuo Wada; Shouzi Obuchi, all of Omuta, and Hiroshi Takayanagi, Yokohama, all of Japan, assignors to Mitsui Toatsu Chemicals, Inc., Tokyo, Japan

Filed Mar. 7, 1989, Ser. No. 319,698
Claims priority, application Japan, Jan. 4, 1988, 63-78186; Aug. 3, 1988, 63-52493; Aug. 2, 1989, 1-27373
Int. Cl.[5] C07D *233/32*
U.S. Cl. 548—343 14 Claims

1. A process for refining 1,3-dimethyl-2-imidazolidinone which comprises the step of bringing 1,3,dimethyl-2-imidazolidinone into contact with a composite salt containing at least two composition components selected from the group consisting of MgO, SiO_2 and Al_2O_3.

8. A process for refining 1,3 dimethyl-2-imidazolidinone comprising the step of contacting 1,3 dimethyl-2-imidazolidinone with a hydrated composite salt, wherein said salt is selected from the group consisting of (a) a hydrated composite salt including SiO_2 and MgO, and (b) a hydrated composite salt including at least one first component selected from the group consisting of SiO_2 and MgO and at least one second component selected from the group consisting of alkaline metal oxides, alkaline earth metal oxides, amphoteric oxides and carbon group oxides.



5,011,937

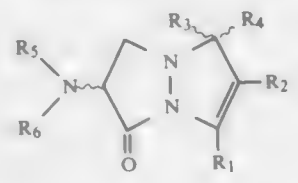
TOLUENE SULFONATE SALTS OF 2-ALKYL IMIDAZOLINES

Cheruthur Govindan, Wadsworth, Ohio, assignor to PPG Industries, Inc., Pittsburgh, Pa.

Filed Nov. 14, 1988, Ser. No. 270,709
Int. Cl.[5] C07D *233/10, 233/14;* C08K *5/34*
U.S. Cl. 548—354 6 Claims

1. A compound represented by the graphic formula:

wherein R^1 and R^3 are each selected from the group consisting of hydrogen, C_1-C_2 alkyl and hydroxy (C_2-C_4) alkyl, R_2 is C_6-C_{22} alkyl, and R_4, R_4', R_5 and R_5' are each selected from the group consisting of hydrogen, C_1-C_2 alkyl, hydroxy (C_1-C_2) alkyl and phenyl.



5,011,938

7-SUBSTITUTED BICYCLIC PYRAZOLIDINONES

Charles J. Barnett; Richard E. Holmes; Louis N. Jungheim, all of Indianapolis; Sandra K. Sigmund, Carmel, and Robert J. Ternansky, Noblesville, all of Ind., assignors to Eli Lilly and Company, Indianapolis, Ind.

Division of Ser. No. 418,782, Oct. 2, 1989, Pat. No. 4,940,718, which is a continuation of Ser. No. 103,488, Sep. 30, 1987, abandoned, which is a continuation-in-part of Ser. No. 862,906, May 14, 1986, abandoned, which is a continuation-in-part of Ser. No. 729,021, Apr. 30, 1985, abandoned. This application Apr. 3, 1990, Ser. No. 503,574
Int. Cl.[5] C07D *231/00*
U.S. Cl. 548—359 10 Claims

1. A compound of the formula:

wherein:

either R_1 or R_2 is hydrogen, halo, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, perfluoro C_2 to C_4 alkyl, C_7 to C_{12} phenylalkyl, C_7 to C_{12} substituted phenylalkyl, phenyl, substituted phenyl, nitro or cyano; a group of the formula

$$-CX_3$$

wherein

X is fluoro, chloro, bromo or iodo; a group of the formula

$$-S(O)_z-R_7$$

wherein

Z is 0, 1 or 2 and R_7 is C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_2 to C_7 alkenyl, C_2 to C_7 alkynyl, phenyl, substituted phenyl, C_7 to C_{12} phenylalkyl, C_7 to C_{12} substituted phenylalkyl, or (disubstituted)amino; a group of the formula

$$-COR_8$$

wherein

R_8 is hydrogen, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, perfluoro C_2 to C_4 alkyl, trihalomethyl, C_7 to C_{12} arylalkyl, C_7 to C_{12} substituted arylalkyl, phenyl, substituted phenyl, amino, (monosubstituted)amino, or (disubstituted-)amino; a group of the formula

$$-C(=N-OR_8')-R_8$$

wherein

R_8 is as defined above and R_8, ' is hydrogen, C_1 to C_6 alkyl, C_2 to C_7 alkenyl, C_2 to C_7 alkynyl, phenyl, substituted phenyl, C_7 to C_{12} phenylalkyl, C_7 to C_{12} substituted phenylalkyl; a group of the formula

$$-COOR_9$$

wherein

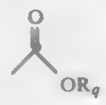
R_9 is hydrogen, an organic or inorganic cation, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_7 to C_{12} arylalkyl, C_7 to C_{12} substituted arylalkyl, phenyl, substituted phenyl, a carboxy-protecting group, or a non-toxic, metabolically-labile, ester-forming group; a group of formula

$$-PO_3(R_{10})_2$$

wherein

R_{10} is hydrogen, an organic or inorganic cation, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_7 to C_{12} arylalkyl, C_7 to C_{12} substituted arylalkyl, phenyl, or substituted phenyl; a group of the formula

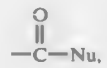
$$-OR_{11}$$



wherein

R_{11} is hydrogen, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_7 to C_{12} phenylalkyl, C_7 to C_{12} substituted phenylalkyl, phenyl, substituted phenyl, or C_1 to C_7 acyl; or a group of the formula

$$-NR_{12}R_{13}$$



wherein

R_{12} and R_{13} are the same or different and are hydrogen, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_7 to C_{12} phenylalkyl, C_7 to C_{12} substituted phenylalkyl, phenyl, substituted phenyl, C_1 to C_7 acyl, or a group of the formula

wherein

R_q is C_1 to C_6 alkyl, C_7 to C_{12} phenylalkyl or phenyl; or one of R_{12} and R_{13} is hydrogen and the other is a group of the formula

wherein

Nu is (monosubstituted)amino, (disubstituted)amino, C_1 to C_6 alkylthio, C_2 to C_7 alkenylthio, C_1 to C_6 substituted alkylthio, phenylalkylthio, C_7 to C_1 phenylalkylthio, or C_7 to C_{12} substituted phenylalkylthio, C_1 to C_6 alkyl alcohol, C_1 to C_6 substituted alkyl alcohol, phenyl alcohol, substituted phenyl alcohol, C_7 to C_{12} phenylalkyl alcohol, or C_7 to C_{12} substituted phenylalkyl alcohol;

and the other of R_1 or R_2 is a group of the formula

$$-COOR_{14}$$

wherein

R_{14} is hydrogen, an organic or inorganic cation, a carboxy-protecting group or a non-toxic, metabolicallylabile ester-forming group; and

R_3 and R_4 are the same or different and are hydrogen, C_1 to C_6 alkyl, C_1 to C_6 substituted alkyl, C_7 to C_{12} arylalkyl, C_7 to C_{12} substituted arylalkyl, phenyl, substituted phenyl or a group of the formula

$$-COOR_{15}$$

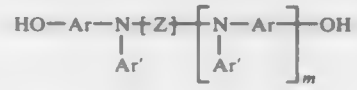
wherein

R_{15} has the same definition as R_9;

R_5 and R_6 are:

(1) each hydrogen; or

(2) different and are either hydrogen or an amino-protecting group.

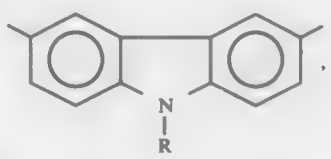


5,011,939

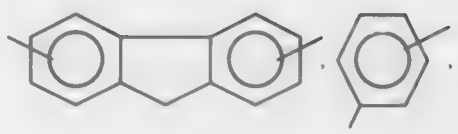
HYDROXY FUNCTIONALIZED ARYLAMINE COMPOUNDS

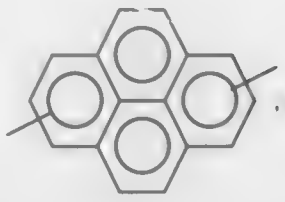
William W. Limburg, Penfield; John F. Yanus; Dale S. Renfer, both of Webster; Richard L. Schank, Pittsford, all of N.Y., and Beng S. Ong, Mississauga, Canada, assignors to Xerox Corporation, Stamford, Conn.

Division of Ser. No. 198,254, May 24, 1988, which is a continuation-in-part of Ser. No. 61,247, Jun. 10, 1987, abandoned. This application May 23, 1989, Ser. No. 355,728
Int. Cl.[5] C07D *209/82;* C07C *211/00, 209/00*
U.S. Cl. 548—440 3 Claims



1. A hydroxy arylamine compound represented by the formula:

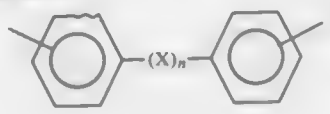


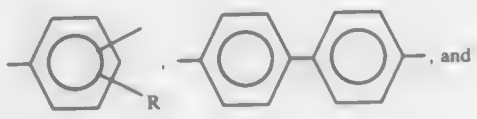


wherein:

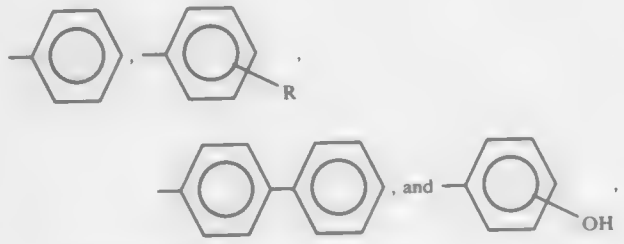
m is 0 or 1,

Z is selected from the group consisting of:

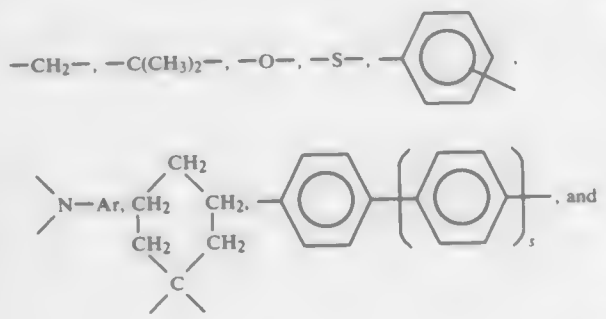




, and



-continued



n is 0 or 1,
Ar is selected from the group consisting of:

R is selected from the group consisting of $-CH_3$, $-C_2H_5$, $-C_3H_7$, and $-C_4H_9$, Ar' is selected from the group consisting of:

X is selected from the group consisting of:

s is 0, 1 or 2,
said hydroxy arylamine compound being free of any segment having the formula:

$$-C{\equiv}C)_n C{\equiv}C-$$

where n=0 or 1, in one or more aromatic rings directly between an —OH group and the nearest nitrogen atom.

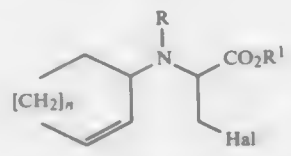
PROCESS FOR THE PREPARATION OF BICYCLIC AMINO CARBOXYLIC ACIDS, INTERMEDIATES IN THIS PROCESS, AND THEIR USE

Hansjörg Urbach, Taunus, and Rainer Henning, Hattersheim am Main, both of Fed. Rep. of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Fed. Rep. of Germany

Filed Jul. 1, 1988, Ser. No. 214,457
Claims priority, application Fed. Rep. of Germany, Jul. 3, 1987, 3722007
Int. Cl.[5] C07D *209/02*
U.S. Cl. 548—452 19 Claims



1. A process for the preparation of a compound of the formula I

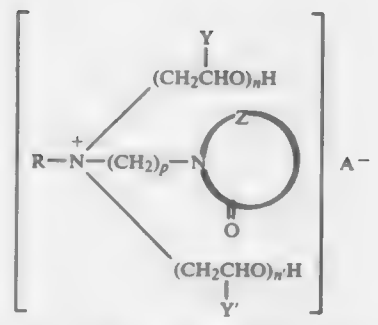
(I)

in which
n=1, 2 or 3;
R denotes (C_1-C_6) -alkanoyl, (C_6-C_{10})-aryl-(C_1-C_4)-alkanoyl, (C_6-(C_{10})-aroyl, (C_1-C_6)-alkoxycarbonyl, (C_7-C_{11})-aralkyloxycarbonyl or, if not covered by the above definition, R is a urethane type protecting grup selected from Pyoc (4-pyridylmethyloxycarbonyl), Fmoc (9-fluoroenylmethyloxycarbonyl), Tcboc (2,2,2-trichloro-t-butyloxycarbonyl), Z (benzyloxycarbonyl), Box (t-butyloxycarbonyl), Ddz (α,α-dimethyl3,5-dimethyloxybenzyloxycarbonyl), Bpoc (1-(4-biphenylyl)-1-methyl-ethyloxycarbonyl), Adoc (1-adamantyloxycarbonyl), Msc (methyl-sulfonyl-ethyloxycarbonyl), Moc (4-methyl-oxybenzyloxycarbonyl), $Z(NO_2)$ (4-nitrobenzyloxy-carbonyl), $Z(Hal)_n$ (halogenosubstituted benzyloxycarbonyl), Dobz (4-dihydroxyborylbenzyloxycarbonyl), Iboc (isobornyloxycarbonyl), Adpoc (1-(1-0adamantyl)-1-methyl-ethyloxycarbonyl), Mboc (1-methylcyclobutyloxy-carbonyl) and 1,4-dimethylpyridyloxycarbonyl; and
R^1 denotes (C_1-C_6)-alkyl, (C_3-C_7)-cycloalkyl, (C_7-C_{11})-aralkyl, p-nitrobenzyl, p-methoxybenzyl, p-bromobenzyl, p-chlorobenzyl, 4-picolyl or benzoylmethyl,

which comprises radical cyclization of a compound of the formula II

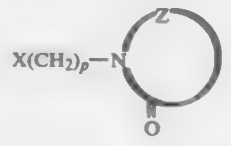
(II)

in which n, R and R^1 are as defined above, and Hal denotes chlorine, bromine or iodine with at least one trialkylstannane in an aprotic solvent at a temperature of from −20° C. to 120° C.



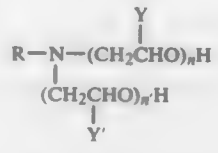
5,011,941

QUATERNIZED NITROGEN CONTAINING COMPOUNDS



Ratan K. Chaudhuri, Butler; David J. Tracy, Lincoln Park, and Robert B. Login, Oakland, all of N.J., assignors to GAF Chemicals Corporation, Wayne, N.J.

Division of Ser. No. 370,226, Jun. 22, 1989. This application Sep. 14, 1990, Ser. No. 582,289
Int. Cl.[5] C07D *207/12, 211/76, 295/12*
U.S. Cl. 548—550 4 Claims



1. The process of synthesizing the compound having the formula

wherein n and n' are each independently integers having a value of from 1 to 25; p is an integer having a value of from 1 to 4; Y and Y' are each independently H or CH_3; R is linear alkyl, alkenyl, or amidoalkyl having from 8 to 22 carbon atoms and is optionally substituted with C_1 to C_4 alkyl; Z is linear alkylene having from 3 to 8 carbon atoms and is optionally substituted with lower alkyl and A^- is an anion which comprises reacting under anhydrous conditions a N-haloalkyl lactam of the formula

with a slight excess of a tertiary amine having the formula

wherein p, Z, R, Y, Y', n and n' are as defined and X is a halogen atom; said reaction being carried out under a pressure of from about 0 to about 50 psig and at a temperature not in excess of 85° C. to produce the corresponding addition product as a quaternized ammonium halide and optionally reacting said quaternized ammonium halide with a sulfate or sulfonate ion exchange agent to provide the corresponding sulfate or sulfonate salt.

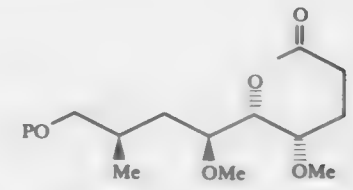
5,011,942

PROCESS FOR RACEMIZING AN ENANTIOMER OF 5,6-DIHYDRO-4-ALKYLAMINO-4H-THIENO(OR FURO) [2,3-B]-THIOPYRAN-2-SULFONAMIDE-7,7-DIOXIDE

Thomas J. Blacklock, Clark; Edward J. J. Grabowski, Westfield, and Paul Sohar, Warren, all of N.J., assignors to Merck & Co., Inc., Rahway, N.J.

Filed Feb. 5, 1990, Ser. No. 474,868
Int. Cl.[5] C07D *495/06*
U.S. Cl. 549—23 18 Claims

1. A process for racemizing the pharmacologically less active enantiomer of a 5,6-dihydro-4-alkylamino-4H-thieno (or furo) [2,3-b] thiopyran-2-sulfonamide-7,7-dioxide which comprises HEATING an N-acyl derivative thereof in the presence of a base, selected from the group consisting of: (a) formamide used as a solvent; (b) an anhydrous base selected from tri(C_{1-3}alkyl)-amine and an alkali metal C_{1-3}alkoxide in a protic solvent; followed by deacylation.

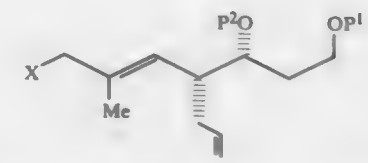


5,011,943

FK-506 C_{10}–C_{24} PROCESS INTERMEDIATES

Zhaoyin Wang, Pierrefonds, Canada, assignor to Merck Frosst Canada, Inc., Kirkland, Canada

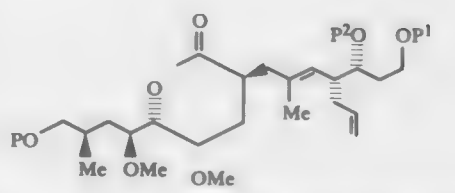
Filed Aug. 28, 1989, Ser. No. 399,206
Int. Cl.[5] C07D *309/30, 319/06;* C07C *69/767, 43/15*
U.S. Cl. 549—214 10 Claims



1. A compound of the formula:

XIII

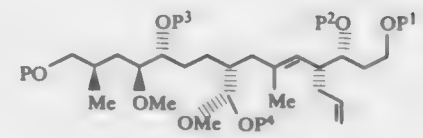
where P is a hydroxy protecting group selected from: trisubstituted silyl, benzyl and protected benzyl, and aroyl and alkanoyl.



3. A compound of the formula:

XXII

where X is a halide and P1 and P2 are hydroxy protecting groups independently selected from: trisubstituted silyl, benzyl and protected benzyl, and aroyl and alkanoyl; or P1 and P2 may be combined to form an aromatic methine diradical.



5. A compound of the formula:

XXIII

where P, P1 and P2 are hydroxy protecting groups independently selected from: trisubstituted silyl, benzyl and protected benzyl, and aroyl and alkanoyl; or P1 and P2 may be combined to form an aromatic methine diradical.

7. A compound of the formula:

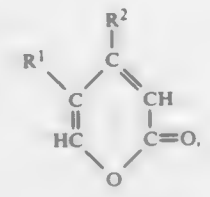
XXVI

where P, P^1, P^2, P^3 and P^4 are independently hydrogen or hydroxy protecting groups independently selected from: trisubstituted silyl, benzyl and protected benzyl, and aroyl and alkanoyl; with the proviso that P^3 and P^4 are different, or P^1 and P^2 may be combined to form an aromatic methine diradical.

5,011,944

SUBSTITUTED ALPHA-PYRONES

Vratislav Kvita, Reinach; Marcus Baumann, Basel; Walter Fischer, Reinach; Carl W. Mayer, Riehen, all of Switzerland, and Thomas Allmendinger, Steinen, Fed. Rep. of Germany, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.



Filed May 24, 1989, Ser. No. 356,825

Claims priority, application Switzerland, May 27, 1988, 2008/88; Jul. 19, 1988, 2753/88

Int. Cl.[5] C07D *309/32*

U.S. Cl. 549—214 **5 Claims**

1. A compound of the formula I

(I)

in which R^1 is $—CF_3$ or $—COOR^3$ and R^3 is the radical of a C_1-C_{18} alcohol diminished by a hydroxyl group, and R^2 is —F, —Br, —Cl, —CN, $—CF_3$, C_1-C_{18}alkyl, C_2-C_{18}alkenyl, C_2-C_{18}alkynyl, C_1-C_{18}alkoxy, C_1-C_{18}alkylthio, C_1-C_{18}alkylsulfonyl, C_6-C_{16}aryl, C_7-C_{24}alkaryl, C_7-C_{12}aralkyl, C_8-C_{24}alkaralkyl, C_6-C_{16}aryloxy, C_6-C_{16}arylthio, C_6-C_{16}arylsulfonyl, C_7-C_{24}alkaryloxy, C_7-C_{20}alkarylthio, C_7-C_{24}alkarylsulfonyl, C_7-C_{12}aralkyloxy, C_7-C_{12}aralkylthio, C_7-C_{12}aralkylsulfonyl, C_8-C_{24}alkaralyloxy, C_8-C_{24}alkaralylthio, C_8-C_{24}alkaralylsulfonyl, secondary amine having 2 to 24 C atoms or trialkylsilyl or trialkoxysilyl each of which has 3 to 18 C atoms wherein aryl is phenyl or naphthyl.

5,011,945

CONTINUOUS PROCESS FOR THE PRODUCTION OF MALEIC ANHYDRIDE

Hassan Taheri, Naperville, Ill., assignor to Amoco Corporation, Chicago, Ill.

Continuation-in-part of Ser. No. 91,440, Aug. 31, 1987, abandoned, and a continuation-in-part of Ser. No. 194,137, May 16, 1988, abandoned. This application Nov. 22, 1989, Ser. No. 440,309

Int. Cl.[5] C07D *307/60*

U.S. Cl. 549—260 **7 Claims**

1. A continuous process for the vapor-phase oxidation of a butane feedstock to produce maleic anhydride in high yield wherein catalyst productivity is within the range of from about 0.12 to about 0.18, measured in pounds of maleic anhydride produced per pound of catalyst per hour, which process comprises:

(a) contacting a nonflammable reactor feed consisting essentially of about 4 to about 10 mole % n-butane, about 10 to about 18 mole % oxygen, and the balance carbon oxides, wherein ratio of carbon monoxide to carbon dioxide is at least 1:1, with an oxidation catalyst comprising vanadium-phosphorus-oxygen, and a co-metal comprising molybdenum, wherein phosphorus-to-vanadium atomic ratio is in the range of from about 0.8:1 to about 2:1 and molybdenum-to-vanadium atomic ratio is in the range of from about 0.001:1 to about 0.2:1;

(b) oxidizing said n-butane in continuous recycle method in a reaction zone, said reaction zone having a feed end and an exit end, wherein volumetric space velocity is in the range of from about 1000 to about 3000/hour per pass, n-butane conversion to maleic anhydride per pass is in the range of from about 20 to 35 mole %, oxygen conversion per pass is from about 30 to about 70 mole %, reaction catalyst temperature is within the range of from about 830° F. to about 900° F., wherein an alkyl ester of orthophosphoric acid and water are continuously added to said reactor feed, and wherein said catalyst is graded along at least a portion of said reaction zone with minimum reactivity nearest the feed end of said reaction zone and maximum reactivity nearest the exit end of said reaction zone;

(c) withdrawing from said reaction zone an effluent comprising maleic anhydride, by-product oxygenated hydrocarbons, carbon oxides, unreacted n-butane and oxygen;

(d) separating a major portion of maleic anhydride and oxygenated hydrocarbon by-products from said effluent:

(e) removing from said effluent remaining after recovery of maleic anhydride and oxygenated hydrocarbons a purge stream at a rate substantially corresponding to the rate of build-up of carbon oxides in the reaction zone; and

(f) recycling effluent remaining after removal of the purge stream to the reaction zone with addition of make-up gases comprising n-butane and oxygen.

PROCESS FOR PREPARING D,L-LACTIDE

Joachim Hess, Bingen; Klaus R. Muller, Ingelheim, and Manfred Muller, Bickenbach, all of Fed. Rep. of Germany, assignors to Boehringer Ingelheim GmbH, Ingelheim am Rhein, Fed. Rep. of Germany

Filed May 25, 1990, Ser. No. 529,022

Claims priority, application Fed. Rep. of Germany, May 26, 1989, 3917178

Int. Cl.[5] C07D *319/12*

U.S. Cl. 549—274 **5 Claims**

1. A process for preparing D,L-lactide which comprises:

(a) dissolving D-lactide and L-lactide in a solvent or a mixture of solvents capable of forming an azeotrope with water, to produce a starting solution;

(b) filtering the starting solution;

(c) concentrating the filtered starting solution, to produce a residual solution;

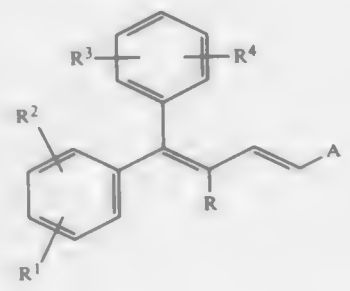
(d) cooling the residual solution until a crystalline precipitate of D,L-lactide forms;

(e) separating the crystalline precipitate from the remainder of the residual solution; and

(f) drying the crystalline precipitate.

5,011,947

ANTIHYPERCHOLESTEROLEMIC ALKYLENE COMPOUNDS



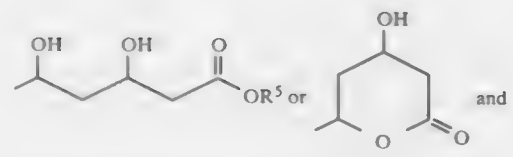
John D. Catt, Southington, and John J. Wright, Guilford, both of Conn., assignors to Bristol-Myers, New York, N.Y.

Continuation of Ser. No. 236,579, Aug. 25, 1988, abandoned. This application Jun. 12, 1990, Ser. No. 538,583

Int. Cl.[5] C07D *301/36;* **C09F** *7/08*

U.S. Cl. 549—292 **14 Claims**

1. A compound of the formula



I

wherein

R^1, R^2, R^3 and R^4 each are independently hydrogen, halogen, C_{1-4} alkyl, C_{1-4} alkoxy or trifluoromethyl;

R is C_{1-7} alkyl, C_{3-6} cycloalkyl, fluoromethyl, difluoromethyl or trifluoromethyl;

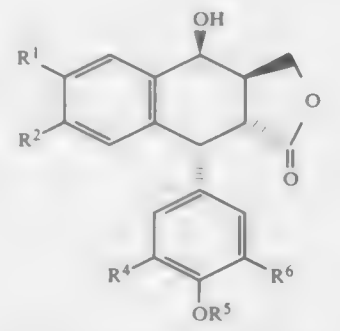
A is

and

R^5 is hydrogen, a hydrolyzable ester group or a cation to form a non-toxic pharmaceutically acceptable salt.

5,011,948

INTERMEDIATES FOR THE PRODUCTION OF EPIPODOPHYLLOTOXIN AND RELATED COMPOUNDS AND PROCESSES FOR THE PREPARATION AND USE THEREOF

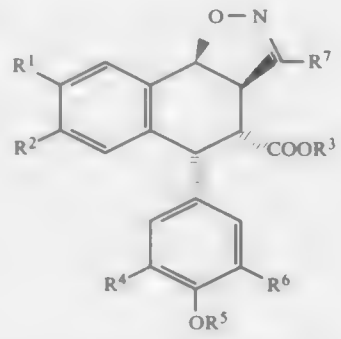


Dolatrai M. Vyas, Madison, Conn., and Paul M. Skonezny, Clay, N.Y., assignors to Bristol-Myers Company, New York, N.Y.

Division of Ser. No. 245,108, Sep. 16, 1988, Pat. No. 4,866,189, which is a division of Ser. No. 76,513, Jul. 22, 1987, Pat. No. 4,795,819, which is a division of Ser. No. 907,442, Sep. 15, 1986, Pat. No. 4,728,740, which is a division of Ser. No. 722,932, Apr. 12, 1985, Pat. No. 4,644,072. This application Jul. 14, 1989, Ser. No. 379,747

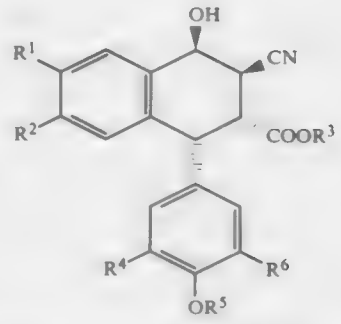
Int. Cl.[5] C07D *493/04, 307/92;* **C07C** *255/47*

U.S. Cl. 549—298 **3 Claims**



1. A process for the preparation of a compound of the formula

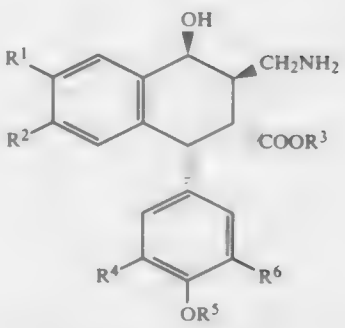
XII



wherein R^1 and R^2 each are independently hydrogen or (lower)alkoxy, or R^1 and R^2, taken together, is methylenedioxy; R^4 and R^6 each are independently hydrogen or (lower)alkoxy; and R^5 is hydrogen or a phenol-protecting group, or a pharmaceutically acceptable addition salt thereof, comprising the steps of:

(a) cleaving an isoxazole ring of the formula

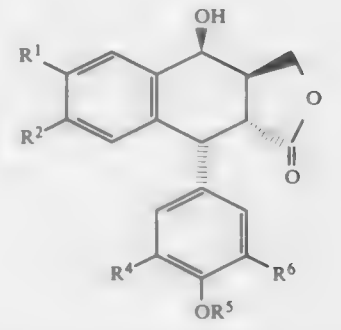
X



wherein R^1, R^2, R^3, R^4, R^5 and R^6 are as defined above, and R^7 is hydrogen, halogen, (lower)alkoxycarbonyl, carboxyl, cyano, trimethylsilyl, phenylsulfonyl orphenoxycarbonyl in which the phenyl ring of R^7 may contain one or two substituents independently selected from (lower)alkyl, halogen, (lower)alkoxy and trifluoromethyl, to produce a compound of the formula

XIc

wherein R^1, R^2, R^3, R^4, R^5 and R^6 are as defined above;

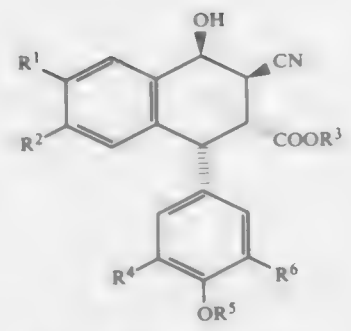


(b) selectively reducing the nitrile of Formula XIc to produce a compound of the formula

XId

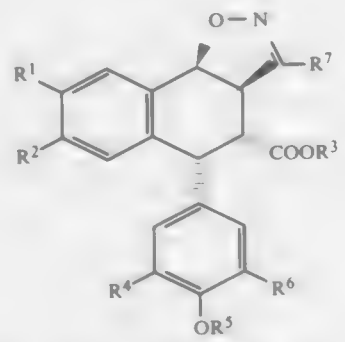
wherein R^1, R^2, R^3, R^4, R^5 and R^6 are as defined above, or a salt thereof; and, if R^3 is a carboxyl-protecting group, removing said carboxyl-protecting group to produce a compound of the Formula XId wherein R^3 is hydrogen; and

(c) cyclizing the compound of Formula XId by diazotization of the amino radical followed by lactonization to produce a compound of the formula



XII

wherein R^1, R^2, R^4, R^5 and R^6 are as defined above.



3. A process for the preparation of a compound of the formula

XIc

wherein R^1 and R^2 each are independently hydrogen or (lower)alkoxy, or R^1 and R^2, taken together, is methylenedioxy; R^3 is hydrogen or a carboxyl-protecting group; R^4 and R^6 each are independently hydrogen or (lower)alkoxy; and R^5 is hydrogen or a phenol-protecting group; or an addition salt thereof, comprising the step of cleaving the isoxazole ring of the formula

X

wherein R^7 is halogen; and R^1, R^2, R^3, R^4, R^5 and R^6 are as defined above, by selective reduction to produce said compound of Formula XIc.

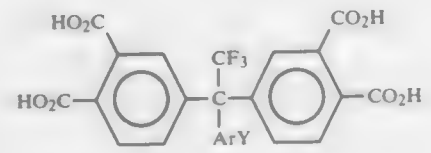
Int. Cl.[5] C07D *303/38*
U.S. Cl. 549—548 **1 Claim**

1. The epoxide of the formula

in which each of A and B is independently selected from CF_3, $CClF_2$, and C_2F_5; D is selected from H, CF_3, F, Cl, and Br; and E is selected from F, Cl, Br, COOR wherein R is lower alkyl, COOH, and COOM wherein M is alkali metal.

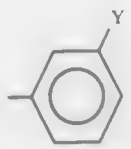
5,011,955

SUBSTITUTED 1,1,1-TRIARYL-2,2,2-TRIFLUOROETHANES AND PROCESSES FOR THEIR SYNTHESIS



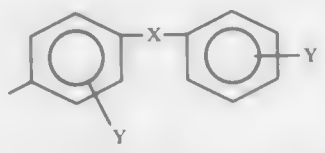
William B. Alston, 4668 Windfall Rd., Medina, Ohio 44256, and Roy F. Gratz, 902 Sylvania Ave., Fredericksburg, Va. 22401

Division of Ser. No. 292,049, Dec. 30, 1988, Pat. No. 4,912,238. This application Oct. 10, 1989, Ser. No. 419,554

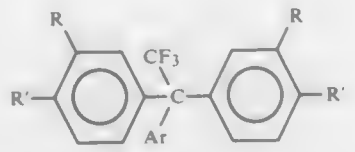


Int. Cl.[5] C07C *15/16;* **C09B** *11/04, 11/06*

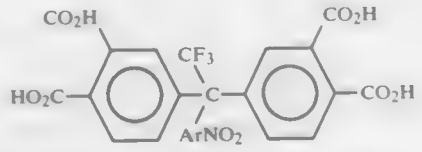
U.S. Cl. 552—101 **1 Claim**



1. A process for preparing



wherein ArY is



Y-substituted polycyclic aromatic hydrocarbons or substituted

wherein Y is ϕ-O, ϕ-S, ϕ-SO_2, ϕ-PH, ϕ_2-P, ϕHN, ϕ_2N or NO_2 and X is O, S, SO_2, NH, PH, Nϕ, Pϕ, C═O, CH_2 or $CH\phi_2$ which comprises oxidation of

in the presence of HNO_3, forming the oxidized product

which is subjected to a nucleophilic displacement reaction comprising reacting said oxidized product to Y radical containing nucleophilic reagents, wherein Y has the same meaning as above.

5,011,956

POLYMER LATEXES CONTAINING METAL IONS AND COMPLEXES

Warren T. Ford, 217 S. Ridge, Stillwater, Okla. 74078; Rama S. Chandran, 2 Aquarius Ct., Apt. 7, Somerville, N.J. 08876-4910; Mahmoud Hassanein, 101 - 5N. University Pl., Stillwater, Okla. 74078, and Hayrettin Turk, P.O. Box 1113, Stillwater, Okla. 74076

Division of Ser. No. 212,172, Jun. 27, 1988, Pat. No. 4,857,493. This application Jul. 6, 1989, Ser. No. 376,400

Int. Cl.[5] C07C *97/18*

U.S. Cl. 552—304 **10 Claims**

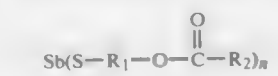
1. A method of catalysis of a chemical reaction by use of charged polymer latex particles comprising the steps of:

(a) preparing an aqueous colloidal suspension of charged polymer latex particles of from about 0.01 to about 1.5 micrometers in diameter which contain from about 0.01 to about 3.0 millimoles of metal complex per gram of dry polymer, wherein the polymer may be either uncrosslinked, or crosslinked with up to 25 mole percent of a polyfunctional monomer; and

(b) contacting reactants in the presence of said aqueous colloidal suspension prepared in step (a), thus catalyzing their reaction.

5,011,957

ANTIMONY MERCAPTIDE ESTERS AND METHODS OF PREPARING THE SAME



Howard F. Efner, Bartlesville, Okla., assignor to Phillips Petroleum Company, Bartlesville, Okla.

Division of Ser. No. 245,784, Sep. 16, 1988, Pat. No. 4,923,643. This application Mar. 12, 1990, Ser. No. 491,963

Int. Cl.[5] C07F *9/90*

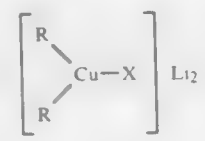
U.S. Cl. 556—77 **17 Claims**

1. An antimony mercaptide ester having the formula

wherein R_1 is selected from hydrocarbylene groups having from 2 to 18 carbon atoms, R_2 is selected from hydrocarbyl groups having from 1 to 35 carbon atoms and n is 5.

5,011,958

PROCESS FOR PREPARING HIGHER ORDER CUPRATE COMPLEXES



Arthur L. Campbell, Glenview; James R. Behling, Lindenhurst; John S. Ng, Chicago, and Kevin A. Babiak, Evanston, all of Ill., assignors to G. D. Searle & Co., Chicago, Ill.

Continuation of Ser. No. 219,427, Jul. 14, 1988, abandoned, which is a division of Ser. No. 59,294, Jun. 8, 1987, Pat. No. 4,785,124. This application Oct. 25, 1989, Ser. No. 427,067

Int. Cl.[5] C07F *1/08*

U.S. Cl. 556—110 **6 Claims**

1. A process for substituting a hydrocarbon group from a cuprate complex to an epoxide through a carbon to carbon bond comprising, preparing a higher order cuprate complex by bringing into reactive contact under an argon atmosphere a first cuprate complex of the formula:

or

$[R-Cu-(CN_2)]Li_2N(R^1)_4$

wherein

(a) X is —CN, —SCN, —OSO_2CF_3, or —S—phenyl;

(b) each R is independently lower alkyl, alkenyl, phenyl, naphthyl, phenanthryl, or thienyl, provided that (i) each of the aforementioned radicals is optionally substituted with non-interfering substituents and (ii) only one R in the first cuprate complex may be alkenyl, phenyl, naphthyl, phenanthryl, or thienyl; and

(c) each R^1 is independently lower alkyl; with a stannane compound of the formula;

$R_fSn(R^2)_3$

wherein each R^2 represents independently lower alkyl and R_f is a carbanion for carbon to carbon bond formation of the formula:

$(R^2)_3Sn-CH=CH-$

whereby R_f replaces at least one R on the first cuprate complex to form a higher order cuprate complex and reacting said higher order cuprate complex with an epoxide to substitute R_f from the higher order cuprate complex to the epoxide through a carbon to carbon bond.

5,011,959

1,2-DIAMINOCYCLOHEXANE-PLATINUM COMPLEXES WITH ANTITUMOR ACTIVITY

Abdul R. Khokhar; Robert A. Newman, and Irwin H. Krakoff, all of Houston, Tex., assignors to The Board of Regents, The University of Texas System, Austin, Tex.

Filed Nov. 17, 1986, Ser. No. 932,176

Int. Cl.[5] C07F *15/00;* **A01N** *43/04, 55/02;* **A61K** *31/28*

U.S. Cl. 556—137 **24 Claims**

1. A water-soluble square-planar cis-platinum(II) four-coordinate complex having the formula:

trans-R,R-DACH Pt(II) X_2

or

trans-R,R-DACH Pt(II) Y

wherein X is a monovalent cation, selected from the group consisting of galacturonato and N,N-dimethylglycinato; wherein Y is a divalent cation selected from the group consisting of citraconato, 1,1-cyclobutanedicarboxylato, 1,1-cyclopropanedicarboxylato, and Z-iminodiacetato where Z is bound to nitrogen and is ethyl, propyl, isopropyl, n-butyl, sec-butyl, ter-butyl, n-amyl, isoamyl or OH.

5,011,960

WIRING PATTERN DETECTION METHOD AND APPARATUS

Moritoshi Ando; Hiroshi Oka, and Satoshi Iwata, all of Atsugi, Japan, assignors to Fujitsu Limited, Kawasaki, Japan

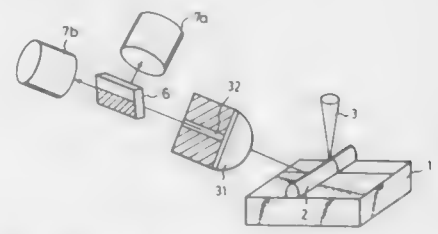
Filed May 9, 1989, Ser. No. 349,270

Claims priority, application Japan, May 20, 1988, 63-124118; Jul. 28, 1988, 63-188918

Int. Cl.[5] G01B *11/24;* **G01N** *21/00*

U.S. Cl. 356—376 **16 Claims**

1. A method of a detection of a wiring pattern using a triangulation method to detect a height thereof, comprising steps of:



illuminating a wiring pattern to be detected on a substrate by a scanned light beam from a light source;

blur-focusing light reflected from the wiring pattern and the substrate through a focusing lens at a focal point of the focusing lens;

separating the blur-focused reflected light into reflected light and transmitted light, each light having a different direction, through a beam-splitter, entered by the blur-focused reflected light;

detecting the separated reflected light and transmitted light using optical sensors, respectively;

measuring a difference in light intensity of the reflected light and the transmitted light; and

determining from the measured difference an upper threshold value and a lower threshold value relative to a height of the wiring pattern.

5,011,961

METHOD OF MAKING ORGANOSILBUTADIYNE POLYMERS

Roberto Bortolin, Barry, Italy, and Bhukandas Parbhoo, Midland, Mich., assignors to Dow Corning Limited, Barry, Wales

Filed Jun. 13, 1990, Ser. No. 537,843

Int. Cl.[5] C07F *7/08*

U.S. Cl. 556—431 **8 Claims**

1. A method of making polymers having the general formula $R'-[(R)_2Si-C\equiv C-C\equiv C]_n(R)_2SiR'$ wherein R is selected from the group consisting of hydrogen, hydrocarbon groups and substituted hydrocarbon groups, R' is selected from the group consisting of a hydroxyl group, halogen atoms, hydrogen, hydrocarbon groups and substituted hydrocarbon groups and n denotes an integer greater than 1 comprising (A) reacting $HC\equiv C-C\equiv CH-OZ$ with allkyllithium in a molar ratio of 1:3 wherein Z denotes an alkyl group having up to 6 carbon atoms followed by (B), further reacting the product of (A) with one or more dihalosilanes.

5,011,962

PROCESS FOR PREPARING ORGANOSILOXANES

Gerhard Staiger, Altölling; Johann Müller, and Walter Doskocil, both of Burghausen, all of Fed. Rep. of Germany, assignors to Wacker-Chemie GmbH, Munich, Fed. Rep. of Germany

Filed May 30, 1990, Ser. No. 530,380

Claims priority, application Fed. Rep. of Germany, Jun. 5, 1989, 3918337

Int. Cl.[5] C07F *7/08, 7/10*

U.S. Cl. 556—453 **9 Claims**

1. A process for preparing organosiloxanes (1) of the general formula

$R_{4-n}{}^1Si(OSiR_3)_n$,

in which R is selected from the group consisting of a hydrogen atom, a monovalent hydrocarbon radical having from 1 to 18 carbon atoms per radical and a substituted monovalent hydrocarbon radical having from 1 to 18 carbon atom per radical, R1 is selected from the group consisting of R and a chlorine atom, and n is 3 or 4, which comprises reacting an organodisiloxane (2) of the general formula

$(R_3Si)_2O$,

with a chlorosilane (3) of the general formula

$R_{4-n}SiCl_n$,

in which R and n are the same as above, in the presence of phosphonitrile chlorides (4) and a cocatalyst (5), in which the cocatalyst (5) is used concomitantly with the phosphonitrile chlorides (4) and is selected from the group consisting of amides of the general formula

X-C(O)-R^2.

in which R^2 is selected from the group consisting of a hydrogen atom, a monovalent hydrocarbon radical having from 1 to 8 carbon atoms per radical and a substituted monovalent hydrocarbon radical having from 1 to 8 carbon atom per radical, and X is selected from th consisting of a radical of the formula R^2_2N- and

where R^2 is the same as above and R^3 is a divalent hydrocarbon radical having from 5 to 7 carbon atoms per radical, urea, urea derivatives of the general formula

X-C(O)-X,

where X is the same as above and cyanuric acid.

5,011,963

TERMINAL PERFLUOROALKYLSILANE COMPOUNDS

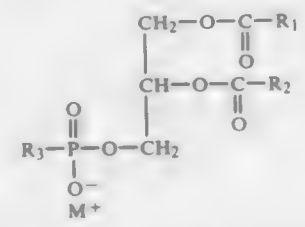
Kazufumi Ogawa; Hideharu Tamura, both of Kadoma; Toshinobu Ishihara, Chiyoda; Yasuhisa Tanaka, Chiyoda, and Mikio Endou, Chiyoda, all of Japan, assignors to Matsushita Electric Ind., Co., Ltd., Osaka and Shin-etsu Chemical Co., Ltd., Tokyo, both of, Japan

Filed Feb. 9, 1989, Ser. No. 307,968
Claims priority, application Japan, Feb. 9, 1988, 63-27952
Int. Cl.[5] C07F *7/08, 7/18*
U.S. Cl. 556—485 **4 Claims**

1. A terminal perfluoroalkylsilane compound having the general formula;

$$F(CF_2)_m(CH_2)_nSi(CH_3)_pX_{3-p}$$

wherein m, n, and p are each integers; m = 1 to 8, m + n = 13 to 32, and p = 0 to 2; and X is a halogen atom selected from I, Br and Cl, or is an alkoxy group.



5,011,964

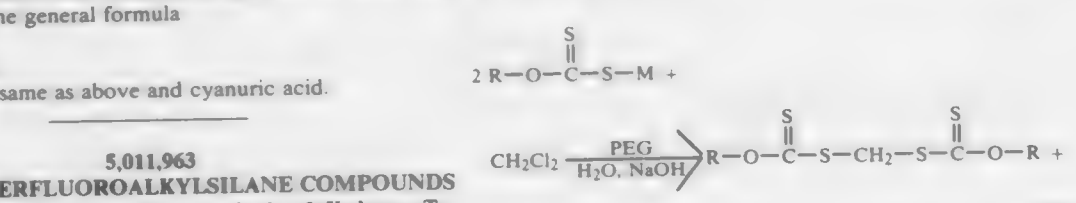
NOVEL DIACYLGLYCEROPHOSPHORIC ACID ESTERS AND USE THEREOF AS SUBSTRATES IN ENZYME ASSAYS

Dennis C. Mynarcik; Owen W. Griffith, both of New York, N.Y., and Gordon F. Fairclough, Jr., Norwalk, Conn., assignors to Cornell Research Foundation, Inc., Ithaca, N.Y.

Filed Apr. 6, 1990, Ser. No. 505,695
Int. Cl.[5] C07F *9/02, 9/10*; C12Q *1/42*
U.S. Cl. 558—179 **8 Claims**

1. Diacylglycerophosphoric acid ester having the following structural formula:

wherein R_1 R_2 are organic groups where at least one of them or the combination of them causes the compound to be insoluble in water, R_3 is a chromogenic head group which is released in enzymatic cleavage by phospholipase D from cabbage to form a chromophore or a molecule which reacts with diazotizing agent to form a chromophore and contains substituted phenol or naphthol or substituted naphthol of substituted umbelliferone and M^+ is a balancing cation.



5,011,965

PROCESS FOR PRODUCTION OF METHYLENE BISXANTHATES

Eugenio A. Saphores; Arturo G. Gleisner, both of Vina del Mar; Juan C. Vega, and Wladimir A. Mardones, both of Santiago, all of Chile, assignors to Establecimientos Industriales Quimicos Oxiquim S.A., Vina del Mar, Chile

Filed Apr. 28, 1989, Ser. No. 344,912
Int. Cl.[5] C07C *327/36*
U.S. Cl. 558—245 **11 Claims**

1. A process for producing a methylene bisxanthate, comprising reacting an aqueous solution of an alkaline xanthate with methylene chloride in the presence of PEG with terminal alcoholic groups as a phase transfer catalyst in accordance with the following formula:

2 MCl.

wherein R is an alkyl group containing from one to six carbon atoms and M is an alkaline metal; and separating the resulting methylene bisxanthate reaction product from other components of the reaction mixture.

5,011,966

LOW PHOSGENE METHOD FOR PREPARING AROMATIC BISCHLOROFORMATES

James M. Silva, Clifton Park, and Thomas J. Fyvie, Schenectady, both of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Jul. 22, 1988, Ser. No. 222,879
Int. Cl.[5] C07C *68/02, 69/96*
U.S. Cl. 558—268 **13 Claims**

1. A method for preparing an aromatic bischloroformate composition which comprises effecting contact at a temperature in the range of about 15°–50° C. between at least one dihydroxyaromatic compound, phosgene, water, an alkali or alkaline earth metal base and a substantially inert, substantially water-insoluble organic liquid, the total molar ratios of phosgene and base to dihydroxyaromatic compound being in the ranges of about 1.1–1.5:1 and about 2.0–2.4:1, respectively, and the total volume ratio of aqueous phase to organic liquid being in the range of about 0.5–1.0:1; said contact being effected by:

preparing a mixture of dihydroxyaromatic compound, organic liquid and about 5–15% of the total base employed;

passing phosgene into said mixture for a period of about 10–30 minutes;

simultaneously introducing the remainder of the base, at a constant rate initially to attain a pH of the aqueous phase of said mixture above a value in the range of 8–11;

discontinuing base addition while continuing phosgene addition;

resuming base addition when the measured pH falls below said pH value, said resumed base addition being at a rate about 5–10% in excess of the amount required to convert the phosgene then being introduced to bischloroformates;

ceasing base addition when phosgene addition is completed, and recovering said bischloroformate composition.

5,011,967

METHOD FOR PREPARING AROMATIC BISCHLOROFORMATE COMPOSITIONS

James M. Silva, Clifton Park, N.Y., and Robert A. Pyles, Evansville, Ind., assignors to General Electric Company, Schenectady, N.Y.

Division of Ser. No. 917,751, Oct. 10, 1986, Pat. No. 4,737,573. This application Dec. 4, 1987, Ser. No. 128,848
Int. Cl.[5] C07C *68/02, 69/96*
U.S. Cl. 558—281 **10 Claims**

1. A method for preparing an aromatic bischloroformate composition which comprises passing phosgene into a heterogeneous mixture consisting essentially of water, a substantially inert, substantially water-insoluble organic liquid and at least one dihydroxyaromatic compound in a tank reactor and simultaneously introducing an aqueous alkali or alkaline earth metal base solution at a rate to maintain the aqueous phase of said mixture at a pH in the range of 8–11; the temperature of said mixture being maintained in the range of about 15°–50° C., the volume ratio of aqueous to organic phase at the conclusion of phosgenation being in the range of about 0.4–1.0:1 and the total amount of phosgene employed being at least about 1.1 mole per mole of dihydroxyaromatic compound; said mixture being agitated under conditions at least sufficient to prevent segregation of the aqueous and organic liquid phases.

5,011,968

PROCESS FOR THE PREPARATION OF 3-CYANO-3,5,5-TRIMETHYLCYCLOHEXANONE

Jon C. Thunberg, Milford, N.H., and Walter B. Begonis, Reading, Mass., assignors to W. R. Grace & Co.-Conn., New York, N.Y.

Filed Feb. 6, 1990, Ser. No. 475,051
Int. Cl.[5] C07C *253/10*
U.S. Cl. 558—341 **17 Claims**

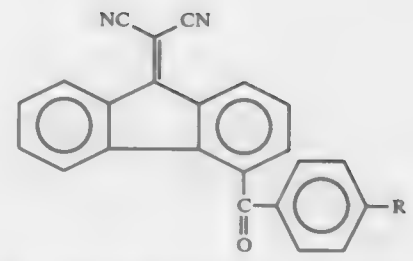
1. A process for the preparation of isophorone nitrile comprising:

a reacting isophorone with hydrogen cyanide in the presence of a quaternary ammonium hydroxide catalyst selected from the group consisting of tetramethylammonium hydroxide, tetraethylammonium hydroxide and tetrabutylammonium hydroxide in a mole ratio of isophorone: hydrogen cyanide: catalyst of about 2.00–3.00: 1.00: 0.005–0.01 and at a temperature of at least about 110° C.

b adjusting the temperature of the resulting mixture to about 110° C. –150° C. to decompose remaining catalyst;

c sparging with an inert gas at a temperature of about 100° C.–200° C. to remove the resulting quaternary ammonium catalyst decomposition product;

d acidifying the mixture with an acid selected from the group consisting of acetic acid, sulfuric acid and phosphoric acid, and sparging with an inert gas to eliminate residual cyanide.



5,011,969

FLUORENE DERIVATIVE AND PROCESS FOR PREPARATION THEREOF

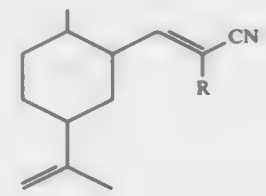
Yutaka Akasaki; Katsumi Nukada, and Katsuhiro Sato, all of Kanagawa, Japan, assignors to Fuji Xerox Co., Ltd., Tokyo, Japan

Filed Nov. 16, 1989, Ser. No. 436,880
Claims priority, application Japan, Nov. 16, 1988, 63-287614
Int. Cl.[5] C07C *255/50*
U.S. Cl. 558—402 **2 Claims**

1. A fluorene derivative represented by formula (I):

(I)

wherein R represents an alkyl group having 1 to 8 carbon atoms, a phenyl group or a C_1–C_8 alkyl-subsitiuted phenyl group.



5,011,970

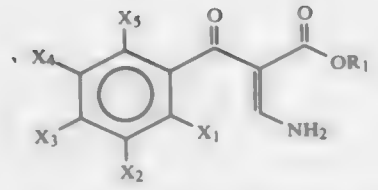
NITRILES USEFUL IN PERFUME

Willem Lenselink, Voorthuizen, Netherlands, assignor to PFW(Nederland)B.V., Amersfoort, Netherlands

Continuation of Ser. No. 569,649, Jan. 10, 1984, abandoned, which is a continuation of Ser. No. 351,088, Feb. 22, 1982, which is a division of Ser. No. 123,581, Feb. 22, 1980, Pat. No. 4,336,204, which is a division of Ser. No. 20,308, Mar. 14, 1929, Pat. No. 4,235,805. This application Nov. 28, 1986, Ser. No. 936,930
Int. Cl.[5] C07C *255/31*
U.S. Cl. 558—430 **6 Claims**

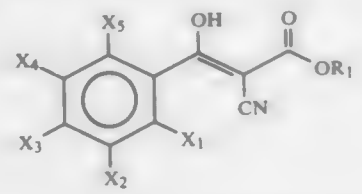
1. A compound having the structural formula:

wherein R is hydrogen or an alkyl radical of 1 to 6 carbon atoms.



5,011,971

PROCESS FOR THE PREPARATION OF SUBSTITUTED 3-AMINO-2 (BENZOYL)-ACRYLIC ACID ESTERS, AND A PROCESS FOR THE PREPARATION OF INTERMEDIATES FOR ANTIBACTERIAL ACTIVE COMPOUNDS FROM THESE COMPOUNDS



Karl Baumann, Wien, and Klaus Fitzinger, Freistadt, both of Austria, assignors to Chemie Linz Gesellschaft m.b.H., Linz, Austria

Filed Jun. 8, 1989, Ser. No. 363,198
Claims priority, application Austria, Jun. 9, 1988, 1495/88
Int. Cl.[5] C07C *227/04*
U.S. Cl. 560—38 **8 Claims**

1. A process for the preparation of a substituted 3-amino-2-(benzoyl)-acrylic acid ester of the formula I

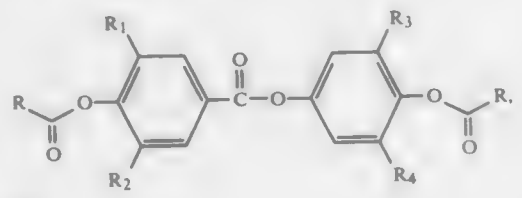
in which R_1 denotes an alkyl radical having 1 to 4 C atoms, X_1 denotes halogen, and X_2, X_3, X_4 and X_5 denote hydrogen or halogen, comprising selectively reducing, with hydrogen in the presence of a hydrogenation catalyst in a solvent or diluent, a corresponding substituted 2-cyano-3-hydroxy-3-hydroxy-3(phenyl)-acrylic acid ester of the formula II

in which R_1, X_1, X_2, X_3, X_4 and X_5 are as defined above.

5,011,972

BISESTERS OF UNSATURATED CARBOXYLIC ACIDS, THEIR PRODUCTION AND THEIR USE IN CURABLE MIXTURES

Helmut-Martin Meier, Ratingen-Eggerscheidt; Harald Pielartzik, Krefeld; Leo Morbitzer, Cologne; Hanns-Peter Müller, Bergisch-Gladbach, and Dietrich Braun, Darmstadt-Arheilgen, all of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Fed. Rep. of Germany



Filed Aug. 28, 1989, Ser. No. 398,991

Claims priority, application Fed. Rep. of Germany, Sep. 8, 1988, 3830453

Int. Cl.[5] C07C *69/76*

U.S. Cl. 560—66 **4 Claims**

1. Bisesters of unsaturated carboxylic acids corresponding to the following formula

in which

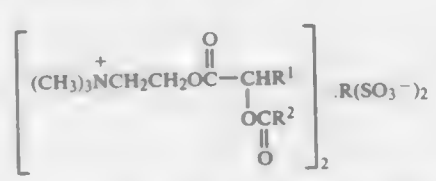
R_1, R_2, R_3 and R_4 independently of one another represent hydrogen, halogen or C_{1-6} alkyl and

R represents residues of unsaturated aliphatic carboxylic acids.

5,011,973

NOVEL PROCESS FOR PRODUCING BISCHOLINE-DISULFONATE DERIVATIVES

Yasuyuki Suzuki; Noboru Takagawa; Mikio Kawabata; Mariko Hayashi; Akiko Takagi; Takako Wakamiya, and Isamu Saikawa, all of Toyama, Japan, assignors to Toyama Chemical Co., Ltd., Tokyo, Japan



Continuation of Ser. No. 111,108, Oct. 20, 1987, abandoned, which is a continuation of Ser. No. 842,069, Feb. 20, 1986, abandoned, which is a continuation of Ser. No. 485,617, Apr. 18, 1983, abandoned. This application May 15, 1989, Ser. No. 352,610

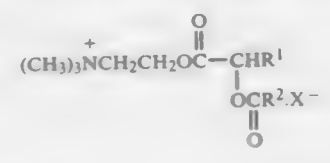
Int. Cl.[5] C07C *69/66*



U.S. Cl. 560—185 **9 Claims**

1. A process for producing bischoline-disulfonate derivatives represented by Formula (I):

(I)

wherein R^1 and R^2 each represent a lower alkyl group and R is a naphthalene group, which comprises reacting a trimethylammonium salt derivative represented by Formula (II):

(II)

wherein X is a removable group taken from the class consisting of halogens, sulfonic acid residues, alkylsulfuric acid residues, and alkylphosphate residues; with a disulfonic acid represented by Formula (III):

$$R(SO_3H)_2 \quad \text{(III)}$$

in the presence of a lower aliphatic alcohol.

5,011,974

PROCESS FOR THE PREPARATION OF DERIVATIVE OF 2-DIETHYLAMINO-1-METHYLETHYL-1-HYDROXY-(BICYCLOHEXYL)-2-CARBOXYLATE

Franco Sbarbaro, S. Olcese, Italy, assignor to Laboratori Guidotti, Pisa, Italy

Continuation of Ser. No. 27,085, Mar. 16, 1987, abandoned, which is a continuation of Ser. No. 479,646, Mar. 28, 1983, abandoned. This application Mar. 1, 1989, Ser. No. 318,520

Claims priority, application Italy, Apr. 1, 1983, 20538 A/83

Int. Cl.[5] C07C *69/74*

U.S. Cl. 560—118 **4 Claims**

1. A process for the preparation of the citrate, maleate, or fumarate of 2-diethylamino-1-methylethyl cis-1-hydroxy-(bicyclohexyl)-2-carboxylate consisting essentially of the following steps:

(a) reacting cis-1-hydroxyl-(bicyclohexyl)-2-carboxylic acid with 1-diethylamino-2-chloropropane in the presence of a hydrogen chloride acceptor; and then

(b) subjecting the reaction product obtained from step (a) to a thermal treatment to cause isomerization; and then

(c) reacting the material obtained from step (b) with phosphoric acid; and then

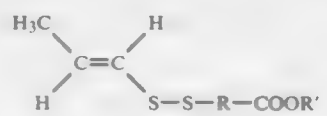
(d) separating a solid crystalline product from the reaction mixture obtained from step (c);

(e) treating the solid crystalline product obtained from step (d) with a base;

(g) reacting the product from step (e) with an organic acid selected from the group consisting of citric acid, maleic acid and fumaric acid to form a crystalline precipitate of the corresponding salt.

5,011,975

(TRANS 1-PROPENYL)DISULFIDE DERIVATIVE AND PROCESS FOR PREPARING THE SAME



Tokiyuki Hiramitsu, Kitaibaraki, and Ken-ichi Sakamoto, Toyama, both of Japan, assignors to Nippon Miktron Limited, Tokyo, Japan

Filed Jul. 17, 1989, Ser. No. 380,468
